WHIZARD[1]

Wolfgang Kilian,[2] Thorsten Ohl,[3] Jürgen Reuter[4]

Version 2.2.1, June 3 2014
with contributions from: Fabian Bach, Felix Braam, David Gordo
Gomez, Sebastian Schmidt, Marco Sekulla, Christian Speckner,
Daniel Wiesler

---

[1]The original meaning of the acronym is *W, Higgs, Z, And Respective Decays*. The current program is much more than that, however.

[2]e-mail: `kilian@physik.uni-siegen.de`

[4]e-mail: `juergen.reuter@desy.de`

Abstract

WHIZARD is an application of the VAMP algorithm: Adaptive multi-channel integration and event generation. The bare VAMP library is augmented by modules for Lorentz algebra, particles, phase space, etc., such that physical processes with arbitrary complex final states [well, in principle. . .] can be integrated and *unweighted* events be generated.

Chapter 1

Changes

For a comprehensive list of changes confer the ChangeLog file or the subversion log.

Chapter 2

Tools

This part contains modules needed for auxiliary purposes:

limits Compile-time (integer) constants: fixed array sizes, input field lengths, and such. Any module that uses such constants has to access them via **limits**.

mpi90 Parallel execution (currently disabled!). This module contains dummy replacements for the message passing interface subroutines.

diagnostics Error and diagnostic message handling. Any messages and errors issued by WHIZARD functions are handled by the subroutines in this module, if possible.

files Files and auxiliary routines that do not belong anywhere else.

permutations Handle permutations of integers.

unix_args Parse the command-line arguments and options. This part is system-dependent, and we provide a replacement if the functions are not available.

2.1 Preliminaries

The WHIZARD file header:

⟨*File header*⟩≡
```
  ! WHIZARD ⟨Version⟩ ⟨Date⟩
  !
  ! Copyright (C) 1999-2014 by
  !     Wolfgang Kilian <kilian@physik.uni-siegen.de>
  !     Thorsten Ohl <ohl@physik.uni-wuerzburg.de>
  !     Juergen Reuter <juergen.reuter@desy.de>
  !
  !     with contributions from
  !     Christian Speckner <cnspeckn@googlemail.com>
  !     and  Fabian Bach, Felix Braam, Sebastian Schmidt, Daniel Wiesler
  !
  ! WHIZARD is free software; you can redistribute it and/or modify it
  ! under the terms of the GNU General Public License as published by
```

```
! the Free Software Foundation; either version 2, or (at your option)
! any later version.
!
! WHIZARD is distributed in the hope that it will be useful, but
! WITHOUT ANY WARRANTY; without even the implied warranty of

!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
! This file has been stripped of most comments.  For documentation, refer
! to the source 'whizard.nw'
```

We are strict with our names:

⟨*Standard module head*⟩≡
```
    implicit none
    private
```

This is the way to envoke the kinds module (not contained in this source)

⟨*Use kinds*⟩≡
```
    use kinds, only: default !NODEP!
```

And we make heavy use of variable-length strings

⟨*Use strings*⟩≡
```
    use iso_varying_string, string_t => varying_string !NODEP!
```

Some parameters (buffer sizes etc.) are hardcoded. They are collected in this module:

⟨`limits.f90`⟩≡
  ⟨*File header*⟩

  module limits

    use iso_fortran_env, only: iostat_end, iostat_eor !NODEP!
  ⟨*Use kinds*⟩

  ⟨*Standard module head*⟩

  ⟨*Limits: public parameters*⟩

  end module limits

The version string is used for checking files. Note that the string length MUST NOT be changed, because reading binary files relies on it.

⟨*Limits: public parameters*⟩≡
```
    integer, parameter, public :: VERSION_STRLEN = 255
    character(len=VERSION_STRLEN), parameter, public :: &
        & VERSION_STRING = "WHIZARD version ⟨Version⟩ (⟨Date⟩)"
```

We collect format string for the different numerical output formats here.

⟨*Limits: public parameters*⟩+≡
```
    character(*), parameter, public :: FMT_19 = "ES19.12"
    character(*), parameter, public :: FMT_18 = "ES18.11"
```

```
character(*), parameter, public :: FMT_17 = "ES17.10"
character(*), parameter, public :: FMT_16 = "ES16.9"
character(*), parameter, public :: FMT_15 = "ES15.8"
character(*), parameter, public :: FMT_14 = "ES14.7"
character(*), parameter, public :: FMT_13 = "ES13.6"
character(*), parameter, public :: FMT_12 = "ES12.5"
```

2.2 Parallelization

This section has been removed, it was never used even in WHIZARD1. Parallelization should be reimplemented from scratch.

2.3 File utilities

This module provides miscellaneous tools associated with strings and files:

- Finding a free unit

- Selecting an output unit (stdout if undefined)

- Upper and lower case for strings

- Formatting a number for TEX output.

⟨`file_utils.f90`⟩≡
  ⟨*File header*⟩

```
  module file_utils

    use iso_fortran_env, only: stdout => output_unit !NODEP!
```
  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
```
    use limits, only: MIN_UNIT, MAX_UNIT !NODEP!
    use, intrinsic :: iso_c_binding !NODEP!
```

  ⟨*Standard module head*⟩

  ⟨*File utils: public*⟩

  ⟨*File utils: interfaces*⟩

```
  contains
```

  ⟨*File utils: procedures*⟩

```
  end module file_utils
```

2.3.1 Finding an I/O unit

Fortran 95 (even Fortran 2003) has no notion of implicit I/O units. Therefore, we have to find a free unit by trial and error.

⟨*Limits: public parameters*⟩+≡
```
    integer, parameter, public :: MIN_UNIT = 11, MAX_UNIT = 99
```

⟨*File utils: public*⟩≡
```
public :: free_unit
```

⟨*File utils: procedures*⟩≡
```
function free_unit () result (unit)
  integer :: unit
  logical :: exists, is_open
  integer :: i, status
  do i = MIN_UNIT, MAX_UNIT
     inquire (unit=i, exist=exists, opened=is_open, iostat=status)
     if (status == 0) then
        if (exists .and. .not. is_open) then
           unit = i; return
        end if
     end if
  end do
  unit = -1
end function free_unit
```

⟨*Use file utils*⟩≡
```
use file_utils !NODEP!
```

Return the given unit, if present, otherwise the default STDOUT unit.

⟨*File utils: public*⟩+≡
```
public :: output_unit
```

⟨*File utils: procedures*⟩+≡
```
function output_unit (unit) result (u)
  integer, intent(in), optional :: unit
  integer :: u
  if (present (unit)) then
     u = unit
  else
     u = stdout
  end if
end function output_unit
```

2.3.2   Deleting a file

Fortran does not contain a command for deleting a file. Here, we provide a subroutine that deletes a file if it exists. We do not handle the subtleties, so we assume that it is writable if it exists.

⟨*File utils: public*⟩+≡
```
public :: delete_file
```

⟨*File utils: procedures*⟩+≡
```
subroutine delete_file (name)
  character(*), intent(in) :: name
  logical :: exist
  integer :: u
  inquire (file = name, exist = exist)
  if (exist) then
     u = free_unit ()
     open (unit = u, file = name)
```

```
      close (u, status = "delete")
    end if
  end subroutine delete_file
```

2.3.3 String auxiliary functions

These are, unfortunately, not part of Fortran.

⟨*File utils: public*⟩+≡
```
    public :: upper_case
    public :: lower_case
```

⟨*File utils: interfaces*⟩≡
```
    interface upper_case
       module procedure upper_case_char, upper_case_string
    end interface
    interface lower_case
       module procedure lower_case_char, lower_case_string
    end interface
```

⟨*File utils: procedures*⟩+≡
```
    function upper_case_char (string) result (new_string)
      character(*), intent(in) :: string
      character(len(string)) :: new_string
      integer :: pos, code
      integer, parameter :: offset = ichar('A')-ichar('a')
      do pos = 1, len (string)
         code = ichar (string(pos:pos))
         select case (code)
         case (ichar('a'):ichar('z'))
            new_string(pos:pos) = char (code + offset)
         case default
            new_string(pos:pos) = string(pos:pos)
         end select
      end do
    end function upper_case_char

    function lower_case_char (string) result (new_string)
      character(*), intent(in) :: string
      character(len(string)) :: new_string
      integer :: pos, code
      integer, parameter :: offset = ichar('a')-ichar('A')
      do pos = 1, len (string)
         code = ichar (string(pos:pos))
         select case (code)
         case (ichar('A'):ichar('Z'))
            new_string(pos:pos) = char (code + offset)
         case default
            new_string(pos:pos) = string(pos:pos)
         end select
      end do
    end function lower_case_char

    function upper_case_string (string) result (new_string)
```

```
    type(string_t), intent(in) :: string
    type(string_t) :: new_string
    new_string = upper_case_char (char (string))
  end function upper_case_string

  function lower_case_string (string) result (new_string)
    type(string_t), intent(in) :: string
    type(string_t) :: new_string
    new_string = lower_case_char (char (string))
  end function lower_case_string
```

Quote underscore characters for use in TEX output.

⟨*File utils: public*⟩+≡
```
    public :: quote_underscore
```

⟨*File utils: procedures*⟩+≡
```
    function quote_underscore (string) result (quoted)
      type(string_t) :: quoted
      type(string_t), intent(in) :: string
      type(string_t) :: part
      type(string_t) :: buffer
      buffer = string
      quoted = ""
      do
        call split (part, buffer, "_")
        quoted = quoted // part
        if (buffer == "")  exit
        quoted = quoted // "\_"
      end do
    end function quote_underscore
```

Convert a FORTRAN string into a zero terminated C string.

⟨*File utils: public*⟩+≡
```
    public :: string_f2c
```

⟨*File utils: interfaces*⟩+≡
```
    interface string_f2c
       module procedure string_f2c_char, string_f2c_var_str
    end interface string_f2c
```

⟨*File utils: procedures*⟩+≡
```
    pure function string_f2c_char (i) result (o)
    character(*), intent(in) :: i
    character(kind=c_char, len=len (i) + 1) :: o
      o = i // c_null_char
    end function string_f2c_char

    pure function string_f2c_var_str (i) result (o)
    type(string_t), intent(in) :: i
    character(kind=c_char, len=len (i) + 1) :: o
      o = char (i) // c_null_char
    end function string_f2c_var_str
```

2.3.4 Formatting numbers

Format a number with n significant digits for use in TeX documents.

⟨*File utils: public*⟩+≡

```
public :: tex_format
```

⟨*File utils: procedures*⟩+≡

```
function tex_format (rval, n_digits) result (string)
  type(string_t) :: string
  real(default), intent(in) :: rval
  integer, intent(in) :: n_digits
  integer :: e, n, w, d
  real(default) :: absval
  real(default) :: mantissa
  character :: sign
  character(20) :: format
  character(80) :: cstr
  n = min (abs (n_digits), 16)
  if (rval == 0) then
     string = "0"
  else
     absval = abs (rval)
     e = log10 (absval)
     if (rval < 0) then
        sign = "-"
     else
        sign = ""
     end if
     select case (e)
     case (:-3)
        d = max (n - 1, 0)
        w = max (d + 2, 2)
        write (format, "('(F',I0,'.',I0,',A,I0,A)')")  w, d
        mantissa = absval * 10._default ** (1 - e)
        write (cstr, fmt=format)  mantissa, "\times 10^{", e - 1, "}"
     case (-2:0)
        d = max (n - e, 1 - e)
        w = max (d + e + 2, d + 2)
        write (format, "('(F',I0,'.',I0,')')")  w, d
        write (cstr, fmt=format)  absval
     case (1:2)
        d = max (n - e - 1, -e, 0)
        w = max (d + e + 2, d + 2, e + 2)
        write (format, "('(F',I0,'.',I0,')')")  w, d
        write (cstr, fmt=format)  absval
     case default
        d = max (n - 1, 0)
        w = max (d + 2, 2)
        write (format, "('(F',I0,'.',I0,',A,I0,A)')")  w, d
        mantissa = absval * 10._default ** (- e)
        write (cstr, fmt=format)  mantissa, "\times 10^{", e, "}"
     end select
     string = sign // trim (cstr)
  end if
end function tex_format
```

Write a number for use in Metapost code:

⟨*File utils: public*⟩+≡
```
public :: mp_format
```

⟨*File utils: procedures*⟩+≡
```
function mp_format (rval) result (string)
  type(string_t) :: string
  real(default), intent(in) :: rval
  character(16) :: tmp
  write (tmp, "(G16.8)")  rval
  string = lower_case (trim (adjustl (trim (tmp))))
end function mp_format
```

2.3.5 Auxiliary stuff

Write a separator line.

⟨*File utils: public*⟩+≡
```
public :: write_separator
public :: write_separator_double
```

⟨*File utils: procedures*⟩+≡
```
subroutine write_separator (u)
  integer, intent(in) :: u
  write (u, "(A)")  repeat ("-", 72)
end subroutine write_separator

subroutine write_separator_double (u)
  integer, intent(in) :: u
  write (u, "(A)")  repeat ("=", 72)
end subroutine write_separator_double
```

⟨*File utils: public*⟩+≡
```
public :: write_indent
```

⟨*File utils: procedures*⟩+≡
```
subroutine write_indent (unit, indent)
  integer, intent(in) :: unit
  integer, intent(in), optional :: indent
  if (present (indent)) then
     write (unit, "(1x,A)", advance="no")  repeat ("  ", indent)
  end if
end subroutine write_indent
```

Conditional format string.

⟨*File utils: public*⟩+≡
```
public :: pac_fmt
```

⟨*File utils: procedures*⟩+≡
```
    subroutine pac_fmt (fmt, fmt_orig, fmt_pac, pacify)
      character(*), intent(in) :: fmt_orig, fmt_pac
      character(*), intent(out) :: fmt
      logical, intent(in), optional :: pacify
      logical :: pacified
      pacified = .false.
      if (present (pacify)) pacified = pacify
      if (pacified) then
         fmt = fmt_pac
      else
         fmt = fmt_orig
      end if
    end subroutine pac_fmt
```

2.4 Unit tests

Here, we provide functionality for automated unit tests. Each test is required to produce output which is compared against a reference file. If the two are identical, we signal success. Otherwise, we signal failure and write the output to a file.

⟨`unit_tests.f90`⟩≡
  ⟨*File header*⟩

```
  module unit_tests
```

  ⟨*Use strings*⟩
  ⟨*Use file utils*⟩

  ⟨*Standard module head*⟩

  ⟨*Tests: public*⟩

  ⟨*Tests: parameters*⟩

  ⟨*Tests: types*⟩

  ⟨*Tests: interfaces*⟩

```
  contains
```

  ⟨*Tests: procedures*⟩

```
  end module unit_tests
```

2.4.1 Parameters

Building blocks of file names:

⟨*Tests: parameters*⟩≡
```
    character(*), parameter :: ref_prefix = "ref-output/"
```

```
character(*), parameter :: ref = ".ref"

character(*), parameter :: err_prefix = "err-output/"
character(*), parameter :: err = ".out"
```

2.4.2 Type for storing test results

We store the results of the individual unit tests in a linked list. Here is the entry:

⟨*Tests: public*⟩≡
```
public :: test_results_t
```

⟨*Tests: types*⟩≡
```
type :: test_result_t
   logical :: success = .false.
   type(string_t) :: name
   type(string_t) :: description
   type(test_result_t), pointer :: next => null ()
end type test_result_t

type :: test_results_t
   private
   type(test_result_t), pointer :: first => null ()
   type(test_result_t), pointer :: last => null ()
   integer :: n_success = 0
   integer :: n_failure = 0
 contains
 ⟨Tests: test results: TBP⟩
end type test_results_t
```

Add a test result.

⟨*Tests: test results: TBP*⟩≡
```
procedure, private :: add => test_results_add
```

⟨*Tests: procedures*⟩≡
```
subroutine test_results_add (list, name, description, success)
  class(test_results_t), intent(inout) :: list
  character(len=*), intent(in) :: name
  character(len=*), intent(in) :: description
  logical, intent(in) :: success
  type(test_result_t), pointer :: result
  allocate (result)
  result%success = success
  result%name = name
  result%description = description
  if (associated (list%first)) then
     list%last%next => result
  else
     list%first => result
  end if
  list%last => result
  if (success) then
     list%n_success = list%n_success + 1
```

```
      else
          list%n_failure = list%n_failure + 1
      end if
   end subroutine test_results_add
```

Display the current state.

⟨*Tests: test results: TBP*⟩+≡
```
    procedure, private :: write => test_results_write
```

⟨*Tests: procedures*⟩+≡
```
    subroutine test_results_write (list, u)
      class(test_results_t), intent(in) :: list
      integer, intent(in) :: u
      type(test_result_t), pointer :: result
      write (u, "(A)")  "*** Test Summary ***"
      if (list%n_success > 0) then
          write (u, "(2x,A)")  "Success:"
          result => list%first
          do while (associated (result))
             if (result%success)  write (u, "(4x,A,': ',A)")  &
                   char (result%name), char (result%description)
             result => result%next
          end do
      end if
      if (list%n_failure > 0) then
          write (u, "(2x,A)")  "Failure:"
          result => list%first
          do while (associated (result))
             if (.not. result%success)  write (u, "(4x,A,': ',A)")  &
                   char (result%name), char (result%description)
             result => result%next
          end do
      end if
      write (u, "(A,I0)")  "Total   = ", list%n_success + list%n_failure
      write (u, "(A,I0)")  "Success = ", list%n_success
      write (u, "(A,I0)")  "Failure = ", list%n_failure
      write (u, "(A)")  "*** End of test Summary ***"
    end subroutine test_results_write
```

Return true if all tests were successful (or no test).

⟨*Tests: test results: TBP*⟩+≡
```
    procedure, private :: report => test_results_report
```

⟨*Tests: procedures*⟩+≡
```
    subroutine test_results_report (list, success)
      class(test_results_t), intent(in) :: list
      logical, intent(out) :: success
      success = list%n_failure == 0
    end subroutine test_results_report
```

Delete the list.

⟨*Tests: test results: TBP*⟩+≡
```
    procedure, private :: final => test_results_final
```

⟨*Tests: procedures*⟩+≡

```fortran
    subroutine test_results_final (list)
      class(test_results_t), intent(inout) :: list
      type(test_result_t), pointer :: result
      do while (associated (list%first))
         result => list%first
         list%first => result%next
         deallocate (result)
      end do
      list%last => null ()
      list%n_success = 0
      list%n_failure = 0
    end subroutine test_results_final
```

2.4.3 Wrapup

This will write results, report status, and finalize. This is the only method which we need to access from outside.

⟨*Tests: test results: TBP*⟩+≡

```fortran
    procedure :: wrapup => test_results_wrapup
```

⟨*Tests: procedures*⟩+≡

```fortran
    subroutine test_results_wrapup (list, u, success)
      class(test_results_t), intent(inout) :: list
      integer, intent(in) :: u
      logical, intent(out), optional :: success
      call list%write (u)
      if (present (success))  call list%report (success)
      call list%final ()
    end subroutine test_results_wrapup
```

2.4.4 Tool for Unit Tests

This procedure takes a test routine as an argument. It runs the test, output directed to a temporary file. Then, it compares the file against a reference file.

The test routine must take the output unit as argument.

⟨*Tests: interfaces*⟩≡

```fortran
    abstract interface
       subroutine unit_test (u)
         integer, intent(in) :: u
       end subroutine unit_test
    end interface
```

The test routine can print to screen and, optionally, to a logging unit.

⟨*Tests: public*⟩+≡

```fortran
    public :: test
```

⟨*Tests: procedures*⟩+≡

```
subroutine test (test_proc, name, description, u_log, results)
  procedure(unit_test) :: test_proc
  character(*), intent(in) :: name
  character(*), intent(in) :: description
  integer, intent(in) :: u_log
  type(test_results_t), intent(inout) :: results
  integer :: u_test, u_ref, u_err
  logical :: exist
  character(256) :: buffer1, buffer2
  integer :: iostat1, iostat2
  logical :: success
  write (*, "(A)", advance="no")  "Running test: " // name
  write (u_log, "(A)")  "Test: " // name
  u_test = free_unit ()
  open (u_test, status="scratch", action="readwrite")
  call test_proc (u_test)
  rewind (u_test)
  inquire (file=ref_prefix//name//ref, exist=exist)
  if (exist) then
     u_ref = free_unit ()
     open (u_ref, file=ref_prefix//name//ref, status="old", action="read")
     COMPARE_FILES: do

2.5   Operating-system interface

For specific purposes, we need direct access to the OS (system calls). This is,
of course, system dependent. The current version is valid for GNU/Linux; we
expect to use a preprocessor for this module if different OSs are to be supported.

   The current implementation lacks error handling.

  end module os_interface

2.5.1   Path variables

This is a transparent container for storing user-defined path variables.

⟨OS interface: public⟩≡
    public :: paths_t

⟨*OS interface: types*⟩≡
```
type :: paths_t
   type(string_t) :: prefix
   type(string_t) :: exec_prefix
   type(string_t) :: bindir
   type(string_t) :: libdir
   type(string_t) :: includedir
   type(string_t) :: datarootdir
   type(string_t) :: localprefix
   type(string_t) :: libtool
   type(string_t) :: lhapdfdir
end type paths_t
```

⟨*OS interface: public*⟩+≡
```
public :: paths_init
```

⟨*OS interface: procedures*⟩≡
```
subroutine paths_init (paths)
  type(paths_t), intent(out) :: paths
  paths%prefix = ""
  paths%exec_prefix = ""
  paths%bindir = ""
  paths%libdir = ""
  paths%includedir = ""
  paths%datarootdir = ""
  paths%localprefix = ""
  paths%libtool = ""
  paths%lhapdfdir = ""
end subroutine paths_init
```

2.5.2 System dependencies

We store all potentially system- and user/run-dependent data in a transparent container. This includes compiler/linker names and flags, file extensions, etc.

⟨*OS interface: public*⟩+≡
```
public :: os_data_t
```

⟨*OS interface: types*⟩+≡
```
type :: os_data_t
   logical :: use_libtool
   logical :: use_testfiles

2.5.3 Dynamic linking

We define a type that holds the filehandle for a dynamically linked library (shared object), together with functions to open and close the library, and to access functions in this library.

⟨*OS interface: public*⟩+≡
```
    public :: dlaccess_t
```

⟨*OS interface: types*⟩+≡
```
    type :: dlaccess_t
       private
       type(string_t) :: filename
       type(c_ptr) :: handle = c_null_ptr
       logical :: is_open = .false.
       logical :: has_error = .false.
       type(string_t) :: error
     contains
     ⟨OS interface: dlaccess: TBP⟩
    end type dlaccess_t
```

Output. This is called by the output routine for the process library.

⟨*OS interface: dlaccess: TBP*⟩≡
```
    procedure :: write => dlaccess_write
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine dlaccess_write (object, unit)
      class(dlaccess_t), intent(in) :: object
      integer, intent(in) :: unit
      write (unit, "(1x,A)")  "DL access info:"
      write (unit, "(3x,A,L1)")  "is open  = ", object%is_open
      if (object%has_error) then
         write (unit, "(3x,A,A,A)")  "error    = '", char (object%error), "'"
      else
         write (unit, "(3x,A)")      "error    = [none]"
      end if
    end subroutine dlaccess_write
```

The interface to the library functions:

⟨*OS interface: interfaces*⟩≡
```
    interface
       function dlopen (filename, flag) result (handle) bind(C)
         import
         character(c_char), dimension(*) :: filename
         integer(c_int), value :: flag
         type(c_ptr) :: handle
       end function dlopen
    end interface

    interface
       function dlclose (handle) result (status) bind(C)
         import
         type(c_ptr), value :: handle
         integer(c_int) :: status
       end function dlclose
```

```
      end interface

      interface
         function dlerror () result (str) bind(C)
            import
            type(c_ptr) :: str
         end function dlerror
      end interface

      interface
         function dlsym (handle, symbol) result (fptr) bind(C)
            import
            type(c_ptr), value :: handle
            character(c_char), dimension(*) :: symbol
            type(c_funptr) :: fptr
         end function dlsym
      end interface
```

This reads an error string and transforms it into a `string_t` object, if an error
has occured. If not, set the error flag to false and return an empty string.

⟨*Limits: public parameters*⟩+≡
```
      integer, parameter, public :: DLERROR_LEN = 160
```

⟨*OS interface: procedures*⟩+≡
```
      subroutine read_dlerror (has_error, error)
        logical, intent(out) :: has_error
        type(string_t), intent(out) :: error
        type(c_ptr) :: err_cptr
        character(len=DLERROR_LEN, kind=c_char), pointer :: err_fptr
        integer :: str_end
        err_cptr = dlerror ()
        if (c_associated (err_cptr)) then
           call c_f_pointer (err_cptr, err_fptr)
           has_error = .true.
           str_end = scan (err_fptr, c_null_char)
           if (str_end > 0) then
              error = err_fptr(1:str_end-1)
           else
              error = err_fptr
           end if
        else
           has_error = .false.
           error = ""
        end if
      end subroutine read_dlerror
```

This is the Fortran API. Init/final open and close the file, i.e., load and unload
the library.

Note that a library can be opened more than once, and that for an ultimate
close as many `dlclose` calls as `dlopen` calls are necessary. However, we assume
that it is opened and closed only once.

⟨*OS interface: public*⟩+≡
```
      public :: dlaccess_init
```

```
    public :: dlaccess_final
```
⟨*OS interface: dlaccess: TBP*⟩+≡
```
    procedure :: init => dlaccess_init
    procedure :: final => dlaccess_final
```
⟨*OS interface: procedures*⟩+≡
```
    subroutine dlaccess_init (dlaccess, prefix, libname, os_data)
      class(dlaccess_t), intent(out) :: dlaccess
      type(string_t), intent(in) :: prefix, libname
      type(os_data_t), intent(in), optional :: os_data
      type(string_t) :: filename
      logical :: exist
      dlaccess%filename = libname
      filename = prefix // "/" // libname
      inquire (file=char(filename), exist=exist)
      if (.not. exist) then
          filename = prefix // "/.libs/" // libname
          inquire (file=char(filename), exist=exist)
          if (.not. exist) then
             dlaccess%has_error = .true.
             dlaccess%error = "Library '" // filename // "' not found"
             return
          end if
      end if
      dlaccess%handle = dlopen (char (filename) // c_null_char, ior ( &
          RTLD_LAZY, RTLD_LOCAL))
      dlaccess%is_open = c_associated (dlaccess%handle)
      call read_dlerror (dlaccess%has_error, dlaccess%error)
    end subroutine dlaccess_init

    subroutine dlaccess_final (dlaccess)
      class(dlaccess_t), intent(inout) :: dlaccess
      integer(c_int) :: status
      if (dlaccess%is_open) then
          status = dlclose (dlaccess%handle)
          dlaccess%is_open = .false.
          call read_dlerror (dlaccess%has_error, dlaccess%error)
      end if
    end subroutine dlaccess_final
```

Return true if an error has occured.

⟨*OS interface: public*⟩+≡
```
    public :: dlaccess_has_error
```
⟨*OS interface: procedures*⟩+≡
```
    function dlaccess_has_error (dlaccess) result (flag)
      logical :: flag
      type(dlaccess_t), intent(in) :: dlaccess
      flag = dlaccess%has_error
    end function dlaccess_has_error
```

Return the error string currently stored in the `dlaccess` object.

⟨*OS interface: public*⟩+≡
```
    public :: dlaccess_get_error
```

⟨*OS interface: procedures*⟩+≡
```
function dlaccess_get_error (dlaccess) result (error)
  type(string_t) :: error
  type(dlaccess_t), intent(in) :: dlaccess
  error = dlaccess%error
end function dlaccess_get_error
```

The symbol handler returns the C address of the function with the given string name. (It is a good idea to use `bind(C)` for all functions accessed by this, such that the name string is well-defined.) Call `c_f_procpointer` to cast this into a Fortran procedure pointer with an appropriate interface.

⟨*OS interface: public*⟩+≡
```
public :: dlaccess_get_c_funptr
```

⟨*OS interface: procedures*⟩+≡
```
function dlaccess_get_c_funptr (dlaccess, fname) result (fptr)
  type(c_funptr) :: fptr
  type(dlaccess_t), intent(inout) :: dlaccess
  type(string_t), intent(in) :: fname
  fptr = dlsym (dlaccess%handle, char (fname) // c_null_char)
  call read_dlerror (dlaccess%has_error, dlaccess%error)
end function dlaccess_get_c_funptr
```

2.5.4 Predicates

Return true if the library is loaded. In particular, this is false if loading was unsuccessful.

⟨*OS interface: public*⟩+≡
```
public :: dlaccess_is_open
```

⟨*OS interface: procedures*⟩+≡
```
function dlaccess_is_open (dlaccess) result (flag)
  logical :: flag
  type(dlaccess_t), intent(in) :: dlaccess
  flag = dlaccess%is_open
end function dlaccess_is_open
```

2.5.5 Shell access

This is the standard system call for executing a shell command, such as invoking a compiler.

In F2008 there will be the equivalent built-in command `execute_command_line`.

⟨*OS interface: public*⟩+≡
```
public :: os_system_call
```

⟨*OS interface: procedures*⟩+≡
```
subroutine os_system_call (command_string, status, verbose)
  type(string_t), intent(in) :: command_string
  integer, intent(out), optional :: status
  logical, intent(in), optional :: verbose
  logical :: verb
```

```
      integer :: stat
      verb = .false.;  if (present (verbose))  verb = verbose
      if (verb) &
          call msg_message ("command: " // char (command_string))
      stat = system (char (command_string) // c_null_char)
      if (present (status)) then
         status = stat
      else if (stat /= 0) then
         if (.not. verb) &
             call msg_message ("command: " // char (command_string))
         write (msg_buffer, "(A,I0)")  "Return code = ", stat
         call msg_message ()
         call msg_fatal ("System command returned with nonzero status code")
      end if
   end subroutine os_system_call
```

⟨*OS interface: interfaces*⟩+≡
```
   interface
     function system (command) result (status) bind(C)
       import
       integer(c_int) :: status
       character(c_char), dimension(*) :: command
     end function system
   end interface
```

2.5.6   Querying for a directory

This queries for the existence of a directory. There is no standard way to achieve this in FORTRAN, and if we were to call into `libc`, we would need access to C macros for evaluating the result, so we resort to calling `test` as a system call.

⟨*OS interface: public*⟩+≡
```
   public :: os_dir_exist
```

⟨*OS interface: procedures*⟩+≡
```
   function os_dir_exist (name) result (res)
     type(string_t), intent(in) :: name
     logical :: res
     integer :: status
     call os_system_call ('test -d "' // name // '"', status=status)
     res = status == 0
   end function os_dir_exist
```

2.5.7   Fortran compiler and linker

Compile a single module for use in a shared library, but without linking.

⟨*OS interface: public*⟩+≡
```
   public :: os_compile_shared
```

⟨*OS interface: procedures*⟩+≡
```
   subroutine os_compile_shared (src, os_data, status)
     type(string_t), intent(in) :: src
     type(os_data_t), intent(in) :: os_data
```

```
   integer, intent(out), optional :: status
   type(string_t) :: command_string
   if (os_data%use_libtool) then
      command_string = &
           os_data%whizard_libtool // " --mode=compile " // &
           os_data%fc // " " // &
           "-c " // &
           os_data%whizard_includes // " " // &
           os_data%fcflags // " " // &
           "'" // src // os_data%fc_src_ext // "'"
   else
      command_string = &
           os_data%fc // " " // &
           "-c  " // &
           os_data%fcflags_pic // " " // &
           os_data%whizard_includes // " " // &
           os_data%fcflags // " " // &
           "'" // src // os_data%fc_src_ext // "'"
   end if
   call os_system_call (command_string, status)
  end subroutine os_compile_shared
```

Link an array of object files to build a shared object library. In the libtool
case, we have to specify a -rpath, otherwise only a static library can be built.
However, since the library is never installed, this rpath is irrelevant.

⟨*OS interface: public*⟩+≡
```
   public :: os_link_shared
```

⟨*OS interface: procedures*⟩+≡
```
  subroutine os_link_shared (objlist, lib, os_data, status)
    type(string_t), intent(in) :: objlist, lib
    type(os_data_t), intent(in) :: os_data
    integer, intent(out), optional :: status
    type(string_t) :: command_string
    if (os_data%use_libtool) then
       command_string = &
            os_data%whizard_libtool // " --mode=link " // &
            os_data%fc // " " // &
            "-module " // &
            "-rpath /usr/local/lib" // " " // &
            os_data%fcflags // " " // &
            os_data%whizard_ldflags // " " // &
            os_data%ldflags // " " // &
            "-o '" // lib // ".la' " // &
            objlist
    else
       command_string = &
            os_data%ld // " " // &
            os_data%ldflags_so // " " // &
            os_data%fcflags // " " // &
            os_data%whizard_ldflags // " " // &
            os_data%ldflags // " " // &
            "-o '" // lib // os_data%shlib_ext // "' " // &
            objlist
```

46

```
      end if
      call os_system_call (command_string, status)
    end subroutine os_link_shared
```

Link an array of object files / libraries to build a static executable.

⟨*OS interface: public*⟩+≡
```
    public :: os_link_static
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine os_link_static (objlist, exec_name, os_data, status)
      type(string_t), intent(in) :: objlist, exec_name
      type(os_data_t), intent(in) :: os_data
      integer, intent(out), optional :: status
      type(string_t) :: command_string
      if (os_data%use_libtool) then
         command_string = &
              os_data%whizard_libtool // " --mode=link " // &
              os_data%fc // " " // &
              "-static-libtool-libs " // &
              os_data%fcflags // " " // &
              os_data%whizard_ldflags // " " // &
              os_data%ldflags // " " // &
              os_data%ldflags_static // " " // &
              "-o '" // exec_name // "' " // &
              objlist // " " // &
              os_data%ldflags_hepmc // " " // &
              os_data%ldflags_hoppet
      else
         command_string = &
              os_data%ld // " " // &
              os_data%ldflags_so // " " // &
              os_data%fcflags // " " // &
              os_data%whizard_ldflags // " " // &
              os_data%ldflags // " " // &
              os_data%ldflags_static // " " // &
              "-o '" // exec_name // "' " // &
              objlist // " " // &
              os_data%ldflags_hepmc // " " // &
              os_data%ldflags_hoppet
      end if
      call os_system_call (command_string, status)
    end subroutine os_link_static
```

Determine the name of the shared library to link. If libtool is used, this is encoded in the `.la` file which resides in place of the library itself.

⟨*OS interface: public*⟩+≡
```
    public :: os_get_dlname
```

⟨*OS interface: procedures*⟩+≡
```
    function os_get_dlname (lib, os_data, ignore, silent) result (dlname)
      type(string_t) :: dlname
      type(string_t), intent(in) :: lib
      type(os_data_t), intent(in) :: os_data
      logical, intent(in), optional :: ignore, silent
```

```
   type(string_t) :: filename
   type(string_t) :: buffer
   logical :: exist, required, quiet
   integer :: u
   u = free_unit ()
   if (present (ignore)) then
      required = .not. ignore
   else
      required = .true.
   end if
      if (present (silent)) then
      quiet = silent
   else
      quiet = .false.
   end if
   if (os_data%use_libtool) then
      filename = lib // ".la"
      inquire (file=char(filename), exist=exist)
      if (exist) then
         open (unit=u, file=char(filename), action="read", status="old")
         SCAN_LTFILE: do
            call get (u, buffer)
            if (extract (buffer, 1, 7) == "dlname=") then
               dlname = extract (buffer, 9)
               dlname = remove (dlname, len (dlname))
               exit SCAN_LTFILE
            end if
         end do SCAN_LTFILE
         close (u)
      else if (required) then
         if (.not. quiet) call msg_fatal (" Library '" // char (lib) &
            // "': libtool archive not found")
         dlname = ""
      else
         if (.not. quiet) call msg_message ("[No compiled library '" &
            // char (lib) // "']")
         dlname = ""
      end if
   else
      dlname = lib // os_data%shlib_ext
      inquire (file=char(dlname), exist=exist)
      if (.not. exist) then
         if (required) then
            if (.not. quiet) call msg_fatal (" Library '" // char (lib) &
               // "' not found")
         else
            if (.not. quiet) call msg_message &
               ("[No compiled process library '" // char (lib) // "']")
            dlname = ""
         end if
      end if
   end if
end function os_get_dlname
```

2.5.8 Controlling OpenMP

OpenMP is handled automatically by the library for the most part. Here is a convenience routine for setting the number of threads, with some diagnostics.

⟨*OS interface: public*⟩+≡
```
    public :: openmp_set_num_threads_verbose
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine openmp_set_num_threads_verbose (num_threads, openmp_logging)
      integer, intent(in) :: num_threads
      integer :: n_threads
      logical, intent(in), optional :: openmp_logging
      logical :: logging
      if (present (openmp_logging)) then
         logging = openmp_logging
      else
         logging = .true.
      end if
      n_threads = num_threads
      if (openmp_is_active ()) then
         if (num_threads == 1) then
            if (logging) then
               write (msg_buffer, "(A,I0,A)")  "OpenMP: Using ", num_threads, &
                   " thread"
               call msg_message
            end if
            n_threads = num_threads
         else if (num_threads > 1) then
            if (logging) then
               write (msg_buffer, "(A,I0,A)")  "OpenMP: Using ", num_threads, &
                   " threads"
               call msg_message
            end if
            n_threads = num_threads
         else
            if (logging) then
               write (msg_buffer, "(A,I0,A)")  "OpenMP: " &
                   // "Illegal value of openmp_num_threads (", num_threads, &
                 ") ignored"
               call msg_error
            end if
            n_threads = openmp_get_default_max_threads ()
            if (logging) then
               write (msg_buffer, "(A,I0,A)")  "OpenMP: Using ", &
                   n_threads, " threads"
               call msg_message
            end if
         end if
         if (n_threads > openmp_get_default_max_threads ()) then
            if (logging) then
               write (msg_buffer, "(A,I0)")  "OpenMP: " &
                   // "Number of threads is greater than library default of ", &
                   openmp_get_default_max_threads ()
               call msg_warning
            end if
```

```
         end if
         call openmp_set_num_threads (n_threads)
      else if (num_threads /= 1) then
         if (logging) then
            write (msg_buffer, "(A,I0,A)")  "openmp_num_threads set to ", &
                 num_threads, ", but OpenMP is not active: ignored"
            call msg_warning
         end if
      end if
   end subroutine openmp_set_num_threads_verbose
```

2.5.9   Unit tests

⟨*OS interface: public*⟩+≡
```
    public :: os_interface_test
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine os_interface_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
⟨*OS interface: execute tests*⟩
```
    end subroutine os_interface_test
```

Write a Fortran source file, compile it to a shared library, load it, and execute
the contained function.

⟨*OS interface: execute tests*⟩≡
```
    call test (os_interface_1, "os_interface_1", &

2.6   CPU timing

This is a simplified module which replaces `clock.f90` below. The time is now stored in a simple derived type which just holds a floating-point number.

⟨`cputime.f90`⟩≡
  ⟨*File header*⟩

```
  module cputime
```

  ⟨*Use kinds*⟩
  ⟨*Use file utils*⟩
  ⟨*Use strings*⟩
```
    use diagnostics !NODEP!
    use unit_tests
```

  ⟨*Standard module head*⟩

  ⟨*CPU time: public*⟩

  ⟨*CPU time: types*⟩

  ⟨*CPU time: interfaces*⟩

```
  contains
```

  ⟨*CPU time: procedures*⟩

  ⟨*CPU time: tests*⟩

```
  end module cputime
```

The CPU time is a floating-point number with an arbitrary reference time. It is single precision (default real, not `real(default)`). It is measured in seconds.

⟨*CPU time: public*⟩≡
```
    public :: time_t
```

⟨*CPU time: types*⟩≡
```
    type :: time_t
       private
       logical :: known = .false.
       real :: value = 0
     contains
```
    ⟨*CPU time: time: TBP*⟩
```
    end type time_t
```

⟨*CPU time: time: TBP*⟩≡
```
    procedure :: write => time_write
```

⟨*CPU time: procedures*⟩≡
```
    subroutine time_write (object, unit)
      class(time_t), intent(in) :: object
```

```
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      write (u, "(1x,A)", advance="no")  "Time in seconds ="
      if (object%known) then
         write (u, "(1x,ES10.3)")  object%value
      else
         write (u, "(1x,A)")  "[unknown]"
      end if
   end subroutine time_write
```

Set the current time

⟨*CPU time: time: TBP*⟩+≡
```
   procedure :: set_current => time_set_current
```

⟨*CPU time: procedures*⟩+≡
```
   subroutine time_set_current (time)
     class(time_t), intent(out) :: time
     integer :: msecs
     call system_clock (msecs)
     time%value = real (msecs) / 1000.
     time%known = time%value > 0
   end subroutine time_set_current
```

Assign to a `real(default` value. If the time is undefined, return zero.

⟨*CPU time: public*⟩+≡
```
   public :: assignment(=)
```

⟨*CPU time: interfaces*⟩≡
```
   interface assignment(=)
     module procedure real_assign_time
     module procedure real_default_assign_time
   end interface
```

⟨*CPU time: procedures*⟩+≡
```
   pure subroutine real_assign_time (r, time)
     real, intent(out) :: r
     class(time_t), intent(in) :: time
     if (time%known) then
        r = time%value
     else
        r = 0
     end if
   end subroutine real_assign_time

   pure subroutine real_default_assign_time (r, time)
     real(default), intent(out) :: r
     class(time_t), intent(in) :: time
     if (time%known) then
        r = time%value
     else
        r = 0
     end if
```

```
      end subroutine real_default_assign_time
```

Assign an integer or (single precision) real value to the time object.

⟨*CPU time: time: TBP*⟩+≡
```
    generic :: assignment(=) => time_assign_from_integer, time_assign_from_real
    procedure, private :: time_assign_from_integer
    procedure, private :: time_assign_from_real
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine time_assign_from_integer (time, ival)
      class(time_t), intent(out) :: time
      integer, intent(in) :: ival
      time%value = ival
      time%known = .true.
    end subroutine time_assign_from_integer

    subroutine time_assign_from_real (time, rval)
      class(time_t), intent(out) :: time
      real, intent(in) :: rval
      time%value = rval
      time%known = .true.
    end subroutine time_assign_from_real
```

Add times and compute time differences. If any input value is undefined, the result is undefined.

⟨*CPU time: time: TBP*⟩+≡
```
    generic :: operator(-) => subtract_times
    generic :: operator(+) => add_times
    procedure, private :: subtract_times
    procedure, private :: add_times
```

⟨*CPU time: procedures*⟩+≡
```
    pure function subtract_times (t_end, t_begin) result (time)
      type(time_t) :: time
      class(time_t), intent(in) :: t_end, t_begin
      if (t_end%known .and. t_begin%known) then
         time%known = .true.
         time%value = t_end%value - t_begin%value
      end if
    end function subtract_times

    pure function add_times (t1, t2) result (time)
      type(time_t) :: time
      class(time_t), intent(in) :: t1, t2
      if (t1%known .and. t2%known) then
         time%known = .true.
         time%value = t1%value + t2%value
      end if
    end function add_times
```

Check if a time is known, so we can use it:

⟨*CPU time: time: TBP*⟩+≡
```
    procedure :: is_known => time_is_known
```

⟨*CPU time: procedures*⟩+≡
```
    function time_is_known (time) result (flag)
      class(time_t), intent(in) :: time
      logical :: flag
      flag = time%known
    end function time_is_known
```

We define functions for converting the time into ss / mm:ss / hh:mm:ss / dd:mm:hh:ss.

⟨*CPU time: time: TBP*⟩+≡
```
    generic :: expand => time_expand_s, time_expand_ms, &
        time_expand_hms, time_expand_dhms
    procedure, private :: time_expand_s
    procedure, private :: time_expand_ms
    procedure, private :: time_expand_hms
    procedure, private :: time_expand_dhms
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine time_expand_s (time, sec)
      class(time_t), intent(in) :: time
      integer, intent(out) :: sec
      if (time%known) then
         sec = time%value
      else
         call msg_bug ("Time: attempt to expand undefined value")
      end if
    end subroutine time_expand_s

    subroutine time_expand_ms (time, min, sec)
      class(time_t), intent(in) :: time
      integer, intent(out) :: min, sec
      if (time%known) then
         if (time%value >= 0) then
            sec = mod (int (time%value), 60)
         else
            sec = - mod (int (- time%value), 60)
         end if
         min = time%value / 60
      else
         call msg_bug ("Time: attempt to expand undefined value")
      end if
    end subroutine time_expand_ms

    subroutine time_expand_hms (time, hour, min, sec)
      class(time_t), intent(in) :: time
      integer, intent(out) :: hour, min, sec
      call time%expand (min, sec)
      hour = min / 60
      if (min >= 0) then
         min = mod (min, 60)
      else
         min = - mod (-min, 60)
      end if
    end subroutine time_expand_hms
```

```
subroutine time_expand_dhms (time, day, hour, min, sec)
  class(time_t), intent(in) :: time
  integer, intent(out) :: day, hour, min, sec
  call time%expand (hour, min, sec)
  day = hour / 24
  if (hour >= 0) then
     hour = mod (hour, 24)
  else
     hour = - mod (- hour, 24)
  end if
end subroutine time_expand_dhms
```

Use the above expansions to generate a time string.

⟨*CPU time: time: TBP*⟩+≡
```
procedure :: to_string_s => time_to_string_s
procedure :: to_string_ms => time_to_string_ms
procedure :: to_string_hms => time_to_string_hms
procedure :: to_string_dhms => time_to_string_dhms
```

⟨*CPU time: procedures*⟩+≡
```
function time_to_string_s (time) result (str)
  class(time_t), intent(in) :: time
  type(string_t) :: str
  character(256) :: buffer
  integer :: s
  call time%expand (s)
  write (buffer, "(I0,'s')")  s
  str = trim (buffer)
end function time_to_string_s

function time_to_string_ms (time, blank) result (str)
  class(time_t), intent(in) :: time
  logical, intent(in), optional :: blank
  type(string_t) :: str
  character(256) :: buffer
  integer :: s, m
  logical :: x_out
  x_out = .false.
  if (present (blank))  x_out = blank
  call time%expand (m, s)
  write (buffer, "(I0,'m:',I2.2,'s')")  m, abs (s)
  str = trim (buffer)
  if (x_out) then
     str = replace (str, len(str)-1, "X")
  end if
end function time_to_string_ms

function time_to_string_hms (time) result (str)
  class(time_t), intent(in) :: time
  type(string_t) :: str
  character(256) :: buffer
  integer :: s, m, h
  call time%expand (h, m, s)
```

```
      write (buffer, "(I0,'h:',I2.2,'m:',I2.2,'s')")  h, abs (m), abs (s)
      str = trim (buffer)
    end function time_to_string_hms

    function time_to_string_dhms (time) result (str)
      class(time_t), intent(in) :: time
      type(string_t) :: str
      character(256) :: buffer
      integer :: s, m, h, d
      call time%expand (d, h, m, s)
      write (buffer, "(I0,'d:',I2.2,'h:',I2.2,'m:',I2.2,'s')")  &
            d, abs (h), abs (m), abs (s)
      str = trim (buffer)
    end function time_to_string_dhms
```

2.6.1 Timer

A timer can measure real (wallclock) time differences. The base type corresponds to the result, i.e., time difference. The object contains two further times for start and stop time.

⟨*CPU time: public*⟩+≡
```
    public :: timer_t
```

⟨*CPU time: types*⟩+≡
```
    type, extends (time_t) :: timer_t
      private
      logical :: running = .false.
      type(time_t) :: t1, t2
     contains
     ⟨CPU time: timer: TBP⟩
    end type timer_t
```

Output. If the timer is running, we indicate this, otherwise write just the result.

⟨*CPU time: timer: TBP*⟩≡
```
    procedure :: write => timer_write
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine timer_write (object, unit)
      class(timer_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      if (object%running) then
         write (u, "(1x,A)")  "Time in seconds = [running]"
      else
         call object%time_t%write (u)
      end if
    end subroutine timer_write
```

Start the timer: store the current time in the first entry and adapt the status. We forget any previous values.

⟨*CPU time: timer: TBP*⟩+≡

```
    procedure :: start => timer_start
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine timer_start (timer)
      class(timer_t), intent(out) :: timer
      call timer%t1%set_current ()
      timer%running = .true.
    end subroutine timer_start
```

Restart the timer: simply adapt the status, keeping the start time.

⟨*CPU time: timer: TBP*⟩+≡
```
    procedure :: restart => timer_restart
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine timer_restart (timer)
      class(timer_t), intent(inout) :: timer
      if (timer%t1%known .and. .not. timer%running) then
         timer%running = .true.
      else
         call msg_bug ("Timer: restart attempt from wrong status")
      end if
    end subroutine timer_restart
```

Stop the timer: store the current time in the second entry, adapt the status, and compute the elapsed time.

⟨*CPU time: timer: TBP*⟩+≡
```
    procedure :: stop => timer_stop
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine timer_stop (timer)
      class(timer_t), intent(inout) :: timer
      call timer%t2%set_current ()
      timer%running = .false.
      call timer%evaluate ()
    end subroutine timer_stop
```

This is separate, available for the unit test.

⟨*CPU time: timer: TBP*⟩+≡
```
    procedure, private :: evaluate => timer_evaluate
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine timer_evaluate (timer)
      class(timer_t), intent(inout) :: timer
      timer%time_t = timer%t2 - timer%t1
    end subroutine timer_evaluate
```

2.6.2   Unit tests

⟨*CPU time: public*⟩+≡
```
    public :: cputime_test
```

⟨*CPU time: tests*⟩≡
```
    subroutine cputime_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
    ⟨CPU time: execute tests⟩
    end subroutine cputime_test
```

Basic tests

Check basic functions of the time object. The part which we can't check is getting the actual time from the system clock, since the output will not be reproducible. However, we can check time formats and operations.

⟨*CPU time: execute tests*⟩≡
```
    call test (cputime_1, "cputime_1", &
         "time operations", &
         u, results)
```

⟨*CPU time: tests*⟩+≡
```
    subroutine cputime_1 (u)
      integer, intent(in) :: u
      type(time_t) :: time, time1, time2
      real :: t
      integer :: d, h, m, s

      write (u, "(A)")  "* Test output: cputime_1"
      write (u, "(A)")  "*   Purpose: check time operations"
      write (u, "(A)")

      write (u, "(A)") "* Undefined time"
      write (u, *)

      call time%write (u)

      write (u, *)
      write (u, "(A)") "* Set time to zero"
      write (u, *)

      time = 0
      call time%write (u)

      write (u, *)
      write (u, "(A)") "* Set time to 1.234 s"
      write (u, *)

      time = 1.234
      call time%write (u)

      t = time
      write (u, "(1x,A,F6.3)")  "Time as real =", t

      write (u, *)
      write (u, "(A)") "* Compute time difference"
      write (u, *)
```

59

```
time1 = 5.33
time2 = 7.55

      write (u, "(A)")  char (time1%to_string_ms ())
      write (u, "(A)")  char (time1%to_string_hms ())
      write (u, "(A)")  char (time1%to_string_dhms ())

      write (u, "(A)")  char (time2%to_string_s ())
```

```
        write (u, "(A)")  char (time2%to_string_ms ())
        write (u, "(A)")  char (time2%to_string_hms ())
        write (u, "(A)")  char (time2%to_string_dhms ())

        write (u, "(A)")
        write (u, "(A)")  "* Test output end: cputime_1"

    end subroutine cputime_1
```

Timer tests

Check a timer object.

⟨*CPU time: execute tests*⟩+≡
```
    call test (cputime_2, "cputime_2", &
         "timer", &
         u, results)
```

⟨*CPU time: tests*⟩+≡
```
    subroutine cputime_2 (u)
      integer, intent(in) :: u
      type(timer_t) :: timer

      write (u, "(A)")  "* Test output: cputime_2"
      write (u, "(A)")  "*   Purpose: check timer"
      write (u, "(A)")

      write (u, "(A)") "* Undefined timer"
      write (u, *)

      call timer%write (u)

      write (u, *)
      write (u, "(A)") "* Start timer"
      write (u, *)

      call timer%start ()
      call timer%write (u)

      write (u, *)
      write (u, "(A)") "* Stop timer (injecting fake timings)"
      write (u, *)

      call timer%stop ()
      timer%t1 = 2
      timer%t2 = 5
      call timer%evaluate ()
      call timer%write (u)

      write (u, *)
      write (u, "(A)") "* Restart timer"
      write (u, *)

      call timer%restart ()
```

```
        call timer%write (u)

        write (u, *)
        write (u, "(A)") "* Stop timer again (injecting fake timing)"
        write (u, *)

        call timer%stop ()
        timer%t2 = 10
        call timer%evaluate ()
        call timer%write (u)

        write (u, *)
        write (u, "(A)")  "* Test output end: cputime_2"

     end subroutine cputime_2
```

2.7 Hashtables

Hash tables, like lists, are not part of Fortran and must be defined on a per-case basis. In this section we define a module that contains a hash function.

Furthermore, for reference there is a complete framework of hashtable type definitions and access functions. This code is to be replicated where hash tables are used, mutatis mutandis.

⟨hashes.f90⟩≡
  ⟨*File header*⟩

```
  module hashes

    use kinds, only: i8, i32 !NODEP!
    use bytes
```

  ⟨*Standard module head*⟩

  ⟨*Hashes: public*⟩

```
  contains
```

  ⟨*Hashes: procedures*⟩

```
  end module hashes
```

2.7.1 The hash function

This is the one-at-a-time hash function by Bob Jenkins (from Wikipedia), re-implemented in Fortran. The function works on an array of bytes (8-bit integers), as could be produced by, e.g., the `transfer` function, and returns a single 32-bit integer. For determining the position in a hashtable, one can pick the lower bits of the result as appropriate to the hashtable size (which should be a power of 2). Note that we are working on signed integers, so the interpreta-

tion of values differs from the C version. This should not matter in practice, however.

⟨*Hashes: public*⟩≡

```
public :: hash
```

⟨*Hashes: procedures*⟩≡

```
function hash (key) result (hashval)
  integer(i32) :: hashval
  integer(i8), dimension(:), intent(in) :: key
  type(word32_t) :: w
  integer :: i
  w = 0_i32
  do i = 1, size (key)
     w = w + key(i)
     w = w + ishft (w, 10)
     w = ieor (w, ishft (w, -6))
  end do
  w = w + ishft (w, 3)
  w = ieor (w, ishft (w, -11))
  w = w + ishft (w, 15)
  hashval = w
end function hash
```

2.7.2   The hash table

We define a generic hashtable type (that depends on the `hash_data_t` type) together with associated methods.

This is a template:

⟨*Hashtables: types*⟩≡

```
type :: hash_data_t
   integer :: i
end type hash_data_t
```

Associated methods:

⟨*Hashtables: procedures*⟩≡

```
subroutine hash_data_final (data)
  type(hash_data_t), intent(inout) :: data
end subroutine hash_data_final

subroutine hash_data_write (data, unit)
  type(hash_data_t), intent(in) :: data
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit);  if (u < 0)  return
  write (u, *) data%i
end subroutine hash_data_write
```

Each hash entry stores the unmasked hash value, the key, and points to actual data if present. Note that this could be an allocatable scalar in principle, but making it a pointer avoids deep copy when expanding the hashtable.

⟨*Hashtables: types*⟩+≡

```
type :: hash_entry_t
   integer(i32) :: hashval = 0
   integer(i8), dimension(:), allocatable :: key
   type(hash_data_t), pointer :: data => null ()
end type hash_entry_t
```

The hashtable object holds the actual table, the number of filled entries and the number of entries after which the size should be doubled. The mask is equal to the table size minus one and thus coincides with the upper bound of the table index, which starts at zero.

⟨*Hashtables: types*⟩+≡

```
type :: hashtable_t
   integer :: n_entries = 0
   real :: fill_ratio = 0
   integer :: n_entries_max = 0
   integer(i32) :: mask = 0
   type(hash_entry_t), dimension(:), allocatable :: entry
end type hashtable_t
```

Initializer: The size has to be a power of two, the fill ratio is a real (machine-default!) number between 0 and 1.

⟨*Hashtables: procedures*⟩+≡

```
subroutine hashtable_init (hashtable, size, fill_ratio)
  type(hashtable_t), intent(out) :: hashtable
  integer, intent(in) :: size
  real, intent(in) :: fill_ratio
  hashtable%fill_ratio = fill_ratio
  hashtable%n_entries_max = size * fill_ratio
  hashtable%mask = size - 1
  allocate (hashtable%entry (0:hashtable%mask))
end subroutine hashtable_init
```

Finalizer: This calls a `hash_data_final` subroutine which must exist.

⟨*Hashtables: procedures*⟩+≡

```
subroutine hashtable_final (hashtable)
  type(hashtable_t), intent(inout) :: hashtable
  integer :: i
  do i = 0, hashtable%mask
     if (associated (hashtable%entry(i)%data)) then
        call hash_data_final (hashtable%entry(i)%data)
        deallocate (hashtable%entry(i)%data)
     end if
  end do
  deallocate (hashtable%entry)
end subroutine hashtable_final
```

Output. Here, we refer to a `hash_data_write` subroutine.

⟨*Hashtables: procedures*⟩+≡

```
subroutine hashtable_write (hashtable, unit)
  type(hashtable_t), intent(in) :: hashtable
  integer, intent(in), optional :: unit
```

65

```
      integer :: u, i
      u = output_unit (unit);  if (u < 0)  return
      do i = 0, hashtable%mask
         if (associated (hashtable%entry(i)%data)) then
            write (u, *) i, "(hash =", hashtable%entry(i)%hashval, ")", &
                 hashtable%entry(i)%key
            call hash_data_write (hashtable%entry(i)%data, unit)
         end if
      end do
   end subroutine hashtable_write
```

2.7.3   Hashtable insertion

Insert a single entry with the hash value as trial place. If the table is filled, first expand it.

⟨*Hashtables: procedures*⟩+≡
```
   subroutine hashtable_insert (hashtable, key, data)
     type(hashtable_t), intent(inout) :: hashtable
     integer(i8), dimension(:), intent(in) :: key
     type(hash_data_t), intent(in), target :: data
     integer(i32) :: h
     if (hashtable%n_entries >= hashtable%n_entries_max) &
          call hashtable_expand (hashtable)
     h = hash (key)
     call hashtable_insert_rec (hashtable, h, h, key, data)
   end subroutine hashtable_insert
```

We need this auxiliary routine for doubling the size of the hashtable. We rely on the fact that default assignment copies the data pointer, not the data themselves. The temporary array must not be finalized; it is deallocated automatically together with its allocatable components.

⟨*Hashtables: procedures*⟩+≡
```
   subroutine hashtable_expand (hashtable)
     type(hashtable_t), intent(inout) :: hashtable
     type(hash_entry_t), dimension(:), allocatable :: table_tmp
     integer :: i, s
     allocate (table_tmp (0:hashtable%mask))
     table_tmp = hashtable%entry
     deallocate (hashtable%entry)
     s = 2 * size (table_tmp)
     hashtable%n_entries = 0
     hashtable%n_entries_max = s * hashtable%fill_ratio
     hashtable%mask = s - 1
     allocate (hashtable%entry (0:hashtable%mask))
     do i = 0, ubound (table_tmp, 1)
        if (associated (table_tmp(i)%data)) then
           call hashtable_insert_rec (hashtable, table_tmp(i)%hashval, &
                table_tmp(i)%hashval, table_tmp(i)%key, table_tmp(i)%data)
        end if
     end do
   end subroutine hashtable_expand
```

Insert a single entry at a trial place h, reduced to the table size. Collision resolution is done simply by choosing the next element, recursively until the place is empty. For bookkeeping, we preserve the original hash value. For a good hash function, there should be no clustering.

Note that if the new key exactly matches an existing key, nothing is done.

⟨*Hashtables: procedures*⟩+≡

```
recursive subroutine hashtable_insert_rec (hashtable, h, hashval, key, data)
  type(hashtable_t), intent(inout) :: hashtable
  integer(i32), intent(in) :: h, hashval
  integer(i8), dimension(:), intent(in) :: key
  type(hash_data_t), intent(in), target :: data
  integer(i32) :: i
  i = iand (h, hashtable%mask)
  if (associated (hashtable%entry(i)%data)) then
     if (size (hashtable%entry(i)%key) /= size (key)) then
        call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
     else if (any (hashtable%entry(i)%key /= key)) then
        call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
     end if
  else
     hashtable%entry(i)%hashval = hashval
     allocate (hashtable%entry(i)%key (size (key)))
     hashtable%entry(i)%key = key
     hashtable%entry(i)%data => data
     hashtable%n_entries = hashtable%n_entries + 1
  end if
end subroutine hashtable_insert_rec
```

2.7.4 Hashtable lookup

The lookup function has to parallel the insert function. If the place is filled, check if the key matches. Yes: return the pointer; no: increment the hash value and check again.

⟨*Hashtables: procedures*⟩+≡

```
function hashtable_lookup (hashtable, key) result (ptr)
  type(hash_data_t), pointer :: ptr
  type(hashtable_t), intent(in) :: hashtable
  integer(i8), dimension(:), intent(in) :: key
  ptr => hashtable_lookup_rec (hashtable, hash (key), key)
end function hashtable_lookup
```

⟨*Hashtables: procedures*⟩+≡

```
recursive function hashtable_lookup_rec (hashtable, h, key) result (ptr)
  type(hash_data_t), pointer :: ptr
  type(hashtable_t), intent(in) :: hashtable
  integer(i32), intent(in) :: h
  integer(i8), dimension(:), intent(in) :: key
  integer(i32) :: i
  i = iand (h, hashtable%mask)
  if (associated (hashtable%entry(i)%data)) then
     if (size (hashtable%entry(i)%key) == size (key)) then
```

```
            if (all (hashtable%entry(i)%key == key)) then
               ptr => hashtable%entry(i)%data
            else
               ptr => hashtable_lookup_rec (hashtable, h + 1, key)
            end if
         else
            ptr => hashtable_lookup_rec (hashtable, h + 1, key)
         end if
      else
         ptr => null ()
      end if
   end function hashtable_lookup_rec
```

⟨*Hashtables: public*⟩≡
```
      public :: hashtable_test
```

⟨*Hashtables: procedures*⟩+≡
```
      subroutine hashtable_test ()
        type(hash_data_t), pointer :: data
        type(hashtable_t) :: hashtable
        integer(i8) :: i
        call hashtable_init (hashtable, 16, 0.25)
        do i = 1, 10
           allocate (data)
           data%i = i*i
           call hashtable_insert (hashtable, [i, i+i], data)
        end do
        call hashtable_insert (hashtable, [2_i8, 4_i8], data)
        call hashtable_write (hashtable)
        data => hashtable_lookup (hashtable, [5_i8, 10_i8])
        if (associated (data)) then
           print *, "lookup:", data%i
        else
           print *, "lookup: --"
        end if
        data => hashtable_lookup (hashtable, [6_i8, 12_i8])
        if (associated (data)) then
           print *, "lookup:", data%i
        else
           print *, "lookup: --"
        end if
        data => hashtable_lookup (hashtable, [4_i8, 9_i8])
        if (associated (data)) then
           print *, "lookup:", data%i
        else
           print *, "lookup: --"
        end if
        call hashtable_final (hashtable)
      end subroutine hashtable_test
```

2.8 Message and signal handling

We are not so ambitious as to do proper exception handling in WHIZARD, but at least it may be useful to have a common interface for diagnostics: Results, messages, warnings, and such. As module variables we keep a buffer where the current message may be written to and a level indicator which tells which messages should be written on screen and which ones should be skipped. Alternatively, a string may be directly supplied to the message routine: this overrides the buffer, avoiding the necessety of formatted I/O in trivial cases.

⟨diagnostics.f90⟩≡

  ⟨*File header*⟩

```
  module diagnostics

    use iso_c_binding !NODEP!
    use system_dependencies !NODEP!
```
⟨*Use kinds*⟩
⟨*Use strings*⟩
```
    use limits, only: BUFFER_SIZE, MAX_ERRORS !NODEP!
    use file_utils !NODEP!
    use iso_fortran_env, only: &
       stdout => output_unit, stdin => input_unit !NODEP!
```

  ⟨*Standard module head*⟩

  ⟨*Diagnostics: public*⟩

  ⟨*Diagnostics: parameters*⟩

  ⟨*Diagnostics: types*⟩

  ⟨*Diagnostics: variables*⟩

  ⟨*Diagnostics: interfaces*⟩

```
  contains
```

  ⟨*Diagnostics: procedures*⟩

```
  end module diagnostics
```
Diagnostics levels:

⟨*Diagnostics: parameters*⟩≡
```
    integer, parameter :: &
        & TERMINATE=-2, BUG=-1, &
        & FATAL=1, ERROR=2, WARNING=3, MESSAGE=4, RESULT=5, DEBUG=6
```

⟨*Diagnostics: variables*⟩≡
```
    integer, save :: msg_level = RESULT
```

Mask fatal errors so that are treated as normal errors. Useful for interactive mode.

⟨*Diagnostics: public*⟩≡
```
    public :: mask_fatal_errors
```

⟨*Diagnostics: variables*⟩+≡
```
    logical, save :: mask_fatal_errors = .false.
```

How to handle bugs and unmasked fatal errors. Either execute a normal stop statement, or call the C `exit()` function, or try to cause a program crash by dereferencing a null pointer.

⟨*Diagnostics: parameters*⟩+≡
```
    integer, parameter :: TERM_STOP = 0, TERM_EXIT = 1, TERM_CRASH = 2
```

⟨*Diagnostics: variables*⟩+≡
```
    integer, save :: handle_fatal_errors = TERM_EXIT
```

Keep track of errors. This might be used for exception handling, later. The counter is incremented only for screen messages, to avoid double counting.

⟨*Diagnostics: public*⟩+≡
```
    public :: msg_count
```

⟨*Diagnostics: variables*⟩+≡
```
    integer, dimension(TERMINATE:DEBUG), save :: msg_count = 0
```

Keep a list of all errors and warnings. Since we do not know the number of entries beforehand, we use a linked list.

⟨*Diagnostics: types*⟩≡
```
    type :: string_list
       character(len=BUFFER_SIZE) :: string
       type(string_list), pointer :: next
    end type string_list
    type :: string_list_pointer
       type(string_list), pointer :: first, last
    end type string_list_pointer
```

⟨*Diagnostics: variables*⟩+≡
```
    type(string_list_pointer), dimension(TERMINATE:WARNING), save :: &
         & msg_list = string_list_pointer (null(), null())
```

Add the current message buffer contents to the internal list.

⟨*Diagnostics: procedures*⟩≡
```
    subroutine msg_add (level)
      integer, intent(in) :: level
      type(string_list), pointer :: message
      select case (level)
      case (TERMINATE:WARNING)
         allocate (message)
         message%string = msg_buffer
         nullify (message%next)
         if (.not.associated (msg_list(level)%first)) &
              & msg_list(level)%first => message
         if (associated (msg_list(level)%last)) &
              & msg_list(level)%last%next => message
         msg_list(level)%last => message
         msg_count(level) = msg_count(level) + 1
      end select
    end subroutine msg_add
```

Initialization:

⟨*Diagnostics: public*⟩+≡
```
    public :: msg_list_clear
```

⟨*Diagnostics: procedures*⟩+≡

```
    subroutine msg_list_clear
      integer :: level
      type(string_list), pointer :: message
      do level = TERMINATE, WARNING
         do while (associated (msg_list(level)%first))
            message => msg_list(level)%first
            msg_list(level)%first => message%next
            deallocate (message)
         end do
         nullify (msg_list(level)%last)
      end do
      msg_count = 0
    end subroutine msg_list_clear
```

Display the summary of errors and warnings (no need to count fatals...)

⟨*Diagnostics: public*⟩+≡

```
    public :: msg_summary
```

⟨*Diagnostics: procedures*⟩+≡

```
    subroutine msg_summary (unit)
      integer, intent(in), optional :: unit
      call expect_summary (unit)
  1   format (A,1x,I2,1x,A,I2,1x,A)
      if (msg_count(ERROR) > 0 .and. msg_count(WARNING) > 0) then
         write (msg_buffer, 1) "There were", &
               & msg_count(ERROR), "error(s) and  ", &
               & msg_count(WARNING), "warning(s)."
         call msg_message (unit=unit)
      else if (msg_count(ERROR) > 0) then
         write (msg_buffer, 1) "There were", &
               & msg_count(ERROR), "error(s) and no warnings."
         call msg_message (unit=unit)
      else if (msg_count(WARNING) > 0) then
         write (msg_buffer, 1) "There were no errors and  ", &
               & msg_count(WARNING), "warning(s)."
         call msg_message (unit=unit)
      end if
    end subroutine msg_summary
```

Print the list of all messages of a given level.

⟨*Diagnostics: public*⟩+≡

```
    public :: msg_listing
```

⟨*Diagnostics: procedures*⟩+≡

```
    subroutine msg_listing (level, unit, prefix)
      integer, intent(in) :: level
      integer, intent(in), optional :: unit
      character(len=*), intent(in), optional :: prefix
      type(string_list), pointer :: message
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      if (present (unit))  u = unit
      message => msg_list(level)%first
```

```
      do while (associated (message))
         if (present (prefix)) then
            write (u, "(A)") prefix // trim (message%string)
         else
            write (u, "(A)") trim (message%string)
         end if
         message => message%next
      end do
      flush (u)
   end subroutine msg_listing
```

There is a hard limit on the line length which we should export. This buffer size is used both by the message handler and by the lexer below.

⟨*Limits: public parameters*⟩+≡
```
    integer, parameter, public :: BUFFER_SIZE = 1000
```

The message buffer:

⟨*Diagnostics: public*⟩+≡
```
    public :: msg_buffer
```

⟨*Diagnostics: variables*⟩+≡
```
    character(len=BUFFER_SIZE), save :: msg_buffer = " "
```

After a message is issued, the buffer should be cleared:

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine buffer_clear
      msg_buffer = " "
    end subroutine buffer_clear
```

The generic handler for messages. If the unit is omitted (or = 6), the message is written to standard output if the precedence if sufficiently high (as determined by the value of `msg_level`). If the string is omitted, the buffer is used. In any case, the buffer is cleared after printing. In accordance with FORTRAN custom, the first column in the output is left blank. For messages and warnings, an additional exclamation mark and a blank is prepended. Furthermore, each message is appended to the internal message list (without prepending anything).

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine message_print (level, string, str_arr, unit, logfile)
      integer, intent(in) :: level
      character(len=*), intent(in), optional :: string
      type(string_t), dimension(:), intent(in), optional :: str_arr
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: logfile
      type(string_t) :: prep_string, aux_string, head_footer
      integer :: lu, i
      logical :: severe, is_error
      severe = .false.
      head_footer  = "*************************************************************************
      aux_string = ""
      is_error = .false.
      select case (level)
      case (TERMINATE)
         prep_string = ""
```

```
case (BUG)
   prep_string  = "*** WHIZARD BUG: "
   aux_string   = "***              "
   severe = .true.
   is_error = .true.

The specific handlers. In the case of fatal errors, bugs (failed assertions) and
normal termination execution is stopped. For non-fatal errors a message is
printed to standard output if no unit is given. Only if the number of MAX_ERRORS
errors is reached, we abort the program. There are no further actions in the
other cases, but this may change.

2.8.1 Logfile

All screen output should be duplicated in the logfile, unless requested otherwise.

⟨*Diagnostics: public*⟩+≡
```
    public :: logging
```

⟨*Diagnostics: variables*⟩+≡
```
    integer, save :: log_unit = -1
    logical, target, save :: logging = .false.
```

⟨*Diagnostics: public*⟩+≡
```
    public :: logfile_init
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine logfile_init (filename)
      type(string_t), intent(in) :: filename
      call msg_message ("Writing log to '" // char (filename) // "'")
      if (.not. logging)  call msg_message ("(Logging turned off.)")
      log_unit = free_unit ()
      open (file = char (filename), unit = log_unit, &
            action = "write", status = "replace")
    end subroutine logfile_init
```

⟨*Diagnostics: public*⟩+≡
```
    public :: logfile_final
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine logfile_final ()
      if (log_unit >= 0) then
         close (log_unit)
         log_unit = -1
```

78

```
      end if
   end subroutine logfile_final
```

This returns the valid logfile unit only if the default is write to screen, and if
`logfile` is not set false.

⟨*Diagnostics: public*⟩+≡
```
   public :: logfile_unit
```

⟨*Diagnostics: procedures*⟩+≡
```
   function logfile_unit (unit, logfile)
     integer :: logfile_unit
     integer, intent(in), optional :: unit
     logical, intent(in), optional :: logfile
     if (logging) then
        if (present (unit)) then
           if (unit == stdout) then
              logfile_unit = log_unit
           else
              logfile_unit = -1
           end if
        else if (present (logfile)) then
           if (logfile) then
              logfile_unit = log_unit
           else
              logfile_unit = -1
           end if
        else
           logfile_unit = log_unit
        end if
     else
        logfile_unit = -1
     end if
   end function logfile_unit
```

2.8.2   Checking values

The `expect` function does not just check a value for correctness (actually, it
checks if a logical expression is true); it records its result here. If failures are
present when the program terminates, the exit code is nonzero.

⟨*Diagnostics: variables*⟩+≡
```
   integer, save :: expect_total = 0
   integer, save :: expect_failures = 0
```

⟨*Diagnostics: public*⟩+≡
```
   public :: expect_record
```

⟨*Diagnostics: procedures*⟩+≡
```
   subroutine expect_record (success)
     logical, intent(in) :: success
     expect_total = expect_total + 1
     if (.not. success)  expect_failures = expect_failures + 1
   end subroutine expect_record
```

⟨*Diagnostics: public*⟩+≡
```
    public :: expect_clear
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine expect_clear ()
      expect_total = 0
      expect_failures = 0
    end subroutine expect_clear
```

⟨*Diagnostics: public*⟩+≡
```
    public :: expect_summary
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine expect_summary (unit, force)
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: force
      logical :: force_output
      force_output = .false.;  if (present (force))  force_output = force
      if (expect_total /= 0 .or. force_output) then
          call msg_message ("Summary of value checks:", unit)
          write (msg_buffer, "(2x,A,1x,I0,1x,A,1x,A,1x,I0)") &
                "Failures:", expect_failures, "/", "Total:", expect_total
          call msg_message (unit=unit)
      end if
    end subroutine expect_summary
```

Helpers for converting integers into strings with minimal length.

⟨*Diagnostics: public*⟩+≡
```
    public :: int2string
    public :: int2char
    public :: int2fixed
```

⟨*Diagnostics: procedures*⟩+≡
```
    pure function int2fixed (i) result (c)
      integer, intent(in) :: i
      character(200) :: c
      c = ""
      write (c, *) i
      c = adjustl (c)
    end function int2fixed

    pure function int2string (i) result (s)
      integer, intent(in) :: i
      type (string_t) :: s
      s = trim (int2fixed (i))
    end function int2string

    pure function int2char (i) result (c)
      integer, intent(in) :: i
      character(len (trim (int2fixed (i)))) :: c
      c = int2fixed (i)
    end function int2char
```

Dito for reals.

⟨*Diagnostics: public*⟩+≡
```
    public :: real2string
    public :: real2char
    public :: real2fixed
```

⟨*Diagnostics: interfaces*⟩+≡
```
    interface real2string

      c = real2fixed_fmt (x, fmt)
    end function real2char_fmt
```

Dito for complex values; we do not use the slightly ugly FORTRAN output form here but instead introduce our own. Ifort and Portland seem to have problems with this, therefore temporarily disable it.

    end subroutine pacify_complex_default
```

2.8.4 Signal handling

Killing the program by external signals may leave the files written by it in an undefined state. This can be avoided by catching signals and deferring program termination. Instead of masking only critical sections, we choose to mask signals globally (done in the main program) and terminate the program at predefined checkpoints only. Checkpoints are after each command, within the sampling function (so the program can be terminated after each event), and after each iteration in the phase-space generation algorithm.

Signal handling is done via a C interface to the `sigaction` system call. When a signal is raised that has been masked by the handler, the corresponding variable is set to the value of the signal. The variables are visible from the C signal handler.

The signal SIGINT is for keyboard interrupt (ctrl-C), SIGTERM is for system interrupt, e.g., at shutdown. The SIGXCPU and SIGXFSZ signals may be issued by batch systems.

⟨*Diagnostics: public*⟩+≡
```
    public :: wo_sigint
    public :: wo_sigterm
    public :: wo_sigxcpu
    public :: wo_sigxfsz
```

⟨*Diagnostics: variables*⟩+≡
```
    integer(c_int), bind(C), volatile :: wo_sigint = 0
    integer(c_int), bind(C), volatile :: wo_sigterm = 0
    integer(c_int), bind(C), volatile :: wo_sigxcpu = 0
    integer(c_int), bind(C), volatile :: wo_sigxfsz = 0
```

Here are the interfaces to the C functions. The routine `mask_term_signals` forces termination signals to be delayed. `release_term_signals` restores normal behavior. However, the program can be terminated anytime by calling `terminate_now_if_signal` which inspects the signals and terminates the program if requested..

⟨*Diagnostics: public*⟩+≡
```
    public :: mask_term_signals
```

⟨*Diagnostics: procedures*⟩+≡

  wo_sigxcpu = sig;
}

static void wo_handler_sigxfsz (int sig) {
  wo_sigxfsz = sig;
}

int wo_mask_sigint () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = wo_handler_sigint;
  return sigaction(SIGINT, &sa, NULL);
}

int wo_mask_sigterm () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = wo_handler_sigterm;
  return sigaction(SIGTERM, &sa, NULL);
}

int wo_mask_sigxcpu () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = wo_handler_sigxcpu;
  return sigaction(SIGXCPU, &sa, NULL);
}

int wo_mask_sigxfsz () {
  struct sigaction sa;
  sigset_t blocks;
```

```c
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = wo_handler_sigxfsz;
  return sigaction(SIGXFSZ, &sa, NULL);
}

int wo_release_sigint () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = SIG_DFL;
  return sigaction(SIGINT, &sa, NULL);
}

int wo_release_sigterm () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = SIG_DFL;
  return sigaction(SIGTERM, &sa, NULL);
}

int wo_release_sigxcpu () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = SIG_DFL;
  return sigaction(SIGXCPU, &sa, NULL);
}

int wo_release_sigxfsz () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = SIG_DFL;
  return sigaction(SIGXFSZ, &sa, NULL);
}
```

2.10   C wrapper for printf

The printf family of functions is implemented in C with an undefined number
of arguments. This is not supported by the bind(C) interface. We therefore
write wrappers for the versions of sprintf that we will actually use.

⟨sprintf_interface.c⟩≡
```c
  /*
  ⟨File header⟩
  */
  #include <stdio.h>

  int sprintf_none(char* str, const char* format) {
    return sprintf(str, format);
  }

  int sprintf_int(char* str, const char* format, int val) {
    return sprintf(str, format, val);
  }

  int sprintf_double(char* str, const char* format, double val) {
    return sprintf(str, format, val);
  }

  int sprintf_str(char* str, const char* format, const char* val) {
    return sprintf(str, format, val);
  }
```

⟨sprintf interfaces⟩≡
```fortran
      interface
        function sprintf_none (str, fmt) result (stat) bind(C)
          use iso_c_binding !NODEP!
          integer(c_int) :: stat
          character(c_char), dimension(*), intent(inout) :: str
          character(c_char), dimension(*), intent(in) :: fmt
        end function sprintf_none
      end interface

      interface
        function sprintf_int (str, fmt, val) result (stat) bind(C)
          use iso_c_binding !NODEP!
          integer(c_int) :: stat
          character(c_char), dimension(*), intent(inout) :: str
          character(c_char), dimension(*), intent(in) :: fmt
          integer(c_int), value :: val
        end function sprintf_int
      end interface

      interface
        function sprintf_double (str, fmt, val) result (stat) bind(C)
          use iso_c_binding !NODEP!
          integer(c_int) :: stat
          character(c_char), dimension(*), intent(inout) :: str
          character(c_char), dimension(*), intent(in) :: fmt
          real(c_double), value :: val
        end function sprintf_double
      end interface

      interface
        function sprintf_str(str, fmt, val) result (stat) bind(C)
```

```
      use iso_c_binding !NODEP!
      integer(c_int) :: stat
      character(c_char), dimension(*), intent(inout) :: str
      character(c_char), dimension(*), intent(in) :: fmt
      character(c_char), dimension(*), intent(in) :: val
    end function sprintf_str
  end interface
```

2.11   Interface for formatted I/O

For access to formatted printing (possibly input), we interface the C `printf` family of functions. There are two important issues here:

1. `printf` takes an arbitrary number of arguments, relying on the C stack. This is not interoperable. We interface it with C wrappers that output a single integer, real or string and restrict the allowed formats accordingly.

2. Restricting format strings is essential also for preventing format string attacks. Allowing arbitrary format string would create a real security hole in a Fortran program.

3. The string returned by `sprintf` must be allocated to the right size.

```

2.11.1 Parsing a C format string

The C format string contains characters and format conversion specifications. The latter are initiated by a `%` sign. If the next letter is also a `%`, a percent sign is printed and no conversion is done. Otherwise, a conversion is done and applied to the next argument in the argument list. First comes an optional flag (`#`, `0`, `-`, `+`, or space), an optional field width (decimal digits starting not with zero), an optional precision (period, then another decimal digit string), a length modifier (irrelevant for us, therefore not supported), and a conversion specifier: `d` or `i` for integer; `e`, `f`, `g` (also upper case) for double-precision real, `s` for a string.

We explicitly exclude all other conversion specifiers, and we check the specifiers against the actual arguments.

A type for passing arguments

This is a polymorphic type that can hold integer, real (double), and string arguments.

⟨*Formats: parameters*⟩≡
```
    integer, parameter :: ARGTYPE_NONE = 0
    integer, parameter :: ARGTYPE_LOG = 1
    integer, parameter :: ARGTYPE_INT = 2
    integer, parameter :: ARGTYPE_REAL = 3
    integer, parameter :: ARGTYPE_STR = 4
```

The integer and real entries are actually scalars, but we avoid relying on the allocatable-scalar feature and make them one-entry arrays. The character entry is a real array which is a copy of the string.

Logical values are mapped to strings (true or false), so this type parameter value is mostly unused.

⟨*Formats: public*⟩≡
```
    public :: sprintf_arg_t
```

⟨*Formats: types*⟩≡
```
    type :: sprintf_arg_t
      private

        ival = arg%ival(1)
        actual_length = sprintf_int (result, fmt, ival)
      case (ARGTYPE_REAL)
        rval = arg%rval(1)
        actual_length = sprintf_double (result, fmt, rval)
      case (ARGTYPE_STR)
        actual_length = sprintf_str (result, fmt, arg%sval)
      case default
        call msg_bug ("sprintf_arg_apply_sprintf called with illegal type")
      end select
      if (actual_length < 0) then
         write (msg_buffer, *) "Format: '", fmt, "'"
         call msg_message ()
         write (msg_buffer, *) "Output: '", result, "'"
```

```
      call msg_message ()
      call msg_error ("I/O error in sprintf call")
      actual_length = 0
    end if
  end subroutine sprintf_arg_apply_sprintf
```

Container type for the output

There is a procedure which chops the format string into pieces that contain at most one conversion specifier. Pairing this with a `sprintf_arg` object, we get the actual input to the `sprintf` interface. The type below holds this input and can allocate the output string.

⟨*Formats: types*⟩+≡
```
  type :: sprintf_interface_t
    private
    character(c_char), dimension(:), allocatable :: input_fmt
    type(sprintf_arg_t) :: arg
    character(c_char), dimension(:), allocatable :: output_str
    integer :: output_str_len = 0
  end type sprintf_interface_t
```

⟨*Formats: procedures*⟩+≡
```
  subroutine sprintf_interface_init (intf, fmt, arg)
    type(sprintf_interface_t), intent(out) :: intf
    type(string_t), intent(in) :: fmt
    type(sprintf_arg_t), intent(in) :: arg
    integer :: fmt_len, i
    fmt_len = len (fmt)
    allocate (intf%input_fmt (fmt_len + 1))
    do i = 1, fmt_len
       intf%input_fmt(i) = extract (fmt, i, i)
    end do
    intf%input_fmt(fmt_len+1) = c_null_char
    intf%arg = arg
    allocate (intf%output_str (len (fmt) + sprintf_arg_get_length (arg) + 1))
  end subroutine sprintf_interface_init
```

⟨*Formats: procedures*⟩+≡
```
  subroutine sprintf_interface_write (intf, unit)
    type(sprintf_interface_t), intent(in) :: intf
    integer, intent(in), optional :: unit
    integer :: u
    u = output_unit (unit)
    write (u, *) "Format string = ", '"', intf%input_fmt, '"'
    write (u, "(1x,A,1x)", advance = "no") "Argument = "
    call sprintf_arg_write (intf%arg, unit)
    if (intf%output_str_len > 0) then
       write (u, *) "Result string = ", &
             '"', intf%output_str (1:intf%output_str_len), '"'
    end if
  end subroutine sprintf_interface_write
```

Return the output string:

⟨Formats: procedures⟩+≡

```
function sprintf_interface_get_result (intf) result (string)
  type(string_t) :: string
  type(sprintf_interface_t), intent(in) :: intf
  character(kind = c_char, len = max (intf%output_str_len, 0)) :: buffer
  integer :: i
  if (intf%output_str_len > 0) then
     do i = 1, intf%output_str_len
        buffer(i:i) = intf%output_str(i)
     end do
     string = buffer(1:intf%output_str_len)
  else
     string = ""
  end if
end function sprintf_interface_get_result
```

⟨Formats: procedures⟩+≡

```
subroutine sprintf_interface_apply_sprintf (intf)
  type(sprintf_interface_t), intent(inout) :: intf
  call sprintf_arg_apply_sprintf &
       (intf%arg, intf%input_fmt, intf%output_str, intf%output_str_len)
end subroutine sprintf_interface_apply_sprintf
```

Import the interfaces defined in the previous section:

⟨Formats: interfaces⟩+≡
  ⟨sprintf interfaces⟩

Scan the format string

Chop it into pieces that contain one conversion specifier each. The zero-th piece contains the part before the first specifier. Check the specifiers and allow only the subset that we support. Also check for an exact match between conversion specifiers and input arguments. The result is an allocated array of `sprintf_interface` object; each one contains a piece of the format string and the corresponding argument.

⟨Formats: procedures⟩+≡

```
subroutine chop_and_check_format_string (fmt, arg, intf)
  type(string_t), intent(in) :: fmt
  type(sprintf_arg_t), dimension(:), intent(in) :: arg
  type(sprintf_interface_t), dimension(:), intent(out), allocatable :: intf
  integer :: n_args, i
  type(string_t), dimension(:), allocatable :: split_fmt
  type(string_t) :: word, buffer, separator
  integer :: pos, length, l
  logical :: ok
  type(sprintf_arg_t) :: arg_null
  ok = .true.
  length = 0
  n_args = size (arg)
  allocate (split_fmt (0:n_args))
```

```

            deallocate (arg)
          end subroutine test_run
      end subroutine format_1
```

2.12   Bytes and such

In a few instances we will need the notion of a byte (8-bit) and a word (32 bit),
even a 64-bit word. A block of 512 bit is also needed (for MD5).

   We rely on integers up to 64 bit being supported by the processor. The main
difference to standard integers is the interpretation as unsigned integers.

⟨bytes.f90⟩≡
  ⟨*File header*⟩

  module bytes

    use kinds, only: i8, i32, i64 !NODEP!
  ⟨*Use file utils*⟩

  ⟨*Standard module head*⟩

  ⟨*Bytes: public*⟩

  ⟨*Bytes: types*⟩

                                   98
```

⟨*Bytes: parameters*⟩

⟨*Bytes: interfaces*⟩

```
contains
```

⟨*Bytes: procedures*⟩

```
end module bytes
```

2.12.1   8-bit words: bytes

This is essentially a wrapper around 8-bit integers. The wrapper emphasises their special interpretation as a sequence of bits. However, we interpret bytes as unsigned integers.

⟨*Bytes: public*⟩≡
```
    public :: byte_t
```

⟨*Bytes: types*⟩≡
```
    type :: byte_t
      private
      integer(i8) :: i
    end type byte_t
```

⟨*Bytes: public*⟩+≡
```
    public :: byte_zero
```

⟨*Bytes: parameters*⟩≡
```
    type(byte_t), parameter :: byte_zero = byte_t (0_i8)
```

Set a byte from 8-bit integer:

⟨*Bytes: public*⟩+≡
```
    public :: assignment(=)
```

⟨*Bytes: interfaces*⟩≡
```
    interface assignment(=)
       module procedure set_byte_from_i8
    end interface
```

⟨*Bytes: procedures*⟩≡
```
    subroutine set_byte_from_i8 (b, i)
      type(byte_t), intent(out) :: b
      integer(i8), intent(in) :: i
      b%i = i
    end subroutine set_byte_from_i8
```

Write a byte in one of two formats: either as a hexadecimal number (two digits, default) or as a decimal number (one to three digits). The decimal version is nontrivial because bytes are unsigned integers. Optionally append a newline.

⟨*Bytes: public*⟩+≡
```
    public :: byte_write
```

⟨*Bytes: interfaces*⟩+≡
```
    interface byte_write
        module procedure byte_write_unit, byte_write_string
    end interface
```
⟨*Bytes: procedures*⟩+≡
```
    subroutine byte_write_unit (b, unit, decimal, newline)
      type(byte_t), intent(in), optional :: b
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: decimal, newline
      logical :: dc, nl
      type(word32_t) :: w
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      dc = .false.;  if (present (decimal))  dc = decimal
      nl = .false.;  if (present (newline))  nl = newline
      if (dc) then
         w = b
         write (u, '(I3)', advance='no')  w%i
      else
         write (u, '(z2.2)', advance='no')  b%i
      end if
      if (nl) write (u, *)
    end subroutine byte_write_unit
```

The string version is hex-only

⟨*Bytes: procedures*⟩+≡
```
    subroutine byte_write_string (b, s)
      type(byte_t), intent(in) :: b
      character(len=2), intent(inout) :: s
      write (s, '(z2.2)')  b%i
    end subroutine byte_write_string
```

2.12.2   32-bit words

This is not exactly a 32-bit integer. A word is to be filled with bytes, and it may be partially filled. The filling is done lowest-byte first, highest-byte last. We count the bits, so `fill` should be either 0, 8, 16, 24, or 32. In printing words, we correspondingly distinguish between printing zeros and printing blanks.

⟨*Bytes: public*⟩+≡
```
    public :: word32_t
```
⟨*Bytes: types*⟩+≡
```
    type :: word32_t
       private
       integer(i32) :: i
       integer :: fill = 0
    end type word32_t
```

Assignment: the word is filled by inserting a 32-bit integer

⟨*Bytes: interfaces*⟩+≡
```
    interface assignment(=)
```

```
    module procedure word32_set_from_i32
    module procedure word32_set_from_byte
  end interface
```

⟨*Bytes: procedures*⟩+≡
```
  subroutine word32_set_from_i32 (w, i)
    type(word32_t), intent(out) :: w
    integer(i32), intent(in) :: i
    w%i = i
    w%fill = 32
  end subroutine word32_set_from_i32
```

Reverse assignment to a 32-bit integer. We do not check the fill status.

⟨*Bytes: interfaces*⟩+≡
```
  interface assignment(=)
    module procedure i32_from_word32
  end interface
```

⟨*Bytes: procedures*⟩+≡
```
  subroutine i32_from_word32 (i, w)
    integer(i32), intent(out) :: i
    type(word32_t), intent(in) :: w
    i = w%i
  end subroutine i32_from_word32
```

Filling with a 8-bit integer is slightly tricky, because in this interpretation integers are unsigned.

⟨*Bytes: procedures*⟩+≡
```
  subroutine word32_set_from_byte (w, b)
    type(word32_t), intent(out) :: w
    type(byte_t), intent(in) :: b
    if (b%i >= 0_i8) then
        w%i = b%i
    else
        w%i = 2_i32*(huge(0_i8)+1_i32) + b%i
    end if
    w%fill = 32
  end subroutine word32_set_from_byte
```

Check the fill status

⟨*Bytes: public*⟩+≡
```
  public :: word32_empty, word32_filled, word32_fill
```

⟨*Bytes: procedures*⟩+≡
```
  function word32_empty (w)
    type(word32_t), intent(in) :: w
    logical :: word32_empty
    word32_empty = (w%fill == 0)
  end function word32_empty

  function word32_filled (w)
    type(word32_t), intent(in) :: w
    logical :: word32_filled
    word32_filled = (w%fill == 32)
```

```
      end function word32_filled

   function word32_fill (w)
      type(word32_t), intent(in) :: w
      integer :: word32_fill
      word32_fill = w%fill
   end function word32_fill
```

Partial assignment: append a byte to a partially filled word. (Note: no assignment if the word is filled, so check this before if necessary.)

⟨*Bytes: public*⟩+≡
```
   public :: word32_append_byte
```

⟨*Bytes: procedures*⟩+≡
```
   subroutine word32_append_byte (w, b)
      type(word32_t), intent(inout) :: w
      type(byte_t), intent(in) :: b
      type(word32_t) :: w1
      if (.not. word32_filled (w)) then
         w1 = b
         call mvbits (w1%i, 0, 8, w%i, w%fill)
         w%fill = w%fill + 8
      end if
   end subroutine word32_append_byte
```

Extract a byte from a word. The argument i is the position, which may be 0, 1, 2, or 3.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

⟨*Bytes: public*⟩+≡
```
   public :: byte_from_word32
```

⟨*Bytes: procedures*⟩+≡
```
   function byte_from_word32 (w, i) result (b)
      type(word32_t), intent(in) :: w
      integer, intent(in) :: i
      type(byte_t) :: b
      integer(i32) :: j
      j = 0
      if (i >= 0 .and. i*8 < w%fill) then
         call mvbits (w%i, i*8, 8, j, 0)
      end if
      b%i = int (ibclr (j, 7), kind=i8)
      if (btest (j, 7))  b%i = ibset (b%i, 7)
   end function byte_from_word32
```

Write a word to file or STDOUT. We understand words as unsigned integers, therefore we cannot use the built-in routine unchanged. However, we can make use of the existence of 64-bit integers and their output routine.

In hexadecimal format, the default version prints eight hex characters, highest-first. The bytes version prints four bytes (two-hex characters), lowest first, with

spaces in-between. The decimal bytes version is analogous. In the `bytes` version, missing bytes are printed as whitespace.

⟨*Bytes: public*⟩+≡
```
    public :: word32_write
```

⟨*Bytes: interfaces*⟩+≡
```
    interface word32_write
       module procedure word32_write_unit
    end interface
```

⟨*Bytes: procedures*⟩+≡
```
    subroutine word32_write_unit (w, unit, bytes, decimal, newline)
      type(word32_t), intent(in) :: w
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: bytes, decimal, newline
      logical :: dc, by, nl
      type(word64_t) :: ww
      integer :: i, u
      u = output_unit (unit);  if (u < 0)  return
      by = .false.;  if (present (bytes))  by = bytes
      dc = .false.;  if (present (decimal)) dc = decimal
      nl = .false.;  if (present (newline)) nl = newline
      if (by) then
         do i = 0, 3
            if (i>0)  write (u, '(1x)', advance='no')
            if (8*i < w%fill) then
               call byte_write (byte_from_word32 (w, i), unit, decimal=decimal)
            else if (dc) then
               write (u, '(3x)', advance='no')
            else
               write (u, '(2x)', advance='no')
            end if
         end do
      else if (dc) then
         ww = w
         write (u, '(I10)', advance='no') ww%i
      else
         select case (w%fill)
         case ( 0)
         case ( 8);  write (6, '(1x,z8.2)', advance='no') ibits (w%i, 0, 8)
         case (16);  write (6, '(1x,z8.4)', advance='no') ibits (w%i, 0,16)
         case (24);  write (6, '(1x,z8.6)', advance='no') ibits (w%i, 0,24)
         case (32);  write (6, '(1x,z8.8)', advance='no') ibits (w%i, 0,32)
         end select
      end if
      if (nl) write (u, *)
    end subroutine word32_write_unit
```

2.12.3 Operations on 32-bit words

Define the usual logical operations, as well as addition (mod 2^{32}). We assume that all operands are completely filled.

⟨*Bytes: public*⟩+≡

```
      public :: not, ior, ieor, iand, ishft, ishftc
```
⟨*Bytes: interfaces*⟩+≡
```
      interface not
         module procedure word_not
      end interface
      interface ior
         module procedure word_or
      end interface
      interface ieor
         module procedure word_eor
      end interface
      interface iand
         module procedure word_and
      end interface
      interface ishft
         module procedure word_shft
      end interface
      interface ishftc
         module procedure word_shftc
      end interface
```
⟨*Bytes: procedures*⟩+≡
```
      function word_not (w1) result (w2)
        type(word32_t), intent(in) :: w1
        type(word32_t) :: w2
        w2 = not (w1%i)
      end function word_not

      function word_or (w1, w2) result (w3)
        type(word32_t), intent(in) :: w1, w2
        type(word32_t) :: w3
        w3 = ior (w1%i, w2%i)
      end function word_or

      function word_eor (w1, w2) result (w3)
        type(word32_t), intent(in) :: w1, w2
        type(word32_t) :: w3
        w3 = ieor (w1%i, w2%i)
      end function word_eor

      function word_and (w1, w2) result (w3)
        type(word32_t), intent(in) :: w1, w2
        type(word32_t) :: w3
        w3 = iand (w1%i, w2%i)
      end function word_and

      function word_shft (w1, s) result (w2)
        type(word32_t), intent(in) :: w1
        integer, intent(in) :: s
        type(word32_t) :: w2
        w2 = ishft (w1%i, s)
      end function word_shft

      function word_shftc (w1, s) result (w2)
```

```
      type(word32_t), intent(in) :: w1
      integer, intent(in) :: s
      type(word32_t) :: w2
      w2 = ishftc (w1%i, s, 32)
    end function word_shftc
```

Addition is defined mod 2^{32}, i.e., without overflow checking. This means that
we have to work around a possible overflow check enforced by the compiler.

⟨*Bytes: public*⟩+≡
```
    public :: operator(+)
```

⟨*Bytes: interfaces*⟩+≡
```
    interface operator(+)
       module procedure word_add
       module procedure word_add_i8
       module procedure word_add_i32
    end interface
```

⟨*Bytes: procedures*⟩+≡
```
    function word_add (w1, w2) result (w3)

      integer(i8), intent(in) :: i
      type(word32_t) :: w3
      integer(i64) :: j
      j = int (ibclr (w1%i, 31), i64) + int (ibclr (i, 7), i64)
      if (btest (i, 7))  j = j + 128
      w3 = int (ibclr (j, 31), kind=i32)
      if (btest (j, 31) .neqv. btest (w1%i, 31))  w3 = ibset (w3%i, 31)
    end function word_add_i8

    function word_add_i32 (w1, i) result (w3)
      type(word32_t), intent(in) :: w1
      integer(i32), intent(in) :: i
      type(word32_t) :: w3
      integer(i64) :: j
      j = int (ibclr (w1%i, 31), i64) + int (ibclr (i, 31), i64)
      w3 = int (ibclr (j, 31), kind=i32)
      if (btest (j, 31)) then
         if (btest (w1%i, 31) .eqv. btest (i, 31))  w3 = ibset (w3%i, 31)
      else
         if (btest (w1%i, 31) .neqv. btest (i, 31))  w3 = ibset (w3%i, 31)
```

```
        end if
    end function word_add_i32
```

2.12.4   64-bit words

These objects consist of two 32-bit words. They thus can hold integer numbers larger than 2^{32} (to be exact, 2^{31} since FORTRAN integers are signed). The order is low-word, high-word.

⟨*Bytes: public*⟩+≡
```
    public :: word64_t
```

⟨*Bytes: types*⟩+≡
```
    type :: word64_t
       private
       integer(i64) :: i
    end type word64_t
```

Set a 64 bit word:

⟨*Bytes: interfaces*⟩+≡
```
    interface assignment(=)
       module procedure word64_set_from_i64
       module procedure word64_set_from_word32
    end interface
```

⟨*Bytes: procedures*⟩+≡
```
    subroutine word64_set_from_i64 (ww, i)
      type(word64_t), intent(out) :: ww
      integer(i64), intent(in) :: i
      ww%i = i
    end subroutine word64_set_from_i64
```

Filling with a 32-bit word:

⟨*Bytes: procedures*⟩+≡
```
    subroutine word64_set_from_word32 (ww, w)
      type(word64_t), intent(out) :: ww
      type(word32_t), intent(in) :: w
      if (w%i >= 0_i32) then
         ww%i = w%i
      else
         ww%i = 2_i64*(huge(0_i32)+1_i64) + w%i
      end if
    end subroutine word64_set_from_word32
```

Extract a byte from a word. The argument `i` is the position, which may be between 0 and 7.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

⟨*Bytes: public*⟩+≡
```
    public :: byte_from_word64, word32_from_word64
```

⟨*Bytes: procedures*⟩+≡
```
    function byte_from_word64 (ww, i) result (b)
      type(word64_t), intent(in) :: ww
      integer, intent(in) :: i
      type(byte_t) :: b
      integer(i64) :: j
      j = 0
      if (i >= 0 .and. i*8 < 64) then
          call mvbits (ww%i, i*8, 8, j, 0)
      end if
      b%i = int (ibclr (j, 7), kind=i8)
      if (btest (j, 7))  b%i = ibset (b%i, 7)
    end function byte_from_word64
```

Extract a 32-bit word from a 64-bit word. The position is either 0 or 1.

⟨*Bytes: procedures*⟩+≡
```
    function word32_from_word64 (ww, i) result (w)
      type(word64_t), intent(in) :: ww
      integer, intent(in) :: i
      type(word32_t) :: w
      integer(i64) :: j
      j = 0
      select case (i)
      case (0);  call mvbits (ww%i,  0, 32, j, 0)
      case (1);  call mvbits (ww%i, 32, 32, j, 0)
      end select
      w = int (ibclr (j, 31), kind=i32)
      if (btest (j, 31))  w = ibset (w%i, 31)
    end function word32_from_word64
```

Print a 64-bit word. Decimal version works up to 2^{63}. The `words` version uses the 'word32' printout, separated by two spaces. The low-word is printed first. The `bytes` version also uses the 'word32' printout. This implies that the lowest byte is first. The default version prints a hexadecimal number without spaces, highest byte first.

⟨*Bytes: public*⟩+≡
```
    public :: word64_write
```

⟨*Bytes: interfaces*⟩+≡
```
    interface word64_write
       module procedure word64_write_unit
    end interface
```

⟨*Bytes: procedures*⟩+≡
```
    subroutine word64_write_unit (ww, unit, words, bytes, decimal, newline)
      type(word64_t), intent(in) :: ww
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: words, bytes, decimal, newline
      logical :: wo, by, dc, nl
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      wo = .false.;  if (present (words))    wo = words
      by = .false.;  if (present (bytes))    by = bytes
      dc = .false.;  if (present (decimal))  dc = decimal
```

```
      nl = .false.;  if (present (newline))  nl = newline
      if (wo .or. by) then
         call word32_write_unit (word32_from_word64 (ww, 0), unit, by, dc)
         write (u, '(2x)', advance='no')
         call word32_write_unit (word32_from_word64 (ww, 1), unit, by, dc)
      else if (dc) then
         write (u, '(I19)', advance='no') ww%i
      else
         write (u, '(Z16)', advance='no') ww%i
      end if
      if (nl) write (u, *)
   end subroutine word64_write_unit
```

2.13   MD5 Checksums

Implementing MD5 checksums allows us to check input/file integrity on the basis of a well-known standard. The building blocks have been introduced in the bytes module.

⟨md5.f90⟩≡
  ⟨*File header*⟩

```
  module md5

    use kinds, only: i8, i32, i64 !NODEP!
```
  ⟨*Use file utils*⟩
```
    use diagnostics !NODEP!
    use bytes
    use limits, only: BUFFER_SIZE, LF, EOR, EOF !NODEP!
    use unit_tests
```

  ⟨*Standard module head*⟩

  ⟨*MD5: public*⟩

  ⟨*MD5: types*⟩

  ⟨*MD5: variables*⟩

  ⟨*MD5: interfaces*⟩

```
  contains
```

  ⟨*MD5: procedures*⟩

  ⟨*MD5: tests*⟩

```
  end module md5
```

2.13.1 Blocks

A block is a sequence of 16 words (64 bytes or 512 bits). We anticipate that blocks will be linked, so include a pointer to the next block. There is a fill status (word counter), as there is one for each word. The fill status is equal to the number of bytes that are in, so it may be between 0 and 64.

⟨*MD5: types*⟩≡

```
type :: block_t
   private
   type(word32_t), dimension(0:15) :: w
   type(block_t), pointer :: next => null ()
   integer :: fill = 0
end type block_t
```

Check if a block is completely filled or empty:

⟨*MD5: procedures*⟩≡

```
function block_is_empty (b)
  type(block_t), intent(in) :: b
  logical :: block_is_empty
  block_is_empty = (b%fill == 0 .and. word32_empty (b%w(0)))
end function block_is_empty

function block_is_filled (b)
  type(block_t), intent(in) :: b
  logical :: block_is_filled
  block_is_filled = (b%fill == 64)
end function block_is_filled
```

Append a single byte to a block. Works only if the block is not yet filled.

⟨*MD5: procedures*⟩+≡

```
subroutine block_append_byte (bl, by)
  type(block_t), intent(inout) :: bl
  type(byte_t), intent(in) :: by
  if (.not. block_is_filled (bl)) then
     call word32_append_byte (bl%w(bl%fill/4), by)
     bl%fill = bl%fill + 1
  end if
end subroutine block_append_byte
```

The printing routine allows for printing as sequences of words or bytes, decimal or hex.

⟨*MD5: interfaces*⟩≡

```
interface block_write
   module procedure block_write_unit
end interface
```

⟨*MD5: procedures*⟩+≡

```
subroutine block_write_unit (b, unit, bytes, decimal)
  type(block_t), intent(in) :: b
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: bytes, decimal
  logical :: by, dc
  integer :: i, u
```

```
      u = output_unit (unit);  if (u < 0)  return
      by = .false.;  if (present (bytes))    by = bytes
      dc = .false.;  if (present (decimal))  dc = decimal
      do i = 0, b%fill/4 - 1
         call newline_or_blank (u, i, by, dc)
         call word32_write (b%w(i), unit, bytes, decimal)
      end do
      if (.not. block_is_filled (b)) then
         i = b%fill/4
         if (.not. word32_empty (b%w(i))) then
            call newline_or_blank (u, i, by, dc)
            call word32_write (b%w(i), unit, bytes, decimal)
         end if
      end if
      write (u, *)
   contains
      subroutine newline_or_blank (u, i, bytes, decimal)
         integer, intent(in) :: u, i
         logical, intent(in) :: bytes, decimal
         if (decimal) then
            select case (i)
            case (0)
            case (2,4,6,8,10,12,14);  write (u, *)
            case default
               write (u, '(2x)', advance='no')
            end select
         else if (bytes) then
            select case (i)
            case (0)
            case (4,8,12);  write (u, *)
            case default
               write (u, '(2x)', advance='no')
            end select
         else
            if (i == 8)  write (u, *)
         end if
      end subroutine newline_or_blank
   end subroutine block_write_unit
```

2.13.2   Messages

A message (within this module) is a linked list of blocks.

⟨*MD5: types*⟩+≡

```
   type :: message_t
      private
      type(block_t), pointer :: first => null ()
      type(block_t), pointer :: last => null ()
      integer :: n_blocks = 0
   end type message_t
```

Clear the message list

⟨*MD5: procedures*⟩+≡

```
    subroutine message_clear (m)
      type(message_t), intent(inout) :: m
      type(block_t), pointer :: b
      nullify (m%last)
      do
         b => m%first
         if (.not.(associated (b))) exit
         m%first => b%next
         deallocate (b)
      end do
      m%n_blocks = 0
    end subroutine message_clear
```

Append an empty block to the message list

⟨MD5: procedures⟩+≡
```
    subroutine message_append_new_block (m)
      type(message_t), intent(inout) :: m
      if (associated (m%last)) then
         allocate (m%last%next)
         m%last => m%last%next
         m%n_blocks = m%n_blocks + 1
      else
         allocate (m%first)
         m%last => m%first
         m%n_blocks = 1
      end if
    end subroutine message_append_new_block
```

Initialize: clear and allocate the first (empty) block.

⟨MD5: procedures⟩+≡
```
    subroutine message_init (m)
      type(message_t), intent(inout) :: m
      call message_clear (m)
      call message_append_new_block (m)
    end subroutine message_init
```

Append a single byte to a message. If necessary, allocate a new block. If the
message is empty, initialize it.

⟨MD5: procedures⟩+≡
```
    subroutine message_append_byte (m, b)
      type(message_t), intent(inout) :: m
      type(byte_t), intent(in) :: b
      if (.not. associated (m%last)) then
         call message_init (m)
      else if (block_is_filled (m%last)) then
         call message_append_new_block (m)
      end if
      call block_append_byte (m%last, b)
    end subroutine message_append_byte
```

Append zero bytes until the current block is filled up to the required position.
If we are already beyond that, append a new block and fill that one.

⟨*MD5: procedures*⟩+≡
```
    subroutine message_pad_zero (m, i)
      type(message_t), intent(inout) :: m
      integer, intent(in) :: i
      type(block_t), pointer :: b
      integer :: j
      if (associated (m%last)) then
         b => m%last
         if (b%fill > i) then
            do j = b%fill + 1, 64 + i
               call message_append_byte (m, byte_zero)
            end do
         else
            do j = b%fill + 1, i
               call message_append_byte (m, byte_zero)
            end do
         end if
      end if
    end subroutine message_pad_zero
```

This returns the number of bits within a message. We need a 64-bit word for the result since it may be more than 2^{31}. This is also required by the MD5 standard.

⟨*MD5: procedures*⟩+≡
```
    function message_bits (m) result (length)
      type(message_t), intent(in) :: m
      type(word64_t) :: length
      type(block_t), pointer :: b
      integer(i64) :: n_blocks_filled, n_bytes_extra
      if (m%n_blocks > 0) then
         b => m%last
         if (block_is_filled (b)) then
            n_blocks_filled = m%n_blocks
            n_bytes_extra = 0
         else
            n_blocks_filled = m%n_blocks - 1
            n_bytes_extra = b%fill
         end if
         length = n_blocks_filled * 512 + n_bytes_extra * 8
      else
         length = 0_i64
      end if
    end function message_bits
```

2.13.3 Message I/O

Append the contents of a string to a message. We first cast the character string into a 8-bit integer array and the append this byte by byte.

⟨*MD5: procedures*⟩+≡
```
    subroutine message_append_string (m, s)
      type(message_t), intent(inout) :: m
      character(len=*), intent(in) :: s
```

```
      integer(i64) :: i, n_bytes
      integer(i8), dimension(:), allocatable :: buffer
      integer(i8), dimension(1) :: mold
      type(byte_t) :: b
      n_bytes = size (transfer (s, mold))
      allocate (buffer (n_bytes))
      buffer = transfer (s, mold)
      do i = 1, size (buffer)
         b = buffer(i)
         call message_append_byte (m, b)
      end do
      deallocate (buffer)
   end subroutine message_append_string
```

Append the contents of a 32-bit integer to a message. We first cast the 32-bit integer into a 8-bit integer array and the append this byte by byte.

⟨*MD5: procedures*⟩+≡
```
   subroutine message_append_i32 (m, x)
     type(message_t), intent(inout) :: m
     integer(i32), intent(in) :: x
     integer(i8), dimension(4) :: buffer
     type(byte_t) :: b
     integer :: i
     buffer = transfer (x, buffer, size(buffer))
     do i = 1, size (buffer)
        b = buffer(i)
        call message_append_byte (m, b)
     end do
   end subroutine message_append_i32
```

Append one line from file to a message. Include the newline character.

⟨*MD5: procedures*⟩+≡
```
   subroutine message_append_from_unit (m, u, iostat)
     type(message_t), intent(inout) :: m
     integer, intent(in) :: u
     integer, intent(out) :: iostat
     character(len=BUFFER_SIZE) :: buffer
     read (u, *, iostat=iostat) buffer
     call message_append_string (m, trim (buffer))
     call message_append_string (m, LF)
   end subroutine message_append_from_unit
```

Fill a message from file. (Each line counts as a string.)

⟨*MD5: procedures*⟩+≡
```
   subroutine message_read_from_file (m, f)
     type(message_t), intent(inout) :: m
     character(len=*), intent(in) :: f
     integer :: u, iostat
     u = free_unit ()
     open (file=f, unit=u, action='read')
     do
        call message_append_from_unit (m, u, iostat=iostat)
```

```
      if (iostat < 0) exit
    end do
    close (u)
  end subroutine message_read_from_file
```

Write a message. After each block, insert an empty line.

⟨*MD5: interfaces*⟩+≡
```
    interface message_write
       module procedure message_write_unit
    end interface
```

⟨*MD5: procedures*⟩+≡
```
    subroutine message_write_unit (m, unit, bytes, decimal)
      type(message_t), intent(in) :: m
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: bytes, decimal
      type(block_t), pointer :: b
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      b => m%first
      if (associated (b)) then
         do
            call block_write_unit (b, unit, bytes, decimal)
            b => b%next
            if (.not. associated (b))  exit
            write (u, *)
         end do
      end if
    end subroutine message_write_unit
```

2.13.4 Auxiliary functions

These four functions on three words are defined in the MD5 standard:

⟨*MD5: procedures*⟩+≡
```
    function ff (x, y, z)
      type(word32_t), intent(in) :: x, y, z
      type(word32_t) :: ff
      ff = ior (iand (x, y), iand (not (x), z))
    end function ff

    function fg (x, y, z)
      type(word32_t), intent(in) :: x, y, z
      type(word32_t) :: fg
      fg = ior (iand (x, z), iand (y, not (z)))
    end function fg

    function fh (x, y, z)
      type(word32_t), intent(in) :: x, y, z
      type(word32_t) :: fh
      fh = ieor (ieor (x, y), z)
    end function fh
```

```
function fi (x, y, z)
  type(word32_t), intent(in) :: x, y, z
  type(word32_t) :: fi
  fi = ieor (y, ior (x, not (z)))
end function fi
```

2.13.5   Auxiliary stuff

This defines and initializes the table of transformation constants:

⟨*MD5: variables*⟩≡
```
type(word32_t), dimension(64), save :: t
logical, save :: table_initialized = .false.
```

⟨*MD5: procedures*⟩+≡
```
subroutine table_init
  type(word64_t) :: ww
  integer :: i
  if (.not.table_initialized) then
     do i = 1, 64
        ww = int (4294967296d0 * abs (sin (i * 1d0)), kind=i64)
        t(i) = word32_from_word64 (ww, 0)
     end do
     table_initialized = .true.
  end if
end subroutine table_init
```

This encodes the message digest (4 words) into a 32-character string.

⟨*MD5: procedures*⟩+≡
```
function digest_string (aa) result (s)
  type(word32_t), dimension (0:3), intent(in) :: aa
  character(len=32) :: s
  integer :: i, j
  do i = 0, 3
     do j = 0, 3
        call byte_write (byte_from_word32 (aa(i), j), s(i*8+j*2+1:i*8+j*2+2))
     end do
  end do
end function digest_string
```

2.13.6   MD5 algorithm

Pad the message with a byte x80 and then pad zeros up to a full block minus two
words; in these words, insert the message length (before padding) as a 64-bit
word, low-word first.

⟨*MD5: procedures*⟩+≡
```
subroutine message_pad (m)
  type(message_t), intent(inout) :: m
  type(word64_t) :: length
  integer(i8), parameter :: ipad = -128  ! z'80'
  type(byte_t) :: b
```

```
      integer :: i
      length = message_bits (m)
      b = ipad
      call message_append_byte (m, b)
      call message_pad_zero (m, 56)
      do i = 0, 7
          call message_append_byte (m, byte_from_word64 (length, i))
      end do
  end subroutine message_pad
```

Apply a series of transformations onto a state a,b,c,d, where the transform function uses each word of the message together with the predefined words. Finally, encode the state as a 32-character string.

⟨*MD5: procedures*⟩+≡
```
  subroutine message_digest (m, s)
    type(message_t), intent(in) :: m
    character(len=32), intent(out) :: s
    integer(i32), parameter :: ia =  1732584193  ! z'67452301'
    integer(i32), parameter :: ib =  -271733879  ! z'efcdab89'
    integer(i32), parameter :: ic = -1732584194  ! z'98badcfe'
    integer(i32), parameter :: id =   271733878  ! z'10325476'
    type(word32_t) :: a, b, c, d
    type(word32_t) :: aa, bb, cc, dd
    type(word32_t), dimension(0:15) :: x
    type(block_t), pointer :: bl
    call table_init
    a = ia;  b = ib;  c = ic;  d = id
    bl => m%first
    do
        if (.not.associated (bl)) exit
        x = bl%w
        aa = a;  bb = b;  cc = c;  dd = d
        call transform (ff, a, b, c, d,  0,  7,  1)
        call transform (ff, d, a, b, c,  1, 12,  2)
        call transform (ff, c, d, a, b,  2, 17,  3)
        call transform (ff, b, c, d, a,  3, 22,  4)
        call transform (ff, a, b, c, d,  4,  7,  5)
        call transform (ff, d, a, b, c,  5, 12,  6)
        call transform (ff, c, d, a, b,  6, 17,  7)
        call transform (ff, b, c, d, a,  7, 22,  8)
        call transform (ff, a, b, c, d,  8,  7,  9)
        call transform (ff, d, a, b, c,  9, 12, 10)
        call transform (ff, c, d, a, b, 10, 17, 11)

      a = a + aa
      b = b + bb
      c = c + cc
      d = d + dd
      bl => bl%next
    end do
  s = digest_string ([a, b, c, d])
contains
⟨MD5: Internal subroutine transform⟩
end subroutine message_digest
```

And this is the actual transformation that depends on one of the previous functions, four words, and three integers. The implicit arguments are `x`, the word from the message to digest, and `t`, the entry in the predefined table.

⟨*MD5: Internal subroutine transform*⟩≡

```
subroutine transform (f, a, b, c, d, k, s, i)
  interface
     function f (x, y, z)
       import word32_t
       type(word32_t), intent(in) :: x, y, z
       type(word32_t) :: f
     end function f
  end interface
  type(word32_t), intent(inout) :: a
  type(word32_t), intent(in) :: b, c, d
  integer, intent(in) :: k, s, i
  a = b + ishftc (a + f(b, c, d) + x(k) + t(i), s)
end subroutine transform
```

2.13.7   User interface

⟨*MD5: public*⟩≡

```
public :: md5sum
```

⟨*MD5: interfaces*⟩+≡

```
interface md5sum
   module procedure md5sum_from_string
   module procedure md5sum_from_unit
end interface
```

This function computes the MD5 sum of the input string and returns it as a 32-character string

⟨*MD5: procedures*⟩+≡

```
function md5sum_from_string (s) result (digest)
  character(len=*), intent(in) :: s
  character(len=32) :: digest
  type(message_t) :: m
  call message_append_string (m, s)
  call message_pad (m)
  call message_digest (m, digest)
  call message_clear (m)
end function md5sum_from_string
```

This funct. reads from unit u (an unformmated sequence of integers) and computes the MD5 sum.

⟨*MD5: procedures*⟩+≡

```
function md5sum_from_unit (u) result (digest)
  integer, intent(in) :: u
  character(len=32) :: digest
  type(message_t) :: m
  character :: char
  integer :: iostat
  READ_CHARS: do
```

```
                 read (u, "(A)", advance="no", iostat=iostat)  char
                 select case (iostat)
                 case (0)
                    call message_append_string (m, char)
                 case (EOR)
                    call message_append_string (m, LF)
                 case (EOF)
                    exit READ_CHARS
                 case default
                    call msg_fatal &
                         ("Computing MD5 sum: I/O error while reading from scratch file")
                 end select
              end do READ_CHARS
              call message_pad (m)
              call message_digest (m, digest)
              call message_clear (m)
            end function md5sum_from_unit
```

2.13.8   Unit tests

⟨*MD5: public*⟩+≡
```
    public :: md5_test
```

⟨*MD5: procedures*⟩+≡
```
    subroutine md5_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
    ⟨MD5: execute tests⟩
    end subroutine md5_test
```

This function checks the implementation by computing the checksum of certain
strings and comparing them with the known values.

⟨*MD5: execute tests*⟩≡
```
    call test (md5_1, "md5_1", &
         "check MD5 sums", &
         u, results)
```

⟨*MD5: tests*⟩≡
```

```
  contains
```

  ⟨*Permutations: procedures*⟩

```
  end module permutations
```

2.14.1 Permutations

A permutation is an array of integers. Each integer between one and `size` should occur exactly once.

⟨*Permutations: public*⟩≡
```
    public :: permutation_t
```

⟨*Permutations: types*⟩≡
```
    type :: permutation_t
      private
      integer, dimension(:), allocatable :: p
    end type permutation_t
```

Initialize with the identity permutation.

⟨*Permutations: public*⟩+≡
```
    public :: permutation_init
    public :: permutation_final
```

⟨*Permutations: procedures*⟩≡
```
    elemental subroutine permutation_init (p, size)
      type(permutation_t), intent(inout) :: p
      integer, intent(in) :: size
      integer :: i
      allocate (p%p (size))
      forall (i = 1:size)
         p%p(i) = i
      end forall
    end subroutine permutation_init

    elemental subroutine permutation_final (p)

  integer :: i, j
  if (allocated (perm%p))  deallocate (perm%p)
  allocate (perm%p (size (a1)))
  do i = 1, size (a1)
     do j = 1, size (a2)
        if (a1(i) == a2(j)) then
           perm%p(i) = j
           exit
        end if
        perm%p(i) = 0
     end do
  end do
end subroutine permutation_find
```

Find all permutations that transform an array of integers into itself. The resulting permutation list is allocated with the correct length and filled.

The first step is to count the number of different entries in `code`. Next, we scan `code` again and assign a mask to each different entry, true for all identical entries. Finally, we recursively permute the identity for each possible mask.

The permutation is done as follows: A list of all permutations of the initial one with respect to the current mask is generated, then the permutations are generated in turn for each permutation in this list with the next mask. The result is always stored back into the main list, starting from the end of the current list.

⟨*Permutations: public*⟩+≡

```fortran
public :: permutation_array_make
```

⟨*Permutations: procedures*⟩+≡

```fortran
subroutine permutation_array_make (pa, code)
  type(permutation_t), dimension(:), allocatable, intent(out) :: pa
  integer, dimension(:), intent(in) :: code
  logical, dimension(size(code)) :: mask
  logical, dimension(:,:), allocatable :: imask
  integer, dimension(:), allocatable :: n_i
  type(permutation_t) :: p_init
  type(permutation_t), dimension(:), allocatable :: p_tmp
  integer :: psize, i, j, k, n_different, n, nn_k
  psize = size (code)
  mask = .true.
  n_different = 0
  do i=1, psize
     if (mask(i)) then
        n_different = n_different + 1
        mask = mask .and. (code /= code(i))
     end if
  end do
  allocate (imask(psize, n_different), n_i(n_different))
  mask = .true.
  k = 0
```

123

```
      do i=1, psize
         if (mask(i)) then
            k = k + 1
            imask(:,k) = (code == code(i))
            n_i(k) = factorial (count(imask(:,k)))
            mask = mask .and. (code /= code(i))
         end if
      end do
      n = product (n_i)
      allocate (pa (n))
      call permutation_init (p_init, psize)
      pa(1) = p_init
      nn_k = 1
      do k = 1, n_different
         allocate (p_tmp (n_i(k)))
         do i = nn_k, 1, -1
            call permutation_array_with_mask (p_tmp, imask(:,k), pa(i))
            do j = n_i(k), 1, -1
               pa((i-1)*n_i(k) + j) = p_tmp(j)
            end do
         end do
         deallocate (p_tmp)
         nn_k = nn_k * n_i(k)
      end do
      call permutation_final (p_init)
      deallocate (imask, n_i)
    end subroutine permutation_array_make
```

Make a list of permutations of the elements marked true in the `mask` array. The final permutation list must be allocated with the correct length ($n!$). The third argument is the initial permutation to start with, which must have the same length as the `mask` array (this is not checked).

⟨*Permutations: procedures*⟩+≡

```
    subroutine permutation_array_with_mask (pa, mask, p_init)
      type(permutation_t), dimension(:), intent(inout) :: pa
      logical, dimension(:), intent(in) :: mask
      type(permutation_t), intent(in) :: p_init
      integer :: plen
      integer :: i, ii, j, fac_i, k, x
      integer, dimension(:), allocatable :: index
      plen = size (pa)
      allocate (index(count(mask)))
      ii = 0
      do i = 1, size (mask)
         if (mask(i)) then
            ii = ii + 1
            index(ii) = i
         end if
      end do
      pa = p_init
      ii = 0
      fac_i = 1
      do i = 1, size (mask)
```

```
          if (mask(i)) then
              ii = ii + 1
              fac_i = fac_i * ii
              x = permute (i, p_init)
              do j = 1, plen
                  k = ii - mod (((j-1)*fac_i)/plen, ii)
                  call insert (pa(j), x, k, ii, index)
              end do
          end if
      end do
      deallocate (index)
    contains
      subroutine insert (p, x, k, n, index)
        type(permutation_t), intent(inout) :: p
        integer, intent(in) :: x, k, n
        integer, dimension(:), intent(in) :: index
        integer :: i
        do i = n, k+1, -1
            p%p(index(i)) = p%p(index(i-1))
        end do
        p%p(index(k)) = x
      end subroutine insert
    end subroutine permutation_array_with_mask
```

The factorial function is needed for pre-determining the number of permutations
that will be generated:

⟨*Permutations: procedures*⟩+≡
```
    function factorial (n) result (f)
      integer, intent(in) :: n
      integer :: f
      integer :: i
      f = 1
      do i=2, abs(n)
          f = f*i
      end do
    end function factorial
```

2.14.2   Operations on binary codes

Binary codes are needed for phase-space trees. Since the permutation function
uses permutations, and no other special type is involved, we put the functions
here.

This is needed for phase space trees: permute bits in a tree binary code. If
no permutation is given, leave as is. (We may want to access the permutation
directly here if this is efficiency-critical.)

⟨*Permutations: public*⟩+≡
```
    public :: tc_permute
```

⟨*Permutations: procedures*⟩+≡
```
    function tc_permute (k, perm, mask_in) result (pk)
      integer(TC), intent(in) :: k, mask_in
      type(permutation_t), intent(in) :: perm
```

```
      integer(TC) :: pk
      integer :: i
      pk = iand (k, mask_in)
      do i = 1, size (perm%p)
         if (btest(k,i-1))  pk = ibset (pk, perm%p(i)-1)
      end do
   end function tc_permute
```

This routine returns the number of set bits in the tree code value `k`. Hence, it is the number of externals connected to the current line. If `mask` is present, the complement of the tree code is also considered, and the smaller number is returned. This gives the true distance from the external states, taking into account the initial particles. The complement number is increased by one, since for a scattering diagram the vertex with the sum of all final-state codes is still one point apart from the initial particles.

⟨*Permutations: public*⟩+≡
```
    public :: tc_decay_level
```

⟨*Permutations: interfaces*⟩≡
```
    interface tc_decay_level
       module procedure decay_level_simple
       module procedure decay_level_complement
    end interface
```

⟨*Permutations: procedures*⟩+≡
```
    function decay_level_complement (k, mask) result (l)
      integer(TC), intent(in) :: k, mask
      integer :: l
      l = min (decay_level_simple (k), &
           &   decay_level_simple (ieor (k, mask)) + 1)
    end function decay_level_complement

    function decay_level_simple (k) result(l)
      integer(TC), intent(in) :: k
      integer :: l
      integer :: i
      l = 0
      do i=0, bit_size(k)-1
         if (btest(k,i)) l = l+1
      end do
    end function decay_level_simple
```

2.15 Sorting

This small module provides functions for sorting integer or real arrays.

⟨`sorting.f90`⟩≡
  ⟨*File header*⟩

  module sorting

  ⟨*Use kinds*⟩

```
    use diagnostics !NODEP!
    use unit_tests
```

⟨*Standard module head*⟩

⟨*Sorting: public*⟩

⟨*Sorting: interfaces*⟩

```
contains
```

⟨*Sorting: procedures*⟩

⟨*Sorting: tests*⟩

```
end module sorting
```

2.15.1 Implementation

The `sort` function returns, for a given integer or real array, the array sorted by increasing value. The current implementation is *mergesort*, which has $O(n \ln n)$ behavior in all cases, and is stable for elements of equal value.

The `sort_abs` variant sorts by increasing absolute value, where for identical absolute value, the positive number comes first.

⟨*Sorting: public*⟩≡
```
    public :: sort
    public :: sort_abs
```

⟨*Sorting: interfaces*⟩≡
```
    interface sort
       module procedure sort_int
       module procedure sort_real
    end interface

    interface sort_abs
       module procedure sort_int_abs
    end interface
```

This variant of integer sort returns The body is identical, just the interface differs.

⟨*Sorting: procedures*⟩≡
```
    function sort_int (val_in) result (val)
      integer, dimension(:), intent(in) :: val_in
      integer, dimension(size(val_in)) :: val
    ⟨Sorting: sort⟩
    end function sort_int

    function sort_real (val_in) result (val)
      real(default), dimension(:), intent(in) :: val_in
      real(default), dimension(size(val_in)) :: val
    ⟨Sorting: sort⟩
    end function sort_real
```

```
    function sort_int_abs (val_in) result (val)
      integer, dimension(:), intent(in) :: val_in
      integer, dimension(size(val_in)) :: val
⟨Sorting: sort abs⟩
    end function sort_int_abs
```

⟨Sorting: sort⟩≡
```
    val = val_in( order (val_in) )
```

⟨Sorting: sort abs⟩≡
```
    val = val_in( order_abs (val_in) )
```

The order function returns, for a given integer or real array, the array of indices
of the elements sorted by increasing value.

⟨Sorting: public⟩+≡
```
    public :: order
    public :: order_abs
```

⟨Sorting: interfaces⟩+≡
```
    interface order
       module procedure order_int
       module procedure order_real
    end interface

    interface order_abs
       module procedure order_int_abs
    end interface
```

⟨Sorting: procedures⟩+≡
```
    function order_int (val) result (idx)
      integer, dimension(:), intent(in) :: val
      integer, dimension(size(val)) :: idx
⟨Sorting: order⟩
    end function order_int

    function order_real (val) result (idx)
      real(default), dimension(:), intent(in) :: val
      integer, dimension(size(val)) :: idx
⟨Sorting: order⟩
    end function order_real

    function order_int_abs (val) result (idx)
      integer, dimension(:), intent(in) :: val
      integer, dimension(size(val)) :: idx
⟨Sorting: order abs⟩
    end function order_int_abs
```

We start by individual elements, merge them to pairs, merge those to four-
element subarrays, and so on. The last subarray can extend only up to the
original array bound, of course, and the second of the subarrays to merge should
contain at least one element.

⟨Sorting: order⟩≡
  ⟨Sorting: order1⟩
```
         call merge (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
```

⟨*Sorting: order2*⟩

⟨*Sorting: order abs*⟩≡
  ⟨*Sorting: order1*⟩
```
        call merge_abs (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
```
  ⟨*Sorting: order2*⟩

⟨*Sorting: order1*⟩≡
```
    integer :: n, i, s, b1, b2, e1, e2
    n = size (idx)
    forall (i = 1:n)
       idx(i) = i
    end forall
    s = 1
    do while (s < n)
       do b1 = 1, n-s, 2*s
          b2 = b1 + s
          e1 = b2 - 1
          e2 = min (e1 + s, n)
```

⟨*Sorting: order2*⟩≡
```
       end do
       s = 2 * s
    end do
```

The merging step does the actual sorting. We take two sorted array sections
and merge them to a sorted result array. We are working on the indices, and
comparing is done by taking the associated `val` which is real or integer.

⟨*Sorting: interfaces*⟩+≡
```
    interface merge
       module procedure merge_int
       module procedure merge_real
    end interface

    interface merge_abs
       module procedure merge_int_abs
    end interface
```

⟨*Sorting: procedures*⟩+≡
```
    subroutine merge_int (res, src1, src2, val)
      integer, dimension(:), intent(out) :: res
      integer, dimension(:), intent(in) :: src1, src2
      integer, dimension(:), intent(in) :: val
      integer, dimension(size(res)) :: tmp
```
  ⟨*Sorting: merge*⟩
```
    end subroutine merge_int

    subroutine merge_real (res, src1, src2, val)
      integer, dimension(:), intent(out) :: res
      integer, dimension(:), intent(in) :: src1, src2
      real(default), dimension(:), intent(in) :: val
      integer, dimension(size(res)) :: tmp
```
  ⟨*Sorting: merge*⟩
```
    end subroutine merge_real
```

```
      subroutine merge_int_abs (res, src1, src2, val)
        integer, dimension(:), intent(out) :: res
        integer, dimension(:), intent(in) :: src1, src2
        integer, dimension(:), intent(in) :: val
        integer, dimension(size(res)) :: tmp
      ⟨Sorting: merge abs⟩
      end subroutine merge_int_abs
```

⟨*Sorting: merge*⟩≡
  ⟨*Sorting: merge1*⟩
```
        if (val(src1(i1)) <= val(src2(i2))) then
```
  ⟨*Sorting: merge2*⟩

We keep the elements if the absolute values are strictly ordered. If they are
equal in magnitude, we keep them if the larger value comes first, or if they are
equal.

⟨*Sorting: merge abs*⟩≡
  ⟨*Sorting: merge1*⟩
```
        if (abs (val(src1(i1))) < abs (val(src2(i2))) .or. &
            (abs (val(src1(i1))) == abs (val(src2(i2))) .and. &
            val(src1(i1)) >= val(src2(i2)))) then
```
  ⟨*Sorting: merge2*⟩

⟨*Sorting: merge1*⟩≡
```
      integer :: i1, i2, i
      i1 = 1
      i2 = 1
      do i = 1, size (tmp)
```

⟨*Sorting: merge2*⟩≡
```
          tmp(i) = src1(i1);  i1 = i1 + 1
          if (i1 > size (src1)) then
             tmp(i+1:) = src2(i2:)
             exit
          end if
        else
          tmp(i) = src2(i2);  i2 = i2 + 1
          if (i2 > size (src2)) then
             tmp(i+1:) = src1(i1:)
             exit
          end if
        end if
      end do
      res = tmp
```

2.15.2 Concatenating arrays

Not precisely a sorting function, but useful: Concatenate two arrays.

⟨*Sorting: public*⟩+≡
```
      public :: concat
```

⟨*Sorting: interfaces*⟩+≡
```
      interface concat
        module procedure concat_int
        module procedure concat_real
```

```
    end interface
```

⟨*Sorting: procedures*⟩+≡
```
    function concat_int (val1, val2) result (val12)
      integer, dimension(:), intent(in) :: val1, val2
      integer, dimension(size(val1)+size(val2)) :: val12
    ⟨Sorting: concat⟩
    end function concat_int

    function concat_real (val1, val2) result (val12)
      real(default), dimension(:), intent(in) :: val1, val2
      integer, dimension(size(val1)+size(val2)) :: val12
    ⟨Sorting: concat⟩
    end function concat_real
```

⟨*Sorting: concat*⟩≡
```
    val12(:size(val1)) = val1
    val12(size(val1)+1:) = val2
```

2.15.3 Unit tests

⟨*Sorting: public*⟩+≡
```
    public :: sorting_test
```

⟨*Sorting: procedures*⟩+≡
```
    subroutine sorting_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
    ⟨Sorting: execute tests⟩
    end subroutine sorting_test
```

This checks whether the sorting routine works correctly.

⟨*Sorting: execute tests*⟩≡
```
    call test (sorting_1, "sorting_1", &
        "check sorting routines", &
        u, results)
```

⟨*Sorting: tests*⟩≡
```
    subroutine sorting_1 (u)
      integer, intent(in) :: u
      integer, parameter :: NMAX = 10
      real(default), dimension(NMAX) :: rval
      integer, dimension(NMAX) :: ival
      real, dimension(NMAX,NMAX) :: harvest_r
      integer, dimension(NMAX,NMAX) :: harvest_i
      integer, dimension(NMAX,NMAX) :: harvest_a
      integer :: i, j
      harvest_r(:, 1) = [0.9976, 0., 0., 0., 0., 0., 0., 0., 0., 0.]
      harvest_r(:, 2) = [0.5668, 0.9659, 0., 0., 0., 0., 0., 0., 0., 0.]
      harvest_r(:, 3) = [0.7479, 0.3674, 0.4806, 0., 0., 0., 0., 0., 0., &
          0.]
      harvest_r(:, 4) = [0.0738, 0.0054, 0.3471, 0.3422, 0., 0., 0., 0., &
          0., 0.]
```

```

```

Chapter 3

Text handling

`WHIZARD` has to handle complex structures in input (and output) data. Doing this in a generic and transparent way requires a generic lexer and parser. The necessary modules are implemented here:

ifiles Implementation of line-oriented internal files in a more flexible way (linked lists of variable-length strings) than the Fortran builtin features.

lexers Read text and transform it into a token stream.

syntax_rules Define the rules for interpreting tokens, to be used by the parser.

parser Categorize tokens (keyword, string, number etc.) and use a set of syntax rules to transform the input into a parse tree.

3.1 Internal files

The internal files introduced here (`ifile`) are a replacement for the built-in
internal files, which are fixed-size arrays of fixed-length character strings. The
`ifile` type is a doubly-linked list of variable-length character strings with line
numbers.

⟨`ifiles.f90`⟩≡
  ⟨*File header*⟩

  ```
  module ifiles
  ```

  ⟨*Use strings*⟩
  ⟨*Use file utils*⟩
  ```
    use limits, only: EOF !NODEP!
  ```

  ⟨*Standard module head*⟩

  ⟨*Ifiles: public*⟩

  ⟨*Ifiles: types*⟩

  ⟨*Ifiles: interfaces*⟩

  ```
  contains
  ```

  ⟨*Ifiles: subroutines*⟩

  ```
  end module ifiles
  ```

3.1.1 iostat codes

⟨*Limits: public parameters*⟩+≡
```
    integer, parameter, public :: EOF = iostat_end,  EOR = iostat_eor
```

3.1.2 The line type

The line entry type is for internal use, it is the list entry to be collected in an
`ifile` object.

⟨*Ifiles: types*⟩≡
```
    type :: line_entry_t
       private
       type(line_entry_t), pointer :: previous => null ()
       type(line_entry_t), pointer :: next => null ()
       type(string_t) :: string
       integer :: index
    end type line_entry_t
```

Create a new list entry, given a varying string as input. The line number and
pointers are not set, these make sense only within an `ifile`.

⟨*Ifiles: subroutines*⟩≡
```
    subroutine line_entry_create (line, string)
```

```
      type(line_entry_t), pointer :: line
      type(string_t), intent(in) :: string
      allocate (line)
      line%string = string
    end subroutine line_entry_create
```

Destroy a single list entry: Since the pointer components should not be deallocated explicitly, just deallocate the object itself.

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine line_entry_destroy (line)
      type(line_entry_t), pointer :: line
      deallocate (line)
    end subroutine line_entry_destroy
```

3.1.3 The ifile type

The internal file is a linked list of line entries.

⟨*Ifiles: public*⟩≡
```
    public :: ifile_t
```

⟨*Ifiles: types*⟩+≡
```
    type :: ifile_t
      private
      type(line_entry_t), pointer :: first => null ()
      type(line_entry_t), pointer :: last => null ()
      integer :: n_lines = 0
    end type ifile_t
```

We need no explicit initializer, but a routine which recursively deallocates the contents may be appropriate. After this, existing line pointers may become undefined, so they should be nullified before the file is destroyed.

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_clear
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine ifile_clear (ifile)
      type(ifile_t), intent(inout) :: ifile
      type(line_entry_t), pointer :: current
      do while (associated (ifile%first))
         current => ifile%first
         ifile%first => current%next
         call line_entry_destroy (current)
      end do
      nullify (ifile%last)
      ifile%n_lines = 0
    end subroutine ifile_clear
```

The finalizer is just an alias for the above.

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_final
```

⟨*Ifiles: interfaces*⟩≡
```
    interface ifile_final
        module procedure ifile_clear
    end interface
```

3.1.4 I/O on ifiles

Fill an ifile from an ordinary external file, i.e., I/O unit. If the ifile is not empty, the old contents will be destroyed. We can read a fixed-length character string, an ISO varying string, an ordinary internal file (character-string array), or from an external unit. In the latter case, lines are appended until EOF is reached. Finally, there is a variant which reads from another ifile, effectively copying it.

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_read
```

⟨*Ifiles: interfaces*⟩+≡
```
    interface ifile_read
        module procedure ifile_read_from_string
        module procedure ifile_read_from_char
        module procedure ifile_read_from_unit
        module procedure ifile_read_from_char_array
        module procedure ifile_read_from_ifile
    end interface
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine ifile_read_from_string (ifile, string)
      type(ifile_t), intent(inout) :: ifile
      type(string_t), intent(in) :: string
      call ifile_clear (ifile)
      call ifile_append (ifile, string)
    end subroutine ifile_read_from_string

    subroutine ifile_read_from_char (ifile, char)
      type(ifile_t), intent(inout) :: ifile
      character(*), intent(in) :: char
      call ifile_clear (ifile)
      call ifile_append (ifile, char)
    end subroutine ifile_read_from_char

    subroutine ifile_read_from_char_array (ifile, char)
      type(ifile_t), intent(inout) :: ifile
      character(*), dimension(:), intent(in) :: char
      call ifile_clear (ifile)
      call ifile_append (ifile, char)
    end subroutine ifile_read_from_char_array

    subroutine ifile_read_from_unit (ifile, unit, iostat)
      type(ifile_t), intent(inout) :: ifile
      integer, intent(in) :: unit
      integer, intent(out), optional :: iostat
      call ifile_clear (ifile)
      call ifile_append (ifile, unit, iostat)
    end subroutine ifile_read_from_unit
```

```
    subroutine ifile_read_from_ifile (ifile, ifile_in)
      type(ifile_t), intent(inout) :: ifile
      type(ifile_t), intent(in) :: ifile_in
      call ifile_clear (ifile)
      call ifile_append (ifile, ifile_in)
    end subroutine ifile_read_from_ifile
```

Append to an ifile. The same as reading, but without resetting the ifile. In addition, there is a routine for appending a whole ifile.

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_append
```

⟨*Ifiles: interfaces*⟩+≡
```
    interface ifile_append
       module procedure ifile_append_from_string
       module procedure ifile_append_from_char
       module procedure ifile_append_from_unit
       module procedure ifile_append_from_char_array
       module procedure ifile_append_from_ifile
    end interface
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine ifile_append_from_string (ifile, string)
      type(ifile_t), intent(inout) :: ifile
      type(string_t), intent(in) :: string
      type(line_entry_t), pointer :: current
      call line_entry_create (current, string)
      current%index = ifile%n_lines + 1
      if (associated (ifile%last)) then
         current%previous => ifile%last
         ifile%last%next => current
      else
         ifile%first => current
      end if
      ifile%last => current
      ifile%n_lines = current%index
    end subroutine ifile_append_from_string

    subroutine ifile_append_from_char (ifile, char)
      type(ifile_t), intent(inout) :: ifile
      character(*), intent(in) :: char
      call ifile_append_from_string (ifile, var_str (trim (char)))
    end subroutine ifile_append_from_char

    subroutine ifile_append_from_char_array (ifile, char)
      type(ifile_t), intent(inout) :: ifile
      character(*), dimension(:), intent(in) :: char
      integer :: i
      do i = 1, size (char)
         call ifile_append_from_string (ifile, var_str (trim (char(i))))
      end do
    end subroutine ifile_append_from_char_array

    subroutine ifile_append_from_unit (ifile, unit, iostat)
      type(ifile_t), intent(inout) :: ifile
```

```
      integer, intent(in) :: unit
      integer, intent(out), optional :: iostat
      type(string_t) :: buffer
      integer :: ios
      ios = 0
      READ_LOOP: do
         call get (unit, buffer, iostat = ios)
         if (ios == EOF .or. ios > 0)  exit READ_LOOP
         call ifile_append_from_string (ifile, buffer)
      end do READ_LOOP
      if (present (iostat)) then
         iostat = ios
      else if (ios > 0) then
         call get (unit, buffer)  ! trigger error again
      end if
   end subroutine ifile_append_from_unit

   subroutine ifile_append_from_ifile (ifile, ifile_in)
     type(ifile_t), intent(inout) :: ifile
     type(ifile_t), intent(in) :: ifile_in
     type(line_entry_t), pointer :: current
     current => ifile_in%first
     do while (associated (current))
        call ifile_append_from_string (ifile, current%string)
        current => current%next
     end do
   end subroutine ifile_append_from_ifile
```

Write the ifile contents to an external unit

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_write
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine ifile_write (ifile, unit, iostat)
      type(ifile_t), intent(in) :: ifile
      integer, intent(in), optional :: unit
      integer, intent(out), optional :: iostat
      integer :: u
      type(line_entry_t), pointer :: current
      u = output_unit (unit);  if (u < 0)  return
      current => ifile%first
      do while (associated (current))
         call put_line (u, current%string, iostat)
         current => current%next
      end do
    end subroutine ifile_write
```

Convert the ifile to an array of strings, which is allocated by this function:

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_to_string_array
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine ifile_to_string_array (ifile, string)
      type(ifile_t), intent(in) :: ifile
```

```
      type(string_t), dimension(:), intent(inout), allocatable :: string
      type(line_entry_t), pointer :: current
      integer :: i
      allocate (string (ifile_get_length (ifile)))
      current => ifile%first
      do i = 1, ifile_get_length (ifile)
         string(i) = current%string
         current => current%next
      end do
   end subroutine ifile_to_string_array
```

3.1.5 Ifile tools

⟨*Ifiles: public*⟩+≡
```
   public :: ifile_get_length
```

⟨*Ifiles: subroutines*⟩+≡
```
   function ifile_get_length (ifile) result (length)
     integer :: length
     type(ifile_t), intent(in) :: ifile
     length = ifile%n_lines
   end function ifile_get_length
```

3.1.6 Line pointers

Instead of the implicit pointer used in ordinary file access, we define explicit
pointers, so there can be more than one at a time.

⟨*Ifiles: public*⟩+≡
```
   public :: line_p
```

⟨*Ifiles: types*⟩+≡
```
   type :: line_p
     private
     type(line_entry_t), pointer :: p => null ()
   end type line_p
```

Assign a file pointer to the first or last line in an ifile:

⟨*Ifiles: public*⟩+≡
```
   public :: line_init
```

⟨*Ifiles: subroutines*⟩+≡
```
   subroutine line_init (line, ifile, back)
     type(line_p), intent(inout) :: line
     type(ifile_t), intent(in) :: ifile
     logical, intent(in), optional :: back
     if (present (back)) then
        if (back) then
           line%p => ifile%last
        else
           line%p => ifile%first
        end if
     else
```

```
        line%p => ifile%first
      end if
    end subroutine line_init
```

Remove the pointer association:

⟨Ifiles: public⟩+≡
```
    public :: line_final
```

⟨Ifiles: subroutines⟩+≡
```
    subroutine line_final (line)
      type(line_p), intent(inout) :: line
      nullify (line%p)
    end subroutine line_final
```

Go one step forward

⟨Ifiles: public⟩+≡
```
    public :: line_advance
```

⟨Ifiles: subroutines⟩+≡
```
    subroutine line_advance (line)
      type(line_p), intent(inout) :: line
      if (associated (line%p))  line%p => line%p%next
    end subroutine line_advance
```

Go one step backward

⟨Ifiles: public⟩+≡
```
    public :: line_backspace
```

⟨Ifiles: subroutines⟩+≡
```
    subroutine line_backspace (line)
      type(line_p), intent(inout) :: line
      if (associated (line%p))  line%p => line%p%previous
    end subroutine line_backspace
```

Check whether we are accessing a valid line

⟨Ifiles: public⟩+≡
```
    public :: line_is_associated
```

⟨Ifiles: subroutines⟩+≡
```
    function line_is_associated (line) result (ok)
      logical :: ok
      type(line_p), intent(in) :: line
      ok = associated (line%p)
    end function line_is_associated
```

3.1.7   Access lines via pointers

We do not need the ifile as an argument to these functions, because the `line` type will point to an existing ifile.

⟨Ifiles: public⟩+≡
```
    public :: line_get_string
```

⟨*Ifiles: subroutines*⟩+≡
```
    function line_get_string (line) result (string)
      type(string_t) :: string
      type(line_p), intent(in) :: line
      if (associated (line%p)) then
         string = line%p%string
      else
         string = ""
      end if
    end function line_get_string
```

Variant where the line pointer is advanced after reading.
⟨*Ifiles: public*⟩+≡
```
    public :: line_get_string_advance
```
⟨*Ifiles: subroutines*⟩+≡
```
    function line_get_string_advance (line) result (string)
      type(string_t) :: string
      type(line_p), intent(inout) :: line
      if (associated (line%p)) then
         string = line%p%string
         call line_advance (line)
      else
         string = ""
      end if
    end function line_get_string_advance
```

⟨*Ifiles: public*⟩+≡
```
    public :: line_get_index
```
⟨*Ifiles: subroutines*⟩+≡
```
    function line_get_index (line) result (index)
      integer :: index
      type(line_p), intent(in) :: line
      if (associated (line%p)) then
         index = line%p%index
      else
         index = 0
      end if
    end function line_get_index
```

⟨*Ifiles: public*⟩+≡
```
    public :: line_get_length
```
⟨*Ifiles: subroutines*⟩+≡
```
    function line_get_length (line) result (length)
      integer :: length
      type(line_p), intent(in) :: line
      if (associated (line%p)) then
         length = len (line%p%string)
      else
         length = 0
      end if
    end function line_get_length
```

3.2 Lexer

The lexer purpose is to read from a line-separated character input stream (usually a file) and properly chop the stream into lexemes (tokens). [The parser will transform lexemes into meaningful tokens, to be stored in a parse tree, therefore we do not use the term 'token' here.] The input is read line-by-line, but interpreted free-form, except for quotes and the comment syntax. (Fortran 2003 would allow us to use a stream type for reading.)

In an object-oriented approach, we can dynamically create and destroy lexers, including the lexer setup.

The main lexer function is to return a lexeme according to the basic lexer rules (quotes, comments, whitespace, special classes). There is also a routine to write back a lexeme to the input stream (but only once).

For the rules, we separate the possible characters into classes. Whitespace usually consists of blank, tab, and line-feed, where any number of consecutive whitespace is equivalent to one. Quoted strings are enclosed by a pair of quote characters, possibly multiline. Comments are similar to quotes, but interpreted as whitespace. Numbers are identified (not distinguishing real and integer) but not interpreted. Other character classes make up identifiers.

⟨lexers.f90⟩≡
  ⟨File header⟩

  module lexers

  ⟨Use strings⟩
  ⟨Use file utils⟩
    use limits, only: EOF, EOR !NODEP!
    use limits, only: LF !NODEP!
    use limits, only: WHITESPACE_CHARS, LCLETTERS, UCLETTERS, DIGITS !NODEP!

3.2.1 Input streams

For flexible input, we define a generic stream type that refers to either an external file, an external unit which is already open, a string, an `ifile` object (internal file, i.e., string list), or a line pointer to an `ifile` object. The stream type actually follows the idea of a formatted external file, which is line-oriented. Thus, the stream reader always returns a whole record (input line).

Note that only in the string version, the stream contents are stored inside the stream object. In the `ifile` version, the stream contains only the line pointer, while in the external-file case, the line pointer is implicitly created by the runtime library.

⟨*Lexer: public*⟩≡
```
    public :: stream_t
```

⟨*Lexer: types*⟩≡
```
    type :: stream_t
       type(string_t), pointer :: filename => null ()
       integer, pointer :: unit => null ()
       type(string_t), pointer :: string => null ()
       type(ifile_t), pointer :: ifile => null ()
       type(line_p), pointer :: line => null ()
       integer :: record = 0
       logical :: eof = .false.
    end type stream_t
```

The initializers refer to the specific version. The stream should be undefined before calling this.

⟨*Lexer: public*⟩+≡
```
    public :: stream_init
```

⟨*Lexer: interfaces*⟩≡
```
    interface stream_init
       module procedure stream_init_filename
       module procedure stream_init_unit
       module procedure stream_init_string
       module procedure stream_init_ifile
       module procedure stream_init_line
    end interface
```

⟨*Lexer: procedures*⟩≡
```
    subroutine stream_init_filename (stream, filename)
      type(stream_t), intent(out) :: stream
      character(*), intent(in) :: filename
      integer :: unit
      unit = free_unit ()
      open (unit=unit, file=filename, status="old", action="read")
      call stream_init_unit (stream, unit)
      allocate (stream%filename)
      stream%filename = filename
    end subroutine stream_init_filename

    subroutine stream_init_unit (stream, unit)
      type(stream_t), intent(out) :: stream
      integer, intent(in) :: unit
```

```
      allocate (stream%unit)
      stream%unit = unit
      stream%eof = .false.
    end subroutine stream_init_unit

    subroutine stream_init_string (stream, string)
      type(stream_t), intent(out) :: stream
      type(string_t), intent(in) :: string
      allocate (stream%string)
      stream%string = string
    end subroutine stream_init_string

    subroutine stream_init_ifile (stream, ifile)
      type(stream_t), intent(out) :: stream
      type(ifile_t), intent(in) :: ifile
      type(line_p) :: line
      call line_init (line, ifile)
      call stream_init_line (stream, line)
      allocate (stream%ifile)
      stream%ifile = ifile
    end subroutine stream_init_ifile

    subroutine stream_init_line (stream, line)
      type(stream_t), intent(out) :: stream
      type(line_p), intent(in) :: line
      allocate (stream%line)
      stream%line = line
    end subroutine stream_init_line
```

The finalizer restores the initial state. If an external file was opened, it is closed.

⟨*Lexer: public*⟩+≡
```
    public :: stream_final
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine stream_final (stream)
      type(stream_t), intent(inout) :: stream
      if (associated (stream%filename)) then
         close (stream%unit)
         deallocate (stream%unit)
         deallocate (stream%filename)
      else if (associated (stream%unit)) then
         deallocate (stream%unit)
      else if (associated (stream%string)) then
         deallocate (stream%string)
      else if (associated (stream%ifile)) then
         call line_final (stream%line)
         deallocate (stream%line)
         deallocate (stream%ifile)
      else if (associated (stream%line)) then
         call line_final (stream%line)
         deallocate (stream%line)
      end if
    end subroutine stream_final
```

This returns the next record from the input stream. Depending on the stream type, the stream pointers are modified: Reading from external unit, the external file is advanced (implicitly). Reading from string, the string is replaced by an empty string. Reading from `ifile`, the line pointer is advanced. Note that the `iostat` argument is mandatory.

⟨*Lexer: public*⟩+≡
```
    public :: stream_get_record
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine stream_get_record (stream, string, iostat)
      type(stream_t), intent(inout) :: stream
      type(string_t), intent(out) :: string
      integer, intent(out) :: iostat
      if (associated (stream%unit)) then
         if (stream%eof) then
            iostat = EOF
         else
            call get (stream%unit, string, iostat=iostat)
            if (iostat == EOR) then
               iostat = 0
               stream%record = stream%record + 1
            end if
            if (iostat == EOF) then
               iostat = 0
               stream%eof = .true.
               if (len (string) /= 0) stream%record = stream%record + 1
            end if
         end if
      else if (associated (stream%string)) then
         if (len (stream%string) /= 0) then
            string = stream%string
            stream%string = ""
            iostat = 0
            stream%record = stream%record + 1
         else
            string = ""
            iostat = EOF
         end if
      else if (associated (stream%line)) then
         if (line_is_associated (stream%line)) then
            string = line_get_string_advance (stream%line)
            iostat = 0
            stream%record = stream%record + 1
         else
            string = ""
            iostat = EOF
         end if
      else
         call msg_bug (" Attempt to read from uninitialized input stream")
      end if
    end subroutine stream_get_record
```

Return the current stream source as a message string.

⟨*Lexer: public*⟩+≡

```
      public :: stream_get_source_info_string
```

⟨*Lexer: procedures*⟩+≡
```
    function stream_get_source_info_string (stream) result (string)
      type(string_t) :: string
      type(stream_t), intent(in) :: stream
      character(20) :: buffer
      if (associated (stream%filename)) then
         string = "File '" // stream%filename // "' (unit = "
         write (buffer, "(I0)")  stream%unit
         string = string // trim (buffer) // ")"
      else if (associated (stream%unit)) then
         write (buffer, "(I0)")  stream%unit
         string = "Unit " // trim (buffer)
      else if (associated (stream%string)) then
         string = "Input string"
      else if (associated (stream%ifile) .or. associated (stream%line)) then
         string = "Internal file"
      else
         string = ""
      end if
    end function stream_get_source_info_string
```

Return the index of the record just read as a message string.

⟨*Lexer: public*⟩+≡
```
      public :: stream_get_record_info_string
```

⟨*Lexer: procedures*⟩+≡
```
    function stream_get_record_info_string (stream) result (string)
      type(string_t) :: string
      type(stream_t), intent(in) :: stream
      character(20) :: buffer
      string = stream_get_source_info_string (stream)
      if (string /= "")  string = string // ", "
      write (buffer, "(I0)")  stream%record
      string = string // "line " // trim (buffer)
    end function stream_get_record_info_string
```

3.2.2 Keyword list

The lexer should be capable of identifying a token as a known keyword. To this
end, we store a list of keywords:

⟨*Lexer: public*⟩+≡
```
      public :: keyword_list_t
```

⟨*Lexer: types*⟩+≡
```
    type :: keyword_entry_t
      private
      type(string_t) :: string
      type(keyword_entry_t), pointer :: next => null ()
    end type keyword_entry_t

    type :: keyword_list_t
```

147

```
    private
    type(keyword_entry_t), pointer :: first => null ()
    type(keyword_entry_t), pointer :: last => null ()
  end type keyword_list_t
```

Add a new string to the keyword list, unless it is already there:

⟨*Lexer: public*⟩+≡
```
    public :: keyword_list_add
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine keyword_list_add (keylist, string)
      type(keyword_list_t), intent(inout) :: keylist
      type(string_t), intent(in) :: string
      type(keyword_entry_t), pointer :: k_entry_new
      if (.not. keyword_list_contains (keylist, string)) then
         allocate (k_entry_new)
         k_entry_new%string = string
         if (associated (keylist%first)) then
            keylist%last%next => k_entry_new
         else
            keylist%first => k_entry_new
         end if
         keylist%last => k_entry_new
      end if
    end subroutine keyword_list_add
```

Return true if a string is a keyword.

⟨*Lexer: public*⟩+≡
```
    public :: keyword_list_contains
```

⟨*Lexer: procedures*⟩+≡
```
    function keyword_list_contains (keylist, string) result (found)
      type(keyword_list_t), intent(in) :: keylist
      type(string_t), intent(in) :: string
      logical :: found
      found = .false.
      call check_rec (keylist%first)
    contains
      recursive subroutine check_rec (k_entry)
        type(keyword_entry_t), pointer :: k_entry
        if (associated (k_entry)) then
           if (k_entry%string /= string) then
              call check_rec (k_entry%next)
           else
              found = .true.
           end if
        end if
      end subroutine check_rec
    end function keyword_list_contains
```

Write the keyword list

⟨*Lexer: public*⟩+≡
```
    public :: keyword_list_write
```

⟨Lexer: interfaces⟩+≡
```
    interface keyword_list_write
       module procedure keyword_list_write_unit
    end interface
```
⟨Lexer: procedures⟩+≡
```
    subroutine keyword_list_write_unit (keylist, unit)
      type(keyword_list_t), intent(in) :: keylist
      integer, intent(in) :: unit
      write (unit, "(A)") "Keyword list:"
      if (associated (keylist%first)) then
         call keyword_write_rec (keylist%first)
         write (unit, *)
      else
         write (unit, "(1x,A)") "[empty]"
      end if
    contains
      recursive subroutine keyword_write_rec (k_entry)
        type(keyword_entry_t), intent(in), pointer :: k_entry
        if (associated (k_entry)) then
           write (unit, "(1x,A)", advance="no")  char (k_entry%string)
           call keyword_write_rec (k_entry%next)
        end if
      end subroutine keyword_write_rec
    end subroutine keyword_list_write_unit
```

Clear the keyword list

⟨Lexer: public⟩+≡
```
    public :: keyword_list_final
```
⟨Lexer: procedures⟩+≡
```
    subroutine keyword_list_final (keylist)
      type(keyword_list_t), intent(inout) :: keylist
      call keyword_destroy_rec (keylist%first)
      nullify (keylist%last)
    contains
      recursive subroutine keyword_destroy_rec (k_entry)
        type(keyword_entry_t), pointer :: k_entry
        if (associated (k_entry)) then
           call keyword_destroy_rec (k_entry%next)
           deallocate (k_entry)
        end if
      end subroutine keyword_destroy_rec
    end subroutine keyword_list_final
```

3.2.3 Lexeme templates

This type is handled like a rudimentary regular expression. It determines the
lexer behavior when matching a string. The actual objects made from this type
and the corresponding matching routines are listed below.

⟨Lexer: types⟩+≡
```
    type :: template_t
```

```
      private
      integer :: type
      character(256) :: charset1, charset2
      integer :: len1, len2
   end type template_t
```

These are the types that valid lexemes can have:

⟨*Lexer: public*⟩+≡
```
   public :: T_KEYWORD, T_IDENTIFIER, T_QUOTED, T_NUMERIC
```

⟨*Lexer: parameters*⟩≡
```
   integer, parameter :: T_KEYWORD = 1
   integer, parameter :: T_IDENTIFIER = 2, T_QUOTED = 3, T_NUMERIC = 4
```

These are special types:

⟨*Lexer: parameters*⟩+≡
```
   integer, parameter :: EMPTY = 0, WHITESPACE = 10
   integer, parameter :: NO_MATCH = 11, IO_ERROR = 12, OVERFLOW = 13
   integer, parameter :: UNMATCHED_QUOTE = 14
```

In addition, we have EOF which is a negative integer, normally -1. Printout for debugging:

⟨*Lexer: procedures*⟩+≡
```
   subroutine lexeme_type_write (type, unit)
     integer, intent(in) :: type
     integer, intent(in) :: unit
     select case (type)
     case (EMPTY);        write(unit,"(A)",advance="no") " EMPTY      "
     case (WHITESPACE);   write(unit,"(A)",advance="no") " WHITESPACE "
     case (T_IDENTIFIER); write(unit,"(A)",advance="no") " IDENTIFIER "
     case (T_QUOTED);     write(unit,"(A)",advance="no") " QUOTED     "
     case (T_NUMERIC);    write(unit,"(A)",advance="no") " NUMERIC    "
     case (IO_ERROR);     write(unit,"(A)",advance="no") " IO_ERROR   "
     case (OVERFLOW);     write(unit,"(A)",advance="no") " OVERFLOW   "
     case (UNMATCHED_QUOTE);   write(unit,"(A)",advance="no") " UNMATCHEDQ "
     case (NO_MATCH);     write(unit,"(A)",advance="no") " NO_MATCH   "
     case (EOF);          write(unit,"(A)",advance="no") " EOF        "
     case default;        write(unit,"(A)",advance="no") " [illegal]  "
     end select
   end subroutine lexeme_type_write

   subroutine template_write (tt, unit)
     type(template_t), intent(in) :: tt
     integer, intent(in) :: unit
     call lexeme_type_write (tt%type, unit)
     write (unit, "(A)", advance="no") "'" // tt%charset1(1:tt%len1) // "'"
     write (unit, "(A)", advance="no") " '" // tt%charset2(1:tt%len2) // "'"
   end subroutine template_write
```

The matching functions all return the number of matched characters in the provided string. If this number is zero, the match has failed.

The template functions are declared pure because they appear in forall loops below.

A template for whitespace:

⟨*Lexer: procedures*⟩+≡

```
pure function template_whitespace (chars) result (tt)
  character(*), intent(in) :: chars
  type(template_t) :: tt
  tt = template_t (WHITESPACE, chars, "", len (chars), 0)
end function template_whitespace
```

Just match the string against the character set.

⟨*Lexer: procedures*⟩+≡

```
subroutine match_whitespace (tt, s, n)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  n = verify (s, tt%charset1(1:tt%len1)) - 1
  if (n < 0)  n = len (s)
end subroutine match_whitespace
```

A template for normal identifiers. To match, a lexeme should have a first character in class `chars1` and an arbitrary number of further characters in class `chars2`. If the latter is empty, we are looking for a single-character lexeme.

⟨*Lexer: procedures*⟩+≡

```
pure function template_identifier (chars1, chars2) result (tt)
  character(*), intent(in) :: chars1, chars2
  type(template_t) :: tt
  tt = template_t (T_IDENTIFIER, chars1, chars2, len(chars1), len(chars2))
end function template_identifier
```

Here, the first letter must match, the others may or may not.

⟨*Lexer: procedures*⟩+≡

```
subroutine match_identifier (tt, s, n)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  if (verify (s(1:1), tt%charset1(1:tt%len1)) == 0) then
     n = verify (s(2:), tt%charset2(1:tt%len2))
     if (n == 0)  n = len (s)
  else
     n = 0
  end if
end subroutine match_identifier
```

A template for quoted strings. The same template applies for comments. The first character set indicates the left quote (could be a sequence of several characters), the second one the matching right quote.

⟨*Lexer: procedures*⟩+≡

```
pure function template_quoted (chars1, chars2) result (tt)
  character(*), intent(in) :: chars1, chars2
  type(template_t) :: tt
  tt = template_t (T_QUOTED, chars1, chars2, len (chars1), len (chars2))
end function template_quoted
```

Here, the beginning of the string must exactly match the first character set, then we look for the second one. If found, return. If there is a first quote but no second one, return a negative number, indicating this error condition.

⟨*Lexer: procedures*⟩+≡
```
subroutine match_quoted (tt, s, n, range)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  integer, dimension(2), intent(out) :: range
  character(tt%len1) :: ch1
  character(tt%len2) :: ch2
  integer :: i
  ch1 = tt%charset1
  if (s(1:tt%len1) == ch1) then
      ch2 = tt%charset2
      do i = tt%len1 + 1, len (s) - tt%len2 + 1
          if (s(i:i+tt%len2-1) == ch2) then
              n = i + tt%len2 - 1
              range(1) = tt%len1 + 1
              range(2) = i - 1
              return
          end if
      end do
      n = -1
      range = 0
  else
      n = 0
      range = 0
  end if
end subroutine match_quoted
```

A template for real numbers. The first character set is the set of allowed exponent letters. In accordance with the other functions we return the lexeme as a string but do not read it.

⟨*Lexer: procedures*⟩+≡
```
pure function template_numeric (chars) result (tt)
  character(*), intent(in) :: chars
  type(template_t) :: tt
  tt = template_t (T_NUMERIC, chars, "", len (chars), 0)
end function template_numeric
```

A numeric lexeme may be real or integer. We purposely do not allow for a preceding sign. If the number is followed by an exponent, this is included, otherwise the rest is ignored.

There is a possible pitfall with this behavior: while the string `1e3` will be interpreted as a single number, the analogous string `1a3` will be split into the number 1 and an identifier `a3`. There is no easy way around such an ambiguity. We should make sure that the syntax does not contain identifiers like `a3` or `e3`.

⟨*Lexer: procedures*⟩+≡
```
subroutine match_numeric (tt, s, n)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
```

```fortran
      integer, intent(out) :: n
      integer :: i, n0
      character(10), parameter :: digits = "0123456789"
      character(2), parameter :: signs = "-+"
      n = verify (s, digits) - 1
      if (n < 0) then
         n = 0
         return
      else if (s(n+1:n+1) == ".") then
         i = verify (s(n+2:), digits) - 1
         if (i < 0) then
            n = len (s)
            return
         else if (i > 0 .or. n > 0) then
            n = n + 1 + i
         end if
      end if
      n0 = n
      if (n > 0) then
         if (verify (s(n+1:n+1), tt%charset1(1:tt%len1)) == 0) then
            n = n + 1
            if (verify (s(n+1:n+1), signs) == 0)  n = n + 1
            i = verify (s(n+1:), digits) - 1
            if (i < 0) then
               n = len (s)
            else if (i == 0) then
               n = n0
            else
               n = n + i
            end if
         end if
      end if
   end subroutine match_numeric
```

The generic matching routine. With Fortran 2003 we would define separate types and use a SELECT TYPE instead.

⟨*Lexer: procedures*⟩+≡

```fortran
   subroutine match_template (tt, s, n, range)
     type(template_t), intent(in) :: tt
     character(*), intent(in) :: s
     integer, intent(out) :: n
     integer, dimension(2), intent(out) :: range
     select case (tt%type)
     case (WHITESPACE)
        call match_whitespace (tt, s, n)
        range = 0
     case (T_IDENTIFIER)
        call match_identifier (tt, s, n)
        range(1) = 1
        range(2) = len_trim (s)
     case (T_QUOTED)
        call match_quoted (tt, s, n, range)
     case (T_NUMERIC)
```

```
      call match_numeric (tt, s, n)
      range(1) = 1
      range(2) = len_trim (s)
   case default
      call msg_bug ("Invalid lexeme template encountered")
   end select
end subroutine match_template
```

Match against an array of templates. Return the index of the first template that matches together with the number of characters matched and the range of the relevant substring. If all fails, these numbers are zero.

⟨*Lexer: procedures*⟩+≡
```
subroutine match (tt, s, n, range, ii)
  type(template_t), dimension(:), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  integer, dimension(2), intent(out) :: range
  integer, intent(out) :: ii
  integer :: i
  do i = 1, size (tt)
     call match_template (tt(i), s, n, range)
     if (n /= 0) then
        ii = i
        return
     end if
  end do
  n = 0
  ii = 0
end subroutine match
```

3.2.4   The lexer setup

This object contains information about character classes. As said above, one class consists of quoting chars (matching left and right), another one of comment chars (similar), a class of whitespace, and several classes of characters that make up identifiers. When creating the lexer setup, the character classes are transformed into lexeme templates which are to be matched in a certain predefined order against the input stream.

BLANK should always be taken as whitespace, some things may depend on this. TAB is also fixed by convention, but may in principle be modified. Newline (DOS!) and linefeed are also defined as whitespace.

⟨*Limits: public parameters*⟩+≡
```
character, parameter, public :: BLANK = ' ',  TAB = achar(9)
character, parameter, public :: CR = achar(13), LF = achar(10)
character, parameter, public :: BACKSLASH = achar(92)
character(*), parameter, public :: WHITESPACE_CHARS = BLANK// TAB // CR // LF
character(*), parameter, public :: LCLETTERS = "abcdefghijklmnopqrstuvwxyz"
character(*), parameter, public :: UCLETTERS = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
character(*), parameter, public :: DIGITS = "0123456789"
```

The lexer setup, containing the list of lexeme templates. No defaults yet. The type with index zero will be assigned to the NO_MATCH lexeme.

The keyword list is not stored, just a pointer to it. We anticipate that the keyword list is part of the syntax table, and the lexer needs not alter it. Furthermore, the lexer is typically finished before the syntax table is.

⟨*Lexer: parameters*⟩+≡
```
integer, parameter :: CASE_KEEP = 0, CASE_UP = 1, CASE_DOWN = 2
```

⟨*Lexer: types*⟩+≡
```
type :: lexer_setup_t
  private
  type(template_t), dimension(:), allocatable :: tt
  integer, dimension(:), allocatable :: type
  integer :: keyword_case = CASE_KEEP
  type(keyword_list_t), pointer :: keyword_list => null ()
end type lexer_setup_t
```

Fill the lexer setup object. Some things are hardcoded here (whitespace, alphanumeric identifiers), some are free: comment chars (but these must be single, and comments must be terminated by line-feed), quote chars and matches (must be single), characters to be read as one-character lexeme, special classes (characters of one class that should be glued together as identifiers).

⟨*Lexer: procedures*⟩+≡
```
subroutine lexer_setup_init (setup, &
    comment_chars, quote_chars, quote_match, &
    single_chars, special_class, &
    keyword_list, upper_case_keywords)
  type(lexer_setup_t), intent(inout) :: setup
  character(*), intent(in) :: comment_chars
  character(*), intent(in) :: quote_chars, quote_match
  character(*), intent(in) :: single_chars
  character(*), dimension(:), intent(in) :: special_class
  type(keyword_list_t), pointer :: keyword_list
  logical, intent(in), optional :: upper_case_keywords
  integer :: n, i
  if (present (upper_case_keywords)) then
     if (upper_case_keywords) then
        setup%keyword_case = CASE_UP
     else
        setup%keyword_case = CASE_DOWN
     end if
  else
     setup%keyword_case = CASE_KEEP
  end if
  n = 1 + len (comment_chars) + len (quote_chars) + 1 &
       + len (single_chars) + size (special_class) + 1
  allocate (setup%tt(n))
  allocate (setup%type(0:n))
  n = 0
  setup%type(n) = NO_MATCH
  n = n + 1
  setup%tt(n) = template_whitespace (WHITESPACE_CHARS)
```

```
    setup%type(n) = EMPTY
    forall (i = 1:len(comment_chars))
        setup%tt(n+i) = template_quoted (comment_chars(i:i), LF)
        setup%type(n+i) = EMPTY
    end forall
    n = n + len (comment_chars)
    forall (i = 1:len(quote_chars))
        setup%tt(n+i) = template_quoted (quote_chars(i:i), quote_match(i:i))
        setup%type(n+i) = T_QUOTED
    end forall
    n = n + len (quote_chars)
    setup%tt(n+1) = template_numeric ("EeDd")
    setup%type(n+1) = T_NUMERIC
    n = n + 1
    forall (i = 1:len (single_chars))
        setup%tt(n+i) = template_identifier (single_chars(i:i), "")
        setup%type(n+i) = T_IDENTIFIER
    end forall
    n = n + len (single_chars)
    forall (i = 1:size (special_class))
        setup%tt(n+i) = template_identifier &
            (trim (special_class(i)), trim (special_class(i)))
        setup%type(n+i) = T_IDENTIFIER
    end forall
    n = n + size (special_class)
    setup%tt(n+1) = template_identifier &
        (LCLETTERS//UCLETTERS, LCLETTERS//DIGITS//"_"//UCLETTERS)
    setup%type(n+1) = T_IDENTIFIER
    n = n + 1
    if (n /= size (setup%tt)) &
        call msg_bug ("Size mismatch in lexer setup")
    setup%keyword_list => keyword_list
  end subroutine lexer_setup_init
```

The destructor is needed only if the object is not itself part of an allocatable array
⟨*Lexer: procedures*⟩+≡
```
  subroutine lexer_setup_final (setup)
    type(lexer_setup_t), intent(inout) :: setup
    deallocate (setup%tt, setup%type)
    setup%keyword_list => null ()
  end subroutine lexer_setup_final
```

For debugging: Write the lexer setup
⟨*Lexer: procedures*⟩+≡
```
  subroutine lexer_setup_write (setup, unit)
    type(lexer_setup_t), intent(in) :: setup
    integer, intent(in) :: unit
    integer :: i
    write (unit, "(A)") "Lexer setup:"
    if (allocated (setup%tt)) then
        do i = 1, size (setup%tt)
            call template_write (setup%tt(i), unit)
```

```
          write (unit, '(A)', advance = "no")  " -> "
          call lexeme_type_write (setup%type(i), unit)
          write (unit, *)
       end do
    else
       write (unit, *) "[empty]"
    end if
    if (associated (setup%keyword_list)) then
       call keyword_list_write (setup%keyword_list, unit)
    end if
 end subroutine lexer_setup_write
```

3.2.5   The lexeme type

An object of this type is returned by the lexer. Apart from the lexeme string,
it gives information about the relevant substring (first and last character index)
and the lexeme type. Interpreting the string is up to the parser.

⟨*Lexer: public*⟩+≡
```
    public :: lexeme_t
```

⟨*Lexer: types*⟩+≡
```
    type :: lexeme_t
       private
       integer :: type = EMPTY
       type(string_t) :: s
       integer :: b = 0, e = 0
    end type lexeme_t
```

Debugging aid:

⟨*Lexer: public*⟩+≡
```
    public :: lexeme_write
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexeme_write (t, unit)
      type(lexeme_t), intent(in) :: t
      integer, intent(in) :: unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      select case (t%type)
      case (T_KEYWORD)
         write (u, *) "KEYWORD:    '" // char (t%s) // "'"
      case (T_IDENTIFIER)
         write (u, *) "IDENTIFIER: '" // char (t%s) // "'"
      case (T_QUOTED)
         write (u, *) "QUOTED:     '" // char (t%s) // "'"
      case (T_NUMERIC)
         write (u, *) "NUMERIC:    '" // char (t%s) // "'"
      case (UNMATCHED_QUOTE)
         write (u, *) "Unmatched quote: "// char (t%s)
      case (OVERFLOW); write (u, *) "Overflow: "// char (t%s)
      case (EMPTY);    write (u, *) "Empty lexeme"
      case (NO_MATCH); write (u, *) "No match"
      case (IO_ERROR); write (u, *) "IO error"
```

```
      case (EOF);       write (u, *) "EOF"
      case default
         write (u, *) "Error"
      end select
   end subroutine lexeme_write
```

Store string and type in a lexeme. The range determines the beginning and end of the relevant part of the string. Check for a keyword.

⟨*Lexer: procedures*⟩+≡

```
   subroutine lexeme_set (t, keyword_list, s, range, type, keyword_case)
     type(lexeme_t), intent(out) :: t
     type(keyword_list_t), pointer :: keyword_list
     type(string_t), intent(in) :: s
     type(string_t) :: keyword
     integer, dimension(2), intent(in) :: range
     integer, intent(in) :: type
     integer, intent(in), optional :: keyword_case
     t%type = type
     if (present (keyword_case)) then
        select case (keyword_case)
        case (CASE_KEEP);   keyword = s
        case (CASE_UP);     keyword = upper_case (s)
        case (CASE_DOWN);   keyword = lower_case (s)
        end select
     else
        keyword = s
     end if
     if (type == T_IDENTIFIER) then
        if (associated (keyword_list)) then
           if (keyword_list_contains (keyword_list, keyword)) &
                t%type = T_KEYWORD
        end if
     end if
     select case (t%type)
     case (T_KEYWORD);  t%s = keyword
     case default;      t%s = s
     end select
     t%b = range(1)
     t%e = range(2)
   end subroutine lexeme_set

   subroutine lexeme_clear (t)
     type(lexeme_t), intent(out) :: t
     t%type = EMPTY
     t%s = ""
   end subroutine lexeme_clear
```

Retrieve the lexeme string, the relevant part of it, and the type. The last function returns true if there is a break condition reached (error or EOF).

⟨*Lexer: public*⟩+≡

```
   public :: lexeme_get_string
   public :: lexeme_get_contents
   public :: lexeme_get_delimiters
```

```
    public :: lexeme_get_type
```

⟨*Lexer: procedures*⟩+≡
```
    function lexeme_get_string (t) result (s)
      type(string_t) :: s
      type(lexeme_t), intent(in) :: t
      s = t%s
    end function lexeme_get_string

    function lexeme_get_contents (t) result (s)
      type(string_t) :: s
      type(lexeme_t), intent(in) :: t
      s = extract (t%s, t%b, t%e)
    end function lexeme_get_contents

    function lexeme_get_delimiters (t) result (del)
      type(string_t), dimension(2) :: del
      type(lexeme_t), intent(in) :: t
      del(1) = extract (t%s, finish = t%b-1)
      del(2) = extract (t%s, start = t%e+1)
    end function lexeme_get_delimiters

    function lexeme_get_type (t) result (type)
      integer :: type
      type(lexeme_t), intent(in) :: t
      type = t%type
    end function lexeme_get_type
```

Check for a generic break condition (error/eof) and for eof in particular.

⟨*Lexer: public*⟩+≡
```
    public :: lexeme_is_break
    public :: lexeme_is_eof
```

⟨*Lexer: procedures*⟩+≡
```
    function lexeme_is_break (t) result (break)
      logical :: break
      type(lexeme_t), intent(in) :: t
      select case (t%type)
      case (EOF, IO_ERROR, OVERFLOW, NO_MATCH)
         break = .true.
      case default
         break = .false.
      end select
    end function lexeme_is_break

    function lexeme_is_eof (t) result (ok)
      logical :: ok
      type(lexeme_t), intent(in) :: t
      ok = t%type == EOF
    end function lexeme_is_eof
```

3.2.6 The lexer object

We store the current lexeme and the current line. The line buffer is set each time a new line is read from file. The working buffer has one character more, to hold any trailing blank. Pointers to line and column are for debugging, they will be used to make up readable error messages for the parser.

⟨*Lexer: public*⟩+≡

```
public :: lexer_t
```

⟨*Lexer: types*⟩+≡

```
type :: lexer_t
   private
   type(lexer_setup_t) :: setup
   type(stream_t), pointer :: stream => null ()
   type(lexeme_t) :: lexeme
   type(string_t) :: previous_line2
   type(string_t) :: previous_line1
   type(string_t) :: current_line
   integer :: lines_read = 0
   integer :: current_column = 0
   integer :: previous_column = 0
   type(string_t) :: buffer
   type(lexer_t), pointer :: parent => null ()
end type lexer_t
```

Create-setup wrapper

⟨*Lexer: public*⟩+≡

```
public :: lexer_init
```

⟨*Lexer: procedures*⟩+≡

```
subroutine lexer_init (lexer, &
     comment_chars, quote_chars, quote_match, &
     single_chars, special_class, &
     keyword_list, upper_case_keywords, &
     parent)
  type(lexer_t), intent(inout) :: lexer
  character(*), intent(in) :: comment_chars
  character(*), intent(in) :: quote_chars, quote_match
  character(*), intent(in) :: single_chars
  character(*), dimension(:), intent(in) :: special_class
  type(keyword_list_t), pointer :: keyword_list
  logical, intent(in), optional :: upper_case_keywords
  type(lexer_t), target, intent(in), optional :: parent
  call lexer_setup_init (lexer%setup, &
       comment_chars = comment_chars, &
       quote_chars = quote_chars, &
       quote_match = quote_match, &
       single_chars = single_chars, &
       special_class = special_class, &
       keyword_list = keyword_list, &
       upper_case_keywords = upper_case_keywords)
  if (present (parent))  lexer%parent => parent
  call lexer_clear (lexer)
end subroutine lexer_init
```

Clear the lexer state, but not the setup. This should be done when the lexing starts, but it is not known whether the lexer was used before.

⟨*Lexer: public*⟩+≡
```
    public :: lexer_clear
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_clear (lexer)
      type(lexer_t), intent(inout) :: lexer
      call lexeme_clear (lexer%lexeme)
      lexer%previous_line2 = ""
      lexer%previous_line1 = ""
      lexer%current_line = ""
      lexer%lines_read = 0
      lexer%current_column = 0
      lexer%previous_column = 0
      lexer%buffer = ""
    end subroutine lexer_clear
```

Reset lexer state and delete setup

⟨*Lexer: public*⟩+≡
```
    public :: lexer_final
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_final (lexer)
      type(lexer_t), intent(inout) :: lexer
      call lexer_clear (lexer)
      call lexer_setup_final (lexer%setup)
    end subroutine lexer_final
```

3.2.7 The lexer routine

For lexing we need to associate an input stream to the lexer.

⟨*Lexer: public*⟩+≡
```
    public :: lexer_assign_stream
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_assign_stream (lexer, stream)
      type(lexer_t), intent(inout) :: lexer
      type(stream_t), intent(in), target :: stream
      lexer%stream => stream
    end subroutine lexer_assign_stream
```

The lexer. The lexer function takes the lexer and returns the currently stored lexeme. If there is none, it is read from buffer, matching against the lexeme templates in the lexer setup. Empty lexemes, i.e., comments and whitespace, are discarded and the buffer is read again until we have found a nonempty lexeme (which may also be EOF or an error condition).

The initial state of the lexer contains an empty lexeme, so reading from buffer is forced. The empty state is restored after returning the lexeme. A nonempty lexeme is present in the lexer only if `lex_back` has been executed before.

The workspace is the `lexer%buffer`, treated as a sort of input stream. We chop off lexemes from the beginning, adjusting the buffer to the left. Whenever the buffer is empty, or we are matching against an open quote which has not terminated, we read a new line and append it to the right. This may result in special conditions, which for simplicity are also returned as lexemes: I/O error, buffer overflow, end of file. If the latter happens during reading a quoted string, we return an unmatched-quote lexeme. Obviously, the special-condition lexemes have to be caught by the parser.

Note that reading further lines is only necessary when reading a quoted string. Otherwise, the line-feed that ends each line is interpreted as whitespace which terminates a preceding lexeme, so there are no other valid multiline lexemes.

To enable meaningful error messages, we also keep track of the line number of the last line read, and the beginning and the end of the current lexeme with respect to this line.

The lexer is implemented as a function that returns the next lexeme (i.e., token). It uses the `lexer` setup and modifies the buffers and pointers stored within the lexer, a side effect. The lexer reads from an input stream object, which also is modified by this reading, e.g., a line pointer is advanced.

⟨*Lexer: public*⟩+≡
```
    public :: lex
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lex (lexeme, lexer)
      type(lexeme_t), intent(out) :: lexeme
      type(lexer_t), intent(inout) :: lexer
      integer :: iostat1, iostat2
      integer :: pos
      integer, dimension(2) :: range
      integer :: template_index, type
      if (.not. associated (lexer%stream)) &
          call msg_bug ("Lexer called without assigned stream")
      GET_LEXEME: do while (lexeme_get_type (lexer%lexeme) == EMPTY)
        if (len (lexer%buffer) /= 0) then
          iostat1 = 0
        else
          call lexer_read_line (lexer, iostat1)
        end if
        select case (iostat1)
        case (0)
          MATCH_BUFFER: do
            call match (lexer%setup%tt, char (lexer%buffer), &
                        pos, range, template_index)
            if (pos >= 0) then
              type = lexer%setup%type(template_index)
              exit MATCH_BUFFER
            else
              pos = 0
              call lexer_read_line (lexer, iostat2)
              select case (iostat2)
              case (EOF); type = UNMATCHED_QUOTE; exit MATCH_BUFFER
              case (1);   type = IO_ERROR;        exit MATCH_BUFFER
              case (2);   type = OVERFLOW;        exit MATCH_BUFFER
```

```
                end select
            end if
          end do MATCH_BUFFER
        case (EOF); type = EOF
        case (1);    type = IO_ERROR
        case (2);    type = OVERFLOW
        end select
        call lexeme_set (lexer%lexeme, lexer%setup%keyword_list, &
             extract (lexer%buffer, finish=pos), range, type, &
             lexer%setup%keyword_case)
        lexer%buffer = remove (lexer%buffer, finish=pos)
        lexer%previous_column = lexer%current_column
        lexer%current_column = lexer%current_column + pos
      end do GET_LEXEME
      lexeme = lexer%lexeme
      call lexeme_clear (lexer%lexeme)
    end subroutine lex
```

Read a line and append it to the input buffer. If the input buffer overflows, return `iostat=2`. Otherwise, `iostat=1` indicates an I/O error, and `iostat=-1` the EOF.

The input stream may either be an external unit or a `ifile` object. In the latter case, a line is read and the line pointer is advanced.

Note that inserting `LF` between input lines is the Unix convention. Since we are doing this explicitly when gluing lines together, we can pattern-match against `LF` without having to worry about the system.

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_read_line (lexer, iostat)
      type(lexer_t), intent(inout) :: lexer
      integer, intent(out) :: iostat
      type(string_t) :: current_line
      current_line = lexer%current_line
      call stream_get_record (lexer%stream, lexer%current_line, iostat)
      if (iostat == 0) then
         lexer%lines_read = lexer%lines_read + 1
         lexer%previous_line2 = lexer%previous_line1
         lexer%previous_line1 = current_line
         lexer%buffer = lexer%buffer // lexer%current_line // LF
         lexer%previous_column = 0
         lexer%current_column = 0
      end if
    end subroutine lexer_read_line
```

Once in a while we have read one lexeme to many, which can be pushed back into the input stream. Do not do this more than once.

⟨*Lexer: public*⟩+≡
```
    public :: lexer_put_back
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_put_back (lexer, lexeme)
      type(lexer_t), intent(inout) :: lexer
      type(lexeme_t), intent(in) :: lexeme
      if (lexeme_get_type (lexer%lexeme) == EMPTY) then
```

163

```
        lexer%lexeme = lexeme
     else
        call msg_bug (" Lexer: lex_back fails; probably called twice")
     end if
  end subroutine lexer_put_back
```

3.2.8   Diagnostics

For debugging: print just the setup

⟨*Lexer: public*⟩+≡
```
    public :: lexer_write_setup
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_write_setup (lexer, unit)
      type(lexer_t), intent(in) :: lexer
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      call lexer_setup_write (lexer%setup, u)
    end subroutine lexer_write_setup
```

This is useful for error printing: show the current line with index and a pointer
to the current column within the line.

⟨*Lexer: public*⟩+≡
```
    public :: lexer_show_location
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_show_location (lexer)
      type(lexer_t), intent(in) :: lexer
      type(string_t) :: loc_str
      if (associated (lexer%parent)) then
         call lexer_show_source (lexer%parent)
         call msg_message ("[includes]")
      else
         call msg_message ()
      end if
      if (associated (lexer%stream)) then
         call msg_message &
              (char (stream_get_record_info_string (lexer%stream)) // ":")
      end if
      if (lexer%lines_read >= 4)  call msg_result ("[...]")
      if (lexer%lines_read >= 3)  call msg_result (char (lexer%previous_line2))
      if (lexer%lines_read >= 2)  call msg_result (char (lexer%previous_line1))
      if (lexer%lines_read >= 1) then
         call msg_result (char (lexer%current_line))
         loc_str = repeat (" ", lexer%previous_column)
         loc_str = loc_str // "^"
         if (lexer%current_column > lexer%previous_column) then
            loc_str = loc_str &
                 // repeat ("-", max (lexer%current_column &
                                       - lexer%previous_column - 1, 0)) &
                 // "^"
         end if
```

164

```
          call msg_result (char (loc_str))
      end if
    end subroutine lexer_show_location
```

This just prints the current stream source.

⟨*Lexer: procedures*⟩+≡
```
    recursive subroutine lexer_show_source (lexer)
      type(lexer_t), intent(in) :: lexer
      if (associated (lexer%parent)) then
         call lexer_show_source (lexer%parent)
         call msg_message ("[includes]")
      else
         call msg_message ()
      end if
      if (associated (lexer%stream)) then
         call msg_message &
              (char (stream_get_source_info_string (lexer%stream)) // ":")
      end if
    end subroutine lexer_show_source
```

3.2.9   Unit tests

⟨*Lexer: public*⟩+≡
```
    public :: lexer_test
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
⟨*Lexer: execute tests*⟩
```
    end subroutine lexer_test
```

Test the lexer by lexing and printing all lexemes from unit u, one per line, using
preset conventions.

⟨*Lexer: execute tests*⟩≡
```
    call test (lexer_1, "lexer_1", &
         "check lexer", u, results)
```

⟨*Lexer: tests*⟩≡
```
    subroutine lexer_1 (u)
      integer, intent(in) :: u
      type(lexer_t), target :: lexer
      type(stream_t), target :: stream
      type(string_t) :: string
      type(lexeme_t) :: lexeme
      string = "abcdefghij"
      call lexer_init (lexer, &
         comment_chars = "", &
         quote_chars = "<'""", &
         quote_match = ">'""", &
         single_chars = "?*+|=,()", &
         special_class = ["."], &
```

```
      keyword_list = null ())
   call stream_init (stream, string)
   call lexer_assign_stream (lexer, stream)
   do
      call lex (lexeme, lexer)
      call lexeme_write (lexeme, u)
      if (lexeme_is_break (lexeme))  exit
   end do
   call stream_final (stream)
   call lexer_final (lexer)
end subroutine lexer_1
```

3.3 Syntax rules

This module provides tools to handle syntax rules in an abstract way.

⟨`syntax_rules.f90`⟩≡
  ⟨*File header*⟩

```
  module syntax_rules
```

  ⟨*Use strings*⟩
  ⟨*Use file utils*⟩
```
    use limits, only: UNQUOTED !NODEP!
    use diagnostics !NODEP!
    use ifiles, only: line_p, line_init, line_get_string_advance, line_final
    use ifiles, only: ifile_t, ifile_get_length
    use lexers
```

  ⟨*Standard module head*⟩

  ⟨*Syntax: public*⟩

  ⟨*Syntax: parameters*⟩

  ⟨*Syntax: types*⟩

  ⟨*Syntax: interfaces*⟩

```
  contains
```

  ⟨*Syntax: subroutines*⟩

```
  end module syntax_rules
```

3.3.1 Syntax rules

Syntax rules are used by the parser. They determine how to translate the stream of lexemes as returned by the lexer into the parse tree node. A rule may be terminal, i.e., replace a matching lexeme into a terminal node. The node will contain the lexeme interpreted as a recognized token:

- a keyword: unquoted fixed character string;

- a real number, to be determined at runtime;

- an integer, to be determined at runtime;

- a boolean value, to be determined at runtime;

- a quoted token (e.g., string), to be determined at runtime;

- an identifier (unquoted string that is not a recognized keyword), to be determined at runtime.

It may be nonterminal, i.e., contain a sequence of child rules. These are matched consecutively (and recursively) against the input stream; the resulting node will be a branch node.

- the file, i.e., the input stream as a whole;

- a sequence of syntax elements, where the last syntax element may be optional, or optional repetitive;

Sequences carry a flag that tells whether the last child is optional or may be repeated an arbitrary number of times, correponding to the regexp modifiers ?, *, and +.

We also need an alternative rule; this will be replaced by the node generated by one of its children that matches; thus, it does not create a node of its own.

- an alternative of syntax elements.

We also define special types of sequences as convenience macros:

- a list: a sequence where the elements are separated by a separator keyword (e.g., commas), the separators are thrown away when parsing the list;

- a group: a sequence of three tokens, where the first and third ones are left and right delimiters, the delimiters are thrown away;

- an argument list: a delimited list, containing both delimiters and separators.

It would be great to have a polymorphic type for this purpose, but until Fortran 2003 is out we have to emulate this.

Here are the syntax element codes:

⟨*Syntax: public*⟩≡
```
    public :: S_UNKNOWN
    public :: S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_QUOTED
    public :: S_IDENTIFIER, S_KEYWORD
    public :: S_SEQUENCE, S_LIST, S_GROUP, S_ARGS
    public :: S_ALTERNATIVE
    public :: S_IGNORE
```

⟨*Syntax: parameters*⟩≡
```
    integer, parameter :: &
        S_UNKNOWN = 0, &
        S_LOGICAL = 1, S_INTEGER = 2, S_REAL = 3, S_COMPLEX = 4, &
        S_QUOTED = 5, S_IDENTIFIER = 6, S_KEYWORD = 7, &
        S_SEQUENCE = 8, S_LIST = 9, S_GROUP = 10, S_ARGS = 11, &
        S_ALTERNATIVE = 12, &
        S_IGNORE = 99
```

We need arrays of rule pointers, therefore this construct.

⟨*Syntax: types*⟩≡
```
    type :: rule_p
       private
       type(syntax_rule_t), pointer :: p => null ()
    end type rule_p
```

Return the association status of the rule pointer:

⟨*Syntax: subroutines*⟩≡
```
    elemental function rule_is_associated (rp) result (ok)
      logical :: ok
      type (rule_p), intent(in) :: rp
      ok = associated (rp%p)
    end function rule_is_associated
```

The rule type is one of the types listed above, represented by an integer code. The keyword, for a non-keyword rule, is an identifier used for the printed syntax table. The array of children is needed for nonterminal rules. In that case, there is a modifier for the last element (blank, "?", "*", or "+"), mirrored in the flags `opt` and `rep`. Then, we have the character constants used as separators and delimiters for this rule. Finally, the `used` flag can be set to indicate that this rule is the child of another rule.

⟨*Syntax: types*⟩+≡
```
    public :: syntax_rule_t
```

⟨*Syntax: types*⟩+≡
```
    type :: syntax_rule_t
      private
      integer :: type = S_UNKNOWN
      logical :: used = .false.
      type(string_t) :: keyword
      type(string_t) :: separator
      type(string_t), dimension(2) :: delimiter
      type(rule_p), dimension(:), allocatable :: child
      character(1) :: modifier = ""
      logical :: opt = .false., rep = .false.
    end type syntax_rule_t
```

Initializer: Set type and key for a rule, but do not (yet) allocate anything. Finalizer: not needed (no pointer components).

⟨*Syntax: subroutines*⟩+≡
```
    subroutine syntax_rule_init (rule, key, type)
      type(syntax_rule_t), intent(inout) :: rule
      type(string_t), intent(in) :: key
      integer, intent(in) :: type
      rule%keyword = key
      rule%type = type
      select case (rule%type)
      case (S_GROUP)
         call syntax_rule_set_delimiter (rule)
      case (S_LIST)
         call syntax_rule_set_separator (rule)
      case (S_ARGS)
         call syntax_rule_set_delimiter (rule)
         call syntax_rule_set_separator (rule)
      end select
    end subroutine syntax_rule_init
```

3.3.2 I/O

These characters will not be enclosed in quotes when writing syntax rules:

⟨*Limits: public parameters*⟩+≡
```
character(*), parameter, public :: &
        UNQUOTED = "(),|_"//LCLETTERS//UCLETTERS//DIGITS
```

Write an account of the rule. Setting `short` true will suppress the node type. Setting `key_only` true will suppress the definition. Setting `advance` false will suppress the trailing newline.

⟨*Syntax: public*⟩+≡
```
public :: syntax_rule_write
```

⟨*Syntax: subroutines*⟩+≡
```
subroutine syntax_rule_write (rule, unit, short, key_only, advance)
  type(syntax_rule_t), intent(in) :: rule
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: short, key_only, advance
  logical :: typ, def, adv
  integer :: u
  u = output_unit (unit);  if (u < 0)  return
  typ = .true.;  if (present (short))    typ = .not. short
  def = .true.;  if (present (key_only)) def = .not. key_only
  adv = .true.;  if (present (advance))  adv = advance
  select case (rule%type)
  case (S_UNKNOWN);    call write_atom ("???", typ)
  case (S_IGNORE);     call write_atom ("IGNORE", typ)
  case (S_LOGICAL);    call write_atom ("LOGICAL", typ)
  case (S_INTEGER);    call write_atom ("INTEGER", typ)
  case (S_REAL);       call write_atom ("REAL", typ)
  case (S_COMPLEX);    call write_atom ("COMPLEX", typ)
  case (S_IDENTIFIER); call write_atom ("IDENTIFIER", typ)
  case (S_KEYWORD);    call write_atom ("KEYWORD", typ)
  case (S_QUOTED)
     call write_quotes (typ, def, del = rule%delimiter)
  case (S_SEQUENCE)
     call write_sequence ("SEQUENCE", typ, def, size (rule%child))
  case (S_GROUP)
     call write_sequence ("GROUP", typ, def, size (rule%child), &
          del = rule%delimiter)
  case (S_LIST)
     call write_sequence ("LIST", typ, def, size (rule%child), &
          sep = rule%separator)
  case (S_ARGS)
     call write_sequence ("ARGUMENTS", typ, def, size (rule%child), &
          del = rule%delimiter, sep = rule%separator)
  case (S_ALTERNATIVE)
     call write_sequence ("ALTERNATIVE", typ, def, size (rule%child), &
          sep = var_str ("|"))
  end select
  if (adv)  write (u, *)
contains
  subroutine write_type (type)
    character(*), intent(in) :: type
    character(11) :: str
```

```
    str = type
    write (u, "(1x,A)", advance="no")  str
end subroutine write_type
subroutine write_key
    write (u, "(1x,A)", advance="no")  char (wkey (rule))
end subroutine write_key
subroutine write_atom (type, typ)
    character(*), intent(in) :: type
    logical, intent(in) :: typ
    if (typ)  call write_type (type)
    call write_key
end subroutine write_atom
subroutine write_maybe_quoted (string)
    character(*), intent(in) :: string
    character, parameter :: q = "'"
    character, parameter :: qq = '"'
    if (verify (string, UNQUOTED) == 0) then
       write (u, "(1x,A)", advance = "no") trim (string)
    else if (verify (string, q) == 0) then
       write (u, "(1x,A)", advance = "no") qq // trim (string) // qq
    else
       write (u, "(1x,A)", advance = "no") q // trim (string) // q
    end if
end subroutine write_maybe_quoted
subroutine write_quotes (typ, def, del)
    logical, intent(in) :: typ, def
    type(string_t), dimension(2), intent(in) :: del
    if (typ)  call write_type ("QUOTED")
    call write_key
    if (def) then
       write (u, "(1x,'=')", advance="no")
       call write_maybe_quoted (char (del(1)))
       write (u, "(1x,A)", advance="no") "..."
       call write_maybe_quoted (char (del(2)))
    end if
end subroutine write_quotes
subroutine write_sequence (type, typ, def, n, del, sep)
    character(*), intent(in) :: type
    logical, intent(in) :: typ, def
    integer, intent(in) :: n
    type(string_t), dimension(2), intent(in), optional :: del
    type(string_t), intent(in), optional :: sep
    integer :: i
    if (typ)  call write_type (type)
    call write_key
    if (def) then
       write (u, "(1x,'=')", advance="no")
       if (present (del))  call write_maybe_quoted (char (del(1)))
       do i = 1, n
          if (i > 1 .and. present (sep)) &
               call write_maybe_quoted (char (sep))
          write (u, "(1x,A)", advance="no")  &
               char (wkey (syntax_rule_get_sub_ptr(rule, i)))
          if (i == n)  write (u, "(A)", advance="no")  trim (rule%modifier)
```

```
        end do
        if (present (del))  call write_maybe_quoted (char (del(2)))
      end if
    end subroutine write_sequence
  end subroutine syntax_rule_write
```

In the printed representation, the keyword strings are enclosed as <...>, unless they are bare keywords. Bare keywords are enclosed as '..' if they contain a character which is not a letter, digit, or underscore. If they contain a single-quote character, they are enclosed as "..". (A keyword must not contain both single- and double-quotes.)

⟨*Syntax: subroutines*⟩+≡
```
    function wkey (rule) result (string)
      type(string_t) :: string
      type(syntax_rule_t), intent(in) :: rule
      select case (rule%type)
      case (S_KEYWORD)
        if (verify (rule%keyword, UNQUOTED) == 0) then
          string = rule%keyword
        else if (scan (rule%keyword, "'") == 0) then
          string = "'" // rule%keyword // "'"
        else
          string = '"' // rule%keyword // '"'
        end if
      case default
        string = "<" // rule%keyword // ">"
      end select
    end function wkey
```

3.3.3   Completing syntax rules

Set the separator and delimiter entries, using defaults:

⟨*Syntax: subroutines*⟩+≡
```
    subroutine syntax_rule_set_separator (rule, separator)
      type(syntax_rule_t), intent(inout) :: rule
      type(string_t), intent(in), optional :: separator
      if (present (separator)) then
        rule%separator = separator
      else
        rule%separator = ","
      end if
    end subroutine syntax_rule_set_separator

    subroutine syntax_rule_set_delimiter (rule, delimiter)
      type(syntax_rule_t), intent(inout) :: rule
      type(string_t), dimension(2), intent(in), optional :: delimiter
      if (present (delimiter)) then
        rule%delimiter = delimiter
      else
        rule%delimiter = ["(", ")"]
      end if
```

```
        end subroutine syntax_rule_set_delimiter
```

Set the modifier entry and corresponding flags:

⟨*Syntax: subroutines*⟩+≡
```
    function is_modifier (string) result (ok)
      logical :: ok
      type(string_t), intent(in) :: string
      select case (char (string))
      case (" ", "?", "*", "+");  ok = .true.
      case default;               ok = .false.
      end select
    end function is_modifier

    subroutine syntax_rule_set_modifier (rule, modifier)
      type(syntax_rule_t), intent(inout) :: rule
      type(string_t), intent(in) :: modifier
      rule%modifier = char (modifier)
      select case (rule%modifier)
      case (" ")
      case ("?");  rule%opt = .true.
      case ("*");  rule%opt = .true.;  rule%rep = .true.
      case ("+");  rule%rep = .true.
      case default
         call msg_bug (" Syntax: sequence modifier '" // rule%modifier &
              // "' is not one of '+' '*' '?'")
      end select
    end subroutine syntax_rule_set_modifier
```

Check a finalized rule for completeness

⟨*Syntax: subroutines*⟩+≡
```
    subroutine syntax_rule_check (rule)
      type(syntax_rule_t), intent(in) :: rule
      if (rule%keyword == "")  call msg_bug ("Rule key not set")
      select case (rule%type)
      case (S_UNKNOWN);  call bug (" Undefined rule")
      case (S_IGNORE, S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, &
               S_IDENTIFIER, S_KEYWORD)
      case (S_QUOTED)
         if (any (rule%delimiter == "")) call bug (" Missing quote character(s)")
      case (S_SEQUENCE)
      case (S_GROUP)
         if (any (rule%delimiter == "")) call bug (" Missing delimiter(s)")
      case (S_LIST)
         if (rule%separator == "") call bug (" Missing separator")
      case (S_ARGS)
         if (any (rule%delimiter == "")) call bug (" Missing delimiter(s)")
         if (rule%separator == "") call bug (" Missing separator")
      case (S_ALTERNATIVE)
      case default
         call bug (" Undefined syntax code")
      end select
      select case (rule%type)
      case (S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
```

```
            if (allocated (rule%child)) then
               if (.not.all (rule_is_associated (rule%child))) &
                    call bug (" Child rules not all associated")
            else
               call bug (" Parent rule without children")
            end if
         case default
            if (allocated (rule%child))  call bug (" Non-parent rule with children")
         end select
      contains
        subroutine bug (string)
          character(*), intent(in) :: string
          call msg_bug (" Syntax table: Rule " // char (rule%keyword) // ": " &
               // string)
        end subroutine bug
      end subroutine syntax_rule_check
```

3.3.4 Accessing rules

This is the API for syntax rules:

⟨*Syntax: public*⟩+≡
```
    public :: syntax_rule_get_type
```

⟨*Syntax: subroutines*⟩+≡
```
    function syntax_rule_get_type (rule) result (type)
      integer :: type
      type(syntax_rule_t), intent(in) :: rule
      type = rule%type
    end function syntax_rule_get_type
```

⟨*Syntax: public*⟩+≡
```
    public :: syntax_rule_get_key
```

⟨*Syntax: subroutines*⟩+≡
```
    function syntax_rule_get_key (rule) result (key)
      type(string_t) :: key
      type(syntax_rule_t), intent(in) :: rule
      key = rule%keyword
    end function syntax_rule_get_key
```

⟨*Syntax: public*⟩+≡
```
    public :: syntax_rule_get_separator
    public :: syntax_rule_get_delimiter
```

⟨*Syntax: subroutines*⟩+≡
```
    function syntax_rule_get_separator (rule) result (separator)
      type(string_t) :: separator
      type(syntax_rule_t), intent(in) :: rule
      separator = rule%separator
    end function syntax_rule_get_separator

    function syntax_rule_get_delimiter (rule) result (delimiter)
      type(string_t), dimension(2) :: delimiter
```

```
        type(syntax_rule_t), intent(in) :: rule
        delimiter = rule%delimiter
      end function syntax_rule_get_delimiter
```

Accessing child rules. If we use `syntax_rule_get_n_sub` for determining loop
bounds, we do not need a check in the second routine.

⟨*Syntax: public*⟩+≡
```
      public :: syntax_rule_get_n_sub
      public :: syntax_rule_get_sub_ptr
```

⟨*Syntax: subroutines*⟩+≡
```
      function syntax_rule_get_n_sub (rule) result (n)
        integer :: n
        type(syntax_rule_t), intent(in) :: rule
        if (allocated (rule%child)) then
           n = size (rule%child)
        else
           n = 0
        end if
      end function syntax_rule_get_n_sub

      function syntax_rule_get_sub_ptr (rule, i) result (sub)
        type(syntax_rule_t), pointer :: sub
        type(syntax_rule_t), intent(in), target :: rule
        integer, intent(in) :: i
        sub => rule%child(i)%p
      end function syntax_rule_get_sub_ptr

      subroutine syntax_rule_set_sub (rule, i, sub)
        type(syntax_rule_t), intent(inout) :: rule
        integer, intent(in) :: i
        type(syntax_rule_t), intent(in), target :: sub
        rule%child(i)%p => sub
      end subroutine syntax_rule_set_sub
```

Return the modifier flags:

⟨*Syntax: public*⟩+≡
```
      public :: syntax_rule_last_optional
      public :: syntax_rule_last_repetitive
```

⟨*Syntax: subroutines*⟩+≡
```
      function syntax_rule_last_optional (rule) result (opt)
        logical :: opt
        type(syntax_rule_t), intent(in) :: rule
        opt = rule%opt
      end function syntax_rule_last_optional
      function syntax_rule_last_repetitive (rule) result (rep)
        logical :: rep
        type(syntax_rule_t), intent(in) :: rule
        rep = rule%rep
      end function syntax_rule_last_repetitive
```

Return true if the rule is atomic, i.e., logical, real, keyword etc.

⟨*Syntax: public*⟩+≡
```
    public :: syntax_rule_is_atomic
```

⟨*Syntax: subroutines*⟩+≡
```
    function syntax_rule_is_atomic (rule) result (atomic)
      logical :: atomic
      type(syntax_rule_t), intent(in) :: rule
      select case (rule%type)
      case (S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_IDENTIFIER, &
              S_KEYWORD, S_QUOTED)
         atomic = .true.
      case default
         atomic = .false.
      end select
    end function syntax_rule_is_atomic
```

3.3.5 Syntax tables

A syntax table contains the tree of syntax rules and, for direct parser access, the list of valid keywords.

Types

The syntax contains an array of rules and a list of keywords. The array is actually used as a tree, where the top rule is the first array element, and the other rules are recursively pointed to by this first rule. (No rule should be used twice or be unused.) The keyword list is derived from the rule tree.

Objects of this type need the target attribute if they are associated with a lexer. The keyword list will be pointed to by this lexer.

⟨*Syntax: public*⟩+≡
```
    public :: syntax_t
```

⟨*Syntax: types*⟩+≡
```
    type :: syntax_t
      private
      type(syntax_rule_t), dimension(:), allocatable :: rule
      type(keyword_list_t) :: keyword_list
    end type syntax_t
```

Constructor/destructor

Initialize and finalize syntax tables

⟨*Syntax: public*⟩+≡
```
    public :: syntax_init
    public :: syntax_final
```

There are two ways to create a syntax: hard-coded from rules or dynamically from file.

⟨*Syntax: interfaces*⟩≡
```
interface syntax_init
   module procedure syntax_init_from_ifile
end interface
```

The syntax definition is read from an `ifile` object which contains the syntax definitions in textual form, one rule per line. This interface allows for determining the number of rules beforehand.

To parse the rule definitions, we make up a temporary lexer. Obviously, we cannot use a generic parser yet, so we have to hardcode the parsing process.

⟨*Syntax: subroutines*⟩+≡
```
subroutine syntax_init_from_ifile (syntax, ifile)
  type(syntax_t), intent(out), target :: syntax
  type(ifile_t), intent(in) :: ifile
  type(lexer_t) :: lexer
  type(line_p) :: line
  type(string_t) :: string
  integer :: n_token
  integer :: i
  call lexer_init (lexer, &
     comment_chars = "", &
     quote_chars = "<'""", &
     quote_match = ">'""", &
     single_chars = "?*+|=,()", &
     special_class = ["."], &
     keyword_list = null ())
  allocate (syntax%rule (ifile_get_length (ifile)))
  call line_init (line, ifile)
  do i = 1, size (syntax%rule)
     string = line_get_string_advance (line)
     call set_rule_type_and_key (syntax%rule(i), string, lexer)
  end do
  call line_init (line, ifile)
  do i = 1, size (syntax%rule)
     string = line_get_string_advance (line)
     select case (syntax%rule(i)%type)
     case (S_QUOTED, S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
        n_token = get_n_token (string, lexer)
        call set_rule_contents &
             (syntax%rule(i), syntax, n_token, string, lexer)
     end select
  end do
  call line_final (line)
  call lexer_final (lexer)
  call syntax_make_keyword_list (syntax)
  if (.not. all (syntax%rule%used)) then
     do i = 1, size (syntax%rule)
        if (.not. syntax%rule(i)%used) then
           call syntax_rule_write (syntax%rule(i), 6)
        end if
     end do
```

```
      call msg_bug (" Syntax table: unused rules")
    end if
  end subroutine syntax_init_from_ifile
```

For a given rule defined in the input, the first task is to determine its type and key. With these, we can initialize the rule in the table, postponing the association of children.

⟨*Syntax: subroutines*⟩+≡
```
  subroutine set_rule_type_and_key (rule, string, lexer)
    type(syntax_rule_t), intent(inout) :: rule
    type(string_t), intent(in) :: string
    type(lexer_t), intent(inout) :: lexer
    type(stream_t), target :: stream
    type(lexeme_t) :: lexeme
    type(string_t) :: key
    character(2) :: type
    call lexer_clear (lexer)
    call stream_init (stream, string)
    call lexer_assign_stream (lexer, stream)
    call lex (lexeme, lexer)
    type = lexeme_get_string (lexeme)
    call lex (lexeme, lexer)
    key = lexeme_get_contents (lexeme)
    call stream_final (stream)
    if (trim (key) /= "") then
       select case (type)
       case ("IG");  call syntax_rule_init (rule, key, S_IGNORE)
       case ("LO");  call syntax_rule_init (rule, key, S_LOGICAL)
       case ("IN");  call syntax_rule_init (rule, key, S_INTEGER)
       case ("RE");  call syntax_rule_init (rule, key, S_REAL)
       case ("CO");  call syntax_rule_init (rule, key, S_COMPLEX)
       case ("ID");  call syntax_rule_init (rule, key, S_IDENTIFIER)
       case ("KE");  call syntax_rule_init (rule, key, S_KEYWORD)
       case ("QU");  call syntax_rule_init (rule, key, S_QUOTED)
       case ("SE");  call syntax_rule_init (rule, key, S_SEQUENCE)
       case ("GR");  call syntax_rule_init (rule, key, S_GROUP)
       case ("LI");  call syntax_rule_init (rule, key, S_LIST)
       case ("AR");  call syntax_rule_init (rule, key, S_ARGS)
       case ("AL");  call syntax_rule_init (rule, key, S_ALTERNATIVE)
       case default
          call lexer_show_location (lexer)
          call msg_bug (" Syntax definition: unknown type '" // type // "'")
       end select
    else
       print *, char (string)
       call msg_bug (" Syntax definition: empty rule key")
    end if
  end subroutine set_rule_type_and_key
```

This function returns the number of tokens in an input line.

⟨*Syntax: subroutines*⟩+≡
```
  function get_n_token (string, lexer) result (n)
    integer :: n
```

```
      type(string_t), intent(in) :: string
      type(lexer_t), intent(inout) :: lexer
      type(stream_t), target :: stream
      type(lexeme_t) :: lexeme
      integer :: i
      call lexer_clear (lexer)
      call stream_init (stream, string)
      call lexer_assign_stream (lexer, stream)
      i = 0
      do
         call lex (lexeme, lexer)
         if (lexeme_is_break (lexeme))  exit
         i = i + 1
      end do
      n = i
      call stream_final (stream)
  end function get_n_token
```

This subroutine extracts the rule contents for an input line. There are three tasks: (1) determine the number of children, depending on the rule type; (2) find and set the separator and delimiter strings, if required; (3) scan the child rules, find them in the syntax table and associate the parent rule with them.

⟨*Syntax: subroutines*⟩+≡

```
    subroutine set_rule_contents (rule, syntax, n_token, string, lexer)
      type(syntax_rule_t), intent(inout) :: rule
      type(syntax_t), intent(in), target :: syntax
      integer, intent(in) :: n_token
      type(string_t), intent(in) :: string
      type(lexer_t), intent(inout) :: lexer
      type(stream_t), target :: stream
      type(lexeme_t), dimension(n_token) :: lexeme
      integer :: i, n_children
      call lexer_clear (lexer)
      call stream_init (stream, string)
      call lexer_assign_stream (lexer, stream)
      do i = 1, n_token
         call lex (lexeme(i), lexer)
      end do
      call stream_final (stream)
      n_children = get_n_children ()
      call set_delimiters

         do i = 1, n_children
            call syntax_rule_set_sub (rule, i, syntax_get_rule_ptr (syntax, &
                 lexeme_get_contents (lexeme(2*i+3))))
         end do
      end select
    end subroutine set_children
    subroutine broken_rule (rule)
      type(syntax_rule_t), intent(in) :: rule
      call lexer_show_location (lexer)
      call msg_bug (" Syntax definition: broken rule '" &
           // char (wkey (rule)) // "'")
    end subroutine broken_rule
  end subroutine set_rule_contents
```

This routine completes the syntax table object. We assume that the rule array
is set up. We associate the top rule with the first entry in the rule array and
build up the keyword list.

The keyword list includes delimiters and separators. Filling it can only be
done after all rules are set. We scan the rule tree. For each keyword that
we find, we try to add it to the keyword list; the pointer to the last element
is carried along with the recursive scanning. Before appending a keyword, we
check whether it is already in the list.

⟨*Syntax: subroutines*⟩+≡
```
  subroutine syntax_make_keyword_list (syntax)
    type(syntax_t), intent(inout), target :: syntax
    type(syntax_rule_t), pointer :: rule
    rule => syntax%rule(1)
    call rule_scan_rec (rule, syntax%keyword_list)
  contains
    recursive subroutine rule_scan_rec (rule, keyword_list)
      type(syntax_rule_t), pointer :: rule
      type(keyword_list_t), intent(inout) :: keyword_list
      integer :: i
      if (rule%used)  return
      rule%used = .true.
```

```fortran
    select case (rule%type)
    case (S_UNKNOWN)
       call msg_bug (" Syntax: rule tree contains undefined rule")
    case (S_KEYWORD)
       call keyword_list_add (keyword_list, rule%keyword)
    end select
    select case (rule%type)
    case (S_LIST, S_ARGS)
       call keyword_list_add (keyword_list, rule%separator)
    end select
    select case (rule%type)
    case (S_GROUP, S_ARGS)
       call keyword_list_add (keyword_list, rule%delimiter(1))
       call keyword_list_add (keyword_list, rule%delimiter(2))
    end select
    select case (rule%type)
    case (S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
       if (.not. allocated (rule%child)) &
            call msg_bug (" Syntax: Non-terminal rule without children")
    case default
       if (allocated (rule%child)) &
            call msg_bug (" Syntax: Terminal rule with children")
    end select
    if (allocated (rule%child)) then
       do i = 1, size (rule%child)
          call rule_scan_rec (rule%child(i)%p, keyword_list)
       end do
    end if
  end subroutine rule_scan_rec
end subroutine syntax_make_keyword_list
```

The finalizer deallocates the rule pointer array and deletes the keyword list.

⟨*Syntax: subroutines*⟩+≡
```fortran
subroutine syntax_final (syntax)
  type(syntax_t), intent(inout) :: syntax
  if (allocated (syntax%rule))  deallocate (syntax%rule)
  call keyword_list_final (syntax%keyword_list)
end subroutine syntax_final
```

3.3.6 Accessing the syntax table

Return a pointer to the top rule

⟨*Syntax: public*⟩+≡
```fortran
public :: syntax_get_top_rule_ptr
```

⟨*Syntax: subroutines*⟩+≡
```fortran
function syntax_get_top_rule_ptr (syntax) result (rule)
  type(syntax_rule_t), pointer :: rule
  type(syntax_t), intent(in), target :: syntax
  if (allocated (syntax%rule)) then
     rule => syntax%rule(1)
  else
```

```
                  rule => null ()
             end if
        end function syntax_get_top_rule_ptr
```

Assign the pointer to the rule associated with a given key (assumes that the
rule array is allocated)

⟨*Syntax: public*⟩+≡
```
        public :: syntax_get_rule_ptr
```

⟨*Syntax: subroutines*⟩+≡
```
        function syntax_get_rule_ptr (syntax, key) result (rule)
          type(syntax_rule_t), pointer :: rule
          type(syntax_t), intent(in), target :: syntax
          type(string_t), intent(in) :: key
          integer :: i
          do i = 1, size (syntax%rule)
             if (syntax%rule(i)%keyword == key) then
                rule => syntax%rule(i)
                return
             end if
          end do
          call msg_bug (" Syntax table: Rule " // char (key) // " not found")
        end function syntax_get_rule_ptr
```

Return a pointer to the keyword list

⟨*Syntax: public*⟩+≡
```
        public :: syntax_get_keyword_list_ptr
```

⟨*Syntax: subroutines*⟩+≡
```
        function syntax_get_keyword_list_ptr (syntax) result (keyword_list)
          type(keyword_list_t), pointer :: keyword_list
          type(syntax_t), intent(in), target :: syntax
          keyword_list => syntax%keyword_list
        end function syntax_get_keyword_list_ptr
```

3.3.7 I/O

Write a readable representation of the syntax table

⟨*Syntax: public*⟩+≡
```
        public :: syntax_write
```

⟨*Syntax: subroutines*⟩+≡
```
        subroutine syntax_write (syntax, unit)
          type(syntax_t), intent(in) :: syntax
          integer, intent(in), optional :: unit
          integer :: u
          integer :: i
          u = output_unit (unit);  if (u < 0)  return
          write (u, "(A)") "Syntax table:"
          if (allocated (syntax%rule)) then
             do i = 1, size (syntax%rule)
                call syntax_rule_write (syntax%rule(i), u)
```

```
      end do
  else
      write (u, "(1x,A)") "[not allocated]"
  end if
  call keyword_list_write (syntax%keyword_list, u)
end subroutine syntax_write
```

3.4 The parser

On a small scale, the parser interprets the string tokens returned by the lexer; they are interpreted as numbers, keywords and such and stored as a typed object. On a large scale, a text is read, parsed, and a syntax rule set is applied such that the tokens are stored as a parse tree. Syntax errors are spotted in this process, so the resulting parse tree is syntactically correct by definition.

⟨parser.f90⟩≡
  ⟨*File header*⟩

  ```
  module parser
  ```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
  ```
    use limits, only: DIGITS, FMT_19 !NODEP!

  ⟨*Parser: interfaces*⟩

  ```
  contains
  ```

  ⟨*Parser: procedures*⟩

  ⟨*Parser: tests*⟩

  ```
  end module parser
  ```

3.4.1 The token type

Tokens are elements of the parsed input that carry a value: logical, integer, real, quoted string, (unquoted) identifier, or known keyword. Note that non-keyword tokens also have an abstract key attached to them.

This is an obvious candidate for polymorphism.

⟨*Parser: types*⟩≡
```
    type :: token_t
       private
       integer :: type = S_UNKNOWN
       logical, pointer :: lval => null ()
       integer, pointer :: ival => null ()
       real(default), pointer :: rval => null ()
       complex(default), pointer :: cval => null ()
```

```
      type(string_t), pointer :: sval => null ()
      type(string_t), pointer :: kval => null ()
      type(string_t), dimension(:), pointer :: quote => null ()
   end type token_t
```

Create a token from the lexeme returned by the lexer: Allocate storage and try
to interpret the lexeme according to the type that is requested by the parser.
For a keyword token, match the lexeme against the requested key. If successful,
set the token type, value, and key. Otherwise, set the type to S_UNKNOWN.

⟨*Parser: procedures*⟩≡

```
   subroutine token_init (token, lexeme, requested_type, key)
     type(token_t), intent(out) :: token
     type(lexeme_t), intent(in) :: lexeme
     integer, intent(in) :: requested_type
     type(string_t), intent(in) :: key
     integer :: type
     type = lexeme_get_type (lexeme)
     token%type = S_UNKNOWN
     select case (requested_type)
     case (S_LOGICAL)
        if (type == T_IDENTIFIER)  call read_logical &
            (char (lexeme_get_string (lexeme)))
     case (S_INTEGER)
        if (type == T_NUMERIC)  call read_integer &
            (char (lexeme_get_string (lexeme)))
     case (S_REAL)

        type(string_t), dimension(2), intent(in) :: del
        allocate (token%sval, token%quote(2))
        token%sval = s
        token%quote(1) = del(1)
        token%quote(2) = del(2)
        token%type = S_QUOTED
      end subroutine read_quoted
    end subroutine token_init
```

Manually set a token to a keyword.

⟨*Parser: procedures*⟩+≡
```
    subroutine token_init_key (token, key)
      type(token_t), intent(out) :: token
      type(string_t), intent(in) :: key
      token%type = S_KEYWORD
      allocate (token%kval)
      token%kval = key
    end subroutine token_init_key
```

Reset a token to an empty state, freeing allocated memory, and deallocate the
token itself.

⟨*Parser: procedures*⟩+≡
```
    subroutine token_final (token)
      type(token_t), intent(inout) :: token
      token%type = S_UNKNOWN
      if (associated (token%lval))  deallocate (token%lval)
      if (associated (token%ival))  deallocate (token%ival)
      if (associated (token%rval))  deallocate (token%rval)
      if (associated (token%sval))  deallocate (token%sval)
      if (associated (token%kval))  deallocate (token%kval)
      if (associated (token%quote))  deallocate (token%quote)
    end subroutine token_final
```

Check for empty=valid token:

⟨*Parser: procedures*⟩+≡
```
    function token_is_valid (token) result (valid)
      logical :: valid
      type(token_t), intent(in) :: token
      valid = token%type /= S_UNKNOWN
    end function token_is_valid
```

Write the contents of a token.

⟨*Parser: procedures*⟩+≡
```
    subroutine token_write (token, unit)
      type(token_t), intent(in) :: token
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      select case (token%type)
      case (S_LOGICAL)
```

```
      write (u, "(L1)") token%lval
   case (S_INTEGER)
      write (u, "(I0)") token%ival
   case (S_REAL)
      write (u, "(" // FMT_19 // ")") token%rval
   case (S_COMPLEX)
      write (u, "('(',"  // FMT_19 // "',','," // FMT_19 // "',')')") token%cval
   case (S_IDENTIFIER)
      write (u, "(A)") char (token%sval)
   case (S_KEYWORD)
      write (u, "(A,A)") '[keyword] ' // char (token%kval)
   case (S_QUOTED)
      write (u, "(A)") &
            char (token%quote(1)) // char (token%sval) // char (token%quote(2))
   case default
      write (u, "(A)") '[empty]'
   end select
end subroutine token_write
```

Token assignment via deep copy. This is useful to avoid confusion when the
token is transferred to some parse-tree node.

⟨*Parser: interfaces*⟩≡
```
   interface assignment(=)
      module procedure token_assign
      module procedure token_assign_integer
      module procedure token_assign_real
      module procedure token_assign_complex
      module procedure token_assign_logical
      module procedure token_assign_string
   end interface
```

We need to copy only the contents that are actually assigned, the other pointers
remain disassociated.

⟨*Parser: procedures*⟩+≡
```
   subroutine token_assign (token, token_in)
     type(token_t), intent(out) :: token
     type(token_t), intent(in) :: token_in
     token%type = token_in%type
     select case (token%type)
     case (S_LOGICAL);    allocate (token%lval);  token%lval = token_in%lval
     case (S_INTEGER);    allocate (token%ival);  token%ival = token_in%ival
     case (S_REAL);       allocate (token%rval);  token%rval = token_in%rval
     case (S_COMPLEX); allocate (token%cval);  token%cval = token_in%cval
     case (S_IDENTIFIER); allocate (token%sval);  token%sval = token_in%sval
     case (S_QUOTED);     allocate (token%sval);  token%sval = token_in%sval
        allocate (token%quote(2));  token%quote = token_in%quote
     end select
     if (token%type /= S_UNKNOWN) then
        allocate (token%kval);  token%kval = token_in%kval
     end if
   end subroutine token_assign
```

We need to copy only the contents that are actually assigned, the other pointers
remain disassociated.

⟨*Parser: procedures*⟩+≡

```
subroutine token_assign_integer (token, ival)
  type(token_t), intent(out) :: token
  integer, intent(in) :: ival
  token%type = S_INTEGER
  allocate (token%ival)
  token%ival = ival
end subroutine token_assign_integer

subroutine token_assign_real (token, rval)
  type(token_t), intent(out) :: token
  real(default), intent(in) :: rval
  token%type = S_REAL
  allocate (token%rval)
  token%rval = rval
end subroutine token_assign_real

subroutine token_assign_complex (token, cval)
  type(token_t), intent(out) :: token
  complex(default), intent(in) :: cval
  token%type = S_COMPLEX
  allocate (token%cval)
  token%cval = cval
end subroutine token_assign_complex

subroutine token_assign_logical (token, lval)
  type(token_t), intent(out) :: token
  logical, intent(in) :: lval
  token%type = S_LOGICAL
  allocate (token%lval)
  token%lval = lval
end subroutine token_assign_logical

subroutine token_assign_string (token, sval)
  type(token_t), intent(out) :: token
  type(string_t), intent(in) :: sval
  token%type = S_QUOTED
  allocate (token%sval)
  token%sval = sval
  allocate (token%quote(2));  token%quote = '"'
end subroutine token_assign_string
```

3.4.2   Retrieve token contents

These functions all do a trivial sanity check that should avoid crashes.

⟨*Parser: procedures*⟩+≡

```
function token_get_logical (token) result (lval)
  logical :: lval
  type(token_t), intent(in) :: token
  if (associated (token%lval)) then
```

```
      lval = token%lval
   else
      call token_mismatch (token, "logical")
   end if
end function token_get_logical

function token_get_integer (token) result (ival)
   integer :: ival
   type(token_t), intent(in) :: token
   if (associated (token%ival)) then
      ival = token%ival
   else
      call token_mismatch (token, "integer")
   end if
end function token_get_integer

function token_get_real (token) result (rval)
   real(default) :: rval
   type(token_t), intent(in) :: token
   if (associated (token%rval)) then
      rval = token%rval
   else
      call token_mismatch (token, "real")
   end if
end function token_get_real

function token_get_cmplx (token) result (cval)
   complex(default) :: cval
   type(token_t), intent(in) :: token
   if (associated (token%cval)) then
      cval = token%cval
   else
      call token_mismatch (token, "complex")
   end if
end function token_get_cmplx

function token_get_string (token) result (sval)
   type(string_t) :: sval
   type(token_t), intent(in) :: token
   if (associated (token%sval)) then
      sval = token%sval
   else
      call token_mismatch (token, "string")
   end if
end function token_get_string

function token_get_key (token) result (kval)
   type(string_t) :: kval
   type(token_t), intent(in) :: token
   if (associated (token%kval)) then
      kval = token%kval
   else
      call token_mismatch (token, "keyword")
   end if
```

```
    end function token_get_key

    function token_get_quote (token) result (quote)
      type(string_t), dimension(2) :: quote
      type(token_t), intent(in) :: token
      if (associated (token%quote)) then
         quote = token%quote
      else
         call token_mismatch (token, "quote")
      end if
    end function token_get_quote
```

⟨*Parser: procedures*⟩+≡
```
    subroutine token_mismatch (token, type)
      type(token_t), intent(in) :: token
      character(*), intent(in) :: type
      write (6, "(A)", advance="no")  "Token: "
      call token_write (token)
      call msg_bug (" Token type mismatch; value required as " // type)
    end subroutine token_mismatch
```

3.4.3   The parse tree: nodes

The parser will generate a parse tree from the input stream. Each node in this
parse tree points to the syntax rule that was applied. (Since syntax rules are
stored in a pointer-type array within the syntax table, they qualify as targets.)
A leaf node contains a token. A branch node has subnodes. The subnodes are
stored as a list, so each node also has a **next** pointer.

⟨*Parser: public*⟩≡
```
    public :: parse_node_t
```

⟨*Parser: types*⟩+≡
```
    type :: parse_node_t
      private
      type(syntax_rule_t), pointer :: rule => null ()
      type(token_t) :: token
      integer :: n_sub = 0
      type(parse_node_t), pointer :: sub_first => null ()
      type(parse_node_t), pointer :: sub_last => null ()
      type(parse_node_t), pointer :: next => null ()
     contains
    ⟨Parser: parse node: TBP⟩
    end type parse_node_t
```

Container for parse node pointers, useful for creating pointer arrays:

⟨*Parser: public*⟩+≡
```
    public :: parse_node_p
```

⟨*Parser: types*⟩+≡
```
    type :: parse_node_p
      type(parse_node_t), pointer :: ptr => null ()
    end type parse_node_p
```

Output. The first version writes a node together with its sub-node tree, organized by indentation.

⟨*Parser: parse node: TBP*⟩≡
```
    procedure :: write => parse_node_write_rec
```

⟨*Parser: public*⟩+≡
```
    public :: parse_node_write_rec
```

⟨*Parser: procedures*⟩+≡
```
    recursive subroutine parse_node_write_rec (node, unit, short, depth)
      class(parse_node_t), intent(in), target :: node
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: short
      integer, intent(in), optional :: depth
      integer :: u, d
      type(parse_node_t), pointer :: current
      u = output_unit (unit);  if (u < 0)  return
      d = 0;  if (present (depth))  d = depth
      call parse_node_write (node, u, short=short)
      current => node%sub_first
      do while (associated (current))
         write (u, "(A)", advance = "no")  repeat ("|  ", d)
         call parse_node_write_rec (current, unit, short, d+1)
         current => current%next
      end do
    end subroutine parse_node_write_rec
```

This does the actual output for a single node, without recursion.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_write
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_write (node, unit, short)
      class(parse_node_t), intent(in) :: node
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: short
      integer :: u
      type(parse_node_t), pointer :: current
      u = output_unit (unit);  if (u < 0)  return
      write (u, "('+ ')", advance = "no")
      if (associated (node%rule)) then
         call syntax_rule_write (node%rule, u, &
              short=short, key_only=.true., advance=.false.)
         if (token_is_valid (node%token)) then
            write (u, "('  = ')", advance="no")
            call token_write (node%token, u)
         else if (associated (node%sub_first)) then
            write (u, "('  = ')", advance="no")
            current => node%sub_first
            do while (associated (current))
               call syntax_rule_write (current%rule, u, &
                    short=.true., key_only=.true., advance=.false.)
               current => current%next
            end do
            write (u, *)
```

193

```
         else
             write (u, *)
         end if
      else
         write (u, *) "[empty]"
      end if
   end subroutine parse_node_write
```

Finalize the token and recursively finalize and deallocate all sub-nodes.

⟨*Parser: public*⟩+≡
```
   public :: parse_node_final
```

⟨*Parser: procedures*⟩+≡
```
   recursive subroutine parse_node_final (node, recursive)
     type(parse_node_t), intent(inout) :: node
     type(parse_node_t), pointer :: current
     logical, intent(in), optional :: recursive
     logical :: rec
     rec = .true.;  if (present (recursive))  rec = recursive
     call token_final (node%token)
     if (rec) then
        do while (associated (node%sub_first))
           current => node%sub_first
           node%sub_first => node%sub_first%next
           call parse_node_final (current)
           deallocate (current)
        end do
     end if
   end subroutine parse_node_final
```

3.4.4   Filling nodes

The constructors allocate and initialize the node. There are two possible initializers (in a later version, should correspond to different type extensions).

First, leaf (terminal) nodes. The token constructor does the actual work, looking at the requested type and key for the given rule and matching against the lexeme contents. If it fails, the token will keep the type S_UNKNOWN and remain empty. Otherwise, we have a valid node which contains the new token.

If the lexeme argument is absent, the token is left empty.

⟨*Parser: procedures*⟩+≡
```
   subroutine parse_node_create_leaf (node, rule, lexeme)
     type(parse_node_t), pointer :: node
     type(syntax_rule_t), intent(in), target :: rule
     type(lexeme_t), intent(in) :: lexeme
     allocate (node)
     node%rule => rule
     call token_init (node%token, lexeme, &
          syntax_rule_get_type (rule), syntax_rule_get_key (rule))
     if (.not. token_is_valid (node%token))  deallocate (node)
   end subroutine parse_node_create_leaf
```

This version allows us to manually create a leaf node that holds a keyword.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_create_key
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_create_key (node, rule)
      type(parse_node_t), intent(out) :: node
      type(syntax_rule_t), intent(in), target :: rule
      node%rule => rule
      call token_init_key (node%token, syntax_rule_get_key (rule))
    end subroutine parse_node_create_key
```

This version allows us to manually create a leaf node that holds a fixed value.
Only one of the optional values should be provided.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_create_value
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_create_value (node, rule, ival, rval, cval, sval, lval)
      type(parse_node_t), intent(out) :: node
      type(syntax_rule_t), intent(in), target :: rule
      integer, intent(in), optional :: ival
      real(default), intent(in), optional :: rval
      complex(default), intent(in), optional :: cval
      type(string_t), intent(in), optional :: sval
      logical, intent(in), optional :: lval
      node%rule => rule
      call parse_node_set_value (node, ival, rval, cval, sval, lval)
    end subroutine parse_node_create_value
```

Directly set the value without changing anything else.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_set_value
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_set_value (node, ival, rval, cval, sval, lval)
      type(parse_node_t), intent(inout) :: node
      integer, intent(in), optional :: ival
      real(default), intent(in), optional :: rval
      complex(default), intent(in), optional :: cval
      type(string_t), intent(in), optional :: sval
      logical, intent(in), optional :: lval
      if (present (ival)) then
         node%token = ival
      else if (present (rval)) then
         node%token = rval
      else if (present (cval)) then
         node%token = cval
      else if (present (lval)) then
         node%token = lval
      else if (present (sval)) then
         node%token = sval
      end if
    end subroutine parse_node_set_value
```

Second, branch nodes. We first assign the rule:

⟨Parser: public⟩+≡
```
    public :: parse_node_create_branch
```

⟨Parser: procedures⟩+≡
```
    subroutine parse_node_create_branch (node, rule)
      type(parse_node_t), pointer :: node
      type(syntax_rule_t), intent(in), target :: rule
      allocate (node)
      node%rule => rule
    end subroutine parse_node_create_branch
```

Append a sub-node. The sub-node must exist and be a valid target, otherwise nothing is done.

⟨Parser: public⟩+≡
```
    public :: parse_node_append_sub
```

⟨Parser: procedures⟩+≡
```
    subroutine parse_node_append_sub (node, sub)
      type(parse_node_t), intent(inout) :: node
      type(parse_node_t), pointer :: sub
      if (associated (sub)) then
         if (associated (node%sub_last)) then
            node%sub_last%next => sub
         else
            node%sub_first => sub
         end if
         node%sub_last => sub
      end if
    end subroutine parse_node_append_sub
```

For easy access, once the list is complete we count the number of sub-nodes. If there are no subnodes, the whole node is deleted.

⟨Parser: public⟩+≡
```
    public :: parse_node_freeze_branch
```

⟨Parser: procedures⟩+≡
```
    subroutine parse_node_freeze_branch (node)
      type(parse_node_t), pointer :: node
      type(parse_node_t), pointer :: current
      node%n_sub = 0
      current => node%sub_first
      do while (associated (current))
         node%n_sub = node%n_sub + 1
         current => current%next
      end do
      if (node%n_sub == 0)  deallocate (node)
    end subroutine parse_node_freeze_branch
```

Replace the syntax rule. This makes sense only if the parse node adheres to the syntax of the new rule.

⟨Parser: public⟩+≡
```
    public :: parse_node_replace_rule
```

⟨Parser: procedures⟩+≡
```
    subroutine parse_node_replace_rule (node, rule)
      type(parse_node_t), pointer :: node
      type(syntax_rule_t), intent(in), target :: rule
      node%rule => rule
    end subroutine parse_node_replace_rule
```

Replace the last subnode by the target node. Since the subnodes are stored as a linked list, we can do this only if we copy the subnodes. Furthermore, the target node must also be copied, and the `next` pointer of the copy is nullified. This ensures that we cannot modify the originals at the subnode level.

All copies are shallow copies. This implies that further modifications at the sub-subnode level will affect the original nodes and must therefore be forbidden.

Use with care, this invites to memory mismanagement. The copy nodes can be deallocated, but not finalized, since its subnodes are the same objects as the subnodes of the target node.

⟨Parser: public⟩+≡
```
    public :: parse_node_replace_last_sub
```

⟨Parser: procedures⟩+≡
```
    subroutine parse_node_replace_last_sub (node, pn_target)
      type(parse_node_t), intent(inout), target :: node
      type(parse_node_t), intent(in), target :: pn_target
      type(parse_node_t), pointer :: current, current_copy, previous
      integer :: i
      select case (node%n_sub)
      case (1)
         allocate (current_copy)
         current_copy = pn_target
         node%sub_first => current_copy
      case (2:)
         current => node%sub_first
         allocate (current_copy)
         current_copy = current
         node%sub_first => current_copy
         previous => current_copy
         do i = 1, node%n_sub - 2
            current => current%next
            allocate (current_copy)
            current_copy = current
            previous%next => current_copy
            previous => current_copy
         end do
         allocate (current_copy)
         current_copy = pn_target
         previous%next => current_copy
      case default
         call parse_node_write (node)
         call msg_bug ("'replace_last_sub' called for non-branch parse node")
      end select
      current_copy%next => null ()
      node%sub_last => current_copy
    end subroutine parse_node_replace_last_sub
```

3.4.5 Accessing nodes

Return the node contents. Check if pointers are associated. No check when accessing a sub-node; assume that `parse_node_n_sub` is always used for the upper bound.

The token extractor returns a pointer.

⟨*Parser: public*⟩+≡
```
public :: parse_node_get_rule_ptr
public :: parse_node_get_n_sub
public :: parse_node_get_sub_ptr
public :: parse_node_get_next_ptr
public :: parse_node_get_last_sub_ptr
```

⟨*Parser: procedures*⟩+≡
```
function parse_node_get_rule_ptr (node) result (rule)
  type(syntax_rule_t), pointer :: rule
  type(parse_node_t), intent(in), target :: node
  if (associated (node%rule)) then
     rule => node%rule
  else
     rule => null ()
     call parse_node_undefined (node, "rule")
  end if
end function parse_node_get_rule_ptr

function parse_node_get_n_sub (node) result (n)
  integer :: n
  type(parse_node_t), intent(in) :: node
  n = node%n_sub
end function parse_node_get_n_sub

function parse_node_get_sub_ptr (node, n, tag, required) result (sub)
  type(parse_node_t), pointer :: sub
  type(parse_node_t), intent(in), target :: node
  integer, intent(in), optional :: n
  character(*), intent(in), optional :: tag
  logical, intent(in), optional :: required
  integer :: i
  sub => node%sub_first
  if (present (n)) then
     do i = 2, n
        if (associated (sub)) then
           sub => sub%next
        else
           return
        end if
     end do
  end if
  call parse_node_check (sub, tag, required)
end function parse_node_get_sub_ptr

function parse_node_get_next_ptr (sub, n, tag, required) result (next)
```

```
      type(parse_node_t), pointer :: next
      type(parse_node_t), intent(in), target :: sub
      integer, intent(in), optional :: n
      character(*), intent(in), optional :: tag
      logical, intent(in), optional :: required
      integer :: i
      next => sub%next
      if (present (n)) then
         do i = 2, n
            if (associated (next)) then
               next => next%next
            else
               exit
            end if
         end do
      end if
      call parse_node_check (next, tag, required)
   end function parse_node_get_next_ptr

   function parse_node_get_last_sub_ptr (node, tag, required) result (sub)
     type(parse_node_t), pointer :: sub
     type(parse_node_t), intent(in), target :: node
     character(*), intent(in), optional :: tag
     logical, intent(in), optional :: required
     sub => node%sub_last
     call parse_node_check (sub, tag, required)
   end function parse_node_get_last_sub_ptr
```

⟨*Parser: procedures*⟩+≡
```
   subroutine parse_node_undefined (node, obj)
     type(parse_node_t), intent(in) :: node
     character(*), intent(in) :: obj
     call parse_node_write (node, 6)
     call msg_bug (" Parse-tree node: " // obj // " requested, but undefined")
   end subroutine parse_node_undefined
```

Check if a parse node has a particular tag, and if it is associated:
⟨*Parser: public*⟩+≡
```
   public :: parse_node_check
```
⟨*Parser: procedures*⟩+≡
```
   subroutine parse_node_check (node, tag, required)
     type(parse_node_t), pointer :: node
     character(*), intent(in), optional :: tag
     logical, intent(in), optional :: required
     if (associated (node)) then
        if (present (tag)) then
           if (parse_node_get_rule_key (node) /= tag) &
                call parse_node_mismatch (tag, node)
        end if
     else
        if (present (required)) then
           if (required) &
                call msg_bug (" Missing node, expected <" // tag // ">")
```

```
        end if
      end if
    end subroutine parse_node_check
```

This is called by a parse-tree scanner if the expected and the actual nodes do not match

⟨*Parser: public*⟩+≡
```
    public :: parse_node_mismatch
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_mismatch (string, parse_node)
      character(*), intent(in) :: string
      type(parse_node_t), intent(in) :: parse_node
      call parse_node_write (parse_node)
      call msg_bug (" Syntax mismatch, expected <" // string // ">.")
    end subroutine parse_node_mismatch
```

The following functions are wrappers for extracting the token contents.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_get_logical
    public :: parse_node_get_integer
    public :: parse_node_get_real
    public :: parse_node_get_cmplx
    public :: parse_node_get_string
    public :: parse_node_get_key
    public :: parse_node_get_rule_key
```

⟨*Parser: procedures*⟩+≡
```
    function parse_node_get_logical (node) result (lval)
      logical :: lval
      type(parse_node_t), intent(in), target :: node
      lval = token_get_logical (parse_node_get_token_ptr (node))
    end function parse_node_get_logical

    function parse_node_get_integer (node) result (ival)
      integer :: ival
      type(parse_node_t), intent(in), target :: node
      ival = token_get_integer (parse_node_get_token_ptr (node))
    end function parse_node_get_integer

    function parse_node_get_real (node) result (rval)
      real(default) :: rval
      type(parse_node_t), intent(in), target :: node
      rval = token_get_real (parse_node_get_token_ptr (node))
    end function parse_node_get_real

    function parse_node_get_cmplx (node) result (cval)
      complex(default) :: cval
      type(parse_node_t), intent(in), target :: node
      cval = token_get_cmplx (parse_node_get_token_ptr (node))
    end function parse_node_get_cmplx

    function parse_node_get_string (node) result (sval)
      type(string_t) :: sval
```

```
    type(parse_node_t), intent(in), target :: node
    sval = token_get_string (parse_node_get_token_ptr (node))
  end function parse_node_get_string

  function parse_node_get_key (node) result (kval)
    type(string_t) :: kval
    type(parse_node_t), intent(in), target :: node
    kval = token_get_key (parse_node_get_token_ptr (node))
  end function parse_node_get_key

  function parse_node_get_rule_key (node) result (kval)
    type(string_t) :: kval
    type(parse_node_t), intent(in), target :: node
    kval = syntax_rule_get_key (parse_node_get_rule_ptr (node))
  end function parse_node_get_rule_key

  function parse_node_get_token_ptr (node) result (token)
    type(token_t), pointer :: token
    type(parse_node_t), intent(in), target :: node
    if (token_is_valid (node%token)) then
       token => node%token
    else
       call parse_node_undefined (node, "token")
    end if
  end function parse_node_get_token_ptr
```

Return a MD5 sum for a parse node. The method is to write the node to a scratch file and to evaluate the MD5 sum of that file.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_get_md5sum
```

⟨*Parser: procedures*⟩+≡
```
    function parse_node_get_md5sum (pn) result (md5sum_pn)
      character(32) :: md5sum_pn
      type(parse_node_t), intent(in) :: pn
      integer :: u
      u = free_unit ()
      open (unit = u, status = "scratch", action = "readwrite")
      call parse_node_write_rec (pn, unit=u)
      rewind (u)
      md5sum_pn = md5sum (u)
      close (u)
    end function parse_node_get_md5sum
```

3.4.6   The parse tree

The parse tree is a tree of nodes, where leaf nodes hold a valid token, while branch nodes point to a list of sub-nodes.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_t
```

⟨*Parser: types*⟩+≡
```
    type :: parse_tree_t
       private
       type(parse_node_t), pointer :: root_node => null ()
    end type parse_tree_t
```

The parser. Its arguments are the parse tree (which should be empty initially), the lexer (which should be already set up), the syntax table (which should be valid), and the input stream. The input stream is completely parsed, using the lexer setup and the syntax rules as given, and the parse tree is built accordingly.

If `check_eof` is absent or true, the parser will complain about trailing garbage. Otherwise, it will ignore it.

By default, the input stream is matched against the top rule in the specified syntax. If `key` is given, it is matched against the rule with the specified key instead.

Failure at the top level means that no rule could match at all; in this case the error message will show the top rule.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_init
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_tree_init &
         (parse_tree, syntax, lexer, key, check_eof)
      type(parse_tree_t), intent(inout) :: parse_tree
      type(lexer_t), intent(inout) :: lexer
      type(syntax_t), intent(in), target :: syntax
      type(string_t), intent(in), optional :: key
      logical, intent(in), optional :: check_eof
      type(syntax_rule_t), pointer :: rule
      type(lexeme_t) :: lexeme
      type(parse_node_t), pointer :: node
      logical :: ok, check
      check = .true.;  if (present (check_eof)) check = check_eof
      call lexer_clear (lexer)
      if (present (key)) then
         rule => syntax_get_rule_ptr (syntax, key)
      else
         rule => syntax_get_top_rule_ptr (syntax)
      end if
      if (associated (rule)) then
         call parse_node_match_rule (node, rule, ok)
         if (ok) then
            parse_tree%root_node => node
         else
            call parse_error (rule, lexeme)
         end if
         if (check) then
            call lex (lexeme, lexer)
            if (.not. lexeme_is_eof (lexeme)) then
               call lexer_show_location (lexer)
               call msg_fatal (" Syntax error " &
                    // "(at or before the location indicated above)")
            end if
```

```
          end if
       else
          call msg_bug (" Parser failed because syntax is empty")
       end if
    contains
    〈Parser: internal subroutines of parse_tree_init〉
    end subroutine parse_tree_init
```

The parser works recursively, following the rule tree, building the tree of nodes
on the fly. If the given rule matches, the node is filled on return. If not, the
node remains empty.

〈Parser: internal subroutines of parse_tree_init〉≡

```
    recursive subroutine parse_node_match_rule (node, rule, ok)
      type(parse_node_t), pointer :: node
      type(syntax_rule_t), intent(in), target :: rule
      logical, intent(out) :: ok
      logical, parameter :: debug = .false.
      integer :: type
      if (debug)  write (6, "(A)", advance="no") "Parsing rule: "
      if (debug)  call syntax_rule_write (rule, 6)
      node => null ()
      type = syntax_rule_get_type (rule)
      if (syntax_rule_is_atomic (rule)) then
         call lex (lexeme, lexer)
         if (debug)  write (6, "(A)", advance="no") "Token: "
         if (debug)  call lexeme_write (lexeme, 6)
         call parse_node_create_leaf (node, rule, lexeme)
         ok = associated (node)
         if (.not. ok)  call lexer_put_back (lexer, lexeme)
      else
         select case (type)
         case (S_ALTERNATIVE);  call parse_alternative (node, rule, ok)
         case (S_GROUP);        call parse_group (node, rule, ok)
         case (S_SEQUENCE);     call parse_sequence (node, rule, .false., ok)
         case (S_LIST);         call parse_sequence (node, rule, .true., ok)
         case (S_ARGS);         call parse_args (node, rule, ok)
         case (S_IGNORE);       call parse_ignore (node, ok)
         end select
      end if
      if (debug) then
         if (ok) then
            write (6, "(A)", advance="no") "Matched rule: "
         else
            write (6, "(A)", advance="no") "Failed rule: "
         end if
         call syntax_rule_write (rule)
         if (associated (node)) call parse_node_write (node)
      end if
    end subroutine parse_node_match_rule
```

Parse an alternative: try each case. If the match succeeds, the node has been
filled, so return. If nothing works, return failure.

〈Parser: internal subroutines of parse_tree_init〉+≡

```
    recursive subroutine parse_alternative (node, rule, ok)
```

```
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
    logical, intent(out) :: ok
    integer :: i
    do i = 1, syntax_rule_get_n_sub (rule)
       call parse_node_match_rule (node, syntax_rule_get_sub_ptr (rule, i), ok)
       if (ok)  return
    end do
    ok = .false.
  end subroutine parse_alternative
```

Parse a group: the first and third lexemes have to be the delimiters, the second one is parsed as the actual node, using now the child rule. If the first match fails, return with failure. If the other matches fail, issue an error, since we cannot lex back more than one item.

⟨*Parser: internal subroutines of* `parse_tree_init`⟩+≡

```
  recursive subroutine parse_group (node, rule, ok)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
    logical, intent(out) :: ok
    type(string_t), dimension(2) :: delimiter
    delimiter = syntax_rule_get_delimiter (rule)
    call lex (lexeme, lexer)
    if (lexeme_get_string (lexeme) == delimiter(1)) then
       call parse_node_match_rule (node, syntax_rule_get_sub_ptr (rule, 1), ok)
       if (ok) then
          call lex (lexeme, lexer)
          if (lexeme_get_string (lexeme) == delimiter(2)) then
             ok = .true.
          else
             call parse_error (rule, lexeme)
          end if
       else
          call parse_error (rule, lexeme)
       end if
    else
       call lexer_put_back (lexer, lexeme)
       ok = .false.
    end if
  end subroutine parse_group
```

Parsing a sequence. The last rule element may be special: optional and/or repetitive. Each sub-node that matches is appended to the sub-node list of the parent node.

If `sep` is true, we look for a separator after each element.

⟨*Parser: internal subroutines of* `parse_tree_init`⟩+≡

```
  recursive subroutine parse_sequence (node, rule, sep, ok)
    type(parse_node_t), pointer :: node
    type(syntax_rule_t), intent(in), target :: rule
    logical, intent(in) :: sep
    logical, intent(out) :: ok
    type(parse_node_t), pointer :: current
    integer :: i, n
    logical :: opt, rep, cont
```

```
        type(string_t) :: separator
        call parse_node_create_branch (node, rule)
        if (sep)  separator = syntax_rule_get_separator (rule)
        n = syntax_rule_get_n_sub (rule)
        opt = syntax_rule_last_optional (rule)
        rep = syntax_rule_last_repetitive (rule)
        ok = .true.
        cont = .true.
        SCAN_RULE: do i = 1, n
           call parse_node_match_rule &
                (current, syntax_rule_get_sub_ptr (rule, i), cont)
           if (cont) then
              call parse_node_append_sub (node, current)
              if (sep .and. (i<n .or. rep)) then
                 call lex (lexeme, lexer)
                 if (lexeme_get_string (lexeme) /= separator) then

     else
        call parse_error (rule, lexeme)
     end if
  else
     call lexer_put_back (lexer, lexeme)
     ok = .false.
  end if
end subroutine parse_args
```

The IGNORE syntax reads one lexeme and discards it if it is numeric, logical or string/identifier (but not a keyword). This is a successful match. Otherwise, the match fails. The node pointer is returned disassociated in any case.

⟨*Parser: internal subroutines of* `parse_tree_init`⟩+≡

```
subroutine parse_ignore (node, ok)
  type(parse_node_t), pointer :: node
  logical, intent(out) :: ok
  call lex (lexeme, lexer)
  select case (lexeme_get_type (lexeme))
  case (T_NUMERIC, T_IDENTIFIER, T_QUOTED)
     ok = .true.
  case default
     ok = .false.
  end select
  node => null ()
end subroutine parse_ignore
```

If the match fails and we cannot step back:

⟨*Parser: internal subroutines of* `parse_tree_init`⟩+≡

```
subroutine parse_error (rule, lexeme)
  type(syntax_rule_t), intent(in) :: rule
  type(lexeme_t), intent(in) :: lexeme
  character(80) :: buffer
  integer :: u, iostat
  call lexer_show_location (lexer)
  u = free_unit ()
  open (u, status = "scratch")
  write (u, "(A)", advance="no")  "Expected syntax:"
  call syntax_rule_write (rule, u)
  write (u, "(A)", advance="no")  "Found token:"
```

```
    call lexeme_write (lexeme, u)
    rewind (u)
    do
        read (u, "(A)", iostat=iostat)  buffer
        if (iostat /= 0)  exit
        call msg_message (trim (buffer))
    end do
    call msg_fatal (" Syntax error " & 
            // "(at or before the location indicated above)")
end subroutine parse_error
```

The finalizer recursively deallocates all nodes and their contents. For each node,
`parse_node_final` is called on the sub-nodes, which in turn deallocates the
token or sub-node array contained within each of them. At the end, only the
top node remains to be deallocated.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_final
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_tree_final (parse_tree)
      type(parse_tree_t), intent(inout) :: parse_tree
      if (associated (parse_tree%root_node)) then
        call parse_node_final (parse_tree%root_node)
        deallocate (parse_tree%root_node)
      end if
    end subroutine parse_tree_final
```

Print the parse tree. Print one token per line, indented according to the depth
of the node.

The `verbose` version includes type identifiers for the nodes.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_write
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_tree_write (parse_tree, unit, verbose)
      type(parse_tree_t), intent(in) :: parse_tree
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: u
      logical :: short
      u = output_unit (unit);  if (u < 0)  return
      short = .true.;  if (present (verbose))  short = .not. verbose
      write (u, "(A)") "Parse tree:"
      if (associated (parse_tree%root_node)) then
        call parse_node_write_rec (parse_tree%root_node, unit, short, 1)
      else
        write (u, *) "[empty]"
      end if
    end subroutine parse_tree_write
```

This is a generic error that can be issued if the parse tree does not meet the
expectaions of the parser. This most certainly indicates a bug.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_bug
```

⟨*Parser: procedures*⟩+≡

```
subroutine parse_tree_bug (node, keys)
  type(parse_node_t), intent(in) :: node
  character(*), intent(in) :: keys
  call parse_node_write (node)
  call msg_bug (" Inconsistency in parse tree: expected " // keys)
end subroutine parse_tree_bug
```

3.4.7   Access the parser

For scanning the parse tree we give access to the top node, as a node pointer.
Of course, there should be no write access.

⟨*Parser: public*⟩+≡

```
public :: parse_tree_get_root_ptr
```

⟨*Parser: procedures*⟩+≡

```
function parse_tree_get_root_ptr (parse_tree) result (node)
  type(parse_node_t), pointer :: node
  type(parse_tree_t), intent(in), target :: parse_tree
  node => parse_tree%root_node
end function parse_tree_get_root_ptr
```

3.4.8   Tools

This operation traverses the parse tree and simplifies any occurences of a set of
syntax rules. If such a parse node has only one sub-node, it is replaced by that
subnode. (This makes sense only of the rules to eliminate have no meaningful
token.)

⟨*Parser: public*⟩+≡

```
public :: parse_tree_reduce
```

⟨*Parser: procedures*⟩+≡

```
subroutine parse_tree_reduce (parse_tree, rule_key)

       pn_sub_prev => pn_sub
       pn_sub => pn_sub%next
```

```
            end do
         if (parse_node_get_n_sub (pn) == 1) then
            if (matches (parse_node_get_rule_key (pn), rule_key)) then
               pn_tmp => pn
               pn => pn%sub_first
               if (associated (pn_prev)) then
                  pn_prev%next => pn
               else if (associated (pn_parent)) then
                  pn_parent%sub_first => pn
               else
                  parse_tree%root_node => pn
               end if
               if (associated (pn_tmp%next)) then
                  pn%next => pn_tmp%next
               else if (associated (pn_parent)) then
                  pn_parent%sub_last => pn
               end if
               call parse_node_final (pn_tmp, recursive=.false.)
               deallocate (pn_tmp)
            end if
         end if
      end subroutine parse_node_reduce
      function matches (key, key_list) result (flag)
        logical :: flag
        type(string_t), intent(in) :: key
        type(string_t), dimension(:), intent(in) :: key_list
        integer :: i
        flag = .true.
        do i = 1, size (key_list)
           if (key == key_list(i))  return
        end do
        flag = .false.
      end function matches
   end subroutine parse_tree_reduce
```

3.4.9   Applications

For a file of the form

```
process foo, bar
  <something>
process xyz
  <something>
```

get the `<something>` entry node for the first matching process tag. If no matching entry is found, the node pointer remains unassociated.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_get_process_ptr
```

⟨*Parser: procedures*⟩+≡
```
    function parse_tree_get_process_ptr (parse_tree, process) result (node)
      type(parse_node_t), pointer :: node
      type(parse_tree_t), intent(in), target :: parse_tree
```

```
      type(string_t), intent(in) :: process
      type(parse_node_t), pointer :: node_root, node_process_def
      type(parse_node_t), pointer :: node_process_phs, node_process_list
      integer :: j
      node_root => parse_tree_get_root_ptr (parse_tree)
      if (associated (node_root)) then
         node_process_phs => parse_node_get_sub_ptr (node_root)
         SCAN_FILE: do while (associated (node_process_phs))
            node_process_def => parse_node_get_sub_ptr (node_process_phs)
            node_process_list => parse_node_get_sub_ptr (node_process_def, 2)
            do j = 1, parse_node_get_n_sub (node_process_list)
               if (parse_node_get_string &
                     (parse_node_get_sub_ptr (node_process_list, j)) &
                     == process) then
                  node => parse_node_get_next_ptr (node_process_def)
                  return
               end if
            end do
            node_process_phs => parse_node_get_next_ptr (node_process_phs)
         end do SCAN_FILE
         node => null ()
      else
         node => null ()
      end if
    end function parse_tree_get_process_ptr
```

3.4.10 Unit tests

⟨*Parser: public*⟩+≡
```
    public :: parse_test
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
    ⟨*Parser: execute tests*⟩
```
    end subroutine parse_test
```

This checks the parser.

⟨*Parser: execute tests*⟩≡
```
    call test (parse_1, "parse_1", &
         "check the parser", &
         u, results)
```

```

3.5 XML Parser

The XML parser is actually independent from the previous modules of lexer and parser. However, for a generic I/O interface we make use of the `stream_t` facility.

We need the XML parser for reading and writing LHEF data files. Only a subset of XML is actually relevant. The parser is of the "pull" type, i.e., the program steers the reading of XML data in a context-sensitive manner.

⟨xml.f90⟩≡
  ⟨*File header*⟩

  module xml

  ⟨*Use strings*⟩
  ⟨*Use file utils*⟩
    use limits, only: BLANK, TAB !NODEP!
    use diagnostics !NODEP!
    use unit_tests
    use ifiles
    use lexers

  ⟨*Standard module head*⟩

  ⟨*XML: public*⟩

  ⟨*XML: types*⟩

  contains

  ⟨*XML: procedures*⟩

  ⟨*XML: tests*⟩

  end module xml

3.5.1 Cached Stream

The stream type as defined in the `lexer` module is versatile regarding the choice of input channel, but it does not allow reading a section more than once. Here, we define an extension where we can return a string to the stream, which is stored in a cache variable, and presented to the caller for the next read.

⟨*XML: public*⟩≡
    public :: cstream_t

⟨*XML: types*⟩≡
    type, extends (stream_t) :: cstream_t
       logical :: cache_is_empty = .true.
       type(string_t) :: cache
     contains
     ⟨*XML: cstream: TBP*⟩
    end type cstream_t

213

The initializers are simply inherited. We require a generic.

⟨*XML: cstream: TBP*⟩≡
```
generic :: init => init_filename, init_unit, init_string, &
    init_ifile, init_line
procedure :: init_filename => cstream_init_filename
procedure :: init_unit => cstream_init_unit
procedure :: init_string => cstream_init_string
procedure :: init_ifile => cstream_init_ifile
procedure :: init_line => cstream_init_line
```

⟨*XML: procedures*⟩≡
```
subroutine cstream_init_filename (cstream, filename)
  class(cstream_t), intent(out) :: cstream
  character(*), intent(in) :: filename
  call stream_init (cstream%stream_t, filename)
end subroutine cstream_init_filename

subroutine cstream_init_unit (cstream, unit)
  class(cstream_t), intent(out) :: cstream
  integer, intent(in) :: unit
  call stream_init (cstream%stream_t, unit)
end subroutine cstream_init_unit

subroutine cstream_init_string (cstream, string)
  class(cstream_t), intent(out) :: cstream
  type(string_t), intent(in) :: string
  call stream_init (cstream%stream_t, string)
end subroutine cstream_init_string

subroutine cstream_init_ifile (cstream, ifile)
  class(cstream_t), intent(out) :: cstream
  type(ifile_t), intent(in) :: ifile
  call stream_init (cstream%stream_t, ifile)
end subroutine cstream_init_ifile

subroutine cstream_init_line (cstream, line)
  class(cstream_t), intent(out) :: cstream
  type(line_p), intent(in) :: line
  call stream_init (cstream%stream_t, line)
end subroutine cstream_init_line
```

Finalizer: also inherited

⟨*XML: cstream: TBP*⟩+≡
```
procedure :: final => cstream_final
```

⟨*XML: procedures*⟩+≡
```
subroutine cstream_final (cstream)
  class(cstream_t), intent(inout) :: cstream
  cstream%cache_is_empty = .true.
  call stream_final (cstream%stream_t)
end subroutine cstream_final
```

Get record: now, if there is a cache string, return this instead of the record from the stream.

214

⟨XML: cstream: TBP⟩+≡

```
    procedure :: get_record => cstream_get_record
```

⟨XML: procedures⟩+≡

```
    subroutine cstream_get_record (cstream, string, iostat)
      class(cstream_t), intent(inout) :: cstream
      type(string_t), intent(out) :: string
      integer, intent(out) :: iostat
      if (cstream%cache_is_empty) then
         call stream_get_record (cstream%stream_t, string, iostat)
      else
         string = cstream%cache
         cstream%cache_is_empty = .true.
         iostat = 0
      end if
    end subroutine cstream_get_record
```

Revert: return the (partially read) record to the stream, putting it in the cache.

⟨XML: cstream: TBP⟩+≡

```
    procedure :: revert_record => cstream_revert_record
```

⟨XML: procedures⟩+≡

```
    subroutine cstream_revert_record (cstream, string)
      class(cstream_t), intent(inout) :: cstream
      type(string_t), intent(in) :: string
      if (cstream%cache_is_empty) then
         cstream%cache = string
         cstream%cache_is_empty = .false.
      else
         call msg_bug ("CStream: attempt to revert twice")
      end if
    end subroutine cstream_revert_record
```

3.5.2 Attributes

A tag attribute has a name and a value; both are strings. When the attribute is defined, the known flag indicates this.

⟨XML: types⟩+≡

```
    type :: attribute_t
      type(string_t) :: name
      type(string_t) :: value
      logical :: known = .false.
     contains
     ⟨XML: attribute: TBP⟩
    end type attribute_t
```

Output in standard format, non-advancing. (If the value is unknown, we indicate this by a question mark, which is non-standard.)

⟨XML: attribute: TBP⟩≡

```
    procedure :: write => attribute_write
```

⟨XML: procedures⟩+≡
```
    subroutine attribute_write (object, unit)
      class(attribute_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      write (u, "(A,'=')", advance = "no")  char (object%name)
      if (object%known) then
          write (u, "(A,A,A)", advance = "no")  '"', char (object%value), '"'
      else
          write (u, "('?')", advance = "no")
      end if
    end subroutine attribute_write
```

This is a genuine constructor. The value is optional.

⟨XML: public⟩+≡
```
    public :: xml_attribute
```

⟨XML: procedures⟩+≡
```
    function xml_attribute (name, value) result (attribute)
      type(string_t), intent(in) :: name
      type(string_t), intent(in), optional :: value
      type(attribute_t) :: attribute
      attribute%name = name
      if (present (value)) then
          attribute%value = value
          attribute%known = .true.
      else
          attribute%known = .false.
      end if
    end function xml_attribute
```

Set a value explicitly.

⟨XML: attribute: TBP⟩+≡
```
    procedure :: set_value => attribute_set_value
```

⟨XML: procedures⟩+≡
```
    subroutine attribute_set_value (attribute, value)
      class(attribute_t), intent(inout) :: attribute
      type(string_t), intent(in) :: value
      attribute%value = value
      attribute%known = .true.
    end subroutine attribute_set_value
```

Extract a value. If unset, return "?"

⟨XML: attribute: TBP⟩+≡
```
    procedure :: get_value => attribute_get_value
```

⟨XML: procedures⟩+≡
```
    function attribute_get_value (attribute) result (value)
      class(attribute_t), intent(in) :: attribute
      type(string_t) :: value
      if (attribute%known) then
          value = attribute%value
```

```
        else
            value = "?"
        end if
    end function attribute_get_value
```

3.5.3 The Tag Type

The basic entity is the internal representation of an XML tag. The tag has a name, a well-defined set of attributes which may be mandatory or optional, and a flag that determines whether there is content or not. The content itself is not stored in the data structure.

⟨*XML: public*⟩+≡
```
    public :: xml_tag_t
```

⟨*XML: types*⟩+≡
```
    type :: xml_tag_t
      type(string_t) :: name
      type(attribute_t), dimension(:), allocatable :: attribute
      logical :: has_content = .false.
    contains
    ⟨XML: tag: TBP⟩
    end type xml_tag_t
```

Initialization. There are different versions, depending on content.

⟨*XML: tag: TBP*⟩≡
```
    generic :: init => init_no_attributes
    procedure :: init_no_attributes => tag_init_no_attributes
```

⟨*XML: procedures*⟩+≡
```
    subroutine tag_init_no_attributes (tag, name, has_content)
      class(xml_tag_t), intent(out) :: tag
      type(string_t), intent(in) :: name
      logical, intent(in), optional :: has_content
      tag%name = name
      allocate (tag%attribute (0))
      if (present (has_content))  tag%has_content = has_content
    end subroutine tag_init_no_attributes
```

This version sets attributes.

⟨*XML: tag: TBP*⟩+≡
```
    generic :: init => init_with_attributes
    procedure :: init_with_attributes => tag_init_with_attributes
```

⟨*XML: procedures*⟩+≡
```
    subroutine tag_init_with_attributes (tag, name, attribute, has_content)
      class(xml_tag_t), intent(out) :: tag
      type(string_t), intent(in) :: name
      type(attribute_t), dimension(:), intent(in) :: attribute
      logical, intent(in), optional :: has_content
      tag%name = name
      allocate (tag%attribute (size (attribute)))
      tag%attribute = attribute
```

```
      if (present (has_content))  tag%has_content = has_content
    end subroutine tag_init_with_attributes
```

Set an attribute value explicitly.
⟨*XML: tag: TBP*⟩+≡
```
    procedure :: set_attribute => tag_set_attribute
```

⟨*XML: procedures*⟩+≡
```
    subroutine tag_set_attribute (tag, i, value)
      class(xml_tag_t), intent(inout) :: tag
      integer, intent(in) :: i
      type(string_t), intent(in) :: value
      call tag%attribute(i)%set_value (value)
    end subroutine tag_set_attribute
```

Get an attribute value.
⟨*XML: tag: TBP*⟩+≡
```
    procedure :: get_attribute => tag_get_attribute
```

⟨*XML: procedures*⟩+≡
```
    function tag_get_attribute (tag, i) result (value)
      class(xml_tag_t), intent(in) :: tag
      integer, intent(in) :: i
      type(string_t) :: value
      value = tag%attribute(i)%get_value ()
    end function tag_get_attribute
```

Output to an I/O unit, default STDOUT. We use non-advancing output.
⟨*XML: tag: TBP*⟩+≡
```
    generic :: write => write_without_content
    procedure :: write_without_content => tag_write
```

⟨*XML: procedures*⟩+≡
```
    subroutine tag_write (tag, unit)
      class(xml_tag_t), intent(in) :: tag
      integer, intent(in), optional :: unit
      integer :: u, i
      u = output_unit (unit)
      write (u, "('<',A)", advance = "no")  char (tag%name)
      do i = 1, size (tag%attribute)
         write (u, "(1x)", advance = "no")
         call tag%attribute(i)%write (u)
      end do
      if (tag%has_content) then
         write (u, "('>')", advance = "no")
      else
         write (u, "(' />')", advance = "no")
      end if
    end subroutine tag_write
```

If there is content, we should write the context next (arbitrary format), the write the corresponding closing tag. Again, non-advancing.
⟨*XML: tag: TBP*⟩+≡
```
    procedure :: close => tag_close
```

⟨*XML: procedures*⟩+≡
```
    subroutine tag_close (tag, unit)
      class(xml_tag_t), intent(in) :: tag
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      write (u, "('</',A,'>')", advance = "no")  char (tag%name)
    end subroutine tag_close
```

Given content as a single string, we can write tag, content, and closing at once

⟨*XML: tag: TBP*⟩+≡
```
    generic :: write => write_with_content
    procedure :: write_with_content => tag_write_with_content
```

⟨*XML: procedures*⟩+≡
```
    subroutine tag_write_with_content (tag, content, unit)
      class(xml_tag_t), intent(in) :: tag
      type(string_t), intent(in) :: content
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      call tag%write (u)
      write (u, "(A)", advance = "no")  char (content)
      call tag%close (u)
    end subroutine tag_write_with_content
```

Input from stream. We know what we are looking for, so we check if the name matches, then fill attributes. We report an error if (a) an I/O error occurs, (b) we reach EOF before encountering the tag, (c) if the tag is incomplete.

Trailing text after reading a tag is put back to the input stream.

We assume that the tag is not broken across records, and that there is only one tag within the record. This is more restricted than standard XML.

⟨*XML: tag: TBP*⟩+≡

```

3.5.8 Optional Tag

Write and read a tag with single-line content.

⟨*XML: execute tests*⟩+≡
```
    call test (xml_3, "xml_3", &
        "content", &
        u, results)
```
⟨*XML: tests*⟩+≡
```
subroutine xml_3 (u)
  integer, intent(in) :: u
  type(xml_tag_t), allocatable :: tag
  integer :: u_tmp
  type(cstream_t) :: cstream
  logical :: success, closing
  type(string_t) :: content

  write (u, "(A)")  "* Test output: xml_3"
  write (u, "(A)")  "*   Purpose: handle tag with content"
  write (u, "(A)")

  write (u, "(A)")  "* Tag without content"
  write (u, *)

  u_tmp = free_unit ()
  open (u_tmp, status = "scratch", action = "readwrite")

  allocate (tag)
  call tag%init (var_str ("tagname"))
  call tag%write (u_tmp)
  write (u_tmp, *)
  deallocate (tag)

  call show (u_tmp, u)

  write (u, *)
  write (u, "(A)")  "Result from read:"
  call cstream%init (u_tmp)
  allocate (tag)
  call tag%init (var_str ("tagname"))
  call tag%read (cstream, success)
```

```
call tag%write (u)
write (u, *)
write (u, "(A,L1)")  "success = ", success
write (u, "(A,L1)")  "content = ", tag%has_content
write (u, *)
deallocate (tag)
call cstream%final ()

write (u, "(A)")  "* Tag with content"
write (u, *)

u_tmp = free_unit ()
open (u_tmp, status = "scratch", action = "readwrite")

allocate (tag)
call tag%init (var_str ("tagname"), has_content = .true.)
call tag%write (var_str ("Content text"), u_tmp)
write (u_tmp, *)
deallocate (tag)

call show (u_tmp, u)

write (u, *)
write (u, "(A)")  "Result from read:"
call cstream%init (u_tmp)
allocate (tag)
call tag%init (var_str ("tagname"))
call tag%read (cstream, success)
call tag%read_content (cstream, content, closing)
call tag%write (u)
write (u, "(A)", advance = "no")  char (content)
call tag%close (u)
write (u, *)
write (u, "(A,L1)")  "success = ", success
write (u, "(A,L1)")  "content = ", tag%has_content
write (u, "(A,L1)")  "closing = ", closing
deallocate (tag)
call cstream%final ()

write (u, *)
write (u, "(A)")  "* Tag with multiline content"
write (u, *)

u_tmp = free_unit ()
open (u_tmp, status = "scratch", action = "readwrite")

allocate (tag)
call tag%init (var_str ("tagname"), has_content = .true.)
call tag%write (u_tmp)
write (u_tmp, *)
write (u_tmp, "(A)")  "Line 1"
write (u_tmp, "(A)")  "Line 2"
call tag%close (u_tmp)
write (u_tmp, *)
```

```
      deallocate (tag)

      call show (u_tmp, u)

      write (u, *)
      write (u, "(A)")  "Result from read:"
      call cstream%init (u_tmp)
      allocate (tag)
      call tag%init (var_str ("tagname"))
      call tag%read (cstream, success)
      call tag%write (u)
      write (u, *)
      do
         call tag%read_content (cstream, content, closing)
         if (closing)  exit
         write (u, "(A)")  char (content)
      end do
      call tag%close (u)
      write (u, *)
      write (u, "(A,L1)")  "success = ", success
      write (u, "(A,L1)")  "content = ", tag%has_content
      deallocate (tag)
      call cstream%final ()

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: xml_3"

    end subroutine xml_3
```

3.5.9 Basic Tag I/O

Write a tag and read it again, using a temporary file.

⟨*XML: execute tests*⟩+≡
```
    call test (xml_4, "xml_4", &
         "attributes", &
         u, results)
```

⟨*XML: tests*⟩+≡
```
    subroutine xml_4 (u)
      integer, intent(in) :: u
      type(xml_tag_t), allocatable :: tag
      integer :: u_tmp
      type(cstream_t) :: cstream
      logical :: success

      write (u, "(A)")  "* Test output: xml_4"
      write (u, "(A)")  "*   Purpose: handle tag with attributes"
      write (u, "(A)")

      write (u, "(A)")  "* Tag with one mandatory and one optional attribute,"
      write (u, "(A)")  "* unknown attribute ignored"
      write (u, *)
```

```
    u_tmp = free_unit ()
    open (u_tmp, status = "scratch", action = "readwrite")

    allocate (tag)
    call tag%init (var_str ("tagname"), &
         [xml_attribute (var_str ("a1"), var_str ("foo")), &
          xml_attribute (var_str ("a3"), var_str ("gee"))])
    call tag%write (u_tmp)
    deallocate (tag)

    call show (u_tmp, u)

    write (u, *)
    write (u, "(A)")  "Result from read:"
    call cstream%init (u_tmp)
    allocate (tag)
    call tag%init (var_str ("tagname"), &
         [xml_attribute (var_str ("a1")), &
          xml_attribute (var_str ("a2"), var_str ("bar"))])
    call tag%read (cstream, success)
    call tag%write (u)
    write (u, *)
    deallocate (tag)
    call cstream%final ()

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: xml_4"

  end subroutine xml_4
```

Chapter 4

Physics library

This part consists of two modules:

constants Physical and mathematical parameters that never change. The file has been moved to the `src/misc` subdirectory of the `WHIZARD` project.

c_particles A simple data type for particles which is C compatible.

lorentz Define three-vectors, four-vectors and Lorentz transformations and common operations for them.

sm_physics Here, running functions are stored for special kinematical setup like running coupling constants, Catani-Seymour dipoles, or Sudakov factors.

4.1   C-compatible Particle Type

For easy communication with C code, we introduce a simple C-compatible type for particles. It has the contents of the `prt_t` type defined in the `subevents` module below (except the source information).

The `c_prt` type is transparent, and its contents should be regarded as part of the interface.

⟨c_particles.f90⟩≡
  ⟨*File header*⟩

```
  module c_particles

    use iso_c_binding !NODEP!
```
⟨*Use file utils*⟩
```
    use limits, only: FMT_14, FMT_19 !NODEP!
```

  ⟨*Standard module head*⟩

  ⟨*C Particles: public*⟩

  ⟨*C Particles: types*⟩

```
  contains
```

  ⟨*C Particles: procedures*⟩
```
  end module c_particles
```

⟨*C Particles: public*⟩≡
```
    public :: c_prt_t
```

⟨*C Particles: types*⟩≡
```
    type, bind(C) :: c_prt_t
       integer(c_int) :: type = 0
       integer(c_int) :: pdg = 0
       integer(c_int) :: polarized = 0
       integer(c_int) :: h = 0
       real(c_double) :: pe = 0
       real(c_double) :: px = 0
       real(c_double) :: py = 0
       real(c_double) :: pz = 0
       real(c_double) :: p2 = 0
    end type c_prt_t
```

This is for debugging only, there is no C binding. It is a simplified version of `prt_write`.

⟨*C Particles: public*⟩+≡
```
    public :: c_prt_write
```

⟨*C Particles: procedures*⟩≡
```
    subroutine c_prt_write (prt, unit)
      type(c_prt_t), intent(in) :: prt
      integer, intent(in), optional :: unit
      integer :: u, i
      u = output_unit (unit);  if (u < 0)  return
```

```
   write (u, "(1x,A)", advance="no")  "prt("
   write (u, "(I0,':')", advance="no")  prt%type
   if (prt%polarized /= 0) then
      write (u, "(I0,'/',I0,'|')", advance="no")  prt%pdg, prt%h
   else
      write (u, "(I0,'|')", advance="no") prt%pdg
   end if
   write (u, "(" // FMT_14 // ",';'," // FMT_14 // ",',',' // &
        FMT_14 // ",',',' // FMT_14 // ")", advance="no") &
        prt%pe, prt%px, prt%py, prt%pz
   write (u, "('|'," // FMT_19 // ")", advance="no")  prt%p2
   write (u, "(A)")  ")"
end subroutine c_prt_write
```

4.2 Lorentz algebra

Define Lorentz vectors, three-vectors, boosts, and some functions to manipulate them.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

⟨`lorentz.f90`⟩≡
  ⟨*File header*⟩

```
module lorentz
```

  ⟨*Use kinds*⟩
```
    use constants, only: pi, twopi, degree !NODEP!
```
  ⟨*Use file utils*⟩
```
    use limits, only: FMT_15, FMT_17, FMT_19 !NODEP!
    use diagnostics !NODEP!
    use c_particles
```

  ⟨*Standard module head*⟩

  ⟨*Lorentz: public*⟩

  ⟨*Lorentz: public operators*⟩

  ⟨*Lorentz: public functions*⟩

  ⟨*Lorentz: types*⟩

  ⟨*Lorentz: parameters*⟩

  ⟨*Lorentz: interfaces*⟩

```
  contains
```

  ⟨*Lorentz: procedures*⟩
```
  end module lorentz
```

4.2.1 Three-vectors

First of all, let us introduce three-vectors in a trivial way. The functions and overloaded elementary operations clearly are too much overhead, but we like to keep the interface for three-vectors and four-vectors exactly parallel. By the way, we might attach a label to a vector by extending the type definition later.

⟨*Lorentz: public*⟩≡
```
    public :: vector3_t
```

⟨*Lorentz: types*⟩≡
```
    type :: vector3_t
       private
       real(default), dimension(3) :: p
    end type vector3_t
```

Output a vector

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_write
```

⟨*Lorentz: procedures*⟩≡
```
    subroutine vector3_write (p, unit, testflag)
      type(vector3_t), intent(in) :: p
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
      character(len=7) :: fmt
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      call pac_fmt (fmt, FMT_19, FMT_15, testflag)
      write(u, "(1x,A,3(1x," // fmt // "))") 'P = ', p%p
    end subroutine vector3_write
```

This is a three-vector with zero components

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_null
```

⟨*Lorentz: parameters*⟩≡
```
    type(vector3_t), parameter :: vector3_null = &
         vector3_t ([ 0._default, 0._default, 0._default ])
```

Canonical three-vector:

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_canonical
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_canonical (k) result (p)
      type(vector3_t) :: p
      integer, intent(in) :: k
      p = vector3_null
      p%p(k) = 1
    end function vector3_canonical
```

A moving particle (k-axis, or arbitrary axis). Note that the function for the generic momentum cannot be elemental.

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_moving
```

⟨*Lorentz: interfaces*⟩≡
```
    interface vector3_moving
       module procedure vector3_moving_canonical
       module procedure vector3_moving_generic
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_moving_canonical (p, k) result(q)
      type(vector3_t) :: q
      real(default), intent(in) :: p
      integer, intent(in) :: k
      q = vector3_null
      q%p(k) = p
```

237

```
      end function vector3_moving_canonical
      pure function vector3_moving_generic (p) result(q)
        real(default), dimension(3), intent(in) :: p
        type(vector3_t) :: q
        q%p = p
      end function vector3_moving_generic
```

Equality and inequality

⟨*Lorentz: public operators*⟩≡
```
      public :: operator(==), operator(/=)
```

⟨*Lorentz: interfaces*⟩+≡
```
      interface operator(==)
         module procedure vector3_eq
      end interface
      interface operator(/=)
         module procedure vector3_neq
      end interface
```

⟨*Lorentz: procedures*⟩+≡
```
      elemental function vector3_eq (p, q) result (r)
        logical :: r
        type(vector3_t), intent(in) :: p,q
        r = all (p%p == q%p)
      end function vector3_eq
      elemental function vector3_neq (p, q) result (r)
        logical :: r
        type(vector3_t), intent(in) :: p,q
        r = any (p%p /= q%p)
      end function vector3_neq
```

Define addition and subtraction

⟨*Lorentz: public operators*⟩+≡
```
      public :: operator(+), operator(-)
```

⟨*Lorentz: interfaces*⟩+≡
```
      interface operator(+)
         module procedure add_vector3
      end interface
      interface operator(-)
         module procedure sub_vector3
      end interface
```

⟨*Lorentz: procedures*⟩+≡
```
      elemental function add_vector3 (p, q) result (r)
        type(vector3_t) :: r
        type(vector3_t), intent(in) :: p,q
        r%p = p%p + q%p
      end function add_vector3
      elemental function sub_vector3 (p, q) result (r)
        type(vector3_t) :: r
        type(vector3_t), intent(in) :: p,q
        r%p = p%p - q%p
      end function sub_vector3
```

The multiplication sign is overloaded with scalar multiplication; similarly division:

⟨*Lorentz: public operators*⟩+≡
```
    public :: operator(*), operator(/)
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(*)
       module procedure prod_integer_vector3, prod_vector3_integer
       module procedure prod_real_vector3, prod_vector3_real
    end interface
    interface operator(/)
       module procedure div_vector3_real, div_vector3_integer
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function prod_real_vector3 (s, p) result (q)
      type(vector3_t) :: q
      real(default), intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = s * p%p
    end function prod_real_vector3
    elemental function prod_vector3_real (p, s) result (q)
      type(vector3_t) :: q
      real(default), intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = s * p%p
    end function prod_vector3_real
    elemental function div_vector3_real (p, s) result (q)
      type(vector3_t) :: q
      real(default), intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = p%p/s
    end function div_vector3_real
    elemental function prod_integer_vector3 (s, p) result (q)
      type(vector3_t) :: q
      integer, intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = s * p%p
    end function prod_integer_vector3
    elemental function prod_vector3_integer (p, s) result (q)
      type(vector3_t) :: q
      integer, intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = s * p%p
    end function prod_vector3_integer
    elemental function div_vector3_integer (p, s) result (q)
      type(vector3_t) :: q
      integer, intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = p%p/s
    end function div_vector3_integer
```

The multiplication sign can also indicate scalar products:

⟨*Lorentz: interfaces*⟩+≡

```
    interface operator(*)
       module procedure prod_vector3
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function prod_vector3 (p, q) result (s)
      real(default) :: s
      type(vector3_t), intent(in) :: p,q
      s = dot_product (p%p, q%p)
    end function prod_vector3
```

⟨*Lorentz: public functions*⟩≡
```
    public :: cross_product
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface cross_product
       module procedure vector3_cross_product
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_cross_product (p, q) result (r)
      type(vector3_t) :: r
      type(vector3_t), intent(in) :: p,q
      integer :: i
      do i=1,3
         r%p(i) = dot_product (p%p, matmul(epsilon_three(i,:,:), q%p))
      end do
    end function vector3_cross_product
```

Exponentiation is defined only for integer powers. Odd powers mean take the square root; so p**1 is the length of p.

⟨*Lorentz: public operators*⟩+≡
```
    public :: operator(**)
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(**)
       module procedure power_vector3
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function power_vector3 (p, e) result (s)
      real(default) :: s
      type(vector3_t), intent(in) :: p
      integer, intent(in) :: e
      s = dot_product (p%p, p%p)
      if (e/=2) then
         if (mod(e,2)==0) then
            s = s**(e/2)
         else
            s = sqrt(s)**e
         end if
      end if
    end function power_vector3
```

Finally, we need a negation.

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(-)
       module procedure negate_vector3
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function negate_vector3 (p) result (q)
      type(vector3_t) :: q
      type(vector3_t), intent(in) :: p
      integer :: i
      do i = 1, 3
         if (p%p(i) == -p%p(i)) then
            q%p(i) = 0
         else
            q%p(i) = -p%p(i)
         end if
      end do
    end function negate_vector3
```

The sum function can be useful:

⟨*Lorentz: public functions*⟩+≡
```
    public :: sum
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface sum
       module procedure sum_vector3
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    pure function sum_vector3 (p) result (q)
      type(vector3_t) :: q
      type(vector3_t), dimension(:), intent(in) :: p
      integer :: i
      do i=1, 3
         q%p(i) = sum (p%p(i))
      end do
    end function sum_vector3
```

Any component:

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_get_component
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_get_component (p, k) result (c)
      type(vector3_t), intent(in) :: p
      integer, intent(in) :: k
      real(default) :: c
      c = p%p(k)
    end function vector3_get_component
```

Extract all components. This is not elemental.

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_get_components
```

⟨*Lorentz: procedures*⟩+≡
```
    pure function vector3_get_components (p) result (a)
      type(vector3_t), intent(in) :: p
      real(default), dimension(3) :: a
      a = p%p
    end function vector3_get_components
```

This function returns the direction of a three-vector, i.e., a normalized three-vector. If the vector is null, we return a null vector.

⟨*Lorentz: public functions*⟩+≡
```
    public :: direction
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface direction
       module procedure vector3_get_direction
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_get_direction (p) result (q)
      type(vector3_t) :: q
      type(vector3_t), intent(in) :: p
      real(default) :: pp
      pp = p**1
      if (pp /= 0) then
         q%p = p%p / pp
      else
         q%p = 0
      end if
    end function vector3_get_direction
```

4.2.2 Four-vectors

In four-vectors the zero-component needs special treatment, therefore we do not use the standard operations. Sure, we pay for the extra layer of abstraction by losing efficiency; so we have to assume that the time-critical applications do not involve four-vector operations.

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_t
```

⟨*Lorentz: types*⟩+≡
```
    type :: vector4_t
      private
      real(default), dimension(0:3) :: p = &
         [0._default, 0._default, 0._default, 0._default]
    end type vector4_t
```

Output a vector

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_write
```

⟨*Lorentz: procedures*⟩+≡
```
    subroutine vector4_write (p, unit, show_mass, testflag)
      type(vector4_t), intent(in) :: p
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: show_mass
      logical, intent(in), optional :: testflag
      integer :: u
      character(len=7) :: fmt
      call pac_fmt (fmt, FMT_19, FMT_15, testflag)
      u = output_unit (unit);  if (u < 0)  return
      write(u, "(1x,A,1x," // fmt // ")") 'E = ', p%p(0)
      write(u, "(1x,A,3(1x," // fmt // "))") 'P = ', p%p(1:)
      if (present (show_mass)) then
         if (show_mass) &
              write (u, "(1x,A,1x," // fmt // ")") 'M = ', p**1
      end if
    end subroutine vector4_write
```

Binary I/O

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_write_raw
    public :: vector4_read_raw
```

⟨*Lorentz: procedures*⟩+≡
```
    subroutine vector4_write_raw (p, u)
      type(vector4_t), intent(in) :: p
      integer, intent(in) :: u
      write (u) p%p
    end subroutine vector4_write_raw

    subroutine vector4_read_raw (p, u, iostat)
      type(vector4_t), intent(out) :: p
      integer, intent(in) :: u
      integer, intent(out), optional :: iostat
      read (u, iostat=iostat) p%p
    end subroutine vector4_read_raw
```

This is a four-vector with zero components

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_null
```

⟨*Lorentz: parameters*⟩+≡
```
    type(vector4_t), parameter :: vector4_null = &
         vector4_t ([ 0._default, 0._default, 0._default, 0._default ])
```

Canonical four-vector:

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_canonical
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_canonical (k) result (p)
      type(vector4_t) :: p
      integer, intent(in) :: k
      p = vector4_null
```

243

```
      p%p(k) = 1
    end function vector4_canonical
```

A particle at rest:

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_at_rest
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_at_rest (m) result (p)
      type(vector4_t) :: p
      real(default), intent(in) :: m
      p = vector4_t ([ m, 0._default, 0._default, 0._default ])
    end function vector4_at_rest
```

A moving particle (k-axis, or arbitrary axis)

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_moving
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface vector4_moving
       module procedure vector4_moving_canonical
       module procedure vector4_moving_generic
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_moving_canonical (E, p, k) result (q)
      type(vector4_t) :: q
      real(default), intent(in) :: E, p
      integer, intent(in) :: k
      q = vector4_at_rest(E)
      q%p(k) = p
    end function vector4_moving_canonical
    elemental function vector4_moving_generic (E, p) result (q)
      type(vector4_t) :: q
      real(default), intent(in) :: E
      type(vector3_t), intent(in) :: p
      q%p(0) = E
      q%p(1:) = p%p
    end function vector4_moving_generic
```

Equality and inequality

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(==)
       module procedure vector4_eq
    end interface
    interface operator(/=)
       module procedure vector4_neq
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_eq (p, q) result (r)
      logical :: r
      type(vector4_t), intent(in) :: p,q
      r = all (p%p == q%p)
```

```
    end function vector4_eq
    elemental function vector4_neq (p, q) result (r)
      logical :: r
      type(vector4_t), intent(in) :: p,q
      r = any (p%p /= q%p)
    end function vector4_neq
```

Addition and subtraction:

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(+)
       module procedure add_vector4
    end interface
    interface operator(-)
       module procedure sub_vector4
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function add_vector4 (p,q) result (r)
      type(vector4_t) :: r
      type(vector4_t), intent(in) :: p,q
      r%p = p%p + q%p
    end function add_vector4
    elemental function sub_vector4 (p,q) result (r)
      type(vector4_t) :: r
      type(vector4_t), intent(in) :: p,q
      r%p = p%p - q%p
    end function sub_vector4
```

We also need scalar multiplication and division:

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(*)
       module procedure prod_real_vector4, prod_vector4_real
       module procedure prod_integer_vector4, prod_vector4_integer
    end interface
    interface operator(/)
       module procedure div_vector4_real
       module procedure div_vector4_integer
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function prod_real_vector4 (s, p) result (q)
      type(vector4_t) :: q
      real(default), intent(in) :: s
      type(vector4_t), intent(in) :: p
      q%p = s * p%p
    end function prod_real_vector4
    elemental function prod_vector4_real (p, s) result (q)
      type(vector4_t) :: q
      real(default), intent(in) :: s
      type(vector4_t), intent(in) :: p
      q%p = s * p%p
    end function prod_vector4_real
    elemental function div_vector4_real (p, s) result (q)
      type(vector4_t) :: q
```

```
    real(default), intent(in) :: s
    type(vector4_t), intent(in) :: p
    q%p = p%p/s
  end function div_vector4_real
  elemental function prod_integer_vector4 (s, p) result (q)
    type(vector4_t) :: q
    integer, intent(in) :: s
    type(vector4_t), intent(in) :: p
    q%p = s * p%p
  end function prod_integer_vector4
  elemental function prod_vector4_integer (p, s) result (q)
    type(vector4_t) :: q
    integer, intent(in) :: s
    type(vector4_t), intent(in) :: p
    q%p = s * p%p
  end function prod_vector4_integer
  elemental function div_vector4_integer (p, s) result (q)
    type(vector4_t) :: q
    integer, intent(in) :: s
    type(vector4_t), intent(in) :: p
    q%p = p%p/s
  end function div_vector4_integer
```

Scalar products and squares in the Minkowski sense:

⟨*Lorentz: interfaces*⟩+≡

```
  interface operator(*)
    module procedure prod_vector4
  end interface
  interface operator(**)
    module procedure power_vector4
  end interface
```

⟨*Lorentz: procedures*⟩+≡

```
  elemental function prod_vector4 (p, q) result (s)
    real(default) :: s
    type(vector4_t), intent(in) :: p,q
    s = p%p(0)*q%p(0) - dot_product(p%p(1:), q%p(1:))
  end function prod_vector4
```

The power operation for four-vectors is signed, i.e., `p**1` is positive for timelike and negative for spacelike vectors. Note that `(p**1)**2` is not necessarily equal to `p**2`.

⟨*Lorentz: procedures*⟩+≡

```
  elemental function power_vector4 (p, e) result (s)
    real(default) :: s
    type(vector4_t), intent(in) :: p
    integer, intent(in) :: e
    s = p*p
    if (e/=2) then
       if (mod(e,2)==0) then
          s = s**(e/2)
       elseif (s>=0) then
          s = sqrt(s)**e
```

```
        else
            s = -(sqrt(abs(s))**e)
        end if
    end if
end function power_vector4
```

Finally, we introduce a negation

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(-)
       module procedure negate_vector4
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function negate_vector4 (p) result (q)
      type(vector4_t) :: q
      type(vector4_t), intent(in) :: p
      integer :: i
      do i = 0, 3
         if (p%p(i) == -p%p(i)) then
            q%p(i) = 0
         else
            q%p(i) = -p%p(i)
         end if
      end do
    end function negate_vector4
```

The sum function can be useful:

⟨*Lorentz: interfaces*⟩+≡
```
    interface sum
       module procedure sum_vector4
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    pure function sum_vector4 (p) result (q)
      type(vector4_t) :: q
      type(vector4_t), dimension(:), intent(in) :: p
      integer :: i
      do i=0, 3
         q%p(i) = sum (p%p(i))
      end do
    end function sum_vector4
```

4.2.3 Conversions

Manually set a component of the four-vector:

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_set_component
```

⟨*Lorentz: procedures*⟩+≡
```
    subroutine vector4_set_component (p, k, c)
      type(vector4_t), intent(inout) :: p
      integer, intent(in) :: k
      real(default), intent(in) :: c
```

```
      p%p(k) = c
    end subroutine vector4_set_component
```

Any component:

⟨Lorentz: public⟩+≡
```
    public :: vector4_get_component
```

⟨Lorentz: procedures⟩+≡
```
    elemental function vector4_get_component (p, k) result (c)
      real(default) :: c
      type(vector4_t), intent(in) :: p
      integer, intent(in) :: k
      c = p%p(k)
    end function vector4_get_component
```

Extract all components. This is not elemental.

⟨Lorentz: public⟩+≡
```
    public :: vector4_get_components
```

⟨Lorentz: procedures⟩+≡
```
    pure function vector4_get_components (p) result (a)
      real(default), dimension(0:3) :: a
      type(vector4_t), intent(in) :: p
      a = p%p
    end function vector4_get_components
```

This function returns the space part of a four-vector, such that we can apply three-vector operations on it:

⟨Lorentz: public functions⟩+≡
```
    public :: space_part
```

⟨Lorentz: interfaces⟩+≡
```
    interface space_part
       module procedure vector4_get_space_part
    end interface
```

⟨Lorentz: procedures⟩+≡
```
    elemental function vector4_get_space_part (p) result (q)
      type(vector3_t) :: q
      type(vector4_t), intent(in) :: p
      q%p = p%p(1:)
    end function vector4_get_space_part
```

This function returns the direction of a four-vector, i.e., a normalized three-vector. If the four-vector has zero space part, we return a null vector.

⟨Lorentz: interfaces⟩+≡
```
    interface direction
       module procedure vector4_get_direction
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
elemental function vector4_get_direction (p) result (q)
  type(vector3_t) :: q
  type(vector4_t), intent(in) :: p
  real(default) :: qq
  q%p = p%p(1:)
  qq = q**1
  if (qq /= 0) then
     q%p = q%p / qq
  else
     q%p = 0
  end if
end function vector4_get_direction
```

This function returns the four-vector as an ordinary array. A second version for an array of four-vectors.

⟨*Lorentz: public functions*⟩+≡
```
public :: array_from_vector4
```

⟨*Lorentz: interfaces*⟩+≡
```
interface array_from_vector4
   module procedure array_from_vector4_1
   module procedure array_from_vector4_2
end interface
```

⟨*Lorentz: procedures*⟩+≡
```
pure function array_from_vector4_1 (p) result (a)
  type(vector4_t), intent(in) :: p
  real(default), dimension(0:3) :: a
  a = p%p
end function array_from_vector4_1

pure function array_from_vector4_2 (p) result (a)
  type(vector4_t), dimension(:), intent(in) :: p
  real(default), dimension(0:3, size(p)) :: a
  integer :: i
  forall (i=1:size(p))
     a(0:3,i) = p(i)%p
  end forall
end function array_from_vector4_2
```

Transform the momentum of a `c_prt` object into a four-vector:

⟨*Lorentz: public*⟩+≡
```
public :: vector4_from_c_prt
```

⟨*Lorentz: procedures*⟩+≡
```
elemental function vector4_from_c_prt (c_prt) result (p)
  type(vector4_t) :: p
  type(c_prt_t), intent(in) :: c_prt
  p%p(0) = c_prt%pe
  p%p(1) = c_prt%px
  p%p(2) = c_prt%py
  p%p(3) = c_prt%pz
end function vector4_from_c_prt
```

Initialize a `c_prt_t` object with the components of a four-vector as its kinematical entries. Compute the invariant mass, or use the optional mass-squared value instead.

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_to_c_prt
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_to_c_prt (p, p2) result (c_prt)
      type(c_prt_t) :: c_prt
      type(vector4_t), intent(in) :: p
      real(default), intent(in), optional :: p2
      c_prt%pe = p%p(0)
      c_prt%px = p%p(1)
      c_prt%py = p%p(2)
      c_prt%pz = p%p(3)
      if (present (p2)) then
         c_prt%p2 = p2
      else
         c_prt%p2 = p ** 2
      end if
    end function vector4_to_c_prt
```

4.2.4 Angles

Return the angles in a canonical system. The angle ϕ is defined between $0 \leq \phi < 2\pi$. In degenerate cases, return zero.

⟨*Lorentz: public functions*⟩+≡
```
    public :: azimuthal_angle
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface azimuthal_angle
       module procedure vector3_azimuthal_angle
       module procedure vector4_azimuthal_angle
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_azimuthal_angle (p) result (phi)
      real(default) :: phi
      type(vector3_t), intent(in) :: p
      if (any(p%p(1:2)/=0)) then
         phi = atan2(p%p(2), p%p(1))
         if (phi < 0) phi = phi + twopi
      else
         phi = 0
      end if
    end function vector3_azimuthal_angle
    elemental function vector4_azimuthal_angle (p) result (phi)
      real(default) :: phi
      type(vector4_t), intent(in) :: p
      phi = vector3_azimuthal_angle (space_part (p))
    end function vector4_azimuthal_angle
```

Azimuthal angle in degrees

⟨*Lorentz: public functions*⟩+≡
```
    public :: azimuthal_angle_deg
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface azimuthal_angle_deg
       module procedure vector3_azimuthal_angle_deg
       module procedure vector4_azimuthal_angle_deg
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_azimuthal_angle_deg (p) result (phi)
      real(default) :: phi
      type(vector3_t), intent(in) :: p
      phi = vector3_azimuthal_angle (p) / degree
    end function vector3_azimuthal_angle_deg
    elemental function vector4_azimuthal_angle_deg (p) result (phi)
      real(default) :: phi
      type(vector4_t), intent(in) :: p
      phi = vector4_azimuthal_angle (p) / degree
    end function vector4_azimuthal_angle_deg
```

The azimuthal distance of two vectors. This is the difference of the azimuthal angles, but cannot be larger than π: The result is between $-\pi < \Delta\phi \leq \pi$.

⟨*Lorentz: public functions*⟩+≡
```
    public :: azimuthal_distance
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface azimuthal_distance
       module procedure vector3_azimuthal_distance
       module procedure vector4_azimuthal_distance
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_azimuthal_distance (p, q) result (dphi)
      real(default) :: dphi
      type(vector3_t), intent(in) :: p,q
      dphi = vector3_azimuthal_angle (q) - vector3_azimuthal_angle (p)
      if (dphi <= -pi) then
         dphi = dphi + twopi
      else if (dphi > pi) then
         dphi = dphi - twopi
      end if
    end function vector3_azimuthal_distance
    elemental function vector4_azimuthal_distance (p, q) result (dphi)
      real(default) :: dphi
      type(vector4_t), intent(in) :: p,q
      dphi = vector3_azimuthal_distance &
           (space_part (p), space_part (q))
    end function vector4_azimuthal_distance
```

The same in degrees:

⟨*Lorentz: public functions*⟩+≡
```
    public :: azimuthal_distance_deg
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface azimuthal_distance_deg
       module procedure vector3_azimuthal_distance_deg
       module procedure vector4_azimuthal_distance_deg
    end interface
```
⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_azimuthal_distance_deg (p, q) result (dphi)
      real(default) :: dphi
      type(vector3_t), intent(in) :: p,q
      dphi = vector3_azimuthal_distance (p, q) / degree
    end function vector3_azimuthal_distance_deg
    elemental function vector4_azimuthal_distance_deg (p, q) result (dphi)
      real(default) :: dphi
      type(vector4_t), intent(in) :: p,q
      dphi = vector4_azimuthal_distance (p, q) / degree
    end function vector4_azimuthal_distance_deg
```

The polar angle is defined $0 \leq \theta \leq \pi$. Note that `ATAN2` has the reversed order of arguments: `ATAN2(Y,X)`. Here, x is the 3-component while y is the transverse momentum which is always nonnegative. Therefore, the result is nonnegative as well.

⟨*Lorentz: public functions*⟩+≡
```
    public :: polar_angle
```
⟨*Lorentz: interfaces*⟩+≡
```
    interface polar_angle
       module procedure polar_angle_vector3
       module procedure polar_angle_vector4
    end interface
```
⟨*Lorentz: procedures*⟩+≡
```
    elemental function polar_angle_vector3 (p) result (theta)
      real(default) :: theta
      type(vector3_t), intent(in) :: p
      if (any(p%p/=0)) then
         theta = atan2 (sqrt(p%p(1)**2 + p%p(2)**2), p%p(3))
      else
         theta = 0
      end if
    end function polar_angle_vector3
    elemental function polar_angle_vector4 (p) result (theta)
      real(default) :: theta
      type(vector4_t), intent(in) :: p
      theta = polar_angle (space_part (p))
    end function polar_angle_vector4
```

This is the cosine of the polar angle: $-1 \leq \cos\theta \leq 1$.

⟨*Lorentz: public functions*⟩+≡
```
    public :: polar_angle_ct
```
⟨*Lorentz: interfaces*⟩+≡
```
    interface polar_angle_ct
       module procedure polar_angle_ct_vector3
       module procedure polar_angle_ct_vector4
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function polar_angle_ct_vector3 (p) result (ct)
      real(default) :: ct
      type(vector3_t), intent(in) :: p
      if (any(p%p/=0)) then
         ct = p%p(3) / p**1
      else
         ct = 1
      end if
    end function polar_angle_ct_vector3
    elemental function polar_angle_ct_vector4 (p) result (ct)
      real(default) :: ct
      type(vector4_t), intent(in) :: p
      ct = polar_angle_ct (space_part (p))
    end function polar_angle_ct_vector4
```

The polar angle in degrees.

⟨*Lorentz: public functions*⟩+≡
```
    public :: polar_angle_deg
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface polar_angle_deg
       module procedure polar_angle_deg_vector3
       module procedure polar_angle_deg_vector4
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function polar_angle_deg_vector3 (p) result (theta)
      real(default) :: theta
      type(vector3_t), intent(in) :: p
      theta = polar_angle (p) / degree
    end function polar_angle_deg_vector3
    elemental function polar_angle_deg_vector4 (p) result (theta)
      real(default) :: theta
      type(vector4_t), intent(in) :: p
      theta = polar_angle (p) / degree
    end function polar_angle_deg_vector4
```

This is the angle enclosed between two three-momenta. If one of the momenta is zero, we return an angle of zero. The range of the result is $0 \leq \theta \leq \pi$. If there is only one argument, take the positive z axis as reference.

⟨*Lorentz: public functions*⟩+≡
```
    public :: enclosed_angle
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface enclosed_angle
       module procedure enclosed_angle_vector3
       module procedure enclosed_angle_vector4
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```

      a = L%L
    end function lorentz_transformation_get_components
```

4.2.7   Functions of Lorentz transformations

For the inverse, we make use of the fact that $\Lambda^{\mu\nu}\Lambda_{\mu\rho} = \delta^\nu_\rho$. So, lowering the indices and transposing is sufficient.

⟨*Lorentz: public functions*⟩+≡
```
    public :: inverse
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface inverse
       module procedure lorentz_transformation_inverse
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function lorentz_transformation_inverse (L) result (IL)
      type(lorentz_transformation_t) :: IL
      type(lorentz_transformation_t), intent(in) :: L
      IL%L(0,0) = L%L(0,0)
      IL%L(0,1:) = -L%L(1:,0)
      IL%L(1:,0) = -L%L(0,1:)
      IL%L(1:,1:) = transpose(L%L(1:,1:))
    end function lorentz_transformation_inverse
```

4.2.8   Invariants

These are used below. The first array index is varying fastest in `FORTRAN`; therefore the extra minus in the odd-rank tensor epsilon.

⟨*Lorentz: parameters*⟩+≡
```
    integer, dimension(3,3), parameter :: delta_three = &
        & reshape( source = (/ 1,0,0, 0,1,0, 0,0,1 /), &
        &          shape  = (/3,3/) )
    integer, dimension(3,3,3), parameter :: epsilon_three = &
        & reshape( source = (/ 0, 0,0,  0,0,-1,   0,1,0,&
        &                      0, 0,1,  0,0, 0,  -1,0,0,&
        &                      0,-1,0,  1,0, 0,   0,0,0 /),&
        &          shape = (/3,3,3/) )
```

This could be of some use:

⟨*Lorentz: public*⟩+≡
```
    public :: identity
```

⟨*Lorentz: parameters*⟩+≡
```
    type(lorentz_transformation_t), parameter :: &
        & identity = &
        & lorentz_transformation_t ( &
        & reshape( source = (/ 1._default, 0._default, 0._default, 0._default, &
        &                      0._default, 1._default, 0._default, 0._default, &
        &                      0._default, 0._default, 1._default, 0._default, &
        &                      0._default, 0._default, 0._default, 1._default /),&
        &          shape = (/ 4,4 /) ) )
```

⟨*Lorentz: public*⟩+≡
```
    public :: space_reflection
```

⟨*Lorentz: parameters*⟩+≡
```
    type(lorentz_transformation_t), parameter :: &
        & space_reflection = &
        & lorentz_transformation_t ( &
        & reshape( source = (/ 1._default, 0._default, 0._default, 0._default, &
        &                      0._default,-1._default, 0._default, 0._default, &
        &                      0._default, 0._default,-1._default, 0._default, &
        &                      0._default, 0._default, 0._default,-1._default /),&
        &            shape = (/ 4,4 /) ) )
```

4.2.9 Boosts

We build Lorentz transformations from boosts and rotations. In both cases we can supply a three-vector which defines the axis and (hyperbolic) angle. For a boost, this is the vector $\vec{\beta} = \vec{p}/E$, such that a particle at rest with mass m is boosted to a particle with three-vector $\vec{p}$. Here, we have

$$\beta = \tanh \chi = p/E, \qquad \gamma = \cosh \chi = E/m, \qquad \beta\gamma = \sinh \chi = p/m \qquad (4.1)$$

⟨*Lorentz: public functions*⟩+≡
```
    public :: boost
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface boost
       module procedure boost_from_rest_frame
       module procedure boost_from_rest_frame_vector3
       module procedure boost_generic
       module procedure boost_canonical
    end interface
```

In the first form, the argument is some four-momentum, the space part of which determines a direction, and the associated mass (which is not checked against the four-momentum). The boost vector $\gamma\vec{\beta}$ is then given by $\vec{p}/m$. This boosts from the rest frame of a particle to the current frame. To be explicit, if $\vec{p}$ is the momentum of a particle and m its mass, $L(\vec{p}/m)$ is the transformation that turns $(m; \vec{0})$ into $(E; \vec{p})$. Conversely, the inverse transformation boosts a vector *into* the rest frame of a particle, in particular $(E; \vec{p})$ into $(m; \vec{0})$.

⟨*Lorentz: procedures*⟩+≡
```
    elemental function boost_from_rest_frame (p, m) result (L)
      type(lorentz_transformation_t) :: L
      type(vector4_t), intent(in) :: p
      real(default), intent(in) :: m
      L = boost_from_rest_frame_vector3 (space_part (p), m)
    end function boost_from_rest_frame
    elemental function boost_from_rest_frame_vector3 (p, m) result (L)
      type(lorentz_transformation_t) :: L
      type(vector3_t), intent(in) :: p
      real(default), intent(in) :: m
      type(vector3_t) :: beta_gamma
      real(default) :: bg2, g, c
      integer :: i,j
```

```
    if (m /= 0) then
       beta_gamma = p / m
       bg2 = beta_gamma**2
    else
       bg2 = 0
    end if
    if (bg2 /= 0) then
       g = sqrt(1 + bg2);  c = (g-1)/bg2
       L%L(0,0)  = g
       L%L(0,1:) = beta_gamma%p
       L%L(1:,0) = L%L(0,1:)
       do i=1,3
          do j=1,3
             L%L(i,j) = delta_three(i,j) + c*beta_gamma%p(i)*beta_gamma%p(j)
          end do
       end do
    else
       L = identity
    end if
    end function boost_from_rest_frame_vector3
```

A canonical boost is a boost along one of the coordinate axes, which we may supply as an integer argument. Here, $\gamma\beta$ is scalar.

⟨*Lorentz: procedures*⟩+≡

```
    elemental function boost_canonical (beta_gamma, k) result (L)
      type(lorentz_transformation_t) :: L
      real(default), intent(in) :: beta_gamma
      integer, intent(in) :: k
      real(default) :: g
      g = sqrt(1 + beta_gamma**2)
      L = identity
      L%L(0,0) = g
      L%L(0,k) = beta_gamma
      L%L(k,0) = L%L(0,k)
      L%L(k,k) = L%L(0,0)
    end function boost_canonical
```

Instead of a canonical axis, we can supply an arbitrary axis which need not be normalized. If it is zero, return the unit matrix.

⟨*Lorentz: procedures*⟩+≡

```
    elemental function boost_generic (beta_gamma, axis) result (L)
      type(lorentz_transformation_t) :: L
      real(default), intent(in) :: beta_gamma
      type(vector3_t), intent(in) :: axis
      if (any(axis%p/=0)) then
         L = boost_from_rest_frame_vector3 (beta_gamma * axis, axis**1)
      else
         L = identity
      end if
    end function boost_generic
```

4.2.10 Rotations

For a rotation, the vector defines the rotation axis, and its length the rotation angle.

⟨*Lorentz: public functions*⟩+≡
```
    public :: rotation
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface rotation
       module procedure rotation_generic
       module procedure rotation_canonical
       module procedure rotation_generic_cs
       module procedure rotation_canonical_cs
    end interface
```

If $\cos\phi$ and $\sin\phi$ is already known, we do not have to calculate them. Of course, the user has to ensure that $\cos^2\phi + \sin^2\phi = 1$, and that the given axis n is normalized to one. In the second form, the length of `axis` is the rotation angle.

⟨*Lorentz: procedures*⟩+≡
```
    elemental function rotation_generic_cs (cp, sp, axis) result (R)
      type(lorentz_transformation_t) :: R
      real(default), intent(in) :: cp, sp
      type(vector3_t), intent(in) :: axis
      integer :: i,j
      R = identity
      do i=1,3
         do j=1,3
            R%L(i,j) = cp*delta_three(i,j) + (1-cp)*axis%p(i)*axis%p(j)  &
                 &    - sp*dot_product(epsilon_three(i,j,:), axis%p)
         end do
      end do
    end function rotation_generic_cs
    elemental function rotation_generic (axis) result (R)
      type(lorentz_transformation_t) :: R
      type(vector3_t), intent(in) :: axis
      real(default) :: phi
      if (any(axis%p/=0)) then
         phi = abs(axis**1)
         R = rotation_generic_cs (cos(phi), sin(phi), axis/phi)
      else
         R = identity
      end if
    end function rotation_generic
```

Alternatively, give just the angle and label the coordinate axis by an integer.

⟨*Lorentz: procedures*⟩+≡
```
    elemental function rotation_canonical_cs (cp, sp, k) result (R)
      type(lorentz_transformation_t) :: R
      real(default), intent(in) :: cp, sp
      integer, intent(in) :: k
      integer :: i,j
      R = identity
      do i=1,3
         do j=1,3
```

```
            R%L(i,j) = -sp*epsilon_three(i,j,k)
          end do
          R%L(i,i) = cp
        end do
        R%L(k,k) = 1
      end function rotation_canonical_cs
      elemental function rotation_canonical (phi, k) result (R)
        type(lorentz_transformation_t) :: R
        real(default), intent(in) :: phi
        integer, intent(in) :: k
        R = rotation_canonical_cs(cos(phi), sin(phi), k)
      end function rotation_canonical
```

This is viewed as a method for the first argument (three-vector): Reconstruct the rotation that rotates it into the second three-vector.

⟨*Lorentz: public functions*⟩+≡
```
    public :: rotation_to_2nd
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface rotation_to_2nd
       module procedure rotation_to_2nd_generic
       module procedure rotation_to_2nd_canonical
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function rotation_to_2nd_generic (p, q) result (R)
      type(lorentz_transformation_t) :: R
      type(vector3_t), intent(in) :: p, q
      type(vector3_t) :: a, b, ab
      real(default) :: ct, st
      if (any (p%p /= 0) .and. any (q%p /= 0)) then
         a = direction (p)
         b = direction (q)
         ab = cross_product(a,b)
         ct = a*b;   st = ab**1
         if (st /= 0) then
            R = rotation_generic_cs (ct, st, ab/st)
         else if (ct < 0) then
            R = space_reflection
         else
            R = identity
         end if
      else
         R = identity
      end if
    end function rotation_to_2nd_generic
```

The same for a canonical axis: The function returns the transformation that rotates the k-axis into the direction of p.

⟨*Lorentz: procedures*⟩+≡
```
    elemental function rotation_to_2nd_canonical (k, p) result (R)
      type(lorentz_transformation_t) :: R
      integer, intent(in) :: k
      type(vector3_t), intent(in) :: p
      type(vector3_t) :: b, ab
      real(default) :: ct, st
```

```
    integer :: i, j
    if (any (p%p /= 0)) then
       b = direction (p)
       ab%p = 0
       do i = 1, 3
          do j = 1, 3
             ab%p(j) = ab%p(j) + b%p(i) * epsilon_three(i,j,k)
          end do
       end do
       ct = b%p(k);  st = ab**1
       if (st /= 0) then
          R = rotation_generic_cs (ct, st, ab/st)
       else if (ct < 0) then
          R = space_reflection
       else
          R = identity
       end if
    else
       R = identity
    end if
end function rotation_to_2nd_canonical
```

4.2.11 Composite Lorentz transformations

This function returns the transformation that, given a pair of vectors $p_{1,2}$, (a) boosts from the rest frame of the c.m. system (with invariant mass m) into the lab frame where p_i are defined, and (b) turns the given axis (or the canonical vectors $\pm e_k$) in the rest frame into the directions of $p_{1,2}$ in the lab frame. Note that the energy components are not used; for a consistent result one should have $(p_1 + p_2)^2 = m^2$.

⟨*Lorentz: public functions*⟩+≡
```
    public :: transformation
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface transformation
       module procedure transformation_rec_generic
       module procedure transformation_rec_canonical
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function transformation_rec_generic (axis, p1, p2, m) result (L)
      type(vector3_t), intent(in) :: axis
      type(vector4_t), intent(in) :: p1, p2
      real(default), intent(in) :: m
      type(lorentz_transformation_t) :: L
      L = boost (p1 + p2, m)
      L = L * rotation_to_2nd (axis, space_part (inverse (L) * p1))
    end function transformation_rec_generic
    elemental function transformation_rec_canonical (k, p1, p2, m) result (L)
      integer, intent(in) :: k
      type(vector4_t), intent(in) :: p1, p2
      real(default), intent(in) :: m
      type(lorentz_transformation_t) :: L
```

```
    L = boost (p1 + p2, m)
    L = L * rotation_to_2nd (k, space_part (inverse (L) * p1))
  end function transformation_rec_canonical
```

4.2.12 Applying Lorentz transformations

Multiplying vectors and Lorentz transformations is straightforward.

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(*)
       module procedure prod_LT_vector4
       module procedure prod_LT_LT
       module procedure prod_vector4_LT
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function prod_LT_vector4 (L, p) result (np)
      type(vector4_t) :: np
      type(lorentz_transformation_t), intent(in) :: L
      type(vector4_t), intent(in) :: p
      np%p = matmul (L%L, p%p)
    end function prod_LT_vector4
    elemental function prod_LT_LT (L1, L2) result (NL)
      type(lorentz_transformation_t) :: NL
      type(lorentz_transformation_t), intent(in) :: L1,L2
      NL%L = matmul (L1%L, L2%L)
    end function prod_LT_LT
    elemental function prod_vector4_LT (p, L) result (np)
      type(vector4_t) :: np
      type(vector4_t), intent(in) :: p
      type(lorentz_transformation_t), intent(in) :: L
      np%p = matmul (p%p, L%L)
    end function prod_vector4_LT
```

4.2.13 Special Lorentz transformations

These routines have their application in the generation and extraction of angles in the phase-space sampling routine. Since this part of the program is time-critical, we calculate the composition of transformations directly instead of multiplying rotations and boosts.

This Lorentz transformation is the composition of a rotation by ϕ around the 3 axis, a rotation by θ around the 2 axis, and a boost along the 3 axis:

$$L = B_3(\beta\gamma) \, R_2(\theta) \, R_3(\phi) \tag{4.2}$$

Instead of the angles we provide sine and cosine.

⟨*Lorentz: public functions*⟩+≡
```
    public :: LT_compose_r3_r2_b3
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function LT_compose_r3_r2_b3 &
        (cp, sp, ct, st, beta_gamma) result (L)
      type(lorentz_transformation_t) :: L
```

```
      real(default), intent(in) :: cp, sp, ct, st, beta_gamma
      real(default) :: gamma
      if (beta_gamma==0) then
         L%L(0,0)  = 1
         L%L(1:,0) = 0
         L%L(0,1:) = 0
         L%L(1,1:) = (/  ct*cp, -ct*sp, st /)
         L%L(2,1:) = (/     sp,     cp, 0._default /)
         L%L(3,1:) = (/ -st*cp,  st*sp, ct /)
      else
         gamma = sqrt(1 + beta_gamma**2)
         L%L(0,0)  = gamma
         L%L(1,0)  = 0
         L%L(2,0)  = 0
         L%L(3,0)  = beta_gamma
         L%L(0,1:) = beta_gamma * (/ -st*cp,  st*sp, ct /)
         L%L(1,1:) =                 (/  ct*cp, -ct*sp, st /)
         L%L(2,1:) =                 (/     sp,     cp, 0._default /)
         L%L(3,1:) = gamma       * (/ -st*cp,  st*sp, ct /)
      end if
    end function LT_compose_r3_r2_b3
```

Different ordering:
$$L = B_3(\beta\gamma)\, R_3(\phi)\, R_2(\theta) \tag{4.3}$$

⟨*Lorentz: public functions*⟩+≡
```
    public :: LT_compose_r2_r3_b3
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function LT_compose_r2_r3_b3 &
        (ct, st, cp, sp, beta_gamma) result (L)
      type(lorentz_transformation_t) :: L
      real(default), intent(in) :: ct, st, cp, sp, beta_gamma
      real(default) :: gamma
      if (beta_gamma==0) then
         L%L(0,0)  = 1
         L%L(1:,0) = 0
         L%L(0,1:) = 0
         L%L(1,1:) = (/  ct*cp,    -sp,     st*cp /)
         L%L(2,1:) = (/  ct*sp,     cp,     st*sp /)
         L%L(3,1:) = (/ -st  , 0._default, ct    /)
      else
         gamma = sqrt(1 + beta_gamma**2)
         L%L(0,0)  = gamma
         L%L(1,0)  = 0
         L%L(2,0)  = 0
         L%L(3,0)  = beta_gamma
         L%L(0,1:) = beta_gamma * (/ -st  , 0._default, ct    /)
         L%L(1,1:) =                 (/  ct*cp,    -sp,     st*cp /)
         L%L(2,1:) =                 (/  ct*sp,     cp,     st*sp /)
         L%L(3,1:) = gamma       * (/ -st  , 0._default, ct    /)
      end if
    end function LT_compose_r2_r3_b3
```

This function returns the previous Lorentz transformation applied to an arbitrary four-momentum and extracts the space part of the result:

$$\vec{n} = [B_3(\beta\gamma)\, R_2(\theta)\, R_3(\phi)\, p]_{\text{space part}} \tag{4.4}$$

The second variant applies if there is no rotation

⟨*Lorentz: public functions*⟩+≡
```
    public :: axis_from_p_r3_r2_b3, axis_from_p_b3
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function axis_from_p_r3_r2_b3 &
        (p, cp, sp, ct, st, beta_gamma) result (n)
      type(vector3_t) :: n
      type(vector4_t), intent(in) :: p
      real(default), intent(in) :: cp, sp, ct, st, beta_gamma
      real(default) :: gamma, px, py
      px = cp * p%p(1) - sp * p%p(2)
      py = sp * p%p(1) + cp * p%p(2)
      n%p(1) =  ct * px + st * p%p(3)
      n%p(2) = py
      n%p(3) = -st * px + ct * p%p(3)
      if (beta_gamma/=0) then
         gamma = sqrt(1 + beta_gamma**2)
         n%p(3) = n%p(3) * gamma + p%p(0) * beta_gamma
      end if
    end function axis_from_p_r3_r2_b3

    elemental function axis_from_p_b3 (p, beta_gamma) result (n)
      type(vector3_t) :: n
      type(vector4_t), intent(in) :: p
      real(default), intent(in) :: beta_gamma
      real(default) :: gamma
      n%p = p%p(1:3)
      if (beta_gamma/=0) then
         gamma = sqrt(1 + beta_gamma**2)
         n%p(3) = n%p(3) * gamma + p%p(0) * beta_gamma
      end if
    end function axis_from_p_b3
```

4.2.14   Special functions

The standard phase space function:

⟨*Lorentz: public functions*⟩+≡
```
    public :: lambda
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function lambda (m1sq, m2sq, m3sq)
      real(default) :: lambda
      real(default), intent(in) :: m1sq, m2sq, m3sq
      lambda = (m1sq - m2sq - m3sq)**2 - 4*m2sq*m3sq
    end function lambda
```

Return a pair of head-to-head colliding momenta, given the collider energy, particle masses, and optionally the momentum of the c.m. system.

⟨*Lorentz: public functions*⟩+≡
```
    public :: colliding_momenta
```

⟨*Lorentz: procedures*⟩+≡
```
    function colliding_momenta (sqrts, m, p_cm) result (p)
      type(vector4_t), dimension(2) :: p
      real(default), intent(in) :: sqrts
      real(default), dimension(2), intent(in), optional :: m
      real(default), intent(in), optional :: p_cm
      real(default), dimension(2) :: dmsq
      real(default) :: ch, sh
      real(default), dimension(2) :: E0, p0
      integer, dimension(2), parameter :: sgn = (/1, -1/)
      if (sqrts == 0) then
         call msg_fatal (" Colliding beams: sqrts is zero (please set sqrts)")
         p = vector4_null;  return
      else if (sqrts <= 0) then
         call msg_fatal (" Colliding beams: sqrts is negative")
         p = vector4_null;  return
      end if
      if (present (m)) then
         dmsq = sgn * (m(1)**2-m(2)**2)
         E0 = (sqrts + dmsq/sqrts) / 2
         if (any (E0 < m)) then
            call msg_fatal &
                 (" Colliding beams: beam energy is less than particle mass")
            p = vector4_null;  return
         end if
         p0 = sgn * sqrt (E0**2 - m**2)
      else
         E0 = sqrts / 2
         p0 = sgn * E0
      end if
      if (present (p_cm)) then
         sh = p_cm / sqrts
         ch = sqrt (1 + sh**2)
         p = vector4_moving (E0 * ch + p0 * sh, E0 * sh + p0 * ch, 3)
      else
         p = vector4_moving (E0, p0, 3)
      end if
    end function colliding_momenta
```

This subroutine is for the purpose of numerical checks and comparisons. The idea is to set a number to zero if it is numerically equivalent with zero. The equivalence is established by comparing with a `tolerance` argument. We implement this for vectors and transformations.

⟨*Lorentz: public functions*⟩+≡
```
    public :: pacify
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface pacify
       module procedure pacify_vector3
```

```
      module procedure pacify_vector4
      module procedure pacify_LT
    end interface pacify
```

⟨*Lorentz: procedures*⟩+≡

```
    elemental subroutine pacify_vector3 (p, tolerance)
      type(vector3_t), intent(inout) :: p
      real(default), intent(in) :: tolerance
      where (abs (p%p) < tolerance)  p%p = 0
    end subroutine pacify_vector3

    elemental subroutine pacify_vector4 (p, tolerance)
      type(vector4_t), intent(inout) :: p
      real(default), intent(in) :: tolerance
      where (abs (p%p) < tolerance)  p%p = 0
    end subroutine pacify_vector4

    elemental subroutine pacify_LT (LT, tolerance)
      type(lorentz_transformation_t), intent(inout) :: LT
      real(default), intent(in) :: tolerance
      where (abs (LT%L) < tolerance)  LT%L = 0
    end subroutine pacify_LT
```

4.3 Special Physics functions

Here, we declare functions that are specific for the Standard Model, including QCD: fixed and running α_s, Catani-Seymour dipole terms, loop functions, etc.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

⟨sm_physics.f90⟩≡
  ⟨*File header*⟩

  ```
  module sm_physics
  ```

  ⟨*Use kinds*⟩
  ```
    use constants !NODEP!
  ```
  ⟨*Use file utils*⟩
  ```
    use limits, only: MZ_REF, ALPHA_QCD_MZ_REF, LAMBDA_QCD_REF !NODEP!
    use diagnostics !NODEP!
    use lorentz !NODEP!
  ```

  ⟨*Standard module head*⟩

  ⟨*SM physics: public*⟩

  ⟨*SM physics: parameters*⟩

  ```
  contains
  ```

  ⟨*SM physics: procedures*⟩

  ```
  end module sm_physics
  ```

4.3.1 Running α_s

First we set a reference value for $\alpha_s(M_Z) = 0.1178$.

⟨*Limits: public parameters*⟩+≡
  ```
    real(default), public, parameter :: MZ_REF = 91.188_default
    real(default), public, parameter :: ALPHA_QCD_MZ_REF = 0.1178_default
    real(default), public, parameter :: LAMBDA_QCD_REF = 200.e-3_default
  ```

Then we define the coefficients of the beta function of QCD (as a reference cf. the Particle Data Group), where n_f is the number of active flavors in two different schemes:

$$\beta_0 = 11 - \frac{2}{3}n_f \qquad (4.5)$$

$$\beta_1 = 51 - \frac{19}{3}n_f \qquad (4.6)$$

$$\beta_2 = 2857 - \frac{5033}{9}n_f + \frac{325}{27}n_f^2 \qquad (4.7)$$

$$b_0 = \frac{1}{12\pi} \left(11C_A - 2n_f\right) \tag{4.8}$$

$$b_1 = \frac{1}{24\pi^2} \left(17C_A^2 - 5C_A n_f - 3C_F n_f\right) \tag{4.9}$$

$$b_2 = \frac{1}{(4\pi)^3} \left(\frac{2857}{54}C_A^3 - \frac{1415}{54} * C_A^2 n_f - \frac{205}{18}C_A C_F n_f + C_F^2 n_f + \frac{79}{54}C_A n_f**2 + \frac{11}{9}C_F n_f**2\right) \tag{4.10}$$

⟨*SM physics: public*⟩≡
```
public :: beta0, beta1, beta2, coeff_b0, coeff_b1, coeff_b2
```

⟨*SM physics: procedures*⟩≡
```
pure function beta0 (nf)
  real(default), intent(in) :: nf
  real(default) :: beta0
  beta0 = 11.0_default - two/three * nf
end function beta0

pure function beta1 (nf)
  real(default), intent(in) :: nf
  real(default) :: beta1
  beta1 = 51.0_default - 19.0_default/three * nf
end function beta1

pure function beta2 (nf)
  real(default), intent(in) :: nf
  real(default) :: beta2
  beta2 = 2857.0_default - 5033.0_default / 9.0_default * &
                 nf + 325.0_default/27.0_default * nf**2
end function beta2

```

There should be two versions of running α_s, one which takes the scale and Λ_{QCD} as imput, and one which takes the scale and e.g. $\alpha_s(m_Z)$ as input. Here, we take the one which takes the QCD scale and scale as inputs from the PDG book.

4.3.2 Catani-Seymour Parameters

These are fundamental constants of the Catani-Seymour dipole formalism. Since the corresponding parameters for the gluon case depend on the number of flavors which is treated as an argument, there we do have functions and not parameters.

$$\gamma_q = \gamma_{\bar{q}} = \frac{3}{2}C_F \qquad \gamma_g = \frac{11}{6}C_A - \frac{2}{3}T_R N_f \qquad (4.11)$$

$$K_q = K_{\bar{q}} = \left(\frac{7}{2} - \frac{\pi^2}{6}\right)C_F \qquad K_g = \left(\frac{67}{18} - \frac{\pi^2}{6}\right)C_A - \frac{10}{9}T_R N_f \qquad (4.12)$$

⟨*SM physics: parameters*⟩≡
```
    real(kind=default), parameter, public ::  gamma_q = three/two * CF, &
      k_q = (7.0_default/two - pi**2/6.0_default) * CF
```

⟨*SM physics: public*⟩+≡
```
    public :: gamma_g, k_g
```

⟨*SM physics: procedures*⟩+≡

   kg = (67.0_default/18.0_default - pi**2/6.0_default) * CA - &
             10.0_default/9.0_default * TR * nf
end function k_g
```

4.3.3 Mathematical Functions

The dilogarithm. This simplified version is bound to double precision, and restricted to argument values less or equal to unity, so we do not need complex algebra. The wrapper converts it to default precision (which is, of course, a no-op if double=default).

The routine calculates the dilogarithm through mapping on the area where there is a quickly convergent series (adapted from an F77 routine by Hans Kuijf, 1988): Map x such that x is not in the neighbourhood of 1. Note that $|z| = -\ln(1-x)$ is always smaller than 1.10, but $\frac{1 \cdot 10^{19}}{19!}$Bernoulli$_{19} = 2.7 \times 10^{-15}$.

⟨*SM physics: public*⟩+≡

```

4.3.6   Functions for Catani-Seymour dipoles

For the automated Catani-Seymour dipole subtraction, we need the following
functions.

⟨*SM physics: public*⟩+≡
```
    public :: ff_dipole
```

⟨*SM physics: procedures*⟩+≡
```
    pure subroutine ff_dipole (v_ijk,y_ijk,p_ij,pp_k,p_i,p_j,p_k)
        type(vector4_t), intent(in) :: p_i, p_j, p_k
        type(vector4_t), intent(out) :: p_ij, pp_k
        real(kind=default), intent(out) :: y_ijk
        real(kind=default) :: z_i
        real(kind=default), intent(out) :: v_ijk
        z_i   = (p_i*p_k) / ((p_k*p_j) + (p_k*p_i))
        y_ijk = (p_i*p_j) / ((p_i*p_j) + (p_i*p_k) + (p_j*p_k))
        p_ij  = p_i + p_j - y_ijk/(1.0_default - y_ijk) * p_k
        pp_k  = (1.0/(1.0_default - y_ijk)) * p_k
        !!! We don't multiply by alpha_s right here:
        v_ijk = 8.0_default * PI * CF * &
            (2.0 / (1.0 - z_i*(1.0 - y_ijk)) - (1.0 + z_i))
    end subroutine ff_dipole
```

⟨*SM physics: public*⟩+≡
```
    public :: fi_dipole
```

⟨*SM physics: procedures*⟩+≡
```
    pure subroutine fi_dipole (v_ija,x_ija,p_ij,pp_a,p_i,p_j,p_a)
      type(vector4_t), intent(in) :: p_i, p_j, p_a
      type(vector4_t), intent(out) :: p_ij, pp_a
      real(kind=default), intent(out) :: x_ija
      real(kind=default) :: z_i
      real(kind=default), intent(out) :: v_ija
      z_i   = (p_i*p_a) / ((p_a*p_j) + (p_a*p_i))
      x_ija = ((p_i*p_a) + (p_j*p_a) - (p_i*p_j)) &
```

```
          / ((p_i*p_a) + (p_j*p_a))
      p_ij  = p_i + p_j - (1.0_default - x_ija) * p_a
      pp_a  = x_ija * p_a
      !!! We don't not multiply by alpha_s right here:
      v_ija = 8.0_default * PI * CF * &
          (2.0 / (1.0 - z_i + (1.0 - x_ija)) - (1.0 + z_i)) / x_ija
    end subroutine fi_dipole
```

⟨*SM physics: public*⟩+≡
```
    public :: if_dipole
```

⟨*SM physics: procedures*⟩+≡
```
    pure subroutine if_dipole (v_kja,u_j,p_aj,pp_k,p_k,p_j,p_a)
      type(vector4_t), intent(in) :: p_k, p_j, p_a
      type(vector4_t), intent(out) :: p_aj, pp_k
      real(kind=default), intent(out) :: u_j
      real(kind=default) :: x_kja
      real(kind=default), intent(out) :: v_kja
      u_j   = (p_a*p_j) / ((p_a*p_j) + (p_a*p_k))
      x_kja = ((p_a*p_k) + (p_a*p_j) - (p_j*p_k)) &
            / ((p_a*p_j) + (p_a*p_k))
      p_aj  = x_kja * p_a
      pp_k  = p_k + p_j - (1.0_default - x_kja) * p_a
      v_kja = 8.0_default * PI * CF * &
            (2.0 / (1.0 - x_kja + u_j) - (1.0 + x_kja)) / x_kja
    end subroutine if_dipole
```

This function depends on a variable number of final state particles whose kinematics all get changed by the initial-initial dipole insertion.

⟨*SM physics: public*⟩+≡
```
    public :: ii_dipole

        else
           p_out(1) = p_b
           p_out(2) = p_aj
        end if
        v_jab = 8.0_default * PI * CF * &
              (2.0 / (1.0 - x_jab) - (1.0 + x_jab)) / x_jab
    end subroutine ii_dipole
```

4.3.7 Distributions for integrated dipoles and such

The Dirac delta distribution, modified for Monte-Carlo sampling:

⟨*SM physics: public*⟩+≡
```
    public :: delta
```

⟨*SM physics: procedures*⟩+≡
```
    elemental function delta (x,eps) result (z)
      real(kind=default), intent(in) :: x, eps
      real(kind=default) :: z
      if (x > 1.0_default - eps) then
         z = 1.0_default/eps
      else
         z = 0
      end if
    end function delta
```

The +-distribution, $P_+(x) = \left(\frac{1}{1-x}\right)_+$, for the regularization of soft-collinear singularities. The constant part for the Monte-Carlo sampling is the integral over the splitting function divided by the weight for the WHIZARD numerical integration over the interval.

⟨*SM physics: public*⟩+≡
```
    public :: plus_distr
```

⟨*SM physics: procedures*⟩+≡
```
    elemental function plus_distr (x,eps) result (plusd)
      real(kind=default), intent(in) :: x, eps
      real(kind=default) :: plusd
      if (x > (1.0_default - eps)) then
         plusd = log(eps)/eps
      else
         plusd = one/(one-x)
```

```
            end if
         end function plus_distr
```

The splitting function in $D = 4$ dimensions, regularized as $+$-distributions if necessary:

$$P^{qq}(x) = P^{\bar{q}\bar{q}}(x) = C_F \cdot \left(\frac{1 + x^2}{1 - x}\right)_+ \tag{4.13}$$

$$P^{qg}(x) = P^{\bar{q}g}(x) = C_F \cdot \frac{1 + (1 - x)^2}{x} \tag{4.14}$$

$$P^{gq}(x) = P^{g\bar{q}}(x) = T_R \cdot \left[x^2 + (1 - x)^2\right] \tag{4.15}$$

$$P^{gg}(x) = 2C_A\left[\left(\frac{1}{1 - x}\right)_+ + \frac{1 - x}{x} - 1 + x(1 - x)\right] + \delta(1 - x)\left(\frac{11}{6}C_A - \frac{2}{3}N_f T_R\right) \tag{4.16}$$

Since the number of flavors summed over in the gluon splitting function might depend on the physics case under consideration it is implemented as an input variable.

⟨*SM physics: public*⟩+≡
```
    public :: pqq
```

⟨*SM physics: procedures*⟩+≡
```
    elemental function pqq (x,eps) result (pqqx)
      real(kind=default), intent(in) :: x, eps
      real(kind=default) :: pqqx
      if (x > (1.0_default - eps)) then
         pqqx = (eps-one)/two + two*log(eps)/eps - three*(eps-one)/eps/two
      else
         pqqx = (one + x**2)/(one-x)
      end if
      pqqx = CF * pqqx
    end function pqq
```

⟨*SM physics: public*⟩+≡
```
    public :: pgq
```

⟨*SM physics: procedures*⟩+≡
```
    elemental function pgq (x) result (pgqx)
      real(kind=default), intent(in) :: x
      real(kind=default) :: pgqx
      pgqx = TR * (x**2 + (one - x)**2)
    end function pgq
```

⟨*SM physics: public*⟩+≡
```
    public :: pqg
```

⟨*SM physics: procedures*⟩+≡
```
    elemental function pqg (x) result (pqgx)
      real(kind=default), intent(in) :: x
      real(kind=default) :: pqgx
      pqgx = CF * (one + (one - x)**2) / x
    end function pqg
```

```
    public :: pgg
```
```
    elemental function pgg (x, nf, eps) result (pggx)
      real(kind=default), intent(in) :: x, nf, eps
      real(kind=default) :: pggx
      pggx = two * CA * ( plus_distr (x, eps) + (one-x)/x - one + &
                    x*(one-x)) + delta (x, eps)  * gamma_g(nf)
    end function pgg
```

For the *qq* and *gg* cases, there exist "regularized" versions of the splitting functions:

$$P_{\text{reg}}^{qq}(x) = -C_F \cdot (1 + x) \tag{4.17}$$

$$P_{\text{reg}}^{gg}(x) = 2C_A \left[\frac{1-x}{x} - 1 + x(1-x) \right] \tag{4.18}$$

$$\tag{4.19}$$

```
    public :: pqq_reg
```
```
    elemental function pqq_reg (x) result (pqqregx)
      real(kind=default), intent(in) :: x
      real(kind=default) :: pqqregx
      pqqregx = - CF * (one + x)
    end function pqq_reg
```

```
    public :: pgg_reg
```
```
    elemental function pgg_reg (x) result (pggregx)
      real(kind=default), intent(in) :: x
      real(kind=default) :: pggregx
      pggregx = two * CA * ((one - x)/x - one + x*(one - x))
    end function pgg_reg
```

Here, we collect the expressions needed for integrated Catani-Seymour dipoles, and the so-called flavor kernels. We always distinguish between the "ordinary" Catani-Seymour version, and the one including a phase-space slicing parameter, α.

The standard flavor kernels $\overline{K}^{ab}$ are:

$$\overline{K}^{qg}(x) = \overline{K}^{\bar{q}g}(x) = P^{qg}(x)\log((1-x)/x) + CF \times x \tag{4.20}$$

$$\overline{K}^{gq}(x) = \overline{K}^{g\bar{q}}(x) = P^{gq}(x)\log((1-x)/x) + TR \times 2x(1-x) \tag{4.21}$$

$$\overline{K}^{qq} = C_F \left[\left(\frac{2}{1-x} \log \frac{1-x}{x} \right)_+ - (1+x)\log((1-x)/x) + (1-x) \right] - (5 - \pi^2) \cdot C_F \cdot \delta(1-x) \tag{4.22}$$

$$\overline{K}^{gg} = 2C_A \left[\left(\frac{1}{1-x} \log \frac{1-x}{x} \right)_+ + \left(\frac{1-x}{x} - 1 + x(1-x) \right) \log((1-x)/x) \right] - delta(1-x) \left[(f \right. \tag{4.23}$$

284

⟨*SM physics: public*⟩+≡
```

  ktildeggx = pgg_reg (x) * log(one-x) + CA * ( - &
      log2_plus_distr (x,eps) - pi**2/three * delta(x,eps))
end function ktildegg
```

The insertion operator might not be necessary for a GOLEM interface but is demanded by the Les Houches NLO accord. It is a three-dimensional array, where the index always gives the inverse power of the DREG expansion parameter, ϵ.

⟨*SM physics: public*⟩+≡
```
public :: insert_q
```
⟨*SM physics: procedures*⟩+≡
```
pure function insert_q ()
  real(kind=default), dimension(0:2) :: insert_q
  insert_q(0) = gamma_q + k_q - pi**2/three * CF
  insert_q(1) = gamma_q
  insert_q(2) = CF
end function insert_q
```

⟨*SM physics: public*⟩+≡
```
    public :: insert_g
```

⟨*SM physics: procedures*⟩+≡
```
    pure function insert_g (nf)
      real(kind=default), intent(in) :: nf
      real(kind=default), dimension(0:2) :: insert_g
      insert_g(0) = gamma_g (nf) + k_g (nf) - pi**2/three * CA
      insert_g(1) = gamma_g (nf)
      insert_g(2) = CA
    end function insert_g
```

For better convergence, one can exclude regions of phase space with a slicing parameter from the dipole subtraction procedure. First of all, the K functions get modified:

$$K_i(\alpha) = K_i - \mathbf{T}_i^2 \log^2 \alpha + \gamma_i(\alpha - 1 - \log \alpha) \tag{4.25}$$

⟨*SM physics: public*⟩+≡
```
    public :: k_q_al, k_g_al
```

⟨*SM physics: procedures*⟩+≡
```
    pure function k_q_al (alpha)
      real(kind=default), intent(in) :: alpha
      real(kind=default) :: k_q_al
      k_q_al = k_q - CF * (log(alpha))**2 + gamma_q * &
                       (alpha - one - log(alpha))
    end function k_q_al

    pure function k_g_al (alpha, nf)
      real(kind=default), intent(in) :: alpha, nf
      real(kind=default) :: k_g_al
      k_g_al = k_g (nf) - CA * (log(alpha))**2 + gamma_g (nf) * &
                       (alpha - one - log(alpha))
    end function k_g_al
```

The +-distribution, but with a phase-space slicing parameter, α, $P_{1-alpha}(x) = \left(\frac{1}{1-x}\right)_{1-x}$. Since we need the fatal error message here, this function cannot be elemental.

⟨*SM physics: public*⟩+≡
```
    public :: plus_distr_al
```

⟨*SM physics: procedures*⟩+≡
```
    function plus_distr_al (x,alpha,eps) result (plusd_al)
       real(kind=default), intent(in) :: x,  eps, alpha
       real(kind=default) :: plusd_al
       if ((1.0_default - alpha) .ge. (1.0_default - eps)) then
          call msg_fatal ('sm_physics, plus_distr_al: alpha and epsilon chosen wrongly')
       elseif (x < (1.0_default - alpha)) then
          plusd_al = 0
       else if (x > (1.0_default - eps)) then
          plusd_al = log(eps/alpha)/eps
       else
          plusd_al = one/(one-x)
       end if
```

```
    end function plus_distr_al
```

Introducing phase-space slicing parameters, these flavor kernels become: The standard flavor kernels $\overline{K}^{ab}$ are:

$$\overline{K}^{qg}_\alpha(x) = \overline{K}^{\bar{q}g}_\alpha(x) = P^{qg}(x)\log(\alpha(1-x)/x) + CF \times x \qquad (4.26)$$

$$\overline{K}^{gq}_\alpha(x) = \overline{K}^{g\bar{q}}_\alpha(x) = P^{gq}(x)\log(\alpha(1-x)/x) + TR \times 2x(1-x) \qquad (4.27)$$

$$\overline{K}^{qq}_\alpha = C_F(1-x) + P^{qq}_{\text{reg}}(x)\log\frac{\alpha(1-x)}{x} + C_F\delta(1-x)\log^2\alpha + C_F\left(\frac{2}{1-x}\log\frac{1-x}{x}\right)_+ - \left(\gamma_q -\right. \qquad (4.28)$$

⟨*SM physics: public*⟩+≡

  ktildeqqx = pqq_reg(x) * log((one-x)/alpha) + CF*( &
        - log2_plus_distr_al(x,alpha,eps) - Pi**2/three * delta(x,eps) &
        + (one+x**2)/(one-x) * log(min(one,(alpha/(one-x)))) &
        + two/(one-x) * log((one+alpha-x)/alpha))
  if (x > (one-alpha)) then
     ktildeqqx = ktildeqqx - CF*two/(one-x)*log(two-x)
  end if
end function ktildeqq_al
```

This is a logarithmic +-distribution, $\left(\frac{\log((1-x)/x)}{1-x}\right)_+$. For the sampling, we need the integral over this function over the incomplete sampling interval $[0, 1-\epsilon]$, which is $\log^2(x) + 2Li_2(x) - \frac{\pi^2}{3}$. As this function is negative definite for $\epsilon > 0.1816$, we take a hard upper limit for that sampling parameter, irrespective of the fact what the user chooses.

⟨*SM physics: public*⟩+≡
```

      else
         lpd_al = two*log(one/(one-x))/(one-x)
      end if
    end function log2_plus_distr_al
```

4.4   QCD Coupling

We provide various distinct implementations of the QCD coupling. In this module, we define an abstract data type and three implementations: fixed, running with $\alpha_s(M_Z)$ as input, and running with Λ_{QCD} as input. We use the functions defined above in the module sm_physics but provide a common interface. Later modules may define additional implementations.

⟨sm_qcd.f90⟩≡
  ⟨*File header*⟩

```
  module sm_qcd
```

  ⟨*Use kinds*⟩
  ⟨*Use file utils*⟩

```
      use limits, only: FMT_12, MZ_REF, ALPHA_QCD_MZ_REF, LAMBDA_QCD_REF !NODEP!
      use diagnostics !NODEP!
      use md5
      use unit_tests

      use sm_physics !NODEP!
```

⟨*Standard module head*⟩

⟨*SM qcd: public*⟩

⟨*SM qcd: types*⟩

⟨*SM qcd: interfaces*⟩

```

```

⟨*SM qcd: procedures*⟩

⟨*SM qcd: tests*⟩

```
      end module sm_qcd
```

4.4.1 Coupling: Abstract Data Type

This is the abstract version of the QCD coupling implementation.

⟨*SM qcd: public*⟩≡
```
      public :: alpha_qcd_t
```

⟨*SM qcd: types*⟩≡
```
      type, abstract :: alpha_qcd_t
       contains
       ⟨SM qcd: alpha qcd: TBP⟩
      end type alpha_qcd_t
```

There must be an output routine.

⟨*SM qcd: alpha qcd: TBP*⟩≡
```
      procedure (alpha_qcd_write), deferred :: write
```

⟨*SM qcd: interfaces*⟩≡
```
      abstract interface
         subroutine alpha_qcd_write (object, unit)
           import
           class(alpha_qcd_t), intent(in) :: object
           integer, intent(in), optional :: unit
         end subroutine alpha_qcd_write
      end interface
```

This method computes the running coupling, given a certain scale. All parameters (reference value, order of the approximation, etc.) must be set before calling this.

⟨*SM qcd: alpha qcd: TBP*⟩+≡
```
      procedure (alpha_qcd_get), deferred :: get
```

⟨*SM qcd: interfaces*⟩+≡
```
abstract interface
   function alpha_qcd_get (alpha_qcd, scale) result (alpha)
     import
     class(alpha_qcd_t), intent(in) :: alpha_qcd
     real(default), intent(in) :: scale
     real(default) :: alpha
   end function alpha_qcd_get
end interface
```

4.4.2   Fixed Coupling

In this version, the α_s value is fixed, the `scale` argument of the `get` method is ignored. There is only one parameter, the value. By default, this is the value at M_Z.

⟨*SM qcd: public*⟩+≡
```
public :: alpha_qcd_fixed_t
```

⟨*SM qcd: types*⟩+≡
```
type, extends (alpha_qcd_t) :: alpha_qcd_fixed_t
   real(default) :: val = ALPHA_QCD_MZ_REF
 contains
 ⟨SM qcd: alpha qcd fixed: TBP⟩
end type alpha_qcd_fixed_t
```

Output.

⟨*SM qcd: alpha qcd fixed: TBP*⟩≡
```
procedure :: write => alpha_qcd_fixed_write
```

⟨*SM qcd: procedures*⟩≡
```
subroutine alpha_qcd_fixed_write (object, unit)
  class(alpha_qcd_fixed_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
  write (u, "(3x,A)")  "QCD parameters (fixed coupling):"
  write (u, "(5x,A," // FMT_12 // ")")  "alpha = ", object%val
end subroutine alpha_qcd_fixed_write
```

Calculation: the scale is ignored in this case.

⟨*SM qcd: alpha qcd fixed: TBP*⟩+≡
```
procedure :: get => alpha_qcd_fixed_get
```

⟨*SM qcd: procedures*⟩+≡
```
function alpha_qcd_fixed_get (alpha_qcd, scale) result (alpha)
  class(alpha_qcd_fixed_t), intent(in) :: alpha_qcd
  real(default), intent(in) :: scale
  real(default) :: alpha
  alpha = alpha_qcd%val
end function alpha_qcd_fixed_get
```

4.4.3 Running Coupling

In this version, the α_s value runs relative to the value at a given reference scale. There are two parameters: the value of this scale (default: M_Z), the value of α_s at this scale, and the number of effective flavors. Furthermore, we have the order of the approximation.

⟨*SM qcd: public*⟩+≡
```
public :: alpha_qcd_from_scale_t
```

⟨*SM qcd: types*⟩+≡
```
type, extends (alpha_qcd_t) :: alpha_qcd_from_scale_t
   real(default) :: mu_ref = MZ_REF
   real(default) :: ref = ALPHA_QCD_MZ_REF
   integer :: order = 0
   integer :: nf = 5
 contains
 ⟨SM qcd: alpha qcd from scale: TBP⟩
 end type alpha_qcd_from_scale_t
```

Output.

⟨*SM qcd: alpha qcd from scale: TBP*⟩≡
```
procedure :: write => alpha_qcd_from_scale_write
```

⟨*SM qcd: procedures*⟩+≡
```
subroutine alpha_qcd_from_scale_write (object, unit)
  class(alpha_qcd_from_scale_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
  write (u, "(3x,A)")  "QCD parameters (running coupling):"
  write (u, "(5x,A," // FMT_12 // ")")  "Scale mu  = ", object%mu_ref
  write (u, "(5x,A," // FMT_12 // ")")  "alpha(mu) = ", object%ref
  write (u, "(5x,A,I0)")     "LL order  = ", object%order
  write (u, "(5x,A,I0)")     "N(flv)    = ", object%nf
end subroutine alpha_qcd_from_scale_write
```

Calculation: here, we call the function for running α_s that was defined in `sm_physics` above. The function does not take into account thresholds, so the number of flavors should be the correct one for the chosen scale. Normally, this should be the Z boson mass.

⟨*SM qcd: alpha qcd from scale: TBP*⟩+≡
```
procedure :: get => alpha_qcd_from_scale_get
```

⟨*SM qcd: procedures*⟩+≡
```
function alpha_qcd_from_scale_get (alpha_qcd, scale) result (alpha)
  class(alpha_qcd_from_scale_t), intent(in) :: alpha_qcd
  real(default), intent(in) :: scale
  real(default) :: alpha
  alpha = running_as (scale, &
       alpha_qcd%ref, alpha_qcd%mu_ref, alpha_qcd%order, &
       real (alpha_qcd%nf, kind=default))
end function alpha_qcd_from_scale_get
```

4.4.4 Running Coupling, determined by $\Lambda_{\mathbf{QCD}}$

In this version, the input are the value Λ_{QCD} and the order of the approximation.

⟨*SM qcd: public*⟩+≡
```
public :: alpha_qcd_from_lambda_t
```

⟨*SM qcd: types*⟩+≡
```
type, extends (alpha_qcd_t) :: alpha_qcd_from_lambda_t
   real(default) :: lambda = LAMBDA_QCD_REF
   integer :: order = 0
   integer :: nf = 5
 contains
 ⟨SM qcd: alpha qcd from lambda: TBP⟩
 end type alpha_qcd_from_lambda_t
```

Output.

⟨*SM qcd: alpha qcd from lambda: TBP*⟩≡
```
procedure :: write => alpha_qcd_from_lambda_write
```

⟨*SM qcd: procedures*⟩+≡
```
subroutine alpha_qcd_from_lambda_write (object, unit)
  class(alpha_qcd_from_lambda_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
  write (u, "(3x,A)")  "QCD parameters (Lambda_QCD as input):"
  write (u, "(5x,A," // FMT_12 // ")")  "Lambda_QCD = ", object%lambda
  write (u, "(5x,A,I0)")     "LL order   = ", object%order
  write (u, "(5x,A,I0)")     "N(flv)     = ", object%nf
end subroutine alpha_qcd_from_lambda_write
```

Calculation: here, we call the second function for running α_s that was defined in `sm_physics` above. The Λ value should be the one that is appropriate for the chosen number of effective flavors. Again, thresholds are not incorporated.

⟨*SM qcd: alpha qcd from lambda: TBP*⟩+≡
```
procedure :: get => alpha_qcd_from_lambda_get
```

⟨*SM qcd: procedures*⟩+≡
```
function alpha_qcd_from_lambda_get (alpha_qcd, scale) result (alpha)
  class(alpha_qcd_from_lambda_t), intent(in) :: alpha_qcd
  real(default), intent(in) :: scale
  real(default) :: alpha
  alpha = running_as_lam (real (alpha_qcd%nf, kind=default), scale, &
       alpha_qcd%lambda, alpha_qcd%order)
end function alpha_qcd_from_lambda_get
```

4.4.5 Wrapper type

We could get along with a polymorphic QCD type, but a monomorphic wrapper type with a polymorphic component is easier to handle and probably safer (w.r.t. compiler bugs). However, we keep the object transparent, so we can set the type-specific parameters directly (by a `dispatch` routine).

⟨*SM qcd: public*⟩+≡

```
    public :: qcd_t
```
⟨*SM qcd: types*⟩+≡
```
    type :: qcd_t
      class(alpha_qcd_t), allocatable :: alpha
      character(32) :: md5sum = ""
     contains
     ⟨SM qcd: qcd: TBP⟩
    end type qcd_t
```

Output. We first print the polymorphic `alpha` which contains a headline, then any extra components.

⟨*SM qcd: qcd: TBP*⟩≡
```
    procedure :: write => qcd_write
```
⟨*SM qcd: procedures*⟩+≡
```
    subroutine qcd_write (qcd, unit, show_md5sum)
      class(qcd_t), intent(in) :: qcd
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: show_md5sum
      logical :: show_md5
      integer :: u
      u = output_unit (unit)
      show_md5 = .true.;  if (present (show_md5sum))  show_md5 = show_md5sum
      if (allocated (qcd%alpha)) then
         call qcd%alpha%write (u)
      else
         write (u, "(3x,A)")  "QCD parameters (coupling undefined)"
      end if
      if (show_md5 .and. qcd%md5sum /= "") &
           write (u, "(5x,A,A,A)") "md5sum = '", qcd%md5sum, "'"
    end subroutine qcd_write
```

Compute a MD5 sum for the `alpha_s` setup. This is done by writing them to a temporary file, using a standard format.

⟨*SM qcd: qcd: TBP*⟩+≡
```
    procedure :: compute_alphas_md5sum => qcd_compute_alphas_md5sum
```
⟨*SM qcd: procedures*⟩+≡
```
    subroutine qcd_compute_alphas_md5sum (qcd)
      class(qcd_t), intent(inout) :: qcd
      integer :: unit
      if (allocated (qcd%alpha)) then
         unit = free_unit ()
         open (unit, status="scratch", action="readwrite")
         call qcd%alpha%write (unit)
         rewind (unit)
         qcd%md5sum = md5sum (unit)
         close (unit)
      end if
    end subroutine qcd_compute_alphas_md5sum
```

Retrieve the MD5 sum of the qcd setup.

⟨SM qcd: qcd: TBP⟩+≡
```
procedure :: get_md5sum => qcd_get_md5sum
```

⟨SM qcd: procedures⟩+≡
```
function qcd_get_md5sum (qcd) result (md5sum)
  character(32) :: md5sum
  class(qcd_t), intent(inout) :: qcd
  md5sum = qcd%md5sum
end function qcd_get_md5sum
```

4.4.6 Unit tests

⟨SM qcd: public⟩+≡
```
public :: sm_qcd_test
```

⟨SM qcd: tests⟩≡
```
subroutine sm_qcd_test (u, results)
  integer, intent(in) :: u
  type(test_results_t), intent(inout) :: results
```
⟨SM qcd: execute tests⟩
```
end subroutine sm_qcd_test
```

QCD Coupling

We check two different implementations of the abstract QCD coupling.

⟨SM qcd: execute tests⟩≡
```
call test (sm_qcd_1, "sm_qcd_1", &
     "running alpha_s", &
     u, results)
```

⟨SM qcd: tests⟩+≡
```
subroutine sm_qcd_1 (u)
  integer, intent(in) :: u

```

Chapter 5

Physics Analysis

This part contains the structures and tools that are necessary for defining parameters, particle sets, analysis objects such as histograms, and expressions that deal with them.

These are the modules:

analysis Observables, histograms, and plots.

pdg_arrays Useful for particle aliases (e.g., 'quark' for u, d, s etc.)

prt_lists Particle lists/arrays used for analyzing events.

variables Store values of various kind, used by expressions and accessed by the command interface.

expressions Expressions of values of all kinds. Includes the API for recording analysis data.

5.1 Analysis tools

This module defines structures useful for data analysis. These include observables, histograms, and plots.

Observables are quantities that are calculated and summed up event by event. At the end, one can compute the average and error.

Histograms have their bins in addition to the observable properties. Histograms are usually written out in tables and displayed graphically.

In plots, each record creates its own entry in a table. This can be used for scatter plots if called event by event, or for plotting dependencies on parameters if called once per integration run.

Graphs are container for histograms and plots, which carry their own graphics options.

The type layout is still somewhat obfuscated. This would become much simpler if type extension could be used.

⟨`analysis.f90`⟩≡
  ⟨*File header*⟩

  ```
  module analysis
  ```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩

  ⟨*Analysis: types*⟩

  ⟨*Analysis: interfaces*⟩

  ⟨*Analysis: variables*⟩

  ```
  contains
  ```

  ⟨*Analysis: procedures*⟩

  ⟨*Analysis: tests*⟩

  ```
  end module analysis
  ```

5.1.1 Output formats

These formats share a common field width (alignment).

⟨*Limits: public parameters*⟩+≡
```
character(*), parameter, public :: HISTOGRAM_HEAD_FORMAT = "1x,A15,3x"
character(*), parameter, public :: HISTOGRAM_INTG_FORMAT = "3x,I9,3x"
character(*), parameter, public :: HISTOGRAM_DATA_FORMAT = FMT_19
```

5.1.2 Graph options

These parameters are used for displaying data. They apply to a whole graph, which may contain more than one plot element.

The GAMELAN code chunks are part of both `graph_options` and `drawing_options`. The `drawing_options` copy is used in histograms and plots, also as graph elements. The `graph_options` copy is used for `graph` objects as a whole. Both copies are usually identical.

⟨*Analysis: public*⟩≡
```
public :: graph_options_t
```

⟨*Analysis: types*⟩≡
```
type :: graph_options_t
  private
  type(string_t) :: id
  type(string_t) :: title
  type(string_t) :: description
  type(string_t) :: x_label
  type(string_t) :: y_label

      dro%gmlcode_bg = ""
      dro%gmlcode_fg = ""
    end subroutine drawing_options_init_plot
```

Set individual options.

⟨Analysis: public⟩+≡
```
    public :: drawing_options_set
```

⟨Analysis: procedures⟩+≡
```
    subroutine drawing_options_set (dro, dataset, &
        with_hbars, with_base, piecewise, fill, draw, err, symbols, &
        fill_options, draw_options, err_options, symbol, &
        gmlcode_bg, gmlcode_fg)
      type(drawing_options_t), intent(inout) :: dro
      type(string_t), intent(in), optional :: dataset
      logical, intent(in), optional :: with_hbars, with_base, piecewise
      logical, intent(in), optional :: fill, draw, err, symbols
      type(string_t), intent(in), optional :: fill_options, draw_options
      type(string_t), intent(in), optional :: err_options, symbol
      type(string_t), intent(in), optional :: gmlcode_bg, gmlcode_fg
      if (present (dataset))  dro%dataset = dataset
      if (present (with_hbars))  dro%with_hbars = with_hbars
      if (present (with_base))  dro%with_base = with_base
      if (present (piecewise))  dro%piecewise = piecewise
      if (present (fill))  dro%fill = fill
      if (present (draw))  dro%draw = draw
      if (present (err))  dro%err = err
      if (present (symbols))  dro%symbols = symbols
      if (present (fill_options))  dro%fill_options = fill_options
      if (present (draw_options))  dro%draw_options = draw_options
      if (present (err_options))  dro%err_options = err_options
      if (present (symbol))  dro%symbol = symbol
```

```
        if (present (gmlcode_bg))  dro%gmlcode_bg = gmlcode_bg
        if (present (gmlcode_fg))  dro%gmlcode_fg = gmlcode_fg
      end subroutine drawing_options_set
```

There are sepate commands for drawing the curve and for drawing errors. The symbols are applied to the latter. First of all, we may have to compute a baseline:

⟨*Analysis: procedures*⟩+≡
```
    function drawing_options_get_calc_command (dro) result (cmd)
      type(string_t) :: cmd
      type(drawing_options_t), intent(in) :: dro
      if (dro%with_base) then
         cmd = "calculate " // dro%dataset // ".base (" // dro%dataset // ") " & 
              // "(x, #0);"
      else
         cmd = ""
      end if
    end function drawing_options_get_calc_command
```

Return the drawing command.

⟨*Analysis: procedures*⟩+≡
```
    function drawing_options_get_draw_command (dro) result (cmd)
      type(string_t) :: cmd
      type(drawing_options_t), intent(in) :: dro
      if (dro%fill) then
         cmd = "fill"
      else if (dro%draw) then
         cmd = "draw"
      else
         cmd = ""
      end if
      if (dro%fill .or. dro%draw) then
         if (dro%piecewise)  cmd = cmd // " piecewise"
         if (dro%draw .and. dro%with_base)  cmd = cmd // " cyclic"
         cmd = cmd // " from (" // dro%dataset
         if (dro%with_base) then
            if (dro%piecewise) then
               cmd = cmd // ", " // dro%dataset // ".base/\"  ! "
            else
               cmd = cmd // " ~ " // dro%dataset // ".base\"  ! "
            end if
         end if
         cmd = cmd // ")"
         if (dro%fill) then
            cmd = cmd // " " // dro%fill_options
            if (dro%draw)  cmd = cmd // " outlined"
         end if
         if (dro%draw)  cmd = cmd // " " // dro%draw_options
         cmd = cmd // ";"
      end if
    end function drawing_options_get_draw_command
```

The error command draws error bars, if any.

⟨*Analysis: procedures*⟩+≡

```
function drawing_options_get_err_command (dro) result (cmd)
  type(string_t) :: cmd
  type(drawing_options_t), intent(in) :: dro
  if (dro%err) then
     cmd = "draw piecewise " &
          // "from (" // dro%dataset // ".err)" &
          // " " // dro%err_options // ";"
   else
      cmd = ""
   end if
end function drawing_options_get_err_command
```

The symbol command draws symbols, if any.

⟨*Analysis: procedures*⟩+≡

```
function drawing_options_get_symb_command (dro) result (cmd)
  type(string_t) :: cmd
  type(drawing_options_t), intent(in) :: dro
  if (dro%symbols) then

          // " from (" // dro%dataset // ")" &
          // " withsymbol (" // dro%symbol // ");"
   else
      cmd = ""
   end if
end function drawing_options_get_symb_command
```

Get extra GAMELAN code to be executed before and after the usual drawing commands.

⟨*Analysis: procedures*⟩+≡

```
function drawing_options_get_gml_bg_command (dro) result (cmd)
  type(string_t) :: cmd
  type(drawing_options_t), intent(in) :: dro
  cmd = dro%gmlcode_bg
end function drawing_options_get_gml_bg_command

function drawing_options_get_gml_fg_command (dro) result (cmd)
  type(string_t) :: cmd
  type(drawing_options_t), intent(in) :: dro
  cmd = dro%gmlcode_fg
end function drawing_options_get_gml_fg_command
```

5.1.4 Observables

The observable type holds the accumulated observable values and weight sums which are necessary for proper averaging.

⟨*Analysis: types*⟩+≡

```
type :: observable_t
  private
  real(default) :: sum_values = 0
```

```
      real(default) :: sum_squared_values = 0
      real(default) :: sum_weights = 0
      real(default) :: sum_squared_weights = 0
      integer :: count = 0
      type(string_t) :: obs_label
      type(string_t) :: obs_unit
      type(graph_options_t) :: graph_options
   end type observable_t
```

Initialize with defined properties

⟨*Analysis: procedures*⟩+≡

```
   subroutine observable_init (obs, obs_label, obs_unit, graph_options)
     type(observable_t), intent(out) :: obs
     type(string_t), intent(in), optional :: obs_label, obs_unit
     type(graph_options_t), intent(in), optional :: graph_options
     if (present (obs_label)) then
        obs%obs_label = obs_label
     else
        obs%obs_label = ""
     end if
     if (present (obs_unit)) then
        obs%obs_unit = obs_unit
     else
        obs%obs_unit = ""
     end if
     if (present (graph_options)) then
        obs%graph_options = graph_options
     else
        call graph_options_init (obs%graph_options)
     end if
   end subroutine observable_init
```

Reset all numeric entries.

⟨*Analysis: procedures*⟩+≡

```
   subroutine observable_clear (obs)
     type(observable_t), intent(inout) :: obs
     obs%sum_values = 0
     obs%sum_squared_values = 0
     obs%sum_weights = 0
     obs%sum_squared_weights = 0
     obs%count = 0
   end subroutine observable_clear
```

Record a a value. Always successful for observables.

⟨*Analysis: interfaces*⟩≡

```
   interface observable_record_value
      module procedure observable_record_value_unweighted
      module procedure observable_record_value_weighted
   end interface
```

⟨*Analysis: procedures*⟩+≡

```
   subroutine observable_record_value_unweighted (obs, value, success)
```

```
    type(observable_t), intent(inout) :: obs
    real(default), intent(in) :: value
    logical, intent(out), optional :: success
    obs%sum_values = obs%sum_values + value
    obs%sum_squared_values = obs%sum_squared_values + value**2
    obs%sum_weights = obs%sum_weights + 1
    obs%sum_squared_weights = obs%sum_squared_weights + 1
    obs%count = obs%count + 1
    if (present (success))  success = .true.
  end subroutine observable_record_value_unweighted

  subroutine observable_record_value_weighted (obs, value, weight, success)
    type(observable_t), intent(inout) :: obs
    real(default), intent(in) :: value, weight
    logical, intent(out), optional :: success
    obs%sum_values = obs%sum_values + value * weight
    obs%sum_squared_values = obs%sum_squared_values + value**2 * weight
    obs%sum_weights = obs%sum_weights + abs (weight)
    obs%sum_squared_weights = obs%sum_squared_weights + weight**2
    obs%count = obs%count + 1
    if (present (success))  success = .true.
  end subroutine observable_record_value_weighted
```

Here are the statistics formulas:

1. Unweighted case: Given a sample of n values x_i, the average is

$$\langle x \rangle = \frac{\sum x_i}{n} \tag{5.1}$$

and the error estimate

$$\Delta x = \sqrt{\frac{1}{n-1} \langle \sum (x_i - \langle x \rangle)^2} \tag{5.2}$$

$$= \sqrt{\frac{1}{n-1} \left(\frac{\sum x_i^2}{n} - \frac{(\sum x_i)^2}{n^2} \right)} \tag{5.3}$$

2. Weighted case: Instead of weight 1, each event comes with weight w_i.

$$\langle x \rangle = \frac{\sum x_i w_i}{\sum w_i} \tag{5.4}$$

and

$$\Delta x = \sqrt{\frac{1}{n-1} \left(\frac{\sum x_i^2 w_i}{\sum w_i} - \frac{(\sum x_i w_i)^2}{(\sum w_i)^2} \right)} \tag{5.5}$$

For $w_i = 1$, this specializes to the previous formula.

            obs_label, obs_unit, graph_options, drawing_options)
   end subroutine histogram_init_bin_width
```

Initialize a histogram by copying another one.

Since h has no pointer (sub)components, intrinsic assignment is sufficient. Optionally, we replace the drawing options.

⟨*Analysis: procedures*⟩+≡
```
   subroutine histogram_init_histogram (h, h_in, drawing_options)
     type(histogram_t), intent(out) :: h
     type(histogram_t), intent(in) :: h_in
     type(drawing_options_t), intent(in), optional :: drawing_options
     h = h_in
     if (present (drawing_options)) then
        h%drawing_options = drawing_options
     end if
   end subroutine histogram_init_histogram
```

Fill histograms

Clear the histogram contents, but do not modify the structure.

⟨*Analysis: procedures*⟩+≡
```
   subroutine histogram_clear (h)
     type(histogram_t), intent(inout) :: h
     call observable_clear (h%obs)
     call observable_clear (h%obs_within_bounds)
     call bin_clear (h%underflow)
     if (allocated (h%bin))  call bin_clear (h%bin)
     call bin_clear (h%overflow)
   end subroutine histogram_clear
```

Record a value. Successful if the value is within bounds, otherwise it is recorded as under-/overflow. Optionally, we may provide an excess weight that could be returned by the unweighting procedure.

⟨*Analysis: procedures*⟩+≡
```
   subroutine histogram_record_value_unweighted (h, value, excess, success)
     type(histogram_t), intent(inout) :: h
     real(default), intent(in) :: value
     real(default), intent(in), optional :: excess
     logical, intent(out), optional :: success
     integer :: i_bin
     call observable_record_value (h%obs, value)
     if (h%width /= 0) then
        i_bin = floor (((value - h%lower_bound) / h%width) * h%n_bins) + 1
     else
        i_bin = 0
     end if
     if (i_bin <= 0) then
        call bin_record_value (h%underflow, .false., 1._default, excess)
```

```
         if (present (success))  success = .false.
      else if (i_bin <= h%n_bins) then
         call observable_record_value (h%obs_within_bounds, value)
         call bin_record_value &
               (h%bin(i_bin), h%normalize_bins, 1._default, excess)
         if (present (success))  success = .true.
      else
         call bin_record_value (h%overflow, .false., 1._default, excess)
         if (present (success))  success = .false.
      end if
   end subroutine histogram_record_value_unweighted
```

Weighted events: analogous, but no excess weight.

⟨*Analysis: procedures*⟩+≡
```
   subroutine histogram_record_value_weighted (h, value, weight, success)
     type(histogram_t), intent(inout) :: h
     real(default), intent(in) :: value, weight
     logical, intent(out), optional :: success
     integer :: i_bin
     call observable_record_value (h%obs, value, weight)
     if (h%width /= 0) then
        i_bin = floor ((((value - h%lower_bound) / h%width) * h%n_bins) + 1
     else

Plots

⟨*Analysis: types*⟩+≡
```
    type :: plot_t
       private
       type(point_t), pointer :: first => null ()
       type(point_t), pointer :: last => null ()
       integer :: count = 0
       type(graph_options_t) :: graph_options
       type(drawing_options_t) :: drawing_options
    end type plot_t
```

Initializer/finalizer

Initialize a plot. We provide the lower and upper bound in the x direction.

⟨*Analysis: interfaces*⟩+≡
```
    interface plot_init
       module procedure plot_init_empty
       module procedure plot_init_plot
    end interface
```
⟨*Analysis: procedures*⟩+≡
```
    subroutine plot_init_empty (p, id, graph_options, drawing_options)
      type(plot_t), intent(out) :: p
      type(string_t), intent(in) :: id
      type(graph_options_t), intent(in), optional :: graph_options
      type(drawing_options_t), intent(in), optional :: drawing_options
      if (present (graph_options)) then
         p%graph_options = graph_options
      else
         call graph_options_init (p%graph_options)
      end if
      call graph_options_set (p%graph_options, id = id)
      if (present (drawing_options)) then
         p%drawing_options = drawing_options
      else
         call drawing_options_init_plot (p%drawing_options)
      end if
    end subroutine plot_init_empty
```

Initialize a plot by copying another one, optionally merging in a new set of
drawing options.

Since p has pointer (sub)components, we have to explicitly deep-copy the original.

⟨*Analysis: procedures*⟩+≡
```
subroutine plot_init_plot (p, p_in, drawing_options)
  type(plot_t), intent(out) :: p
  type(plot_t), intent(in) :: p_in
  type(drawing_options_t), intent(in), optional :: drawing_options
  type(point_t), pointer :: current, new
  current => p_in%first
  do while (associated (current))
     allocate (new)
     call point_init (new, current)
     if (associated (p%last)) then
        p%last%next => new
     else
        p%first => new
     end if
     p%last => new
     current => current%next
  end do
  p%count = p_in%count
  p%graph_options = p_in%graph_options
  if (present (drawing_options)) then
     p%drawing_options = drawing_options
  else
     p%drawing_options = p_in%drawing_options
  end if
end subroutine plot_init_plot
```

Finalize the plot by deallocating the list of points.

⟨*Analysis: procedures*⟩+≡
```
subroutine plot_final (plot)
  type(plot_t), intent(inout) :: plot
  type(point_t), pointer :: current
  do while (associated (plot%first))
     current => plot%first
     plot%first => current%next
     deallocate (current)
  end do
  plot%last => null ()
end subroutine plot_final
```

Fill plots

Clear the plot contents, but do not modify the structure.

⟨*Analysis: procedures*⟩+≡
```
subroutine plot_clear (plot)
  type(plot_t), intent(inout) :: plot
  plot%count = 0
  call plot_final (plot)
end subroutine plot_clear
```

Record a value. Successful if the value is within bounds, otherwise it is recorded as under-/overflow.

⟨*Analysis: procedures*⟩+≡

```
subroutine plot_record_value (plot, x, y, yerr, xerr, success)
  type(plot_t), intent(inout) :: plot
  real(default), intent(in) :: x, y
  real(default), intent(in), optional :: yerr, xerr
  logical, intent(out), optional :: success
  type(point_t), pointer :: point
  plot%count = plot%count + 1
  allocate (point)
  call point_init (point, x, y, yerr, xerr)
  if (associated (plot%first)) then
     plot%last%next => point
  else
     plot%first => point
  end if
  plot%last => point
  if (present (success))  success = .true.
end subroutine plot_record_value
```

Access contents

The number of points.

⟨*Analysis: procedures*⟩+≡

```
function plot_get_n_entries (plot) result (n)
  integer :: n
  type(plot_t), intent(in) :: plot
  n = plot%count
end function plot_get_n_entries
```

Return a pointer to the graph options.

⟨*Analysis: procedures*⟩+≡

```
function plot_get_graph_options_ptr (p) result (ptr)
  type(graph_options_t), pointer :: ptr
  type(plot_t), intent(in), target :: p
  ptr => p%graph_options
end function plot_get_graph_options_ptr
```

Return a pointer to the drawing options.

⟨*Analysis: procedures*⟩+≡

```
function plot_get_drawing_options_ptr (p) result (ptr)
  type(drawing_options_t), pointer :: ptr
  type(plot_t), intent(in), target :: p
  ptr => p%drawing_options
end function plot_get_drawing_options_ptr
```

Output

This output format is used by the GAMELAN driver below.

⟨*Analysis: procedures*⟩+≡
```
subroutine plot_write (plot, unit)
  type(plot_t), intent(in) :: plot
  integer, intent(in), optional :: unit
  type(point_t), pointer :: point
  integer :: u
  u = output_unit (unit);  if (u < 0)  return
  call point_write_header (u)
  point => plot%first
  do while (associated (point))
    call point_write (point, unit)
    point => point%next
  end do
  write (u, *)
  write (u, "(A,1x,A)")  "#", "Summary:"
  write (u, "(A,1x,I0)") &
      "n_entries =", plot_get_n_entries (plot)
  write (u, *)
end subroutine plot_write
```

Write the GAMELAN reader for plot contents.

⟨*Analysis: procedures*⟩+≡
```
subroutine plot_write_gml_reader (p, filename, unit)
  type(plot_t), intent(in) :: p
  type(string_t), intent(in) :: filename

        if (err_cmd /= "")  write (u, "(2x,A)")  char (err_cmd)
        symb_cmd = drawing_options_get_symb_command (p%drawing_options)
        if (symb_cmd /= "")  write (u, "(2x,A)")  char (symb_cmd)
        fg_cmd = drawing_options_get_gml_fg_command (p%drawing_options)
        if (fg_cmd /= "")  write (u, "(2x,A)")  char (fg_cmd)
        write (u, "(2x,A)")  char (graph_options_get_gml_x_label (p%graph_options))
        write (u, "(2x,A)")  char (graph_options_get_gml_y_label (p%graph_options))
        call graph_options_write_tex_footer (p%graph_options, unit)
      end subroutine plot_write_gml_driver
```

Append header for generic data output in ifile format.

⟨*Analysis: procedures*⟩+≡
```
    subroutine plot_get_header (plot, header, comment)
      type(plot_t), intent(in) :: plot
      type(ifile_t), intent(inout) :: header
      type(string_t), intent(in), optional :: comment
      type(string_t) :: c
      if (present (comment)) then
         c = comment
      else
         c = ""
      end if
      call ifile_append (header, c // "WHIZARD plot data")
      call graph_options_get_header (plot%graph_options, header, comment)
      call ifile_append (header, &
           c // "number of points: " &
           // int2char (plot_get_n_entries (plot)))
    end subroutine plot_get_header
```

5.1.8 Graphs

A graph is a container for several graph elements. Each graph element is ei-
ther a plot or a histogram. There is an appropriate base type below (the
`analysis_object_t`), but to avoid recursion, we define a separate base type
here. Note that there is no actual recursion: a graph is an analysis object, but
a graph cannot contain graphs.

(If we could use type extension, the implementation would be much more
transparent.)

Graph elements

Graph elements cannot be filled by the `record` command directly. The contents are always copied from elementary histograms or plots.

⟨*Analysis: types*⟩+≡
```
type :: graph_element_t
  private
  integer :: type = AN_UNDEFINED
  type(histogram_t), pointer :: h => null ()
  type(plot_t), pointer :: p => null ()
end type graph_element_t
```

⟨*Analysis: procedures*⟩+≡
```
subroutine graph_element_final (el)
  type(graph_element_t), intent(inout) :: el
  select case (el%type)
  case (AN_HISTOGRAM)
     deallocate (el%h)
  case (AN_PLOT)
     call plot_final (el%p)
     deallocate (el%p)
  end select
  el%type = AN_UNDEFINED
end subroutine graph_element_final
```

Return the number of entries in the graph element:

⟨*Analysis: procedures*⟩+≡
```
function graph_element_get_n_entries (el) result (n)
  integer :: n
  type(graph_element_t), intent(in) :: el
  select case (el%type)
  case (AN_HISTOGRAM);  n = histogram_get_n_entries (el%h)
  case (AN_PLOT);       n = plot_get_n_entries (el%p)
  case default;         n = 0
  end select
end function graph_element_get_n_entries
```

Return a pointer to the graph / drawing options.

⟨*Analysis: procedures*⟩+≡
```
function graph_element_get_graph_options_ptr (el) result (ptr)
  type(graph_options_t), pointer :: ptr
  type(graph_element_t), intent(in) :: el
  select case (el%type)
  case (AN_HISTOGRAM);  ptr => histogram_get_graph_options_ptr (el%h)
  case (AN_PLOT);       ptr => plot_get_graph_options_ptr (el%p)
  case default;         ptr => null ()
  end select
end function graph_element_get_graph_options_ptr

function graph_element_get_drawing_options_ptr (el) result (ptr)
  type(drawing_options_t), pointer :: ptr
  type(graph_element_t), intent(in) :: el
```

```
      select case (el%type)
      case (AN_HISTOGRAM);  ptr => histogram_get_drawing_options_ptr (el%h)
      case (AN_PLOT);       ptr => plot_get_drawing_options_ptr (el%p)
      case default;         ptr => null ()
      end select
    end function graph_element_get_drawing_options_ptr
```

Output, simple wrapper for the plot/histogram writer.

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_element_write (el, unit)
      type(graph_element_t), intent(in) :: el
      integer, intent(in), optional :: unit
      type(graph_options_t), pointer :: gro
      type(string_t) :: id
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      gro => graph_element_get_graph_options_ptr (el)
      id = graph_options_get_id (gro)
      write (u, "(A,A)")  '#', repeat ("-", 78)
      select case (el%type)
      case (AN_HISTOGRAM)
         write (u, "(A)", advance="no")  "# Histogram: "
         write (u, "(1x,A)")  char (id)
         call histogram_write (el%h, unit)
      case (AN_PLOT)
         write (u, "(A)", advance="no")  "# Plot: "
         write (u, "(1x,A)")  char (id)
         call plot_write (el%p, unit)
      end select
    end subroutine graph_element_write
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_element_write_gml_reader (el, filename, unit)
      type(graph_element_t), intent(in) :: el
      type(string_t), intent(in) :: filename
      integer, intent(in), optional :: unit
      select case (el%type)
      case (AN_HISTOGRAM);  call histogram_write_gml_reader (el%h, filename, unit)
      case (AN_PLOT);       call plot_write_gml_reader (el%p, filename, unit)
      end select
    end subroutine graph_element_write_gml_reader
```

The graph type

The actual graph type contains its own `graph_options`, which override the
individual settings. The `drawing_options` are set in the graph elements. This
distinction motivates the separation of the two types.

⟨*Analysis: types*⟩+≡
```
    type :: graph_t
      private
      type(graph_element_t), dimension(:), allocatable :: el
```

```
      type(graph_options_t) :: graph_options
   end type graph_t
```

Initializer/finalizer

The graph is created with a definite number of elements. The elements are filled
one by one, optionally with modified drawing options.

⟨*Analysis: procedures*⟩+≡
```
   subroutine graph_init (g, id, n_elements, graph_options)
     type(graph_t), intent(out) :: g
     type(string_t), intent(in) :: id
     integer, intent(in) :: n_elements
     type(graph_options_t), intent(in), optional :: graph_options
     allocate (g%el (n_elements))
     if (present (graph_options)) then
        g%graph_options = graph_options
     else
        call graph_options_init (g%graph_options)
     end if
     call graph_options_set (g%graph_options, id = id)
   end subroutine graph_init
```

⟨*Analysis: procedures*⟩+≡
```
   subroutine graph_insert_histogram (g, i, h, drawing_options)
     type(graph_t), intent(inout), target :: g
     integer, intent(in) :: i
     type(histogram_t), intent(in) :: h
     type(drawing_options_t), intent(in), optional :: drawing_options
     type(graph_options_t), pointer :: gro
     type(drawing_options_t), pointer :: dro
     type(string_t) :: id
     g%el(i)%type = AN_HISTOGRAM
     allocate (g%el(i)%h)
     call histogram_init_histogram (g%el(i)%h, h, drawing_options)
     gro => histogram_get_graph_options_ptr (g%el(i)%h)
     dro => histogram_get_drawing_options_ptr (g%el(i)%h)
     id = graph_options_get_id (gro)
     call drawing_options_set (dro, dataset = "dat." // id)
   end subroutine graph_insert_histogram
```

⟨*Analysis: procedures*⟩+≡
```
   subroutine graph_insert_plot (g, i, p, drawing_options)
     type(graph_t), intent(inout) :: g
     integer, intent(in) :: i
     type(plot_t), intent(in) :: p
     type(drawing_options_t), intent(in), optional :: drawing_options
     type(graph_options_t), pointer :: gro
     type(drawing_options_t), pointer :: dro
     type(string_t) :: id
     g%el(i)%type = AN_PLOT
     allocate (g%el(i)%p)
     call plot_init_plot (g%el(i)%p, p, drawing_options)
```

```
      gro => plot_get_graph_options_ptr (g%el(i)%p)
      dro => plot_get_drawing_options_ptr (g%el(i)%p)
      id = graph_options_get_id (gro)
      call drawing_options_set (dro, dataset = "dat." // id)
    end subroutine graph_insert_plot
```

Finalizer.

⟨*Analysis: procedures*⟩+≡

```
    subroutine graph_final (g)
      type(graph_t), intent(inout) :: g
      integer :: i
      do i = 1, size (g%el)
        call graph_element_final (g%el(i))
      end do
      deallocate (g%el)
    end subroutine graph_final
```

Access contents

The number of elements.

⟨*Analysis: procedures*⟩+≡

```
    function graph_get_n_elements (graph) result (n)
      integer :: n
      type(graph_t), intent(in) :: graph
      n = size (graph%el)
    end function graph_get_n_elements
```

Retrieve a pointer to the drawing options of an element, so they can be modi-
fied. (The `target` attribute is not actually needed because the components are
pointers.)

⟨*Analysis: procedures*⟩+≡

```
    function graph_get_drawing_options_ptr (g, i) result (ptr)
      type(drawing_options_t), pointer :: ptr
      type(graph_t), intent(in), target :: g
      integer, intent(in) :: i
      ptr => graph_element_get_drawing_options_ptr (g%el(i))
    end function graph_get_drawing_options_ptr
```

Output

The default output format just writes histogram and plot data.

⟨*Analysis: procedures*⟩+≡

```
    subroutine graph_write (graph, unit)
      type(graph_t), intent(in) :: graph
      integer, intent(in), optional :: unit
      integer :: i
      do i = 1, size (graph%el)
        call graph_element_write (graph%el(i), unit)
      end do
```

```
        end subroutine graph_write
```

The GAMELAN driver is not a simple wrapper, but it writes the plot/histogram
contents embedded the complete graph. First, data are read in, global back-
ground commands next, then individual elements, then global foreground com-
mands.

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_write_gml_driver (g, filename, unit)
      type(graph_t), intent(in) :: g
      type(string_t), intent(in) :: filename
      type(string_t) :: calc_cmd, bg_cmd, draw_cmd, err_cmd, symb_cmd, fg_cmd
      integer, intent(in), optional :: unit
      type(drawing_options_t), pointer :: dro
      integer :: u, i
      u = output_unit (unit);  if (u < 0)  return
      call graph_options_write_tex_header (g%graph_options, unit)
      write (u, "(2x,A)") &
           char (graph_options_get_gml_setup (g%graph_options))
      write (u, "(2x,A)") &
           char (graph_options_get_gml_graphrange (g%graph_options))
      do i = 1, size (g%el)
         call graph_element_write_gml_reader (g%el(i), filename, unit)
         calc_cmd = drawing_options_get_calc_command &
                       (graph_element_get_drawing_options_ptr (g%el(i)))
         if (calc_cmd /= "")  write (u, "(2x,A)")  char (calc_cmd)
      end do
      bg_cmd = graph_options_get_gml_bg_command (g%graph_options)
      if (bg_cmd /= "")  write (u, "(2x,A)")  char (bg_cmd)
      do i = 1, size (g%el)
         dro => graph_element_get_drawing_options_ptr (g%el(i))
         bg_cmd = drawing_options_get_gml_bg_command (dro)
         if (bg_cmd /= "")  write (u, "(2x,A)")  char (bg_cmd)
         draw_cmd = drawing_options_get_draw_command (dro)
         if (draw_cmd /= "")  write (u, "(2x,A)")  char (draw_cmd)
         err_cmd = drawing_options_get_err_command (dro)
         if (err_cmd /= "")  write (u, "(2x,A)")  char (err_cmd)
         symb_cmd = drawing_options_get_symb_command (dro)
         if (symb_cmd /= "")  write (u, "(2x,A)")  char (symb_cmd)
         fg_cmd = drawing_options_get_gml_fg_command (dro)
         if (fg_cmd /= "")  write (u, "(2x,A)")  char (fg_cmd)
      end do
      fg_cmd = graph_options_get_gml_fg_command (g%graph_options)
      if (fg_cmd /= "")  write (u, "(2x,A)")  char (fg_cmd)
      write (u, "(2x,A)")  char (graph_options_get_gml_x_label (g%graph_options))
      write (u, "(2x,A)")  char (graph_options_get_gml_y_label (g%graph_options))
      call graph_options_write_tex_footer (g%graph_options, unit)
    end subroutine graph_write_gml_driver
```

Append header for generic data output in ifile format.

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_get_header (graph, header, comment)
      type(graph_t), intent(in) :: graph
      type(ifile_t), intent(inout) :: header
```

```
type(string_t), intent(in), optional :: comment
type(string_t) :: c
if (present (comment)) then
   c = comment
else
   c = ""
end if
call ifile_append (header, c // "WHIZARD graph data")
call graph_options_get_header (graph%graph_options, header, comment)
call ifile_append (header, &
      c // "number of graph elements: " &
      // int2char (graph_get_n_elements (graph)))
end subroutine graph_get_header
```

5.1.9   Analysis objects

This data structure holds all observables, histograms and such that are currently active. We have one global store; individual items are identified by their ID strings.

(This should rather be coded by type extension.)

⟨*Analysis: parameters*⟩≡
```
integer, parameter :: AN_UNDEFINED = 0
integer, parameter :: AN_OBSERVABLE = 1
integer, parameter :: AN_HISTOGRAM = 2
integer, parameter :: AN_PLOT = 3
integer, parameter :: AN_GRAPH = 4
```

⟨*Analysis: public*⟩+≡
```
public :: AN_UNDEFINED, AN_HISTOGRAM, AN_OBSERVABLE, AN_PLOT, AN_GRAPH
```

⟨*Analysis: types*⟩+≡
```
type :: analysis_object_t
   private
   type(string_t) :: id
   integer :: type = AN_UNDEFINED
   type(observable_t), pointer :: obs => null ()
   type(histogram_t), pointer :: h => null ()
   type(plot_t), pointer :: p => null ()
   type(graph_t), pointer :: g => null ()
   type(analysis_object_t), pointer :: next => null ()
end type analysis_object_t
```

Initializer/finalizer

Allocate with the correct type but do not fill initial values.

⟨*Analysis: procedures*⟩+≡
```
subroutine analysis_object_init (obj, id, type)
  type(analysis_object_t), intent(out) :: obj
  type(string_t), intent(in) :: id
  integer, intent(in) :: type
  obj%id = id
```

```
      obj%type = type
      select case (obj%type)
      case (AN_OBSERVABLE);  allocate (obj%obs)
      case (AN_HISTOGRAM);   allocate (obj%h)
      case (AN_PLOT);        allocate (obj%p)
      case (AN_GRAPH);       allocate (obj%g)
      end select
    end subroutine analysis_object_init
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_object_final (obj)
      type(analysis_object_t), intent(inout) :: obj
      select case (obj%type)
      case (AN_OBSERVABLE)
         deallocate (obj%obs)
      case (AN_HISTOGRAM)
         deallocate (obj%h)
      case (AN_PLOT)
         call plot_final (obj%p)
         deallocate (obj%p)
      case (AN_GRAPH)
         call graph_final (obj%g)
         deallocate (obj%g)
      end select
      obj%type = AN_UNDEFINED
    end subroutine analysis_object_final
```

Clear the analysis object, i.e., reset it to its initial state. Not applicable to graphs, which are always combinations of other existing objects.

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_object_clear (obj)
      type(analysis_object_t), intent(inout) :: obj
      select case (obj%type)
      case (AN_OBSERVABLE)
         call observable_clear (obj%obs)
      case (AN_HISTOGRAM)
         call histogram_clear (obj%h)
      case (AN_PLOT)
         call plot_clear (obj%p)
      end select
    end subroutine analysis_object_clear
```

Fill with data

Record data. The effect depends on the type of analysis object.

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_object_record_data (obj, &
         x, y, yerr, xerr, weight, excess, success)
      type(analysis_object_t), intent(inout) :: obj
      real(default), intent(in) :: x
      real(default), intent(in), optional :: y, yerr, xerr, weight, excess
```

```
      logical, intent(out), optional :: success
      select case (obj%type)
      case (AN_OBSERVABLE)
         if (present (weight)) then
            call observable_record_value_weighted (obj%obs, x, weight, success)
         else
            call observable_record_value_unweighted (obj%obs, x, success)
         end if
      case (AN_HISTOGRAM)
         if (present (weight)) then
            call histogram_record_value_weighted (obj%h, x, weight, success)
         else
            call histogram_record_value_unweighted (obj%h, x, excess, success)
         end if
      case (AN_PLOT)
         if (present (y)) then
            call plot_record_value (obj%p, x, y, yerr, xerr, success)
         else
            if (present (success))  success = .false.
         end if
      case default
         if (present (success))  success = .false.
      end select
    end subroutine analysis_object_record_data
```

Explicitly set the pointer to the next object in the list.

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_object_set_next_ptr (obj, next)
      type(analysis_object_t), intent(inout) :: obj
      type(analysis_object_t), pointer :: next
      obj%next => next
    end subroutine analysis_object_set_next_ptr
```

Access contents

Return a pointer to the next object in the list.

⟨*Analysis: procedures*⟩+≡
```
    function analysis_object_get_next_ptr (obj) result (next)
      type(analysis_object_t), pointer :: next
      type(analysis_object_t), intent(in) :: obj
      next => obj%next
    end function analysis_object_get_next_ptr
```

Return data as appropriate for the object type.

⟨*Analysis: procedures*⟩+≡
```
    function analysis_object_get_n_elements (obj) result (n)
      integer :: n
      type(analysis_object_t), intent(in) :: obj
      select case (obj%type)
      case (AN_HISTOGRAM)
         n = 1
```

```fortran
    case (AN_PLOT)
       n = 1
    case (AN_GRAPH)
       n = graph_get_n_elements (obj%g)
    case default
       n = 0
    end select
end function analysis_object_get_n_elements

  select case (obj%type)
  case (AN_OBSERVABLE)
     n = observable_get_n_entries (obj%obs)
  case (AN_HISTOGRAM)
     wb = .false.;  if (present (within_bounds)) wb = within_bounds
     if (wb) then
        n = histogram_get_n_entries_within_bounds (obj%h)
     else
        n = histogram_get_n_entries (obj%h)
     end if
  case (AN_PLOT)
     n = plot_get_n_entries (obj%p)
  case default
     n = 0
  end select
end function analysis_object_get_n_entries

function analysis_object_get_average (obj, within_bounds) result (avg)
  real(default) :: avg
  type(analysis_object_t), intent(in) :: obj
  logical, intent(in), optional :: within_bounds
  logical :: wb
  select case (obj%type)
  case (AN_OBSERVABLE)
     avg = observable_get_average (obj%obs)
  case (AN_HISTOGRAM)
     wb = .false.;  if (present (within_bounds)) wb = within_bounds
     if (wb) then
        avg = histogram_get_average_within_bounds (obj%h)
     else
        avg = histogram_get_average (obj%h)
     end if
  case default
     avg = 0
  end select
end function analysis_object_get_average

function analysis_object_get_error (obj, within_bounds) result (err)
  real(default) :: err
  type(analysis_object_t), intent(in) :: obj
```

```
      logical, intent(in), optional :: within_bounds
      logical :: wb
      select case (obj%type)
      case (AN_OBSERVABLE)
         err = observable_get_error (obj%obs)
      case (AN_HISTOGRAM)
         wb = .false.;  if (present (within_bounds)) wb = within_bounds
         if (wb) then
            err = histogram_get_error_within_bounds (obj%h)
         else
            err = histogram_get_error (obj%h)
         end if
      case default
         err = 0
      end select
    end function analysis_object_get_error
```

Return pointers to the actual contents:

⟨*Analysis: procedures*⟩+≡

```
    function analysis_object_get_observable_ptr (obj) result (obs)
      type(observable_t), pointer :: obs
      type(analysis_object_t), intent(in) :: obj
      select case (obj%type)
      case (AN_OBSERVABLE);  obs => obj%obs
      case default;          obs => null ()
      end select
    end function analysis_object_get_observable_ptr

    function analysis_object_get_histogram_ptr (obj) result (h)
      type(histogram_t), pointer :: h

  case (AN_GRAPH)
     call graph_write_gml_driver (obj%g, filename, unit)
  end select
end subroutine analysis_object_write_driver
```

Return a data header for external formats, in ifile form.

⟨*Analysis: procedures*⟩+≡
```
subroutine analysis_object_get_header (obj, header, comment)
  type(analysis_object_t), intent(in) :: obj
  type(ifile_t), intent(inout) :: header
  type(string_t), intent(in), optional :: comment
  select case (obj%type)
  case (AN_HISTOGRAM)
     call histogram_get_header (obj%h, header, comment)
  case (AN_PLOT)
     call plot_get_header (obj%p, header, comment)
  end select
end subroutine analysis_object_get_header
```

5.1.10   Analysis object iterator

Analysis objects are containers which have iterable data structures: histograms/bins
and plots/points. If they are to be treated on a common basis, it is useful to
have an iterator which hides the implementation details.

   The iterator is used only for elementary analysis objects that contain plot

data: histograms or plots. It is invalid for meta-objects (graphs) and non-graphical objects (observables).

⟨*Analysis: public*⟩+≡
```
public :: analysis_iterator_t
```

⟨*Analysis: types*⟩+≡
```
type :: analysis_iterator_t
  private
  integer :: type = AN_UNDEFINED
  type(analysis_object_t), pointer :: object => null ()
  integer :: index = 1
  type(point_t), pointer :: point => null ()
end type
```

The initializer places the iterator at the beginning of the analysis object.

⟨*Analysis: procedures*⟩+≡
```
subroutine analysis_iterator_init (iterator, object)
  type(analysis_iterator_t), intent(out) :: iterator
  type(analysis_object_t), intent(in), target :: object
  iterator%object => object
  if (associated (iterator%object)) then
     iterator%type = iterator%object%type
     select case (iterator%type)
     case (AN_PLOT)
        iterator%point => iterator%object%p%first
     end select
  end if
end subroutine analysis_iterator_init
```

The iterator is valid as long as it points to an existing entry. An iterator for a data object without array data (observable) is always invalid.

⟨*Analysis: public*⟩+≡
```
public :: analysis_iterator_is_valid
```

⟨*Analysis: procedures*⟩+≡
```
function analysis_iterator_is_valid (iterator) result (valid)
  logical :: valid
  type(analysis_iterator_t), intent(in) :: iterator
  if (associated (iterator%object)) then
     select case (iterator%type)
     case (AN_HISTOGRAM)
        valid = iterator%index <= histogram_get_n_bins (iterator%object%h)
     case (AN_PLOT)
        valid = associated (iterator%point)
     case default
        valid = .false.
     end select
  else
     valid = .false.
  end if
end function analysis_iterator_is_valid
```

Advance the iterator.

⟨Analysis: public⟩+≡
```
    public :: analysis_iterator_advance
```

⟨Analysis: procedures⟩+≡
```
    subroutine analysis_iterator_advance (iterator)
      type(analysis_iterator_t), intent(inout) :: iterator
      if (associated (iterator%object)) then
         select case (iterator%type)
         case (AN_PLOT)
            iterator%point => iterator%point%next
         end select
         iterator%index = iterator%index + 1
      end if
    end subroutine analysis_iterator_advance
```

Retrieve the object type:

⟨Analysis: public⟩+≡
```
    public :: analysis_iterator_get_type
```

⟨Analysis: procedures⟩+≡
```
    function analysis_iterator_get_type (iterator) result (type)
      integer :: type
      type(analysis_iterator_t), intent(in) :: iterator
      type = iterator%type
    end function analysis_iterator_get_type
```

Use the iterator to retrieve data. We implement a common routine which takes the data descriptors as optional arguments. Data which do not occur in the selected type trigger to an error condition.

The iterator must point to a valid entry.

⟨Analysis: public⟩+≡
```
    public :: analysis_iterator_get_data
```

⟨Analysis: procedures⟩+≡
```
    subroutine analysis_iterator_get_data (iterator, &
        x, y, yerr, xerr, width, excess, index, n_total)
      type(analysis_iterator_t), intent(in) :: iterator
      real(default), intent(out), optional :: x, y, yerr, xerr, width, excess
      integer, intent(out), optional :: index, n_total
      select case (iterator%type)
      case (AN_HISTOGRAM)
         if (present (x)) &
              x = bin_get_midpoint (iterator%object%h%bin(iterator%index))
         if (present (y)) &
              y = bin_get_sum (iterator%object%h%bin(iterator%index))
         if (present (yerr)) &
              yerr = bin_get_error (iterator%object%h%bin(iterator%index))
         if (present (xerr)) &
              call invalid ("histogram", "xerr")
         if (present (width)) &
              width = bin_get_width (iterator%object%h%bin(iterator%index))
         if (present (excess)) &
              excess = bin_get_excess (iterator%object%h%bin(iterator%index))
```

```
      if (present (index)) &
           index = iterator%index
      if (present (n_total)) &
           n_total = histogram_get_n_bins (iterator%object%h)
   case (AN_PLOT)
      if (present (x)) &
           x = point_get_x (iterator%point)
      if (present (y)) &
           y = point_get_y (iterator%point)
      if (present (yerr)) &
           yerr = point_get_yerr (iterator%point)
      if (present (xerr)) &
           xerr = point_get_xerr (iterator%point)
      if (present (width)) &
           call invalid ("plot", "width")
      if (present (excess)) &
           call invalid ("plot", "excess")
      if (present (index)) &
           index = iterator%index
      if (present (n_total)) &
           n_total = plot_get_n_entries (iterator%object%p)
   case default
      call msg_bug ("analysis_iterator_get_data: called " &
           // "for unsupported analysis object type")
   end select
 contains
   subroutine invalid (typestr, objstr)
     character(*), intent(in) :: typestr, objstr
     call msg_bug ("analysis_iterator_get_data: attempt to get '" &
          // objstr // "' for type '" // typestr // "'")
   end subroutine invalid
 end subroutine analysis_iterator_get_data
```

5.1.11   Analysis store

This data structure holds all observables, histograms and such that are currently
active. We have one global store; individual items are identified by their ID
strings and types.

⟨Analysis: variables⟩≡
```
    type(analysis_store_t), save :: analysis_store
```

⟨Analysis: types⟩+≡
```
    type :: analysis_store_t
      private
      type(analysis_object_t), pointer :: first => null ()
      type(analysis_object_t), pointer :: last => null ()
    end type analysis_store_t
```

Delete the analysis store
⟨Analysis: public⟩+≡
```
    public :: analysis_final
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_final ()
      type(analysis_object_t), pointer :: current
      do while (associated (analysis_store%first))
         current => analysis_store%first
         analysis_store%first => current%next
         call analysis_object_final (current)
      end do
      analysis_store%last => null ()
    end subroutine analysis_final
```

Append a new analysis object

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_store_append_object (id, type)
      type(string_t), intent(in) :: id
      integer, intent(in) :: type
      type(analysis_object_t), pointer :: obj
      allocate (obj)
      call analysis_object_init (obj, id, type)
      if (associated (analysis_store%last)) then
         analysis_store%last%next => obj
      else
         analysis_store%first => obj
      end if
      analysis_store%last => obj
    end subroutine analysis_store_append_object
```

Return a pointer to the analysis object with given ID.

⟨*Analysis: procedures*⟩+≡
```
    function analysis_store_get_object_ptr (id) result (obj)
      type(string_t), intent(in) :: id
      type(analysis_object_t), pointer :: obj
      obj => analysis_store%first
      do while (associated (obj))
         if (obj%id == id)  return
         obj => obj%next
      end do
    end function analysis_store_get_object_ptr
```

Initialize an analysis object: either reset it if present, or append a new entry.

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_store_init_object (id, type, obj)
      type(string_t), intent(in) :: id
      integer, intent(in) :: type
      type(analysis_object_t), pointer :: obj, next
      obj => analysis_store_get_object_ptr (id)
      if (associated (obj)) then
         next => analysis_object_get_next_ptr (obj)
         call analysis_object_final (obj)
         call analysis_object_init (obj, id, type)
         call analysis_object_set_next_ptr (obj, next)
      else
```

```
      call analysis_store_append_object (id, type)
      obj => analysis_store%last
    end if
  end subroutine analysis_store_init_object
```

Get the type of a analysis object

⟨*Analysis: public*⟩+≡
```
    public :: analysis_store_get_object_type
```

⟨*Analysis: procedures*⟩+≡
```
    function analysis_store_get_object_type (id) result (type)
      type(string_t), intent(in) :: id
      integer :: type
      type(analysis_object_t), pointer :: object
      object => analysis_store_get_object_ptr (id)
      if (associated (object)) then
        type = object%type
      else
        type = AN_UNDEFINED
      end if
    end function analysis_store_get_object_type
```

Return the number of objects in the store.

⟨*Analysis: procedures*⟩+≡
```
    function analysis_store_get_n_objects () result (n)
      integer :: n
      type(analysis_object_t), pointer :: current
      n = 0
      current => analysis_store%first
      do while (associated (current))
        n = n + 1
        current => current%next
      end do
    end function analysis_store_get_n_objects
```

Allocate an array and fill it with all existing IDs.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_store_get_ids
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_store_get_ids (id)
      type(string_t), dimension(:), allocatable, intent(out) :: id
      type(analysis_object_t), pointer :: current
      integer :: i
      allocate (id (analysis_store_get_n_objects()))
      i = 0
      current => analysis_store%first
      do while (associated (current))
        i = i + 1
        id(i) = current%id
        current => current%next
      end do
    end subroutine analysis_store_get_ids
```

5.1.12   LᴬTEX driver file

Write a driver file for all objects in the store.

⟨*Analysis: procedures*⟩+≡

```
subroutine analysis_store_write_driver_all (filename_data, unit)
  type(string_t), intent(in) :: filename_data
  integer, intent(in), optional :: unit
  type(analysis_object_t), pointer :: obj
  call analysis_store_write_driver_header (unit)
  obj => analysis_store%first
  do while (associated (obj))
     call analysis_object_write_driver (obj, filename_data, unit)
     obj => obj%next
  end do
  call analysis_store_write_driver_footer (unit)
end subroutine analysis_store_write_driver_all
```

Write a driver file for an array of objects.

⟨*Analysis: procedures*⟩+≡

```
subroutine analysis_store_write_driver_obj (filename_data, id, unit)
  type(string_t), intent(in) :: filename_data
  type(string_t), dimension(:), intent(in) :: id
  integer, intent(in), optional :: unit
  type(analysis_object_t), pointer :: obj
  integer :: i
  call analysis_store_write_driver_header (unit)
  do i = 1, size (id)
     obj => analysis_store_get_object_ptr (id(i))
     if (associated (obj))  &
          call analysis_object_write_driver (obj, filename_data, unit)
  end do
  call analysis_store_write_driver_footer (unit)
end subroutine analysis_store_write_driver_obj
```

The beginning of the driver file.

⟨*Analysis: procedures*⟩+≡

```
subroutine analysis_store_write_driver_header (unit)
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit);  if (u < 0)  return
  write (u, '(A)') "\documentclass[12pt]{article}"
  write (u, *)
  write (u, '(A)') "\usepackage{gamelan}"
  write (u, '(A)') "\usepackage{amsmath}"
  write (u, '(A)') "\usepackage{ifpdf}"
  write (u, '(A)') "\ifpdf"
  write (u, '(A)') "   \DeclareGraphicsRule{*}{mps}{*}{}"
  write (u, '(A)') "\else"
  write (u, '(A)') "   \DeclareGraphicsRule{*}{eps}{*}{}"
  write (u, '(A)') "\fi"
  write (u, *)
  write (u, '(A)') "\begin{document}"
  write (u, '(A)') "\begin{gmlfile}"
```

```
    write (u, *)
    write (u, '(A)') "\begin{gmlcode}"
    write (u, '(A)') "  color col.default, col.excess;"
    write (u, '(A)') "  col.default = 0.9white;"
    write (u, '(A)') "  col.excess  = red;"
    write (u, '(A)') "  boolean show_excess;"
    !!! Future excess options for plots
    ! if (mcs(1)%plot_excess .and. mcs(1)%unweighted) then
    !    write (u, '(A)') "  show_excess = true;"
    ! else
    write (u, '(A)') "  show_excess = false;"
    ! end if
    write (u, '(A)') "\end{gmlcode}"
    write (u, *)
  end subroutine analysis_store_write_driver_header
```

The end of the driver file.

⟨*Analysis: procedures*⟩+≡
```
  subroutine analysis_store_write_driver_footer (unit)
    integer, intent(in), optional :: unit
    integer :: u
    u = output_unit (unit);  if (u < 0)  return
    write(u, *)
    write(u, '(A)') "\end{gmlfile}"
    write(u, '(A)') "\end{document}"
  end subroutine analysis_store_write_driver_footer
```

5.1.13   API

Creating new objects

The specific versions below:

⟨*Analysis: public*⟩+≡
```
  public :: analysis_init_observable
```

⟨*Analysis: procedures*⟩+≡
```
  subroutine analysis_init_observable (id, obs_label, obs_unit, graph_options)
    type(string_t), intent(in) :: id
    type(string_t), intent(in), optional :: obs_label, obs_unit

      call analysis_store_init_object (id, AN_PLOT, obj)
      plot => analysis_object_get_plot_ptr (obj)
      call plot_init (plot, id, graph_options, drawing_options)
```

```
      end subroutine analysis_init_plot
```

⟨*Analysis: public*⟩+≡
```
    public :: analysis_init_graph
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_init_graph (id, n_elements, graph_options)
      type(string_t), intent(in) :: id
      integer, intent(in) :: n_elements
      type(graph_options_t), intent(in), optional :: graph_options
      type(analysis_object_t), pointer :: obj
      type(graph_t), pointer :: graph
      call analysis_store_init_object (id, AN_GRAPH, obj)
      graph => analysis_object_get_graph_ptr (obj)
      call graph_init (graph, id, n_elements, graph_options)
    end subroutine analysis_init_graph
```

Recording data

This procedure resets an object or the whole store to its initial state.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_clear
```

⟨*Analysis: interfaces*⟩+≡
```
    interface analysis_clear
       module procedure analysis_store_clear_obj
       module procedure analysis_store_clear_all
    end interface
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_store_clear_obj (id)
      type(string_t), intent(in) :: id
      type(analysis_object_t), pointer :: obj
      obj => analysis_store_get_object_ptr (id)
      if (associated (obj)) then
         call analysis_object_clear (obj)
      end if
    end subroutine analysis_store_clear_obj

    subroutine analysis_store_clear_all ()
      type(analysis_object_t), pointer :: obj
      obj => analysis_store%first
      do while (associated (obj))
         call analysis_object_clear (obj)
         obj => obj%next
      end do
    end subroutine analysis_store_clear_all
```

There is one generic recording function whose behavior depends on the type of analysis object.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_record_data
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_record_data (id, x, y, yerr, xerr, &
        weight, excess, success, exist)
      type(string_t), intent(in) :: id
      real(default), intent(in) :: x
      real(default), intent(in), optional :: y, yerr, xerr, weight, excess
      logical, intent(out), optional :: success, exist
      type(analysis_object_t), pointer :: obj
      obj => analysis_store_get_object_ptr (id)
      if (associated (obj)) then
         call analysis_object_record_data (obj, x, y, yerr, xerr, &
              weight, excess, success)
         if (present (exist))  exist = .true.
      else
         if (present (success))  success = .false.
         if (present (exist))  exist = .false.
      end if
    end subroutine analysis_record_data
```

Build a graph

This routine sets up the array of graph elements by copying the graph elements
given as input. The object must exist and already be initialized as a graph.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_fill_graph
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_fill_graph (id, i, id_in, drawing_options)
      type(string_t), intent(in) :: id
      integer, intent(in) :: i
      type(string_t), intent(in) :: id_in
      type(drawing_options_t), intent(in), optional :: drawing_options
      type(analysis_object_t), pointer :: obj
      type(graph_t), pointer :: g
      type(histogram_t), pointer :: h
      type(plot_t), pointer :: p
      obj => analysis_store_get_object_ptr (id)
      g => analysis_object_get_graph_ptr (obj)
      obj => analysis_store_get_object_ptr (id_in)
      if (associated (obj)) then
         select case (obj%type)
         case (AN_HISTOGRAM)
            h => analysis_object_get_histogram_ptr (obj)
            call graph_insert_histogram (g, i, h, drawing_options)
         case (AN_PLOT)
            p => analysis_object_get_plot_ptr (obj)
            call graph_insert_plot (g, i, p, drawing_options)
         case default
            call msg_error ("Graph '" // char (id) // "': Element '" &
                 // char (id_in) // "' is neither histogram nor plot.")
         end select
      else
         call msg_error ("Graph '" // char (id) // "': Element '" &
```

354

```
                // char (id_in) // "' is undefined.")
        end if
    end subroutine analysis_fill_graph
```

Retrieve generic results

Check if a named object exists.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_exists
```

⟨*Analysis: procedures*⟩+≡
```
    function analysis_exists (id) result (flag)
      type(string_t), intent(in) :: id
      logical :: flag
      type(analysis_object_t), pointer :: obj
      flag = .true.
      obj => analysis_store%first
      do while (associated (obj))
         if (obj%id == id)  return
         obj => obj%next
      end do
      flag = .false.
    end function analysis_exists
```

The following functions should work for all kinds of analysis object:

⟨*Analysis: public*⟩+≡
```
    public :: analysis_get_n_elements
    public :: analysis_get_n_entries
    public :: analysis_get_average
    public :: analysis_get_error
```

⟨*Analysis: procedures*⟩+≡
```
    function analysis_get_n_elements (id) result (n)
      integer :: n
      type(string_t), intent(in) :: id
      type(analysis_object_t), pointer :: obj
      obj => analysis_store_get_object_ptr (id)
      if (associated (obj)) then
         n = analysis_object_get_n_elements (obj)
      else
         n = 0
      end if
    end function analysis_get_n_elements

    function analysis_get_n_entries (id, within_bounds) result (n)
      integer :: n
      type(string_t), intent(in) :: id
      logical, intent(in), optional :: within_bounds
      type(analysis_object_t), pointer :: obj
      obj => analysis_store_get_object_ptr (id)
      if (associated (obj)) then
         n = analysis_object_get_n_entries (obj, within_bounds)
      else
```

```
      n = 0
    end if
  end function analysis_get_n_entries

  function analysis_get_average (id, within_bounds) result (avg)
    real(default) :: avg
    type(string_t), intent(in) :: id
    type(analysis_object_t), pointer :: obj
    logical, intent(in), optional :: within_bounds
    obj => analysis_store_get_object_ptr (id)
    if (associated (obj)) then
       avg = analysis_object_get_average (obj, within_bounds)
    else
       avg = 0
    end if
  end function analysis_get_average

  function analysis_get_error (id, within_bounds) result (err)
    real(default) :: err
    type(string_t), intent(in) :: id
    type(analysis_object_t), pointer :: obj
    logical, intent(in), optional :: within_bounds
    obj => analysis_store_get_object_ptr (id)
    if (associated (obj)) then
       err = analysis_object_get_error (obj, within_bounds)
    else
       err = 0
    end if
  end function analysis_get_error
```

Return true if any analysis object is graphical
⟨*Analysis: public*⟩+≡
```
    public :: analysis_has_plots
```

⟨*Analysis: interfaces*⟩+≡
```
    interface analysis_has_plots
       module procedure analysis_has_plots_any
       module procedure analysis_has_plots_obj
    end interface
```

⟨*Analysis: procedures*⟩+≡
```
    function analysis_has_plots_any () result (flag)
      logical :: flag
      type(analysis_object_t), pointer :: obj
      flag = .false.
      obj => analysis_store%first
      do while (associated (obj))
         flag = analysis_object_has_plot (obj)
         if (flag)  return
      end do
    end function analysis_has_plots_any

    function analysis_has_plots_obj (id) result (flag)
      logical :: flag
```

```
    type(string_t), dimension(:), intent(in) :: id
    type(analysis_object_t), pointer :: obj
    integer :: i
    flag = .false.
    do i = 1, size (id)
       obj => analysis_store_get_object_ptr (id(i))
       if (associated (obj)) then
          flag = analysis_object_has_plot (obj)
          if (flag)  return
       end if
    end do
  end function analysis_has_plots_obj
```

Iterators

Initialize an iterator for the given object. If the object does not exist or has wrong type, the iterator will be invalid.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_init_iterator
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_init_iterator (id, iterator)
      type(string_t), intent(in) :: id
      type(analysis_iterator_t), intent(out) :: iterator
      type(analysis_object_t), pointer :: obj
      obj => analysis_store_get_object_ptr (id)
      if (associated (obj))  call analysis_iterator_init (iterator, obj)
    end subroutine analysis_init_iterator
```

Output

⟨*Analysis: public*⟩+≡
```

```

5.2 Fastjet interface

The FastJet library is linked externally, if available. The wrapper code is also in a separate directory. Here, we define WHIZARD-specific procedures and tests.

⟨jets.f90⟩≡

  ⟨*File header*⟩

  ```
  module jets
  ```

  ⟨*Use kinds*⟩
  ```
    use unit_tests
    use fastjet !NODEP!
  ```

  ⟨*Standard module head*⟩

  ⟨*Jets: public*⟩

  ```
  contains
  ```

  ⟨*Jets: procedures*⟩

  ⟨*Jets: tests*⟩

  ```
  end module jets
  ```

5.2.1 Re-exported symbols

We use this module as a proxy for the FastJet interface, therefore we re-export some symbols.

⟨*Jets: public*⟩≡
```
    public :: fastjet_available
    public :: fastjet_init
    public :: jet_definition_t
    public :: pseudojet_t
    public :: pseudojet_vector_t
    public :: cluster_sequence_t
    public :: assignment (=)
```

The initialization routine prints the banner.

⟨*Jets: procedures*⟩≡
```
    subroutine fastjet_init ()
      call print_banner ()
    end subroutine fastjet_init
```

The jet algorithm codes (actually, integers)

⟨*Jets: public*⟩+≡
```
    public :: kt_algorithm
    public :: cambridge_algorithm
    public :: antikt_algorithm
    public :: genkt_algorithm
    public :: cambridge_for_passive_algorithm
    public :: genkt_for_passive_algorithm
```

```
    public :: ee_kt_algorithm
    public :: ee_genkt_algorithm
    public :: plugin_algorithm
    public :: undefined_jet_algorithm
```

5.2.2 Unit tests

⟨*Jets: public*⟩+≡
```
    public :: jets_test
```

⟨*Jets: procedures*⟩+≡
```
    subroutine jets_test (u, results)
      integer, intent(in) :: u
      type (test_results_t), intent(inout) :: results
```
⟨*Jets: execute tests*⟩
```
    end subroutine jets_test
```

This test is actually the minimal example from the FastJet manual, translated to Fortran.

Note that FastJet creates pseudojet vectors, which we mirror in the `pseudojet_vector_t`, but immediately assign to pseudojet arrays. Without automatic finalization available in the compilers, we should avoid this in actual code and rather introduce intermediate variables for those objects, which we can finalize explicitly.

⟨*Jets: execute tests*⟩≡
```
    call test (jets_1, "jets_1", &
         "basic FastJet functionality", &
         u, results)
```

⟨*Jets: tests*⟩≡
```
    subroutine jets_1 (u)
      integer, intent(in) :: u

      type(pseudojet_t), dimension(:), allocatable :: prt, jets, constituents
      type(jet_definition_t) :: jet_def
      type(cluster_sequence_t) :: cs

      integer, parameter :: dp = default
      integer :: i, j

      write (u, "(A)")  "* Test output: jets_1"
      write (u, "(A)")  "*   Purpose: test basic FastJet functionality"
      write (u, "(A)")

```

5.3   PDG arrays

For defining aliases, we introduce a special type which holds a set of (integer) PDG codes.

⟨pdg_arrays.f90⟩≡
  ⟨*File header*⟩

  module pdg_arrays

  ⟨*Use file utils*⟩
    use sorting
    use unit_tests

  ⟨*Standard module head*⟩

  ⟨*PDG arrays: public*⟩

  ⟨*PDG arrays: parameters*⟩

  ⟨*PDG arrays: types*⟩

  ⟨*PDG arrays: interfaces*⟩

  contains

  ⟨*PDG arrays: procedures*⟩

  ⟨*PDG arrays: tests*⟩

  end module pdg_arrays

5.3.1   Type definition

Using an allocatable array eliminates the need for initializer and/or finalizer.

⟨*PDG arrays: public*⟩≡
    public :: pdg_array_t

⟨*PDG arrays: types*⟩≡
    type :: pdg_array_t
       private
       integer, dimension(:), allocatable :: pdg
     contains
     ⟨*PDG arrays: pdg array: TBP*⟩
    end type pdg_array_t

Output

⟨*PDG arrays: public*⟩+≡
    public :: pdg_array_write

⟨*PDG arrays: pdg array: TBP*⟩≡
    procedure :: write => pdg_array_write

⟨PDG arrays: procedures⟩≡

```
subroutine pdg_array_write (aval, unit)
  class(pdg_array_t), intent(in) :: aval
  integer, intent(in), optional :: unit
  integer :: u, i
  u = output_unit (unit);  if (u < 0)  return
  write (u, "(A)", advance="no")  "PDG("
  if (allocated (aval%pdg)) then
     do i = 1, size (aval%pdg)
        if (i > 1)  write (u, "(A)", advance="no")  ", "
        write (u, "(I0)", advance="no")  aval%pdg(i)
     end do
  end if
  write (u, "(A)", advance="no")  ")"
end subroutine pdg_array_write
```

5.3.2   Parameters

We need an UNDEFINED value:

⟨PDG arrays: parameters⟩≡

```
integer, parameter, public :: UNDEFINED = 0
```

5.3.3   Basic operations

Assignment. We define assignment from and to an integer array. Note that the integer array, if it is the l.h.s., must be declared allocatable by the caller.

⟨PDG arrays: public⟩+≡

```
public :: assignment(=)
```

⟨PDG arrays: interfaces⟩≡

```
interface assignment(=)
   module procedure pdg_array_from_int_array
   module procedure pdg_array_from_int
   module procedure int_array_from_pdg_array
end interface
```

⟨PDG arrays: procedures⟩+≡

```
subroutine pdg_array_from_int_array (aval, iarray)
  type(pdg_array_t), intent(out) :: aval
  integer, dimension(:), intent(in) :: iarray
  allocate (aval%pdg (size (iarray)))
  aval%pdg = iarray
end subroutine pdg_array_from_int_array

elemental subroutine pdg_array_from_int (aval, int)
  type(pdg_array_t), intent(out) :: aval
  integer, intent(in) :: int
  allocate (aval%pdg (1))
  aval%pdg = int
end subroutine pdg_array_from_int

subroutine int_array_from_pdg_array (iarray, aval)
```

```
      integer, dimension(:), allocatable, intent(out) :: iarray
      type(pdg_array_t), intent(in) :: aval
      if (allocated (aval%pdg)) then
         allocate (iarray (size (aval%pdg)))
         iarray = aval%pdg
      else
         allocate (iarray (0))
      end if
   end subroutine int_array_from_pdg_array
```

Length of the array.

⟨*PDG arrays: public*⟩+≡
```
   public :: pdg_array_get_length
```

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
   procedure :: get_length => pdg_array_get_length
```

⟨*PDG arrays: procedures*⟩+≡
```
   elemental function pdg_array_get_length (aval) result (n)
     class(pdg_array_t), intent(in) :: aval
     integer :: n
     if (allocated (aval%pdg)) then
        n = size (aval%pdg)
     else
        n = 0
     end if
   end function pdg_array_get_length
```

Return the element with index i.

⟨*PDG arrays: public*⟩+≡
```
   public :: pdg_array_get
```

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
   procedure :: get => pdg_array_get
```

⟨*PDG arrays: procedures*⟩+≡
```
   elemental function pdg_array_get (aval, i) result (pdg)
     class(pdg_array_t), intent(in) :: aval
     integer, intent(in) :: i
     integer :: pdg
     pdg = aval%pdg(i)
   end function pdg_array_get
```

Replace element with index i by a new array of elements.

⟨*PDG arrays: public*⟩+≡
```
   public :: pdg_array_replace
```

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
   procedure :: replace => pdg_array_replace
```

⟨*PDG arrays: procedures*⟩+≡
```
   function pdg_array_replace (aval, i, pdg_new) result (aval_new)
     class(pdg_array_t), intent(in) :: aval
     integer, intent(in) :: i
     integer, dimension(:), intent(in) :: pdg_new
```

```
      type(pdg_array_t) :: aval_new
      integer :: n, l
      n = size (aval%pdg)
      l = size (pdg_new)
      allocate (aval_new%pdg (n + l - 1))
      aval_new%pdg(:i-1) = aval%pdg(:i-1)
      aval_new%pdg(i:i+l-1) = pdg_new
      aval_new%pdg(i+l:) = aval%pdg(i+1:)
    end function pdg_array_replace
```

Concatenate two PDG arrays

⟨*PDG arrays: public*⟩+≡
```
    public :: operator(//)
```

⟨*PDG arrays: interfaces*⟩+≡
```
    interface operator(//)
       module procedure concat_pdg_arrays
    end interface
```

⟨*PDG arrays: procedures*⟩+≡
```
    function concat_pdg_arrays (aval1, aval2) result (aval)
      type(pdg_array_t) :: aval
      type(pdg_array_t), intent(in) :: aval1, aval2
      integer :: n1, n2
      if (allocated (aval1%pdg) .and. allocated (aval2%pdg)) then
         n1 = size (aval1%pdg)
         n2 = size (aval2%pdg)
         allocate (aval%pdg (n1 + n2))
         aval%pdg(:n1) = aval1%pdg
         aval%pdg(n1+1:) = aval2%pdg
      else if (allocated (aval1%pdg)) then
         aval = aval1
      else if (allocated (aval2%pdg)) then
         aval = aval2
      end if
    end function concat_pdg_arrays
```

5.3.4 Matching

A PDG array matches a given PDG code if the code is present within the array.
If either one is zero (UNDEFINED), the match also succeeds.

⟨*PDG arrays: public*⟩+≡
```
    public :: operator(.match.)
```

⟨*PDG arrays: interfaces*⟩+≡
```
    interface operator(.match.)
       module procedure pdg_array_match_integer
    end interface
```

⟨*PDG arrays: procedures*⟩+≡
```
    elemental function pdg_array_match_integer (aval, pdg) result (flag)
      logical :: flag
      type(pdg_array_t), intent(in) :: aval
      integer, intent(in) :: pdg
      if (allocated (aval%pdg)) then
         flag = pdg == UNDEFINED &
               .or. any (aval%pdg == UNDEFINED) &
               .or. any (aval%pdg == pdg)
      else
         flag = .false.
      end if
    end function pdg_array_match_integer
```

Comparison. Here, we take the PDG arrays as-is, assuming that they are sorted.

The ordering is a bit odd: first, we look only at the absolute values of the PDG codes. If they all match, the particle comes before the antiparticle, scanning from left to right.

⟨*PDG arrays: public*⟩+≡
```
    public :: operator(<)
    public :: operator(>)
    public :: operator(<=)
    public :: operator(>=)
    public :: operator(==)
    public :: operator(/=)
```

⟨*PDG arrays: interfaces*⟩+≡
```
    interface operator(<)
       module procedure pdg_array_lt
    end interface
    interface operator(>)
       module procedure pdg_array_gt
    end interface
    interface operator(<=)
       module procedure pdg_array_le
    end interface
    interface operator(>=)
       module procedure pdg_array_ge
    end interface
    interface operator(==)
       module procedure pdg_array_eq
    end interface
    interface operator(/=)
       module procedure pdg_array_ne
    end interface
```

⟨*PDG arrays: procedures*⟩+≡
```
    elemental function pdg_array_lt (aval1, aval2) result (flag)
      type(pdg_array_t), intent(in) :: aval1, aval2
      logical :: flag
      integer :: i
      if (size (aval1%pdg) /= size (aval2%pdg)) then
         flag = size (aval1%pdg) < size (aval2%pdg)
```

```
        else
            do i = 1, size (aval1%pdg)
                if (abs (aval1%pdg(i)) /= abs (aval2%pdg(i))) then
                    flag = abs (aval1%pdg(i)) < abs (aval2%pdg(i))
                    return
                end if
            end do
            do i = 1, size (aval1%pdg)
                if (aval1%pdg(i) /= aval2%pdg(i)) then
                    flag = aval1%pdg(i) > aval2%pdg(i)
                    return
                end if
            end do
            flag = .false.
        end if
    end function pdg_array_lt

    elemental function pdg_array_gt (aval1, aval2) result (flag)
        type(pdg_array_t), intent(in) :: aval1, aval2
        logical :: flag
        flag = .not. (aval1 < aval2 .or. aval1 == aval2)
    end function pdg_array_gt

    elemental function pdg_array_le (aval1, aval2) result (flag)
        type(pdg_array_t), intent(in) :: aval1, aval2
        logical :: flag
        flag = aval1 < aval2 .or. aval1 == aval2
    end function pdg_array_le

    elemental function pdg_array_ge (aval1, aval2) result (flag)
        type(pdg_array_t), intent(in) :: aval1, aval2
        logical :: flag
        flag = .not. (aval1 < aval2)
    end function pdg_array_ge

    elemental function pdg_array_eq (aval1, aval2) result (flag)
        type(pdg_array_t), intent(in) :: aval1, aval2
        logical :: flag
        if (size (aval1%pdg) /= size (aval2%pdg)) then
            flag = .false.
        else
            flag = all (aval1%pdg == aval2%pdg)
        end if
    end function pdg_array_eq

    elemental function pdg_array_ne (aval1, aval2) result (flag)
        type(pdg_array_t), intent(in) :: aval1, aval2
        logical :: flag
        flag = .not. (aval1 == aval2)
    end function pdg_array_ne
```

Equivalence. Two PDG arrays are equivalent if either one contains UNDEFINED or if each element of array 1 is present in array 2, and vice versa.

⟨*PDG arrays: public*⟩+≡
```
    public :: operator(.eqv.)
    public :: operator(.neqv.)
```
⟨*PDG arrays: interfaces*⟩+≡
```
    interface operator(.eqv.)
       module procedure pdg_array_equivalent
    end interface
    interface operator(.neqv.)
       module procedure pdg_array_inequivalent
    end interface
```

⟨*PDG arrays: procedures*⟩+≡
```
    elemental function pdg_array_equivalent (aval1, aval2) result (eq)
      logical :: eq
      type(pdg_array_t), intent(in) :: aval1, aval2
      logical, dimension(:), allocatable :: match1, match2
      integer :: i
      if (allocated (aval1%pdg) .and. allocated (aval2%pdg)) then
         eq = any (aval1%pdg == UNDEFINED) &
              .or. any (aval2%pdg == UNDEFINED)
         if (.not. eq) then
            allocate (match1 (size (aval1%pdg)))
            allocate (match2 (size (aval2%pdg)))
            match1 = .false.
            match2 = .false.
            do i = 1, size (aval1%pdg)
               match2 = match2 .or. aval1%pdg(i) == aval2%pdg
            end do
            do i = 1, size (aval2%pdg)
               match1 = match1 .or. aval2%pdg(i) == aval1%pdg
            end do
            eq = all (match1) .and. all (match2)
         end if
      else
         eq = .false.
      end if
    end function pdg_array_equivalent

    elemental function pdg_array_inequivalent (aval1, aval2) result (neq)
      logical :: neq
      type(pdg_array_t), intent(in) :: aval1, aval2
      neq = .not. pdg_array_equivalent (aval1, aval2)
    end function pdg_array_inequivalent
```

5.3.5 Sorting

Sort a PDG array by absolute value, particle before antiparticle. After sorting, we eliminate double entries.

⟨*PDG arrays: public*⟩+≡
```
    public :: sort_abs
```

⟨PDG arrays: interfaces⟩+≡
```
    interface sort_abs
       module procedure pdg_array_sort_abs
    end interface
```

⟨PDG arrays: pdg array: TBP⟩+≡
```
    procedure :: sort_abs => pdg_array_sort_abs
```
⟨PDG arrays: procedures⟩+≡
```
    function pdg_array_sort_abs (aval1, unique) result (aval2)
      class(pdg_array_t), intent(in) :: aval1
      logical, intent(in), optional :: unique
      type(pdg_array_t) :: aval2
      integer, dimension(:), allocatable :: tmp
      logical, dimension(:), allocatable :: mask
      integer :: i, n
      logical :: uni
      uni = .false.;  if (present (unique))  uni = unique
      n = size (aval1%pdg)
      if (uni) then
         allocate (tmp (n), mask(n))
         tmp = sort_abs (aval1%pdg)
         mask(1) = .true.
         do i = 2, n
            mask(i) = tmp(i) /= tmp(i-1)
         end do
         allocate (aval2%pdg (count (mask)))
         aval2%pdg = pack (tmp, mask)
      else
         allocate (aval2%pdg (n))
         aval2%pdg = sort_abs (aval1%pdg)
      end if
    end function pdg_array_sort_abs
```

5.3.6   PDG array list

A PDG array list, or PDG list, is an array of PDG-array objects with some
convenience methods.

⟨PDG arrays: public⟩+≡
```
    public :: pdg_list_t
```

⟨PDG arrays: types⟩+≡
```
    type :: pdg_list_t
      type(pdg_array_t), dimension(:), allocatable :: a
     contains
```
⟨PDG arrays: pdg list: TBP⟩
```
    end type pdg_list_t
```

Output, as a comma-separated list without advancing I/O.

⟨PDG arrays: pdg list: TBP⟩≡
```
    procedure :: write => pdg_list_write
```

⟨*PDG arrays: procedures*⟩+≡
```
    subroutine pdg_list_write (object, unit)
      class(pdg_list_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u, i
      u = output_unit (unit)
      if (allocated (object%a)) then
         do i = 1, size (object%a)
            if (i > 1)  write (u, "(A)", advance="no")  ", "
            call object%a(i)%write (u)
         end do
      end if
    end subroutine pdg_list_write
```

Initialize for a certain size. The entries are initially empty PDG arrays.

⟨*PDG arrays: pdg list: TBP*⟩+≡
```
    procedure :: init => pdg_list_init
```

⟨*PDG arrays: procedures*⟩+≡
```
    subroutine pdg_list_init (pl, n)
      class(pdg_list_t), intent(out) :: pl
      integer, intent(in) :: n
      allocate (pl%a (n))
    end subroutine pdg_list_init
```

Set one of the entries. No bounds-check.

⟨*PDG arrays: pdg list: TBP*⟩+≡
```
    generic :: set => pdg_list_set_int
    generic :: set => pdg_list_set_int_array
    generic :: set => pdg_list_set_pdg_array
    procedure, private :: pdg_list_set_int
    procedure, private :: pdg_list_set_int_array
    procedure, private :: pdg_list_set_pdg_array
```

⟨*PDG arrays: procedures*⟩+≡
```
    subroutine pdg_list_set_int (pl, i, pdg)
      class(pdg_list_t), intent(inout) :: pl
      integer, intent(in) :: i
      integer, intent(in) :: pdg
      pl%a(i) = pdg
    end subroutine pdg_list_set_int

    subroutine pdg_list_set_int_array (pl, i, pdg)
      class(pdg_list_t), intent(inout) :: pl
      integer, intent(in) :: i
      integer, dimension(:), intent(in) :: pdg
      pl%a(i) = pdg
    end subroutine pdg_list_set_int_array

    subroutine pdg_list_set_pdg_array (pl, i, pa)
      class(pdg_list_t), intent(inout) :: pl
      integer, intent(in) :: i
      type(pdg_array_t), intent(in) :: pa
      pl%a(i) = pa
```

```
      end subroutine pdg_list_set_pdg_array
```

Array size, not the length of individual entries

⟨*PDG arrays: pdg list: TBP*⟩+≡
```
    procedure :: get_size => pdg_list_get_size
```

⟨*PDG arrays: procedures*⟩+≡
```
    function pdg_list_get_size (pl) result (n)
      class(pdg_list_t), intent(in) :: pl
      integer :: n
      if (allocated (pl%a)) then
         n = size (pl%a)
      else
         n = 0
      end if
    end function pdg_list_get_size
```

Return an entry, as a PDG array.

⟨*PDG arrays: pdg list: TBP*⟩+≡
```
    procedure :: get => pdg_list_get
```

⟨*PDG arrays: procedures*⟩+≡
```
    function pdg_list_get (pl, i) result (pa)
      class(pdg_list_t), intent(in) :: pl
      integer, intent(in) :: i
      type(pdg_array_t) :: pa
      pa = pl%a(i)
    end function pdg_list_get
```

Sort the list. First, each entry gets sorted, including elimination of doublers.
Then, we sort the list, using the first member of each PDG array as the marker.
No removal of doublers at this stage.

⟨*PDG arrays: pdg list: TBP*⟩+≡
```
    procedure :: sort_abs => pdg_list_sort_abs
```

⟨*PDG arrays: procedures*⟩+≡
```

⟨*Subevents: public*⟩

⟨*Subevents: parameters*⟩

⟨*Subevents: types*⟩

⟨*Subevents: interfaces*⟩

```
  contains
```

⟨*Subevents: procedures*⟩

```
  end module subevents
```

5.4.1 Particles

For the purpose of this module, a particle has a type which can indicate a beam, incoming, outgoing, or composite particle, flavor and helicity codes (integer, undefined for composite), four-momentum and invariant mass squared. (Other particles types are used in extended event types, but also defined here.) Furthermore, each particle has an allocatable array of ancestors – particle indices which indicate the building blocks of a composite particle. For an incoming/outgoing particle, the array contains only the index of the particle itself.

For incoming particles, the momentum is inverted before storing it in the particle object.

⟨*Subevents: parameters*⟩≡
```
    integer, parameter, public :: PRT_UNDEFINED = 0
    integer, parameter, public :: PRT_BEAM = -9
    integer, parameter, public :: PRT_INCOMING = 1
    integer, parameter, public :: PRT_OUTGOING = 2
```

```
integer, parameter, public :: PRT_COMPOSITE = 3
integer, parameter, public :: PRT_VIRTUAL = 4
integer, parameter, public :: PRT_RESONANT = 5
integer, parameter, public :: PRT_BEAM_REMNANT = 9
```

The type

We initialize only the type here and mark as unpolarized. The initializers below
do the rest.

⟨*Subevents: public*⟩≡
```
public :: prt_t
```

⟨*Subevents: types*⟩≡
```
type :: prt_t
   private
   integer :: type = PRT_UNDEFINED
   integer :: pdg
   logical :: polarized = .false.
   integer :: h
   type(vector4_t) :: p
   real(default) :: p2
   integer, dimension(:), allocatable :: src
end type prt_t
```

Initializers. Polarization is set separately. Finalizers are not needed.

⟨*Subevents: procedures*⟩≡
```
subroutine prt_init_beam (prt, pdg, p, p2, src)
  type(prt_t), intent(out) :: prt
  integer, intent(in) :: pdg
  type(vector4_t), intent(in) :: p
  real(default), intent(in) :: p2
  integer, dimension(:), intent(in) :: src
  prt%type = PRT_BEAM
  call prt_set (prt, pdg, - p, p2, src)
end subroutine prt_init_beam

subroutine prt_init_incoming (prt, pdg, p, p2, src)
  type(prt_t), intent(out) :: prt
  integer, intent(in) :: pdg
  type(vector4_t), intent(in) :: p
  real(default), intent(in) :: p2
  integer, dimension(:), intent(in) :: src
  prt%type = PRT_INCOMING
  call prt_set (prt, pdg, - p, p2, src)
end subroutine prt_init_incoming

subroutine prt_init_outgoing (prt, pdg, p, p2, src)
  type(prt_t), intent(out) :: prt
  integer, intent(in) :: pdg
  type(vector4_t), intent(in) :: p
  real(default), intent(in) :: p2
  integer, dimension(:), intent(in) :: src
```

```
      prt%type = PRT_OUTGOING
      call prt_set (prt, pdg, p, p2, src)
    end subroutine prt_init_outgoing

    subroutine prt_init_composite (prt, p, src)
      type(prt_t), intent(out) :: prt
      type(vector4_t), intent(in) :: p
      integer, dimension(:), intent(in) :: src
      prt%type = PRT_COMPOSITE
      call prt_set (prt, 0, p, p**2, src)
    end subroutine prt_init_composite
```

This version is for temporary particle objects, so the `src` array is not set.

⟨*Subevents: public*⟩+≡
```
    public :: prt_init_combine
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine prt_init_combine (prt, prt1, prt2)
      type(prt_t), intent(out) :: prt
      type(prt_t), intent(in) :: prt1, prt2
      type(vector4_t) :: p
      integer, dimension(0) :: src
      prt%type = PRT_COMPOSITE
      p = prt1%p + prt2%p
      call prt_set (prt, 0, p, p**2, src)
    end subroutine prt_init_combine
```

Init from a pseudojet object.

⟨*Subevents: procedures*⟩+≡
```
    subroutine prt_init_pseudojet (prt, jet, src)
      type(prt_t), intent(out) :: prt
      type(pseudojet_t), intent(in) :: jet
      integer, dimension(:), intent(in) :: src
      type(vector4_t) :: p
      prt%type = PRT_COMPOSITE
      p = vector4_moving (jet%e(), &
          vector3_moving ([jet%px(), jet%py(), jet%pz()]))
      call prt_set (prt, 0, p, p**2, src)
    end subroutine prt_init_pseudojet
```

      h = prt%h
    end function prt_get_helicity
```

Setting data

Set the PDG, momentum and momentum squared, and ancestors. If allocate-on-assignment is available, this can be simplified.

⟨*Subevents: procedures*⟩+≡
```
    subroutine prt_set (prt, pdg, p, p2, src)
      type(prt_t), intent(inout) :: prt
      integer, intent(in) :: pdg
      type(vector4_t), intent(in) :: p
      real(default), intent(in) :: p2
      integer, dimension(:), intent(in) :: src
      prt%pdg = pdg
      prt%p = p
```

```
      prt%p2 = p2
      if (allocated (prt%src)) then
         if (size (src) /= size (prt%src)) then
            deallocate (prt%src)
            allocate (prt%src (size (src)))
         end if
      else
         allocate (prt%src (size (src)))
      end if
      prt%src = src
    end subroutine prt_set
```

Set the particle PDG code separately.

⟨*Subevents: procedures*⟩+≡
```
    elemental subroutine prt_set_pdg (prt, pdg)
      type(prt_t), intent(inout) :: prt
      integer, intent(in) :: pdg
      prt%pdg = pdg
    end subroutine prt_set_pdg
```

Set the momentum separately.

⟨*Subevents: procedures*⟩+≡
```
    elemental subroutine prt_set_p (prt, p)
      type(prt_t), intent(inout) :: prt
      type(vector4_t), intent(in) :: p
      prt%p = p
    end subroutine prt_set_p
```

Set the squared invariant mass separately.

⟨*Subevents: procedures*⟩+≡
```
    elemental subroutine prt_set_p2 (prt, p2)
      type(prt_t), intent(inout) :: prt
      real(default), intent(in) :: p2
      prt%p2 = p2
    end subroutine prt_set_p2
```

Set helicity (optional).

⟨*Subevents: procedures*⟩+≡
```
    subroutine prt_polarize (prt, h)
      type(prt_t), intent(inout) :: prt
      integer, intent(in) :: h
      prt%polarized = .true.
      prt%h = h
    end subroutine prt_polarize
```

Conversion

Transform a `prt_t` object into a `c_prt_t` object.

⟨*Subevents: public*⟩+≡
```
    public :: c_prt
```

⟨*Subevents: interfaces*⟩≡
```
    interface c_prt
       module procedure c_prt_from_prt
    end interface
```

⟨*Subevents: procedures*⟩+≡
```
    elemental function c_prt_from_prt (prt) result (c_prt)
      type(c_prt_t) :: c_prt
      type(prt_t), intent(in) :: prt
      c_prt%type = prt%type
      c_prt%pdg = prt%pdg
      if (prt%polarized) then
         c_prt%polarized = 1
      else
         c_prt%polarized = 0
      end if
      c_prt%h = prt%h
      c_prt%pe = energy (prt%p)
      c_prt%px = vector4_get_component (prt%p, 1)
      c_prt%py = vector4_get_component (prt%p, 2)
      c_prt%pz = vector4_get_component (prt%p, 3)
      c_prt%p2 = prt%p2
    end function c_prt_from_prt
```

Output

        write (u, "(" // FMT_14 // ",';'," // FMT_14 // ",','," // &
             FMT_14 // ",','," // FMT_14 // ")", advance="no") &
             array_from_vector4 (prt%p)
        write (u, "('|'," // FMT_19 // ")", advance="no")  prt%p2
     end select
     if (allocated (prt%src)) then
        write (u, "('|')", advance="no")
        do i = 1, size (prt%src)
           write (u, "(1x,I0)", advance="no")  prt%src(i)
        end do
     end if
     write (u, "(A)")  ")"
   end subroutine prt_write
```

Tools

Two particles match if their `src` arrays are the same.

⟨*Subevents: interfaces*⟩+≡
```
   interface operator(.match.)
      module procedure prt_match
   end interface
```

⟨*Subevents: procedures*⟩+≡
```
   elemental function prt_match (prt1, prt2) result (match)
     logical :: match
     type(prt_t), intent(in) :: prt1, prt2
     if (size (prt1%src) == size (prt2%src)) then
        match = all (prt1%src == prt2%src)
     else
        match = .false.
     end if
   end function prt_match
```

The combine operation makes a pseudoparticle whose momentum is the result of adding (the momenta of) the pair of input particles. We trace the particles from which a particle is built by storing a `src` array. Each particle entry in the `src` list contains a list of indices which indicates its building blocks. The indices refer to an original list of particles. Index lists are sorted, and they contain no element more than once.

We thus require that in a given pseudoparticle, each original particle occurs at most once.

The result is intent(inout), so it will not be initialized when the subroutine is entered.

⟨*Subevents: procedures*⟩+≡
```
   subroutine prt_combine (prt, prt_in1, prt_in2, ok)
     type(prt_t), intent(inout) :: prt
     type(prt_t), intent(in) :: prt_in1, prt_in2
     logical :: ok
     integer, dimension(:), allocatable :: src
     call combine_index_lists (src, prt_in1%src, prt_in2%src)
```

```
      ok = allocated (src)
      if (ok)  call prt_init_composite (prt, prt_in1%p + prt_in2%p, src)
   end subroutine prt_combine
```

This variant does not produce the combined particle, it just checks whether the combination is valid (no common `src` entry).

⟨*Subevents: public*⟩+≡
```
   public :: are_disjoint
```

⟨*Subevents: procedures*⟩+≡
```
   function are_disjoint (prt_in1, prt_in2) result (flag)
     logical :: flag
     type(prt_t), intent(in) :: prt_in1, prt_in2
     flag = index_lists_are_disjoint (prt_in1%src, prt_in2%src)
   end function are_disjoint
```

`src` Lists with length > 1 are built by a `combine` operation which merges the lists in a sorted manner. If the result would have a duplicate entry, it is discarded, and the result is unallocated.

⟨*Subevents: procedures*⟩+≡
```
   subroutine combine_index_lists (res, src1, src2)
     integer, dimension(:), intent(in) :: src1, src2
     integer, dimension(:), allocatable :: res
     integer :: i1, i2, i
     allocate (res (size (src1) + size (src2)))
     if (size (src1) == 0) then
        res = src2
        return
     else if (size (src2) == 0) then
        res = src1
        return
     end if
     i1 = 1
     i2 = 1
     LOOP: do i = 1, size (res)
        if (src1(i1) < src2(i2)) then
           res(i) = src1(i1);   i1 = i1 + 1
           if (i1 > size (src1)) then
              res(i+1:) = src2(i2:)
              exit LOOP
           end if
        else if (src1(i1) > src2(i2)) then
           res(i) = src2(i2);   i2 = i2 + 1
           if (i2 > size (src2)) then
              res(i+1:) = src1(i1:)
              exit LOOP
           end if
        else
           deallocate (res)
           exit LOOP
        end if
     end do LOOP
   end subroutine combine_index_lists
```

This function is similar, but it does not actually merge the list, it just checks whether they are disjoint (no common `src` entry).

⟨*Subevents: procedures*⟩+≡
```
function index_lists_are_disjoint (src1, src2) result (flag)
  logical :: flag
  integer, dimension(:), intent(in) :: src1, src2
  integer :: i1, i2, i
  flag = .true.
  i1 = 1
  i2 = 1
  LOOP: do i = 1, size (src1) + size (src2)
     if (src1(i1) < src2(i2)) then
        i1 = i1 + 1
        if (i1 > size (src1)) then
           exit LOOP
        end if
     else if (src1(i1) > src2(i2)) then
        i2 = i2 + 1
        if (i2 > size (src2)) then
           exit LOOP
        end if
     else
        flag = .false.
        exit LOOP
     end if
  end do LOOP
end function index_lists_are_disjoint
```

5.4.2 C-compatible particle type

5.4.3 subevents

Particles are collected in subevents. This type is implemented as a dynamically allocated array, which need not be completely filled. The value `n_active` determines the number of meaningful entries.

Type definition

⟨*Subevents: public*⟩+≡
```
public :: subevt_t
```

⟨*Subevents: types*⟩+≡
```
type :: subevt_t
  private
  integer :: n_active = 0
  type(prt_t), dimension(:), allocatable :: prt
 contains
 ⟨Subevents: subevt: TBP⟩
end type subevt_t
```

Initialize, allocating with size zero (default) or given size. The number of contained particles is set equal to the size.

⟨*Subevents: public*⟩+≡
```
    public :: subevt_init
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine subevt_init (subevt, n_active)
      type(subevt_t), intent(out) :: subevt
      integer, intent(in), optional :: n_active
      if (present (n_active))  subevt%n_active = n_active
      allocate (subevt%prt (subevt%n_active))
    end subroutine subevt_init
```

(Re-)allocate the subevent with some given size. If the size is greater than the previous one, do a real reallocation. Otherwise, just reset the recorded size. Contents are untouched, but become invalid.

⟨*Subevents: public*⟩+≡
```
    public :: subevt_reset
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine subevt_reset (subevt, n_active)
      type(subevt_t), intent(inout) :: subevt
      integer, intent(in) :: n_active
      subevt%n_active = n_active
      if (subevt%n_active > size (subevt%prt)) then
         deallocate (subevt%prt)
         allocate (subevt%prt (subevt%n_active))
      end if
    end subroutine subevt_reset
```

Output. No prefix for the headline 'subevt', because this will usually be printed appending to a previous line.

⟨*Subevents: public*⟩+≡
```
    public :: subevt_write
```

⟨*Subevents: subevt: TBP*⟩≡
```
    procedure :: write => subevt_write
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine subevt_write (object, unit, prefix)
      class(subevt_t), intent(in) :: object
      integer, intent(in), optional :: unit
      character(*), intent(in), optional :: prefix
      integer :: u, i
      u = output_unit (unit);  if (u < 0)  return
      write (u, "(1x,A)") "subevent:"
      do i = 1, object%n_active
         if (present (prefix))  write (u, "(A)", advance="no") prefix
         write (u, "(1x,I0)", advance="no")  i
         call prt_write (object%prt(i), unit)
      end do
    end subroutine subevt_write
```

Defined assignment: transfer only meaningful entries. This is a deep copy (as would be default assignment).

⟨*Subevents: interfaces*⟩+≡
```
interface assignment(=)
   module procedure subevt_assign
end interface
```

⟨*Subevents: procedures*⟩+≡
```
subroutine subevt_assign (subevt, subevt_in)
  type(subevt_t), intent(inout) :: subevt
  type(subevt_t), intent(in) :: subevt_in
  if (.not. allocated (subevt%prt)) then
     call subevt_init (subevt, subevt_in%n_active)
  else
     call subevt_reset (subevt, subevt_in%n_active)
  end if
  subevt%prt(:subevt%n_active) = subevt_in%prt(:subevt%n_active)
end subroutine subevt_assign
```

Fill contents

Store incoming/outgoing particles which are completely defined.

⟨*Subevents: public*⟩+≡
```

end function c_prt_from_subevt

function c_prt_array_from_subevt (subevt) result (c_prt_array)
  type(subevt_t), intent(in) :: subevt
  type(c_prt_t), dimension(subevt%n_active) :: c_prt_array
  c_prt_array = c_prt_from_prt (subevt%prt(1:subevt%n_active))
end function c_prt_array_from_subevt
```

Operations with subevents

The join operation joins two subevents. When appending the elements of the second list, we check for each particle whether it is already in the first list. If yes, it is discarded. The result list should be initialized already.

If a mask is present, it refers to the second subevent. Particles where the mask is not set are discarded.

⟨*Subevents: public*⟩+≡
```
    public :: subevt_join
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine subevt_join (subevt, pl1, pl2, mask2)
      type(subevt_t), intent(inout) :: subevt
      type(subevt_t), intent(in) :: pl1, pl2
      logical, dimension(:), intent(in), optional :: mask2
      integer :: n1, n2, i, n
      n1 = pl1%n_active
      n2 = pl2%n_active
      call subevt_reset (subevt, n1 + n2)
      subevt%prt(:n1)   = pl1%prt(:n1)
      n = n1
      if (present (mask2)) then
         do i = 1, pl2%n_active
            if (mask2(i)) then
               if (disjoint (i)) then

        flag = .true.
      end function disjoint
    end subroutine subevt_join
```

The combine operation makes a subevent whose entries are the result of adding (the momenta of) each pair of particles in the input lists. We trace the particles from which a particles is built by storing a `src` array. Each particle entry in the `src` list contains a list of indices which indicates its building blocks. The indices

refer to an original list of particles. Index lists are sorted, and they contain no element more than once.

We thus require that in a given pseudoparticle, each original particle occurs at most once.

⟨*Subevents: public*⟩+≡
```
    public :: subevt_combine
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine subevt_combine (subevt, pl1, pl2, mask12)
      type(subevt_t), intent(inout) :: subevt
      type(subevt_t), intent(in) :: pl1, pl2
      logical, dimension(:,:), intent(in), optional :: mask12
      integer :: n1, n2, i1, i2, n, j
      logical :: ok
      n1 = pl1%n_active
      n2 = pl2%n_active
      call subevt_reset (subevt, n1 * n2)
      n = 1
      do i1 = 1, n1
         do i2 = 1, n2
            if (present (mask12)) then
               ok = mask12(i1,i2)
            else
               ok = .true.
            end if
            if (ok)  call prt_combine &
                 (subevt%prt(n), pl1%prt(i1), pl2%prt(i2), ok)
            if (ok) then
               CHECK_DOUBLES: do j = 1, n - 1
                  if (subevt%prt(n) .match. subevt%prt(j)) then
                     ok = .false.;  exit CHECK_DOUBLES
                  end if
               end do CHECK_DOUBLES
               if (ok)  n = n + 1
            end if
         end do
      end do
      subevt%n_active = n - 1
    end subroutine subevt_combine
```

The collect operation makes a single-entry subevent which results from combining (the momenta of) all particles in the input list. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

(Thus, if the input particles are already composite, there is some chance that the result depends on the order of the input list and is not as expected. This situation should be avoided.)

⟨*Subevents: public*⟩+≡
```
    public :: subevt_collect
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine subevt_collect (subevt, pl1, mask1)
```

```

do i = 1, pl1%n_active
   if (mask1(i)) then
      if (subevt%n_active == 0) then
         subevt%n_active = 1
         subevt%prt(1) = pl1%prt(i)
      else
         call prt_combine (prt, subevt%prt(1), pl1%prt(i), ok)
         if (ok)  subevt%prt(1) = prt
      end if
   end if
end do
end subroutine subevt_collect
```

The cluster operation is similar to `collect`, but applies a jet algorithm. The result is a subevent consisting of jets and, possibly, unclustered extra particles. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

The algorithm: first determine the (pseudo)particles that participate in the clustering. They should not overlap, and the mask entry must be set. We then cluster the particles, using the given jet definition. The result particles are retrieved from the cluster sequence. We still have to determine the source indices for each jet: for each input particle, we get the jet index. Accumulating the source entries for all particles that are part of a given jet, we derive the jet source entries. Finally, we delete the C structures that have been constructed by FastJet and its interface.

j = 0
do i = 1, n_active
   if (mask(i)) then
      j = j + 1
      subevt%prt(j) = subevt_in%prt(i)
   end if
end do
end subroutine subevt_select_pdg_code
```

5.4.4   Eliminate numerical noise

This is useful for testing purposes: set entries to zero that are smaller in absolute values than a given tolerance parameter.

Note: instead of setting the tolerance in terms of EPSILON (kind-dependent), we fix it to 10^{-16}, which is the typical value for double precision. The reason is that there are situations where intermediate representations (external libraries, files) are limited to double precision, even if the main program uses higher precision.

⟨*Subevents: public*⟩+≡
```
   public :: pacify
```

⟨*Subevents: interfaces*⟩+≡
```
   interface pacify
      module procedure pacify_prt
      module procedure pacify_subevt
   end interface pacify
```

⟨*Subevents: procedures*⟩+≡
```
   subroutine pacify_prt (prt)
     class(prt_t), intent(inout) :: prt
     real(default) :: e
     e = 1e-16_default * energy (prt%p)
     call pacify (prt%p, 10 * e)
     call pacify (prt%p2, 1e4 * e)
   end subroutine pacify_prt

   subroutine pacify_subevt (subevt)
     class(subevt_t), intent(inout) :: subevt
     integer :: i
     do i = 1, subevt%n_active
        call pacify (subevt%prt(i))
     end do
   end subroutine pacify_subevt
```

5.5   User Code Interface

Here we collect interface code that enables the user to inject his own code into the WHIZARD workflow. The code uses data types defined above, and is

referenced in the `expressions` module.

⟨`user_code_interface.f90`⟩≡
  ⟨*File header*⟩

  ```
  module user_code_interface

    use iso_c_binding !NODEP!
  ```
  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
  ```
    use diagnostics !NODEP!
    use c_particles !NODEP!
    use os_interface
  ```

  ⟨*Standard module head*⟩

  ⟨*User Code: public*⟩

  ⟨*User Code: variables*⟩

  ⟨*User Code: interfaces*⟩

  ```
  contains
  ```

  ⟨*User Code: procedures*⟩

  ```
  end module user_code_interface
  ```

5.5.1 User Code Management

This data structure globally holds the filehandle of the user-code library:

⟨*User Code: public*⟩≡
```
    public :: has_user_lib
```

⟨*User Code: variables*⟩≡
```
    type(dlaccess_t), save :: user_lib_handle
    logical, save :: has_user_lib = .false.
    type(string_t), save :: user
```

Compile, link and load user code files. Dlopen all user-provided libraries, included the one just compiled (if any).

By default, we are looking for a library `user.so/dylib`. If this is not present, try `user.f90` and compile it. This can be overridden.

In detail: First, compile all sources explicitly specified on the command line. Then collect all libraries specified on the command line, including `user.so` if it was generated. If there is still no code, check for an existing `user.f90` and compile this. Link everything into a `user.la` libtool library. When done, dlopen all libraries that we have so far.

⟨*User Code: public*⟩+≡
```
    public :: user_code_init
```

403

⟨*User Code: procedures*⟩≡

```

5.5.2 Interfaces for user-defined functions

The following functions represent user-defined real observables. There may be one or two particles as argument, the result is a real value.

⟨*User Code: public*⟩+≡
```
    public :: user_obs_int_unary
    public :: user_obs_int_binary
    public :: user_obs_real_unary
    public :: user_obs_real_binary
```

⟨*User Code: interfaces*⟩≡
```
    abstract interface
       function user_obs_int_unary (prt1) result (ival) bind(C)
         use iso_c_binding !NODEP!
```

```
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1
        integer(c_int) :: ival
      end function user_obs_int_unary
    end interface

    abstract interface
      function user_obs_int_binary (prt1, prt2) result (ival) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1, prt2
        integer(c_int) :: ival
      end function user_obs_int_binary
    end interface

    abstract interface
      function user_obs_real_unary (prt1) result (rval) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1
        real(c_double) :: rval
      end function user_obs_real_unary
    end interface

    abstract interface
      function user_obs_real_binary (prt1, prt2) result (rval) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1, prt2
        real(c_double) :: rval
      end function user_obs_real_binary
    end interface
```

The following function takes an array of C-compatible particles and return a single value. The particle array represents a subevent. For C interoperability, we have to use an assumed-size array, hence the array size has to be transferred explicitly.

The cut function returns an int, which we should interpret as a logical value (nonzero=true).

⟨*User Code: public*⟩+≡
```
    public :: user_cut_fun
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
      function user_cut_fun (prt, n_prt) result (iflag) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), dimension(*), intent(in) :: prt
        integer(c_int), intent(in) :: n_prt
        integer(c_int) :: iflag
      end function user_cut_fun
    end interface
```

The event-shape function returns a real value.

⟨*User Code: public*⟩+≡
```
    public :: user_event_shape_fun
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
       function user_event_shape_fun (prt, n_prt) result (rval) bind(C)
         use iso_c_binding !NODEP!
         use c_particles !NODEP!
         type(c_prt_t), dimension(*), intent(in) :: prt
         integer(c_int), intent(in) :: n_prt
         real(c_double) :: rval
       end function user_event_shape_fun
    end interface
```

5.5.3 Interfaces for user-defined interactions

The following procedure interfaces pertain to user-defined interactions, e.g., spectra or structure functions.

This subroutine retrieves the basic information for setting up the interaction and event generation. All parameters are `intent(inout)`, so we can provide default values. `n_in` and `n_out` are the number of incoming and outgoing particles, respectively. `n_states` is the total number of distinct states that should be generated (counting all states of the incoming particles). `n_col` is the maximal number of color entries a particle can have. `n_dim` is the number of input parameters, i.e., integration dimensions, that the structure function call requires for computing kinematics and matrix elements. `n_var` is the number of variables (e.g., momentum fractions) that the structure function call has to transfer from the kinematics to the dynamics evaluation.

⟨*User Code: public*⟩+≡
```
    public :: user_int_info
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
       subroutine user_int_info (n_in, n_out, n_states, n_col, n_dim, n_var) &
            bind(C)
         use iso_c_binding !NODEP!
         integer(c_int), intent(inout) :: n_in, n_out, n_states, n_col
         integer(c_int), intent(inout) :: n_dim, n_var
       end subroutine user_int_info
    end interface
```

This subroutine retrieves the settings for the quantum number mask of a given particle index in the interaction. A nonzero value indicates that the corresponding quantum number is to be ignored. The lock index is the index of a particle that the current particle is related to. The relation applies if quantum numbers of one of the locked particles are summed over. (This is intended for helicity.)

⟨*User Code: public*⟩+≡
```
    public :: user_int_mask
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
       subroutine user_int_mask (i_prt, m_flv, m_hel, m_col, i_lock) bind(C)
         use iso_c_binding !NODEP!
         integer(c_int), intent(in) :: i_prt
         integer(c_int), intent(inout) :: m_flv, m_hel, m_col, i_lock
       end subroutine user_int_mask
    end interface
```

This subroutine retrieves the quantum numbers for the particle index `i_prt` in state `i_state`. The `flv` value is a PDG code. The `hel` value is an integer helicity (twice the helicity for fermions). The `col` array is an array which has at most `n_col` entries (see above). All parameters are `intent(inout)` since default values exist. In particular, if a mask entry is set by the previous procedure, the corresponding quantum number is ignored anyway.

⟨*User Code: public*⟩+≡
```
    public :: user_int_state
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
       subroutine user_int_state (i_state, i_prt, flv, hel, col) bind(C)
         use iso_c_binding !NODEP!
         integer(c_int), intent(in) :: i_state, i_prt
         integer(c_int), intent(inout) :: flv, hel
         integer(c_int), dimension(*), intent(inout) :: col
       end subroutine user_int_state
    end interface
```

This subroutine takes an array of particle objects with array length `n_in` and an array of input parameters between 0 and 1 with array length `n_dim`. It returns an array of particle objects with array length `n_out`. In addition, it returns an array of internal variables (e.g., momentum fractions, Jacobian) with array length `n_var` that is used by the following subroutine for evaluating the dynamics, i.e., the matrix elements.

⟨*User Code: public*⟩+≡
```
    public :: user_int_kinematics
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
       subroutine user_int_kinematics (prt_in, rval, prt_out, xval) bind(C)
         use iso_c_binding !NODEP!
         use c_particles !NODEP!
         type(c_prt_t), dimension(*), intent(in) :: prt_in
         real(c_double), dimension(*), intent(in) :: rval
         type(c_prt_t), dimension(*), intent(inout) :: prt_out
         real(c_double), dimension(*), intent(out) :: xval
       end subroutine user_int_kinematics
    end interface
```

This subroutine takes the array of variables (e.g., momentum fractions) with length `n_var` which has been generated by the previous subroutine and a real variable, the energy scale of the event. It returns an array of matrix-element

values, one entry for each quantum state `n_states`. The ordering of matrix elements must correspond to the ordering of states.

⟨*User Code: public*⟩+≡
```
    public :: user_int_evaluate
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
       subroutine user_int_evaluate (xval, scale, fval) bind(C)
         use iso_c_binding !NODEP!
         real(c_double), dimension(*), intent(in) :: xval
         real(c_double), intent(in) :: scale
         real(c_double), dimension(*), intent(out) :: fval
       end subroutine user_int_evaluate
    end interface
```

5.6 Variables

The user interface deals with variables that are handled similar to full-flegded programming languages. The system will add a lot of predefined variables (model parameters, flags, etc.) that are accessible to the user by the same methods.

Variables can be of various type: logical (boolean/flag), integer, real (default precision), subevents (used in cut expressions), arrays of PDG codes (aliases for particles), strings. Furthermore, in cut expressions we have unary and binary observables, which are used like real parameters but behave like functions.

⟨`variables.f90`⟩≡
  ⟨*File header*⟩

  `module variables`

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
  ⟨*Use file utils*⟩
```
    use limits, only: FMT_14, FMT_19 !NODEP!
    use diagnostics !NODEP!
    use lorentz !NODEP!
    use pdg_arrays
    use subevents
```

  ⟨*Variables: interfaces*⟩

  `contains`

⟨*Variables: procedures*⟩

```
end module variables
```

5.6.1 Variable list entries

Variable (and constant) values can be of one of the following types:

⟨*Variables: parameters*⟩≡
```
    integer, parameter, public :: V_NONE = 0, V_LOG = 1, V_INT = 2, V_REAL = 3
    integer, parameter, public :: V_CMPLX = 4, V_SEV = 5, V_PDG = 6, V_STR = 7
    integer, parameter, public :: V_OBS1_INT = 11, V_OBS2_INT = 12
    integer, parameter, public :: V_OBS1_REAL = 21, V_OBS2_REAL = 22
    integer, parameter, public :: V_UOBS1_INT = 31, V_UOBS2_INT = 32
    integer, parameter, public :: V_UOBS1_REAL = 41, V_UOBS2_REAL = 42
```

The type

This is an entry in the variable list. It can be of any type; in each case only one value is allocated. It may be physically allocated upon creation, in which case `is_allocated` is true, or it may contain just a pointer to a value somewhere else, in which case `is_allocated` is false.

The flag `is_defined` is set when the variable is given a value, even the undefined value. (Therefore it is distinct from `is_known`.) This matters for variable declaration in the SINDARIN language. The variable is set up in the compilation step and initially marked as defined, but after compilation all variables are set undefined. Each variable becomes defined when it is explicitly set. The difference matters in loops.

`is_locked` means that it cannot be given a value using the interface routines `var_list_set_XXX` below. It can only be initialized, or change automatically due to a side effect.

`is_copy` means that this is a local copy of a global variable. The copy has a pointer to the original, which can be used to restore a previous value.

`is_intrinsic` means that this variable is defined by the program, not by the user. Intrinsic variables cannot be (re)declared, but their values can be reset unless they are locked. `is_user_var` means that the variable has been declared by the user. It could be a new variable, or a local copy of an intrinsic variable.

The flag `is_known` is a pointer which parallels the use of the value pointer. For pointer variables, it is set if the value should point to a known value. For ordinary variables, it should be true.

The value is implemented as a set of alternative type-specific pointers. This emulates polymorphism, and it allows for actual pointer variables. Observable-type variables have function pointers as values, so they behave like macros. The functions make use of the particle objects accessible via the pointers `prt1` and `prt2`.

Finally, the `next` pointer indicates that we are making lists of variables. A more efficient implementation might switch to hashes or similar; the current implementation has $O(N)$ lookup.

⟨*Variables: public*⟩≡
```
    public :: var_entry_t
```

⟨Variables: types⟩≡

```
type :: var_entry_t
   private
   integer :: type = V_NONE

    end subroutine var_entry_set_string
```

5.6.3   Copies and pointer variables

Initialize an entry with a copy of an existing variable entry. The copy is physically allocated with the same type as the original.

⟨*Variables: procedures*⟩+≡

```
    subroutine var_entry_init_copy (var, original, user)
      type(var_entry_t), intent(out) :: var
      type(var_entry_t), intent(in), target :: original
      logical, intent(in), optional :: user
      type(string_t) :: name
      logical :: intrinsic
      name = var_entry_get_name (original)
```

```
      intrinsic = original%is_intrinsic
      select case (original%type)
      case (V_LOG)
         call var_entry_init_log (var, name, intrinsic=intrinsic, user=user)
      case (V_INT)
         call var_entry_init_int (var, name, intrinsic=intrinsic, user=user)
      case (V_REAL)
         call var_entry_init_real (var, name, intrinsic=intrinsic, user=user)
      case (V_CMPLX)
         call var_entry_init_cmplx (var, name, intrinsic=intrinsic, user=user)
      case (V_SEV)
         call var_entry_init_subevt (var, name, intrinsic=intrinsic, user=user)
      case (V_PDG)
         call var_entry_init_pdg_array (var, name, intrinsic=intrinsic, user=user)
      case (V_STR)
         call var_entry_init_string (var, name, intrinsic=intrinsic, user=user)
      end select
      var%is_copy = .true.
    end subroutine var_entry_init_copy
```

Clear the pointer to the original.

⟨*Variables: procedures*⟩+≡
```
    subroutine var_entry_clear_original_pointer (var)
      type(var_entry_t), intent(inout) :: var
      var%original => null ()
    end subroutine var_entry_clear_original_pointer
```

Set the pointer to the original. For a free parameter, the variable holds both the value and the pointer. For a derived parameter, we associate the pointer directly. Derived parameters thus need not be synchronized explicitly.

⟨*Variables: procedures*⟩+≡
```
    subroutine var_entry_set_original_pointer (var, original)
      type(var_entry_t), intent(inout) :: var
      type(var_entry_t), intent(in), target :: original
      if (var_entry_is_locked (original)) then
         call var_entry_lock (var)
      end if
      var%original => original
    end subroutine var_entry_set_original_pointer
```

Synchronize a variable with its original: if a pointer exists, set the value to be equal to value pointed to.

⟨*Variables: procedures*⟩+≡
```
    subroutine var_entry_synchronize (var)
      type(var_entry_t), intent(inout) :: var
      if (associated (var%original)) then
         var%is_defined = var%original%is_defined
         var%is_known = var%original%is_known
         if (var%original%is_known) then
            select case (var%type)
            case (V_LOG);  var%lval = var%original%lval
            case (V_INT);  var%ival = var%original%ival
```

```
          case (V_REAL); var%rval = var%original%rval
          case (V_CMPLX); var%cval = var%original%cval
          case (V_SEV);  var%pval = var%original%pval
          case (V_PDG);  var%aval = var%original%aval
          case (V_STR);  var%sval = var%original%sval
          end select
       end if
    end if
  end subroutine var_entry_synchronize
```

Restore the previous value of the original, using the value stored in the variable. This is a side-effect operation.

⟨*Variables: procedures*⟩+≡
```
  subroutine var_entry_restore (var)
    type(var_entry_t), intent(inout) :: var
    if (associated (var%original)) then
       if (var%is_known) then
          select case (var%type)
          case (V_LOG);  var%original%lval = var%lval
          case (V_INT);  var%original%ival = var%ival
          case (V_REAL); var%original%rval = var%rval
          case (V_CMPLX); var%original%cval = var%cval
          case (V_SEV);  var%original%pval = var%pval
          case (V_PDG);  var%original%aval = var%aval
          case (V_STR);  var%original%sval = var%sval
          end select
       end if
    end if
  end subroutine var_entry_restore
```

5.6.4 Variable lists

The type

Variable lists can be linked together. No initializer needed. They are deleted separately.

⟨*Variables: public*⟩+≡
```
  public :: var_list_t
```

⟨*Variables: types*⟩+≡
```
  type :: var_list_t
    private
    type(var_entry_t), pointer :: first => null ()
    type(var_entry_t), pointer :: last => null ()
    type(var_list_t), pointer :: next => null ()
  end type var_list_t
```

Constructors

⟨*Variables: public*⟩+≡
```
  public :: var_list_link
```

⟨*Variables: procedures*⟩+≡
```
    subroutine var_list_link (var_list, next)
      type(var_list_t), intent(inout) :: var_list
      type(var_list_t), intent(in), target :: next
      var_list%next => next
    end subroutine var_list_link
```

Append a new entry to an existing list.

⟨*Variables: procedures*⟩+≡
```
    subroutine var_list_append (var_list, var, verbose)
      type(var_list_t), intent(inout) :: var_list
      type(var_entry_t), intent(in), target :: var
      logical, intent(in), optional :: verbose
      if (associated (var_list%last)) then
         var_list%last%next => var
      else

      end if
    end subroutine var_list_write_var
```

5.6.5 Tools

Return a pointer to the variable list linked to by the current one.

⟨*Variables: public*⟩+≡
```
    public :: var_list_get_next_ptr
```

⟨*Variables: procedures*⟩+≡
```
    function var_list_get_next_ptr (var_list) result (next_ptr)
      type(var_list_t), pointer :: next_ptr
      type(var_list_t), intent(in) :: var_list
      next_ptr => var_list%next
    end function var_list_get_next_ptr
```

Return a pointer to the variable with the requested name. If no such name
exists, return a null pointer. In that case, try the next list if present, unless
`follow_link` is unset. If `defined` is set, ignore entries that exist but are unde-
fined.

⟨*Variables: public*⟩+≡
```
    public :: var_list_get_var_ptr
```

⟨*Variables: procedures*⟩+≡
```
    recursive function var_list_get_var_ptr &
         (var_list, name, type, follow_link, defined) result (var)
      type(var_entry_t), pointer :: var
      type(var_list_t), intent(in), target :: var_list
      type(string_t), intent(in) :: name
      integer, intent(in), optional :: type
      logical, intent(in), optional :: follow_link, defined
      logical :: ignore_undef, search_next
      ignore_undef = .true.;  if (present (defined))  ignore_undef = .not. defined
      var => var_list%first
      if (present (type)) then
         do while (associated (var))
```

```
               if (var%type == type) then
                  if (var%name == name) then
                     if (ignore_undef .or. var%is_defined)  return
                  end if
               end if
               var => var%next
            end do
         else
            do while (associated (var))
               if (var%name == name) then
                  if (ignore_undef .or. var%is_defined)  return
               end if
               var => var%next
            end do
         end if
         search_next = associated (var_list%next)
         if (present (follow_link)) &
              search_next = search_next .and. follow_link
         if (search_next) &
              var => var_list_get_var_ptr &
                   (var_list%next, name, type, defined=defined)
      end function var_list_get_var_ptr
```

Return the variable type

⟨*Variables: public*⟩+≡
```
      public :: var_list_get_type
```

⟨*Variables: procedures*⟩+≡
```
      function var_list_get_type (var_list, name, follow_link) result (type)
        integer :: type
        type(string_t), intent(in) :: name
        type(var_list_t), intent(in), target :: var_list
        logical, intent(in), optional :: follow_link
        type(var_entry_t), pointer :: var
        var => var_list_get_var_ptr (var_list, name, follow_link=follow_link)
        if (associated (var)) then
           type = var%type
        else
           type = V_NONE
        end if
      end function var_list_get_type
```

Return true if the variable exists.

⟨*Variables: public*⟩+≡
```
      public :: var_list_exists
```

⟨*Variables: procedures*⟩+≡
```
      function var_list_exists (var_list, name, follow_link) result (flag)
        logical :: flag
        type(string_t), intent(in) :: name
        type(var_list_t), intent(in), target :: var_list
        logical, intent(in), optional :: follow_link
        type(var_entry_t), pointer :: var

```

```
      flag = associated (var)
   end function var_list_exists
```

Return true if the variable is declared as intrinsic.

⟨*Variables: public*⟩+≡
```
    public :: var_list_is_intrinsic
```

⟨*Variables: procedures*⟩+≡
```
    function var_list_is_intrinsic (var_list, name, follow_link) result (flag)
      logical :: flag
      type(string_t), intent(in) :: name
      type(var_list_t), intent(in), target :: var_list
      logical, intent(in), optional :: follow_link
      type(var_entry_t), pointer :: var
      var => var_list_get_var_ptr (var_list, name, follow_link=follow_link)
      if (associated (var)) then
         flag = var%is_intrinsic
      else
         flag = .false.
      end if
    end function var_list_is_intrinsic
```

Return true if the value is known.

⟨*Variables: public*⟩+≡
```
    public :: var_list_is_known
```

⟨*Variables: interfaces*⟩+≡
```
    interface var_list_is_known
       module procedure var_list_is_known_s
       module procedure var_list_is_known_c
    end interface
```

⟨*Variables: procedures*⟩+≡
```
    function var_list_is_known_s (var_list, name, follow_link) result (flag)
      logical :: flag
      type(string_t), intent(in) :: name
      type(var_list_t), intent(in), target :: var_list
      logical, intent(in), optional :: follow_link
      type(var_entry_t), pointer :: var
      var => var_list_get_var_ptr (var_list, name, follow_link=follow_link)
      if (associated (var)) then
         flag = var%is_known
      else
         flag = .false.
      end if
    end function var_list_is_known_s

    function var_list_is_known_c (var_list, name, follow_link) result (flag)
      logical :: flag
      character(*), intent(in) :: name
      type(var_list_t), intent(in), target :: var_list
      logical, intent(in), optional :: follow_link
      flag = var_list_is_known_s (var_list, var_str (name), follow_link)
    end function var_list_is_known_c
```

Return true if the value is locked.

⟨Variables: public⟩+≡
```
    public :: var_list_is_locked
```

⟨Variables: procedures⟩+≡
```
    function var_list_is_locked (var_list, name, follow_link) result (flag)
      logical :: flag
      type(string_t), intent(in) :: name
      type(var_list_t), intent(in), target :: var_list
      logical, intent(in), optional :: follow_link
      type(var_entry_t), pointer :: var
      var => var_list_get_var_ptr (var_list, name, follow_link=follow_link)
      if (associated (var)) then

      end if
    end function var_has_value
```

5.6.6 Process-specific variables

We allow the user to set a numeric process ID for each declared process.

⟨*Variables: public*⟩+≡

```
    public :: var_list_init_num_id
```

⟨*Variables: procedures*⟩+≡
```
    subroutine var_list_init_num_id (var_list, proc_id, num_id)
      type(var_list_t), intent(inout) :: var_list
      type(string_t), intent(in) :: proc_id
      integer, intent(in), optional :: num_id
      call var_list_set_procvar_int (var_list, proc_id, &
           var_str ("num_id"), num_id)
    end subroutine var_list_init_num_id
```

Integration results are stored in special variables. They are initialized by this subroutine. The values may or may not already known.

Note: the values which are accessible are those that are unique for a process with multiple MCI records. The rest has been discarded.

⟨*Variables: public*⟩+≡
```
    public :: var_list_init_process_results
```

⟨*Variables: procedures*⟩+≡
```
    subroutine var_list_init_process_results (var_list, proc_id, &

      end if
   end subroutine var_list_set_procvar_real
```

5.6.7   Observable initialization

Observables are formally treated as variables, which however are evaluated each time the observable is used. The arguments (pointers) to evaluate and the function are part of the variable-list entry.

The procedure pointer should be set by this subroutine. This, however, triggers a bug in nagfor 5.2(649). As a workaround, we return the variable pointer, so the pointer can be set directly.

⟨*Variables: procedures*⟩+≡
```
   subroutine var_list_set_obs (var_list, name, type, var, prt1, prt2)
     type(var_list_t), intent(inout) :: var_list
     type(string_t), intent(in) :: name
     integer, intent(in) :: type
     type(var_entry_t), pointer :: var
     type(prt_t), intent(in), target :: prt1
     type(prt_t), intent(in), optional, target :: prt2
     allocate (var)
     call var_entry_init_obs (var, name, type, prt1, prt2)
     call var_list_append (var_list, var)
   end subroutine var_list_set_obs
```

Unary and binary observables are different. Most unary observables can be equally well evaluated for particle pairs. Binary observables cannot be evaluated for single particles.

⟨*Variables: public*⟩+≡
```
   public :: var_list_set_observables_unary
   public :: var_list_set_observables_binary
```

⟨*Variables: procedures*⟩+≡

```

Check if a variable name is defined as an observable:

⟨*Variables: procedures*⟩+≡
```
  function string_is_observable_id (string) result (flag)
    logical :: flag
    type(string_t), intent(in) :: string
    select case (char (string))
    case ("PDG", "Hel", "M", "M2", "E", "Px", "Py", "Pz", "P", "Pl", "Pt", &
          "Theta", "Phi", "Rap", "Eta", "Theta_RF", "Dist", "kT")
       flag = .true.
    case default
       flag = .false.
    end select
  end function string_is_observable_id
```

5.6.8   Observables

These are analogous to the unary and binary numeric functions listed above.
An observable takes the `pval` component(s) of its one or two argument nodes
and produces an integer or real value.

Integer-valued unary observables

The PDG code

⟨*Variables: procedures*⟩+≡
```
  integer function obs_pdg1 (prt1) result (pdg)
    type(prt_t), intent(in) :: prt1
    pdg = prt_get_pdg (prt1)
  end function obs_pdg1
```

The helicity. The return value is meaningful only if the particle is polarized,
otherwise an invalid value is returned (-9).

⟨*Variables: procedures*⟩+≡
```
  integer function obs_helicity1 (prt1) result (h)
    type(prt_t), intent(in) :: prt1
    if (prt_is_polarized (prt1)) then
       h = prt_get_helicity (prt1)
    else
       h = -9
    end if
  end function obs_helicity1
```

Real-valued unary observables

The invariant mass squared, obtained from the separately stored value.

⟨*Variables: procedures*⟩+≡

```
    real(default) function obs_mass_squared1 (prt1) result (p2)
      type(prt_t), intent(in) :: prt1
      p2 = prt_get_msq (prt1)
    end function obs_mass_squared1
```

The signed invariant mass, which is the signed square root of the previous observable.

⟨*Variables: procedures*⟩+≡
```
    real(default) function obs_signed_mass1 (prt1) result (m)
      type(prt_t), intent(in) :: prt1
      real(default) :: msq
      msq = prt_get_msq (prt1)
      m = sign (sqrt (abs (msq)), msq)
    end function obs_signed_mass1
```

The particle energy

⟨*Variables: procedures*⟩+≡
```
    real(default) function obs_energy1 (prt1) result (e)
      type(prt_t), intent(in) :: prt1
      e = energy (prt_get_momentum (prt1))
    end function obs_energy1
```

Particle momentum (components)

⟨*Variables: procedures*⟩+≡
```
    real(default) function obs_px1 (prt1) result (p)
      type(prt_t), intent(in) :: prt1
      p = vector4_get_component (prt_get_momentum (prt1), 1)
    end function obs_px1

    real(default) function obs_py1 (prt1) result (p)
      type(prt_t), intent(in) :: prt1
      p = vector4_get_component (prt_get_momentum (prt1), 2)
    end function obs_py1

      end function obs_ktmeasure
```

5.6.9   API for variable lists

Set a new value. If the variable holds a pointer, this pointer is followed, e.g.,
a model parameter is actually set. If `ignore` is set, do nothing if the variable
does not exist. If `verbose` is set, echo the new value.

   The specific versions:

⟨*Variables: public*⟩+≡
```
      public :: var_list_set_log
      public :: var_list_set_int
      public :: var_list_set_real
```

```

5.6.10   Linking model variables

The variable list of a model can be linked to the global variable list, so the
model variables become available. However, the model may change during the
execution of the command list, and this is not known at compile time. So, we
make a copy of all variables that can be modified by the user; this will include
all variables that are present in any of the models. At runtime, the linked list
and the pointers to it can be exchanged, but the global variables will stay.

Append a single model variable to the local variable list. The pointer to the
original is not set (yet). Check first if it already exists; in that case, do nothing.

⟨*Variables: public*⟩+≡
```
      public :: var_list_init_copy
```

⟨*Variables: procedures*⟩+≡
```
      subroutine var_list_init_copy (var_list, model_var, user)
        type(var_list_t), intent(inout), target :: var_list
        type(var_entry_t), intent(in), target :: model_var
        logical, intent(in), optional :: user
        type(var_entry_t), pointer :: var
        if (.not. var_list_exists &
             (var_list, model_var%name, follow_link = .false.)) then
           allocate (var)
           call var_entry_init_copy (var, model_var, user)
           call var_list_append (var_list, var)
        end if
      end subroutine var_list_init_copy
```

Append all model variables, or reuse (unset) them if they already exist. If
`derived_only` is set, copy only derived parameters; these are real parameters
that are locked. How should we (should we at all?) generalize this to complex
parameters?

⟨*Variables: public*⟩+≡
```
      public :: var_list_init_copies
```

⟨*Variables: procedures*⟩+≡
```
      subroutine var_list_init_copies (var_list, model_vars, derived_only)
        type(var_list_t), intent(inout), target :: var_list
        type(var_list_t), intent(in) :: model_vars
        logical, intent(in), optional :: derived_only
        type(var_entry_t), pointer :: model_var, var
        type(string_t) :: name
        logical :: copy_all, locked, derived
        integer :: type

           type = var_entry_get_type (model_var)
           locked = var_entry_is_locked (model_var)
```

```
                derived = type == V_REAL .and. locked
                if (copy_all .or. derived) then
                   var => var_list_get_var_ptr &
                        (var_list, name, type, follow_link = .false.)
                   if (associated (var)) then
                      call var_entry_clear_value (var)
                   else
                      allocate (var)
                      call var_entry_init_copy (var, model_var)
                      call var_list_append (var_list, var)
                   end if
                end if
                model_var => model_var%next
             end do
          end subroutine var_list_init_copies
```

Clear all previously allocated pointers to some model:

⟨*Variables: procedures*⟩+≡
```
       subroutine var_list_clear_original_pointers (var_list)
         type(var_list_t), intent(inout) :: var_list
         type(var_entry_t), pointer :: var
         var => var_list%first
         do while (associated (var))
            call var_entry_clear_original_pointer (var)
            var => var%next
         end do
       end subroutine var_list_clear_original_pointers
```

Assign the pointer to the original for a single variable.

⟨*Variables: public*⟩+≡
```
       public :: var_list_set_original_pointer
```

⟨*Variables: procedures*⟩+≡
```
       subroutine var_list_set_original_pointer (var_list, name, model_vars)
         type(var_list_t), intent(inout) :: var_list
         type(string_t), intent(in) :: name
         type(var_list_t), intent(in), target :: model_vars
         type(var_entry_t), pointer :: var, model_var
         integer :: type
         model_var => var_list_get_var_ptr (model_vars, name)
         if (associated (model_var)) then
            type = var_entry_get_type (model_var)
            var => var_list_get_var_ptr (var_list, name, type, follow_link=.false.)
            if (associated (var)) then
               call var_entry_set_original_pointer (var, model_var)
            end if
         end if
       end subroutine var_list_set_original_pointer
```

Assign pointers to the originals for all variables in the model variable list.

⟨*Variables: public*⟩+≡
```
       public :: var_list_set_original_pointers
```

⟨*Variables: procedures*⟩+≡
```
    subroutine var_list_set_original_pointers (var_list, model_vars)
      type(var_list_t), intent(inout) :: var_list
      type(var_list_t), intent(in), target :: model_vars
      type(var_entry_t), pointer :: var, model_var
      type(string_t) :: name
      integer :: type
      model_var => model_vars%first
      do while (associated (model_var))
         name = var_entry_get_name (model_var)
         type = var_entry_get_type (model_var)
         var => var_list_get_var_ptr (var_list, name, type, follow_link=.false.)
         if (associated (var)) then
            call var_entry_set_original_pointer (var, model_var)
         end if
         model_var => model_var%next
      end do
    end subroutine var_list_set_original_pointers
```

Synchronize the local variable list with the model variable list (which is accessed by the pointers assigned in the previous subroutine).

If `reset_pointers` is unset, do not reset pointers but just update values where a variable is a copy. Resetting pointers is done only in the local variable list.

⟨*Variables: public*⟩+≡
```
    public :: var_list_synchronize
```

⟨*Variables: procedures*⟩+≡
```
    subroutine var_list_synchronize (var_list, model_vars, reset_pointers)
      type(var_list_t), intent(inout) :: var_list
      type(var_list_t), intent(in), target :: model_vars
      logical, intent(in), optional :: reset_pointers
      type(var_entry_t), pointer :: var
      if (present (reset_pointers)) then
         if (reset_pointers) then
            call var_list_clear_original_pointers (var_list)
            call var_list_set_original_pointers (var_list, model_vars)
         end if
      end if
      var => var_list%first
      do while (associated (var))
         call var_entry_synchronize (var)
         var => var%next
      end do
    end subroutine var_list_synchronize
```

This is the inverse operation: synchronize the model variable list with the current variable list. This is necessary after discarding a local variable list.

For accessing all model variables, we should follow the links first, then scan the current list.

⟨*Variables: public*⟩+≡
```
    public :: var_list_restore
```

⟨Variables: procedures⟩+≡
```
recursive subroutine var_list_restore (var_list, follow_link)
  type(var_list_t), intent(inout) :: var_list
  type(var_entry_t), pointer :: var
  logical, intent(in), optional :: follow_link
  logical :: rec
  rec = .true.;  if (present (follow_link))  rec = follow_link
  if (rec .and. associated (var_list%next)) then
     call var_list_restore (var_list%next, rec)
  end if
  var => var_list%first
  do while (associated (var))
     call var_entry_restore (var)
     var => var%next
  end do
end subroutine var_list_restore
```

Mark all entries in the current variable list as undefined. This is done when a local variable list is discarded. If the local list is used again (by a loop), the entries will be re-initialized.

⟨Variables: public⟩+≡
```
public :: var_list_undefine
```

⟨Variables: procedures⟩+≡
```
recursive subroutine var_list_undefine (var_list, follow_link)
  type(var_list_t), intent(inout) :: var_list
  logical, intent(in), optional :: follow_link
  type(var_entry_t), pointer :: var
  logical :: rec
  rec = .true.;  if (present (follow_link))  rec = follow_link
  var => var_list%first
  do while (associated (var))
     call var_entry_undefine (var)
     var => var%next
  end do
  if (rec .and. associated (var_list%next)) then
     call var_list_undefine (var_list%next, follow_link=follow_link)
  end if
end subroutine var_list_undefine
```

Make a deep copy of a variable list. The copy does not contain any pointer variables. Clear the original pointer after use, since the original may be lost when the copy is in use.

⟨Variables: public⟩+≡
```
public :: var_list_init_snapshot
```

⟨Variables: procedures⟩+≡
```
recursive subroutine var_list_init_snapshot (var_list, vars_in, follow_link)
  type(var_list_t), intent(out) :: var_list
  type(var_list_t), intent(in) :: vars_in
  logical, intent(in), optional :: follow_link
  type(var_entry_t), pointer :: var, var_in
  type(var_list_t), pointer :: var_list_next
```

```
      logical :: rec
      rec = .true.;  if (present (follow_link))  rec = follow_link
      var_in => vars_in%first
      do while (associated (var_in))
         allocate (var)
         call var_entry_init_copy (var, var_in)
         call var_entry_set_original_pointer (var, var_in)
         call var_entry_synchronize (var)
         call var_entry_clear_original_pointer (var)
         call var_list_append (var_list, var)
         var_in => var_in%next
      end do
      if (rec .and. associated (vars_in%next)) then
         allocate (var_list_next)
         call var_list_init_snapshot (var_list_next, vars_in%next)
         call var_list_link (var_list, var_list_next)
      end if
   end subroutine var_list_init_snapshot
```

Check if a user variable can be set. The `new` flag is set if the user variable has
an explicit declaration. If an error occurs, return `V_NONE` as variable type.

Also determine the actual type of generic numerical variables, which enter
the procedure with type `V_NONE`.

⟨*Variables: public*⟩+≡
```
    public :: var_list_check_user_var
```

⟨*Variables: procedures*⟩+≡
```
    subroutine var_list_check_user_var (var_list, name, type, new)

                        // "redeclared with different type")
                    type = V_NONE
                    return
                end if
            end if
        else
            if (string_is_result_var (name)) then
                call msg_error ("Result variable '" // char (name) // "' " &
                    // "set without prior integration")
                type = V_NONE
                return
            else if (string_is_num_id (name)) then
                call msg_error ("Numeric process ID '" // char (name) // "' " &
                    // "set without process declaration")
                type = V_NONE
                return
            else if (.not. new) then
                call msg_error ("Variable '" // char (name) // "' " &
                    // "set without declaration")
                type = V_NONE
                return
            end if
        end if
    end subroutine var_list_check_user_var
```

Check if a variable name is a result variable of integer type:

⟨*Variables: procedures*⟩+≡

```
    function string_is_integer_result_var (string) result (flag)
      logical :: flag
      type(string_t), intent(in) :: string
      type(string_t) :: buffer, name, separator
      buffer = string
      call split (buffer, name, "(", separator=separator)  ! ")"
      if (separator == "(") then
         select case (char (name))
         case ("num_id", "n_calls")
            flag = .true.
         case default
            flag = .false.
         end select
      else
         flag = .false.
      end if
    end function string_is_integer_result_var
```

Check if a variable name is an integration-result variable:

⟨*Variables: procedures*⟩+≡

```
    function string_is_result_var (string) result (flag)
```

```
   logical :: flag
   type(string_t), intent(in) :: string
   type(string_t) :: buffer, name, separator
   buffer = string
   call split (buffer, name, "(", separator=separator)  ! ")"
   if (separator == "(") then
      select case (char (name))
      case ("integral", "error")
         flag = .true.
      case default
         flag = .false.
      end select
   else
      flag = .false.
   end if
end function string_is_result_var
```

Check if a variable name is a numeric process ID:

⟨*Variables: procedures*⟩+≡
```
function string_is_num_id (string) result (flag)
   logical :: flag
   type(string_t), intent(in) :: string
   type(string_t) :: buffer, name, separator
   buffer = string
   call split (buffer, name, "(", separator=separator)  ! ")"
   if (separator == "(") then
      select case (char (name))
      case ("num_id")
         flag = .true.
      case default
         flag = .false.
      end select
   else
      flag = .false.
   end if
end function string_is_num_id
```

5.7   Expressions

In this module we define the structures needed to parse a user-defined expression, to compile it into an evaluation tree, and to evaluate it.

We have two flavors of expressions: one with particles and one without particles. The latter version is used for defining cut/selection criteria and for online analysis.

5.7.1   Tree nodes

The evaluation tree consists of branch nodes (unary and binary) and of leaf nodes, originating from a common root. The node object should be polymorphic. For the time being, polymorphism is emulated here. This means that we have to maintain all possibilities that the node may hold, including associated procedures as pointers.

The following parameter values characterize the node. Unary and binary operators have sub-nodes. The other are leaf nodes. Possible leafs are literal constants or named-parameter references.

⟨*Expressions: types*⟩≡
```
integer, parameter :: EN_UNKNOWN = 0, EN_UNARY = 1, EN_BINARY = 2
integer, parameter :: EN_CONSTANT = 3, EN_VARIABLE = 4
integer, parameter :: EN_CONDITIONAL = 5, EN_BLOCK = 6
```

```
      integer, parameter :: EN_RECORD_CMD = 7
      integer, parameter :: EN_OBS1_INT = 11, EN_OBS2_INT = 12
      integer, parameter :: EN_OBS1_REAL = 21, EN_OBS2_REAL = 22
      integer, parameter :: EN_UOBS1_INT = 31, EN_UOBS2_INT = 32
      integer, parameter :: EN_UOBS1_REAL = 41, EN_UOBS2_REAL = 42
      integer, parameter :: EN_PRT_FUN_UNARY = 101, EN_PRT_FUN_BINARY = 102
      integer, parameter :: EN_EVAL_FUN_UNARY = 111, EN_EVAL_FUN_BINARY = 112
      integer, parameter :: EN_LOG_FUN_UNARY = 121, EN_LOG_FUN_BINARY = 122
      integer, parameter :: EN_INT_FUN_UNARY = 131, EN_INT_FUN_BINARY = 132
      integer, parameter :: EN_REAL_FUN_UNARY = 141, EN_REAL_FUN_BINARY = 142
      integer, parameter :: EN_FORMAT_STR = 161
```

    if (present (arg2)) then
       node%type = EN_BINARY
    else
       node%type = EN_UNARY
    end if
    node%tag = tag
    node%result_type = result_type
    call eval_node_allocate_value (node)
    node%arg1 => arg1
    if (present (arg2))  node%arg2 => arg2
  end subroutine eval_node_init_branch
```

Allocate the node value according to the result type.

⟨*Expressions: procedures*⟩+≡
```
  subroutine eval_node_allocate_value (node)
    type(eval_node_t), intent(inout) :: node
    select case (node%result_type)
    case (V_LOG);  allocate (node%lval)
    case (V_INT);  allocate (node%ival)
    case (V_REAL); allocate (node%rval)
```

```
      case (V_CMPLX); allocate (node%cval)
      case (V_PDG);  allocate (node%aval)
      case (V_SEV);  allocate (node%pval)
         call subevt_init (node%pval)
      case (V_STR);  allocate (node%sval)
      end select
      allocate (node%value_is_known)
      node%value_is_known = .false.
    end subroutine eval_node_allocate_value
```

Initialize a node with an observable. This includes a procedure pointer. The input is a variable entry from the stack which holds the necessary information.

The user-observable version does not contain a pointer. The appropriate procedure is called directly at evaluation time. Furthermore, this is a branch node with a reference to the string-expression node which determines the name of the user procedure.

⟨*Expressions: procedures*⟩+≡
```
    subroutine eval_node_init_obs (node, var, arg)
      type(eval_node_t), intent(out) :: node
      type(var_entry_t), intent(in), target :: var
      type(eval_node_t), intent(in), target, optional :: arg

   end select
   select case (var_type)
   case (V_UOBS1_INT, V_UOBS1_REAL, V_UOBS2_INT, V_UOBS2_REAL)
      if (present (arg))  node%arg0 => arg
   end select
 end subroutine eval_node_init_obs
```

Initialize a block node which contains, in addition to the expression to be eval-
uated, a variable definition. The result type is not yet assigned, because we can
compile the enclosed expression only after the var list is set up.

Note that the node always allocates a new variable list and appends it to
the current one. Thus, if the variable redefines an existing one, it only shadows
it but does not reset it. Any side-effects are therefore absent and need not be
undone outside the block.

If the flag **new** is set, a variable is (re)declared. This must not be done for
intrinsic variables. Vice versa, if the variable is not existent, the **new** flag is
required.

⟨*Expressions: procedures*⟩+≡

```
    subroutine eval_node_init_block (node, name, type, var_def, var_list)
      type(eval_node_t), intent(out), target :: node
      type(string_t), intent(in) :: name

        end select
    end if
end subroutine eval_node_init_block
```

Complete block initialization by assigning the expression to evaluate to `arg0`.

⟨*Expressions: procedures*⟩+≡
```
    subroutine eval_node_set_expr (node, arg, result_type)
      type(eval_node_t), intent(inout) :: node
      type(eval_node_t), intent(in), target :: arg
      integer, intent(in), optional :: result_type
      if (present (result_type)) then
         node%result_type = result_type
      else
         node%result_type = arg%result_type
      end if
      call eval_node_allocate_value (node)
      node%arg0 => arg
    end subroutine eval_node_set_expr
```

Initialize a conditional. There are three branches: the condition (evaluates to logical) and the two alternatives (evaluate both to the same arbitrary type).

⟨*Expressions: procedures*⟩+≡
```
    subroutine eval_node_init_conditional (node, result_type, cond, arg1, arg2)
      type(eval_node_t), intent(out) :: node
      integer, intent(in) :: result_type
      type(eval_node_t), intent(in), target :: cond, arg1, arg2
      node%type = EN_CONDITIONAL
      node%tag = "cond"
      node%result_type = result_type
      call eval_node_allocate_value (node)
      node%arg0 => cond
      node%arg1 => arg1
```

```
      node%arg2 => arg2
   end subroutine eval_node_init_conditional
```

Initialize a recording command (which evaluates to a logical constant). The first branch is the ID of the analysis object to be filled, the optional branches 1 to 4 are the values to be recorded.

If the event-weight pointer is null, we record values with unit weight. Otherwise, we use the value pointed to as event weight.

There can be up to four arguments which represent x, y, Δy, Δx. Therefore, this is the only node type that may fill four sub-nodes.

⟨*Expressions: procedures*⟩+≡
```
   subroutine eval_node_init_record_cmd &
      (node, event_weight, id, arg1, arg2, arg3, arg4)
     type(eval_node_t), intent(out) :: node
     real(default), pointer :: event_weight
     type(eval_node_t), intent(in), target :: id
     type(eval_node_t), intent(in), optional, target :: arg1, arg2, arg3, arg4
     call eval_node_init_log (node, .true.)
     node%type = EN_RECORD_CMD
     node%rval => event_weight
     node%tag = "record_cmd"
     node%arg0 => id
     if (present (arg1)) then
        node%arg1 => arg1
        if (present (arg2)) then
           node%arg2 => arg2
           if (present (arg3)) then
              node%arg3 => arg3
              if (present (arg4)) then
                 node%arg4 => arg4
              end if
           end if
        end if
     end if
   end subroutine eval_node_init_record_cmd
```

Initialize a node for operations on subevents. The particle lists (one or two) are inserted as **arg1** and **arg2**. We allocated particle pointers as temporaries for iterating over particle lists. The procedure pointer which holds the function to evaluate for the subevents (e.g., combine, select) is also initialized.

⟨*Expressions: procedures*⟩+≡
```
   subroutine eval_node_init_prt_fun_unary (node, arg1, name, proc)
     type(eval_node_t), intent(out) :: node
     type(eval_node_t), intent(in), target :: arg1
     type(string_t), intent(in) :: name
     procedure(unary_sev) :: proc
     node%type = EN_PRT_FUN_UNARY
     node%tag = name
     node%result_type = V_SEV
     call eval_node_allocate_value (node)
     node%arg1 => arg1
     allocate (node%index, source = 0)
```

```
    allocate (node%prt1)
    node%op1_sev => proc
  end subroutine eval_node_init_prt_fun_unary

  subroutine eval_node_init_prt_fun_binary (node, arg1, arg2, name, proc)
    type(eval_node_t), intent(out) :: node
    type(eval_node_t), intent(in), target :: arg1, arg2
    type(string_t), intent(in) :: name
    procedure(binary_sev) :: proc
    node%type = EN_PRT_FUN_BINARY
    node%tag = name
    node%result_type = V_SEV
    call eval_node_allocate_value (node)
    node%arg1 => arg1
    node%arg2 => arg2
    allocate (node%index, source = 0)
    allocate (node%prt1)
    allocate (node%prt2)
    node%op2_sev => proc
  end subroutine eval_node_init_prt_fun_binary
```

Similar, but for particle-list functions that evaluate to a real value.

⟨*Expressions: procedures*⟩+≡

```
  subroutine eval_node_init_eval_fun_unary (node, arg1, name)
    type(eval_node_t), intent(out) :: node
    type(eval_node_t), intent(in), target :: arg1
    type(string_t), intent(in) :: name

      node%arg1 => arg
      allocate (node%ival)
      node%ival = n_args
    end subroutine eval_node_init_format_string
```

If particle functions depend upon a condition (or an expression is evaluated),
the observables that can be evaluated for the given particles have to be thrown
on the local variable stack. This is done here. Each observable is initialized
with the particle pointers which have been allocated for the node.

The integer variable that is referred to by the Index pseudo-observable is
always known when it is referred to.

⟨*Expressions: procedures*⟩+≡
```
    subroutine eval_node_set_observables (node, var_list)
      type(eval_node_t), intent(inout) :: node
      type(var_list_t), intent(in), target :: var_list

5.7.2 Operation types

For the operations associated to evaluation tree nodes, we define abstract interfaces for all cases.

Particles/subevents are transferred by-reference, to avoid unnecessary copying. Therefore, subroutines instead of functions. (Furthermore, the function version of `unary_prt` triggers an obscure bug in nagfor 5.2(649) [invalid C code].)

⟨*Expressions: interfaces*⟩≡

```
    abstract interface
       logical function unary_log (arg)
         import eval_node_t
         type(eval_node_t), intent(in) :: arg
       end function unary_log
    end interface
    abstract interface

5.7.3   Specific operators

Our expression syntax contains all Fortran functions that make sense. These functions have to be provided in a form that they can be used in procedures pointers, and have the abstract interfaces above. For some intrinsic functions, we could use specific versions provided by Fortran directly. However, this has two drawbacks: (i) We should work with the values instead of the eval-nodes as argument, which complicates the interface; (ii) more importantly, the `default` real type need not be equivalent to double precision. This would, at least, introduce system dependencies. Finally, for operators there are no specific versions.

Therefore, we write wrappers for all possible functions, at the expense of some overhead.

Binary numerical functions

⟨*Expressions: procedures*⟩+≡
```
    integer function add_ii (en1, en2) result (y)
      type(eval_node_t), intent(in) :: en1, en2

```

This is the interface to user-supplied observables. The node en0 evaluates to a
string that indicates the procedure name. We search for the procedure in the
dynamic library and load it into the procedure pointer which is then called.
en1 is the subevent on which the external code operates. The external function

returns a `c_int`, which we translate into a real value.

⟨*Expressions: procedures*⟩+≡

```
    function user_obs_int_p (en0, prt1) result (ival)
      integer :: ival

         name = ""
      end select
      call c_f_procpointer (user_code_find_proc (name), user_event_shape)
      rval = user_event_shape (c_prt (en1%pval), &
                               int (subevt_get_length (en1%pval), kind=c_int))
    end subroutine user_event_shape_a
```

Binary particle-list functions

This joins two subevents, stored in the evaluation nodes `en1` and `en2`. If `en0` is also present, it amounts to a logical test returning true or false for every pair of particles. A particle of the second list gets a mask entry only if it passes the test for all particles of the first list.

⟨*Expressions: procedures*⟩+≡

```
    subroutine join_pp (subevt, en1, en2, en0)
      type(subevt_t), intent(inout) :: subevt
      type(eval_node_t), intent(in) :: en1, en2
      type(eval_node_t), intent(inout), optional :: en0
      logical, dimension(:), allocatable :: mask2
      integer :: i, j, n1, n2
      n1 = subevt_get_length (en1%pval)
      n2 = subevt_get_length (en2%pval)
      allocate (mask2 (n2))
      mask2 = .true.
      if (present (en0)) then
         do i = 1, n1
            en0%index = i
            en0%prt1 = subevt_get_prt (en1%pval, i)
            do j = 1, n2
               en0%prt2 = subevt_get_prt (en2%pval, j)
               call eval_node_evaluate (en0)
               mask2(j) = mask2(j) .and. en0%lval
            end do
         end do
      end if
      call subevt_join (subevt, en1%pval, en2%pval, mask2)
    end subroutine join_pp
```

Combine two subevents, i.e., make a list of composite particles built from all possible particle pairs from the two lists. If `en0` is present, create a mask which is true only for those pairs that pass the test.

⟨*Expressions: procedures*⟩+≡

```
    subroutine combine_pp (subevt, en1, en2, en0)
      type(subevt_t), intent(inout) :: subevt
      type(eval_node_t), intent(in) :: en1, en2
      type(eval_node_t), intent(inout), optional :: en0
      logical, dimension(:,:), allocatable :: mask12
      integer :: i, j, n1, n2
      n1 = subevt_get_length (en1%pval)
```

```
            n2 = subevt_get_length (en2%pval)
            if (present (en0)) then
                allocate (mask12 (n1, n2))
                do i = 1, n1
                    en0%index = i
                    en0%prt1 = subevt_get_prt (en1%pval, i)
                    do j = 1, n2
                        en0%prt2 = subevt_get_prt (en2%pval, j)
                        call eval_node_evaluate (en0)
                        mask12(i,j) = en0%lval
                    end do
                end do
                call subevt_combine (subevt, en1%pval, en2%pval, mask12)
            else
                call subevt_combine (subevt, en1%pval, en2%pval)
            end if
        end subroutine combine_pp
```

Combine all particles of the first argument. If en0 is present, create a mask
which is true only for those particles that pass the test w.r.t. all particles in the
second argument. If en0 is absent, the second argument is ignored.

⟨*Expressions: procedures*⟩+≡

```
        subroutine collect_pp (subevt, en1, en2, en0)
            type(subevt_t), intent(inout) :: subevt
            type(eval_node_t), intent(in) :: en1, en2
            type(eval_node_t), intent(inout), optional :: en0
            logical, dimension(:), allocatable :: mask1
            integer :: i, j, n1, n2
            n1 = subevt_get_length (en1%pval)
            n2 = subevt_get_length (en2%pval)
            allocate (mask1 (n1))
            mask1 = .true.
            if (present (en0)) then
                do i = 1, n1
                    en0%index = i

                    do j = 1, n2
                        en0%prt2 = subevt_get_prt (en2%pval, j)
                        call eval_node_evaluate (en0)
                        mask1(i) = mask1(i) .and. en0%lval
                    end do
                end do
            end if
            call subevt_collect (subevt, en1%pval, mask1)
        end subroutine collect_pp
```

Select all particles of the first argument. If en0 is present, create a mask which
is true only for those particles that pass the test w.r.t. all particles in the
second argument. If en0 is absent, the second argument is ignored, and the first
argument is transferred unchanged. (This case is not very useful, of course.)

⟨*Expressions: procedures*⟩+≡

```
        subroutine select_pp (subevt, en1, en2, en0)
            type(subevt_t), intent(inout) :: subevt
```

```
      type(eval_node_t), intent(in) :: en1, en2
      type(eval_node_t), intent(inout), optional :: en0
      logical, dimension(:), allocatable :: mask1
      integer :: i, j, n1, n2
      n1 = subevt_get_length (en1%pval)
      n2 = subevt_get_length (en2%pval)
      allocate (mask1 (n1))
      mask1 = .true.
      if (present (en0)) then
         do i = 1, n1
            en0%index = i
            en0%prt1 = subevt_get_prt (en1%pval, i)
            do j = 1, n2
               en0%prt2 = subevt_get_prt (en2%pval, j)
               call eval_node_evaluate (en0)
               mask1(i) = mask1(i) .and. en0%lval
            end do
         end do
      end if
      call subevt_select (subevt, en1%pval, mask1)
   end subroutine select_pp
```

Sort the first subevent according to the result of evaluating en0. From the second subevent, only the first element is taken as reference. If en0 is absent, we sort by default method (PDG code, particles before antiparticles).

⟨*Expressions: procedures*⟩+≡

```
   subroutine sort_pp (subevt, en1, en2, en0)
     type(subevt_t), intent(inout) :: subevt
     type(eval_node_t), intent(in) :: en1, en2
     type(eval_node_t), intent(inout), optional :: en0
     integer, dimension(:), allocatable :: ival
     real(default), dimension(:), allocatable :: rval
     integer :: i, n1
     n1 = subevt_get_length (en1%pval)
     if (present (en0)) then
        select case (en0%result_type)

        end if
     end do
  end do LOOP1
end function no_pp
```

This function evaluates an observable for a pair of particles. From the two
particle lists, we take the first pair without **src** overlap. If there is no valid
pair, we revert the status of the value to unknown.

⟨*Expressions: procedures*⟩+≡
```
subroutine eval_pp (en1, en2, en0, rval, is_known)
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout) :: en0
  real(default), intent(out) :: rval
  logical, intent(out) :: is_known
  integer :: i, j, n1, n2
  n1 = subevt_get_length (en1%pval)
  n2 = subevt_get_length (en2%pval)
  rval = 0
  is_known = .false.
  LOOP1: do i = 1, n1
     en0%index = i
     en0%prt1 = subevt_get_prt (en1%pval, i)
     do j = 1, n2
        en0%prt2 = subevt_get_prt (en2%pval, j)
        if (are_disjoint (en0%prt1, en0%prt2)) then
           call eval_node_evaluate (en0)
           rval = en0%rval
           is_known = .true.
           exit LOOP1
        end if
     end do
  end do LOOP1
end subroutine eval_pp
```

This is the interface to user-supplied observables. The node **en0** evaluates to a

string that indicates the procedure name. We search for the procedure in the dynamic library and load it into the procedure pointer which is then called. `en1` is the subevent on which the external code operates. The external function returns a `c_int`, which we translate into a real value.

⟨*Expressions: procedures*⟩+≡

```
function user_obs_int_pp (en0, prt1, prt2) result (ival)
  integer :: ival
  type(eval_node_t), intent(inout) :: en0
  type(prt_t), intent(in) :: prt1, prt2
  type(string_t) :: name
  procedure(user_obs_int_binary), pointer :: user_obs
  call eval_node_evaluate (en0)
  if (en0%value_is_known) then
      select case (en0%result_type)
      case (V_STR);  name = en0%sval
      case default
         call msg_bug ("user_obs: procedure name must be a string")
         name = ""

The following function returns an integer value, namely the number of valid particle-pairs from both lists for which the condition is true. Invalid pairs (with common `src` entry) are ignored. If there is no condition, it returns the number of valid particle pairs.

A function would be more natural. Making it a subroutine avoids another compiler bug (internal error in nagfor 5.2 (649)). (See the interface `binary_num`.)

⟨*Expressions: procedures*⟩+≡

```
subroutine count_pp (ival, en1, en2, en0)
  integer, intent(out) :: ival
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0
  integer :: i, j, n1, n2, count
  n1 = subevt_get_length (en1%pval)
  n2 = subevt_get_length (en2%pval)
  if (present (en0)) then
     count = 0
     do i = 1, n1
        en0%index = i
        en0%prt1 = subevt_get_prt (en1%pval, i)
        do j = 1, n2
           en0%prt2 = subevt_get_prt (en2%pval, j)
           if (are_disjoint (en0%prt1, en0%prt2)) then
              call eval_node_evaluate (en0)
              if (en0%lval)  count = count + 1
           end if
        end do
     end do
  else
     count = 0
     do i = 1, n1
        do j = 1, n2
           if (are_disjoint (subevt_get_prt (en1%pval, i), &
                             subevt_get_prt (en2%pval, j))) then
              count = count + 1
           end if
        end do
     end do
  end if
  ival = count
end subroutine count_pp
```

This function makes up a subevent from the second argument which consists only of particles which match the PDG code array (first argument).

⟨*Expressions: procedures*⟩+≡

```
subroutine select_pdg_ca (subevt, en1, en2, en0)
  type(subevt_t), intent(inout) :: subevt
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0
  if (present (en0)) then
     call subevt_select_pdg_code (subevt, en1%aval, en2%pval, en0%ival)
  else
     call subevt_select_pdg_code (subevt, en1%aval, en2%pval)
  end if
end subroutine select_pdg_ca
```

Binary string functions

Currently, the only string operation is concatenation.

⟨*Expressions: procedures*⟩+≡
```
    subroutine concat_ss (string, en1, en2)
      type(string_t), intent(out) :: string
      type(eval_node_t), intent(in) :: en1, en2
      string = en1%sval // en2%sval
    end subroutine concat_ss
```

5.7.4   Compiling the parse tree

The evaluation tree is built recursively by following a parse tree. Debug option:

⟨*Expressions: variables*⟩≡
```
    logical, parameter :: debug = .false.
```

Evaluate an expression. The requested type is given as an optional argument;
default is numeric (integer or real).

⟨*Expressions: procedures*⟩+≡
```
    recursive subroutine eval_node_compile_genexpr &
        (en, pn, var_list, result_type)
      type(eval_node_t), pointer :: en
      type(parse_node_t), intent(in) :: pn
      type(var_list_t), intent(in), target :: var_list
      integer, intent(in), optional :: result_type
      if (debug) then
         print *, "read genexpr";  call parse_node_write (pn)
      end if
      if (present (result_type)) then

         print *, "done genexpr"
      end if
    end subroutine eval_node_compile_genexpr
```

Numeric expressions

This procedure compiles a numerical expression. This is a single term or a sum
or difference of terms. We have to account for all combinations of integer and
real arguments. If both are constant, we immediately do the calculation and
allocate a constant node.

⟨*Expressions: procedures*⟩+≡
```
    recursive subroutine eval_node_compile_expr (en, pn, var_list)
      type(eval_node_t), pointer :: en

Real, complex and integer values are numeric literals with an optional unit
attached. In case of an integer, the unit actually makes it a real value in
disguise. The signed version of real values is not possible in generic expressions;
it is a special case for numeric constants in model files (see below). We do not
introduce signed versions of complex values.

⟨*Expressions: procedures*⟩+≡

      end subroutine eval_node_compile_constant
```

Compile a variable, with or without a specified type. Take the list of variables, look for the name and make a node with a pointer to the value. If no type is provided, the variable is numeric, and the stored value determines whether it is real or integer.

We explicitly demand that the variable is defined, so we do not accidentally point to variables that are declared only later in the script but have come into existence in a previous compilation pass.

Variables may actually be anonymous, these are expressions in disguise. In that case, the expression replaces the variable name in the parse tree, and we allocate an ordinary expression node in the eval tree.

Variables of type `V_PDG` (pdg-code array) are not treated here. They are handled by `eval_node_compile_cvariable`.

Retrieve the result of an integration. If the requested process has been integrated, the results are available as special variables. (The variables cannot be accessed in the usual way since they contain brackets in their names.)

Since this compilation step may occur before the processes have been loaded, we have to initialize the required variables before they are used.

This user observable behaves like a variable. We link the node to the generic user-observable entry in the variable list. The syntax element has an argument which provides the name of the user variable, this is stored as an eval-node alongside with the variable. When the variable value is used, the user-supplied external function is called and provides the (real) result value.

Variable definition

A block expression contains a variable definition (first argument) and an expression where the definition can be used (second argument). The `result_type` decides which type of expression is expected for the second argument. For numeric variables, if there is a mismatch between real and integer type, insert an extra node for type conversion.

```

Conditionals

A conditional has the structure if lexpr then expr else expr. So we first evaluate the logical expression, then depending on the result the first or second expression. Note that the second expression is mandatory.

The `result_type`, if present, defines the requested type of the **then** and **else** clauses. Default is numeric (int/real). If there is a mismatch between real and integer result types, insert conversion nodes.

⟨*Expressions: procedures*⟩+≡

```
   recursive subroutine eval_node_compile_conditional &
        (en, pn, var_list, result_type)

Comparisons

Up to the loop, this is easy. There is always at least one comparison. This is
evaluated, and the result is the logical node **en**. If it is constant, we keep its
second sub-node as **en2**. (Thus, at the very end **en2** has to be deleted if **en** is
(still) constant.)

If there is another comparison, we first check if the first comparison was
constant. In that case, there are two possibilities: (i) it was true. Then, its
right-hand side is compared with the new right-hand side, and the result replaces
the previous one which is deleted. (ii) it was false. In this case, the result of the
whole comparison is false, and we can exit the loop without evaluating anything
else.

Now assume that the first comparison results in a valid branch, its second
sub-node kept as **en2**. We first need a copy of this, which becomes the new
left-hand side. If **en2** is constant, we make an identical constant node **en1**.
Otherwise, we make **en1** an appropriate pointer node. Next, the first branch is
saved as **en0** and we evaluate the comparison between **en1** and the a right-hand
side. If this turns out to be constant, there are again two possibilities: (i) true,
then we revert to the previous result. (ii) false, then the wh

      if (debug) then
         call eval_node_write (en)
         print *, "done compared_expr"
      end if
   end subroutine eval_node_compile_compared_expr
```

This takes two extra arguments: **en1**, the left-hand-side of the comparison, is already allocated and evaluated. **en2** (the right-hand side) and **en** (the result) are allocated by the routine. **pn** is the parse node which contains the operator and the right-hand side as subnodes.

If the result of the comparison is constant, **en1** is deleted but **en2** is kept, because it may be used in a subsequent comparison. **en** then becomes a constant. If the result is variable, **en** becomes a branch node which refers to **en1** and **en2**.

        call eval_node_write (en)
        print *, "done pterm"
    end if
  end subroutine eval_node_compile_pterm
```

A particle-list value is a PDG-code array, a particle identifier, a variable, a
(grouped) pexpr, a block pexpr, a conditional, or a particle-list function.

The `cexpr` node is responsible for transforming a constant PDG-code array
into a subevent. It takes the code array as its first argument, the event subevent
as its second argument, and the requested particle type (incoming/outgoing) as
its zero-th argument. The result is the list of particles in the event that match
the code array.

⟨*Expressions: procedures*⟩+≡

```

```

Particle functions

This combines the treatment of 'join', 'combine', 'collect', 'cluster', 'select', and 'extract' which all have the same syntax. The one or two argument nodes are allocated. If there is a condition, the condition node is also allocated as a logical expression, for which the variable list is augmented by the appropriate (unary/binary) observables.

⟨*Expressions: procedures*⟩+≡

```

         call eval_node_write (en)
         print *, "done cvariable"
      end if
    end subroutine eval_node_compile_cvariable
```

String expressions

A string expression is either a string value or a concatenation of string values.

⟨*Expressions: procedures*⟩+≡
```
    recursive subroutine eval_node_compile_sexpr (en, pn, var_list)
      type(eval_node_t), pointer :: en
      type(parse_node_t), intent(in) :: pn
      type(var_list_t), intent(in), target :: var_list
      type(parse_node_t), pointer :: pn_svalue, pn_concatenation, pn_op, pn_arg
      type(eval_node_t), pointer :: en1, en2
      type(string_t) :: string
      if (debug) then
         print *, "read sexpr";  call parse_node_write (pn)
      end if
      pn_svalue => parse_node_get_sub_ptr (pn)
      call eval_node_compile_svalue (en, pn_svalue, var_list)
      pn_concatenation => &
           parse_node_get_next_ptr (pn_svalue, tag="str_concatenation")
      do while (associated (pn_concatenation))
        pn_op => parse_node_get_sub_ptr (pn_concatenation)
        pn_arg => parse_node_get_next_ptr (pn_op)
        en1 => en
        call eval_node_compile_svalue (en2, pn_arg, var_list)
```

```
        allocate (en)
        if (en1%type == EN_CONSTANT .and. en2%type == EN_CONSTANT) then
            call concat_ss (string, en1, en2)
            call eval_node_init_string (en, string)
            call eval_node_final_rec (en1)
            call eval_node_final_rec (en2)
            deallocate (en1, en2)
        else
            call eval_node_init_branch &
                 (en, var_str ("concat"), V_STR, en1, en2)
            call eval_node_set_op2_str (en, concat_ss)
        end if
        pn_concatenation => parse_node_get_next_ptr (pn_concatenation)
    end do
    if (debug) then
        call eval_node_write (en)
        print *, "done sexpr"
    end if
end subroutine eval_node_compile_sexpr
```

A string value is a string literal, a variable, a (grouped) sexpr, a block sexpr, or
a conditional.

⟨*Expressions: procedures*⟩+≡

```
recursive subroutine eval_node_compile_svalue (en, pn, var_list)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in) :: pn
  type(var_list_t), intent(in), target :: var_list
  if (debug) then
      print *, "read svalue";  call parse_node_write (pn)
  end if
  select case (char (parse_node_get_rule_key (pn)))
  case ("svariable")
      call eval_node_compile_variable (en, pn, var_list, V_STR)
  case ("sexpr")
      call eval_node_compile_sexpr (en, pn, var_list)
  case ("block_sexpr")
      call eval_node_compile_block_expr (en, pn, var_list, V_STR)
  case ("conditional_sexpr")
      call eval_node_compile_conditional (en, pn, var_list, V_STR)
  case ("sprintf_fun")
      call eval_node_compile_sprintf (en, pn, var_list)
  case ("string_literal")
      allocate (en)
      call eval_node_init_string (en, parse_node_get_string (pn))
  case default
      call parse_node_mismatch &
           ("svariable|" // &
            "grouped_sexpr|block_sexpr|conditional_sexpr|" // &
            "string_function|string_literal", pn)
  end select
  if (debug) then
      call eval_node_write (en)
      print *, "done svalue"
```

```
      end if
   end subroutine eval_node_compile_svalue
```

There is currently one string function, `sprintf`. For `sprintf`, the first argument (no brackets) is the format string, the optional arguments in brackets are the expressions or variables to be formatted.

⟨*Expressions: procedures*⟩+≡

```
   recursive subroutine eval_node_compile_sprintf (en, pn, var_list)
     type(eval_node_t), pointer :: en
     type(parse_node_t), intent(in) :: pn
     type(var_list_t), intent(in), target :: var_list
     type(parse_node_t), pointer :: pn_clause, pn_key, pn_args
     type(parse_node_t), pointer :: pn_arg0
     type(eval_node_t), pointer :: en0, en1

5.7.5   Auxiliary functions for the compiler

Issue an error that the current node could not be compiled because of type mismatch:

⟨*Expressions: procedures*⟩+≡
```
    subroutine eval_type_error (pn, string, t)
      type(parse_node_t), intent(in) :: pn
      character(*), intent(in) :: string
      integer, intent(in) :: t
      type(string_t) :: type
      select case (t)
      case (V_NONE); type = "(none)"
      case (V_LOG);  type = "'logical'"
      case (V_INT);  type = "'integer'"
      case (V_REAL); type = "'real'"
      case (V_CMPLX); type = "'complex'"
      case default;  type = "(unknown)"
```

```
      end select
      call parse_node_write (pn)
      call msg_fatal (" The " // string // &
            " operation is not defined for the given argument type " // &
            char (type))
   end subroutine eval_type_error
```

If two numerics are combined, the result is integer if both arguments are integer, if one is integer and the other real or both are real, than its argument is real, otherwise complex.

⟨*Expressions: procedures*⟩+≡
```
   function numeric_result_type (t1, t2) result (t)
     integer, intent(in) :: t1, t2
     integer :: t
     if (t1 == V_INT .and. t2 == V_INT) then
        t = V_INT
      else if (t1 == V_INT .and. t2 == V_REAL) then
        t = V_REAL
      else if (t1 == V_REAL .and. t2 == V_INT) then
        t = V_REAL
      else if (t1 == V_REAL .and. t2 == V_REAL) then
        t = V_REAL
      else
        t = V_CMPLX
      end if
   end function numeric_result_type
```

5.7.6 Evaluation

Evaluation is done recursively. For leaf nodes nothing is to be done.

Evaluating particle-list functions: First, we evaluate the particle lists. If a condition is present, we assign the particle pointers of the condition node to the allocated particle entries in the parent node, keeping in mind that the observables in the variable stack used for the evaluation of the condition also contain pointers to these entries. Then, the assigned procedure is evaluated, which sets the subevent in the parent node. If required, the procedure evaluates the condition node once for each (pair of) particles to determine the result.

⟨*Expressions: procedures*⟩+≡
```
   recursive subroutine eval_node_evaluate (en)

5.7.7   Evaluation syntax

We have two different flavors of the syntax: with and without particles.

⟨*Expressions: variables*⟩+≡
```
    type(syntax_t), target, save :: syntax_expr
    type(syntax_t), target, save :: syntax_pexpr
```

These are for testing only and may be removed:

⟨*Expressions: public*⟩≡
```
    public :: syntax_expr_init
    public :: syntax_pexpr_init
```

⟨*Expressions: procedures*⟩+≡
```
    subroutine syntax_expr_init ()
      type(ifile_t) :: ifile
```

```
      call define_expr_syntax (ifile, particles=.false., analysis=.false.)
      call syntax_init (syntax_expr, ifile)
      call ifile_final (ifile)
    end subroutine syntax_expr_init

    subroutine syntax_pexpr_init ()
      type(ifile_t) :: ifile
      call define_expr_syntax (ifile, particles=.true., analysis=.false.)
      call syntax_init (syntax_pexpr, ifile)
      call ifile_final (ifile)
    end subroutine syntax_pexpr_init
```

⟨*Expressions: public*⟩+≡
```
    public :: syntax_expr_final
    public :: syntax_pexpr_final
```

⟨*Expressions: procedures*⟩+≡
```
    subroutine syntax_expr_final ()
      call syntax_final (syntax_expr)
    end subroutine syntax_expr_final

    subroutine syntax_pexpr_final ()
      call syntax_final (syntax_pexpr)
    end subroutine syntax_pexpr_final
```

⟨*Expressions: public*⟩+≡
```
    public :: syntax_pexpr_write
```

⟨*Expressions: procedures*⟩+≡
```
    subroutine syntax_pexpr_write (unit)
      integer, intent(in), optional :: unit
      call syntax_write (syntax_pexpr, unit)
    end subroutine syntax_pexpr_write
```

⟨*Expressions: public*⟩+≡
```
    public :: define_expr_syntax
```

Numeric expressions.

⟨*Expressions: procedures*⟩+≡
```
    subroutine define_expr_syntax (ifile, particles, analysis)

```

5.7.10 Direct evaluation

These procedures create an eval tree and evaluate it on-the-fly, returning only
the final value. The evaluation must yield a well-defined value, unless the
`is_known` flag is present, which will be set accordingly.

Chapter 6

Physics Models

A model object represents a physics model. It contains a table of particle data, a list of parameters, and a vertex table. The list of parameters is a variable list which includes the real parameters (which are pointers to the particle data table) and PDG array variables for the particles themselves. The vertex list is used for phase-space generation, not for calculating the matrix element.

Model definitions are read from model files. Therefore, this module contains a parser for model files. The parameter definitions (derived parameters) are Sindarin expressions.

The models, as read from file, are stored in a model library which is a simple list of model definitions. For setting up a process object we should make a copy (an instance) of a model, which gets the current parameter values from the global variable list.

```

6.1.1 Physics Parameters

A parameter has a name, a value. Derived parameters also have a definition in
terms of other parameters, which is stored as an `eval_tree`. External parame-
ters are set by an external program.

The `pn` component is a pointer to the parameter definition inside the model
parse tree. It allows us to recreate the `eval_tree` when making copies (in-
stances) of the parameter object.

⟨*Models: parameters*⟩≡
```
    integer, parameter :: PAR_NONE = 0
    integer, parameter :: PAR_INDEPENDENT = 1, PAR_DERIVED = 2
    integer, parameter :: PAR_EXTERNAL = 3
```

⟨*Models: public*⟩≡
```
    public :: parameter_t
```
⟨*Models: types*⟩≡
```
    type :: parameter_t
       private
       integer :: type  = PAR_NONE
       type(string_t) :: name
       real(default) :: value = 0
       type(parse_node_t), pointer :: pn => null ()
       type(eval_tree_t) :: eval_tree
    end type parameter_t
```

Initialization depends on parameter type. Independent parameters are initial-
ized by a constant value or a constant numerical expression (which may contain

616

a unit). Derived parameters are initialized by an arbitrary numerical expression, which makes use of the current variable list. The expression is evaluated by the function `parameter_reset`.

⟨*Models: procedures*⟩≡
```
    subroutine parameter_init_independent_value (par, name, value)
      type(parameter_t), intent(out) :: par
      type(string_t), intent(in) :: name
      real(default), intent(in) :: value
      par%type = PAR_INDEPENDENT
      par%name = name
      par%value = value
    end subroutine parameter_init_independent_value

    subroutine parameter_init_independent (par, name, pn)
      type(parameter_t), intent(out) :: par
      type(string_t), intent(in) :: name
      type(parse_node_t), intent(in), target :: pn
      par%type = PAR_INDEPENDENT
      par%name = name
      par%pn => pn
      call eval_tree_init_numeric_value (par%eval_tree, pn)
      par%value = eval_tree_get_real (par%eval_tree)
    end subroutine parameter_init_independent

    subroutine parameter_init_derived (par, name, pn, var_list)
      type(parameter_t), intent(out) :: par
      type(string_t), intent(in) :: name
      type(parse_node_t), intent(in), target :: pn
      type(var_list_t), intent(in), target :: var_list
      par%type = PAR_DERIVED
      par%name = name
      par%pn => pn
      call eval_tree_init_expr (par%eval_tree, pn, var_list=var_list)
      call parameter_reset_derived (par)
    end subroutine parameter_init_derived

    subroutine parameter_init_external (par, name)
      type(parameter_t), intent(out) :: par
      type(string_t), intent(in) :: name
      par%type = PAR_EXTERNAL
      par%name = name
    end subroutine parameter_init_external
```

The finalizer is needed for the evaluation tree in the definition.

⟨*Models: procedures*⟩+≡
```
    subroutine parameter_final (par)
      type(parameter_t), intent(inout) :: par
      call eval_tree_final (par%eval_tree)
    end subroutine parameter_final
```

All derived parameters should be recalculated if some independent parameters have changed:

⟨*Models: procedures*⟩+≡

```
    subroutine parameter_reset_derived (par)
      type(parameter_t), intent(inout) :: par
      select case (par%type)
      case (PAR_DERIVED)
         call eval_tree_evaluate (par%eval_tree)
         par%value = eval_tree_get_real (par%eval_tree)
      end select
    end subroutine parameter_reset_derived
```

Direct access to the parameter value:

⟨*Models: procedures*⟩+≡
```
    function parameter_get_value_ptr (par) result (val)
      real(default), pointer :: val
      type(parameter_t), intent(in), target :: par
      val => par%value
    end function parameter_get_value_ptr
```

Output. [We should have a formula format for the eval tree, suitable for input and output!]

⟨*Models: procedures*⟩+≡
```
    subroutine parameter_write (par, unit, write_defs)
      type(parameter_t), intent(in) :: par
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: write_defs
      logical :: defs
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      defs = .false.;  if (present (write_defs))  defs = write_defs
      select case (par%type)
      case (PAR_INDEPENDENT)
         write (u, "(3x,A)", advance="no")  "parameter"
      case (PAR_DERIVED)
         write (u, "(3x,A)", advance="no")  "derived"
      case (PAR_EXTERNAL)
         write (u, "(3x,A)", advance="no")  "external"
      end select
      write (u, "(1x,A,1x,A)", advance="no")  char (par%name), "= "
      write (u, "(" // FMT_19 // ")", advance="no") par%value
      select case (par%type)
      case (PAR_DERIVED)
         if (defs) then
            call eval_tree_write (par%eval_tree, unit)
         else
            write (u, *)
         end if
      case default
         write (u, *)
      end select
    end subroutine parameter_write
```

Screen output variant.

⟨*Models: procedures*⟩+≡
```

```
```

```
subroutine parameter_show_independent (par, l, u)
  type(parameter_t), intent(in) :: par
  integer, intent(in) :: l, u
  character(len=l) :: buffer
  select case (par%type)
  case (PAR_INDEPENDENT)
     buffer = par%name
     write (u, "(4x,A,1x,'=',1x," // FMT_19 // ")")  buffer, par%value
  end select

  type(parameter_t), intent(in) :: par
  integer, intent(in) :: l, u
  character(len=l) :: buffer
  select case (par%type)
  case (PAR_EXTERNAL)
     buffer = par%name
     write (u, "(4x,A,1x,'=',1x," // FMT_19 // ")")  buffer, par%value
  end select
end subroutine parameter_show_external
```

6.1.2   Particle codes

Let us define a few particle codes independent of the model.

SM fermions:

⟨*Models: types*⟩+≡
```
integer, parameter, public :: ELECTRON = 11
```

Gauge bosons:

⟨*Models: types*⟩+≡
```
integer, parameter, public :: GLUON = 21
integer, parameter, public :: PHOTON = 22
integer, parameter, public :: Z_BOSON = 23
integer, parameter, public :: W_BOSON = 24
```

Hadrons:

⟨*Models: types*⟩+≡
```
integer, parameter, public :: PROTON = 2212
```

⟨*Models: types*⟩+≡
```
    integer, parameter, public :: PION = 111
    integer, parameter, public :: PIPLUS = 211
    integer, parameter, public :: PIMINUS = - PIPLUS
```

Hadron remnants (internal)

⟨*Models: types*⟩+≡
```
    integer, parameter, public :: HADRON_REMNANT = 90
    integer, parameter, public :: HADRON_REMNANT_SINGLET = 91
    integer, parameter, public :: HADRON_REMNANT_TRIPLET = 92
    integer, parameter, public :: HADRON_REMNANT_OCTET = 93
```

Generic particles for internal use in event analysis:

⟨*Models: types*⟩+≡
```
    integer, parameter, public :: PRT_ANY = 81
    integer, parameter, public :: PRT_VISIBLE = 82
    integer, parameter, public :: PRT_CHARGED = 83
    integer, parameter, public :: PRT_COLORED = 84
```

Further particle codes for internal use:

⟨*Models: types*⟩+≡
```
    integer, parameter, public :: INVALID = 97
    integer, parameter, public :: KEYSTONE = 98
    integer, parameter, public :: COMPOSITE = 99
```

6.1.3 Spin codes

Somewhat redundant, but for better readability we define named constants for spin types. If the mass is nonzero, this is equal to the number of degrees of freedom.

⟨*Models: types*⟩+≡
```
    integer, parameter, public:: UNKNOWN=0
    integer, parameter, public :: SCALAR=1, SPINOR=2, VECTOR=3, &
         VECTORSPINOR=4, TENSOR=5
```

Isospin types and charge types are counted in an analogous way, where charge type 1 is charge 0, 2 is charge 1/3, and so on. Zero always means unknown. Note that charge and isospin types have an explicit sign.

Color types are defined as the dimension of the representation.

6.1.4 Particle data

The particle-data type holds all information that pertains to a particular particle within a particular model. Information such as spin type, particle code etc. is stored within the object itself, while mass and width are associated to parameters, otherwise assumed zero.

⟨*Models: public*⟩+≡
```
    public :: particle_data_t
```

⟨Models: types⟩+≡
```
    type :: particle_data_t
       private
       type(string_t) :: longname

       type(string_t), dimension(:), allocatable :: p_decay
       type(string_t), dimension(:), allocatable :: a_decay
    end type particle_data_t
```

Initialize particle data with PDG long name and PDG code. TeX names should
be initialized to avoid issues with accessing unallocated string contents.

⟨Models: public⟩+≡
```
    public :: particle_data_init
```

⟨Models: procedures⟩+≡
```
    subroutine particle_data_init (prt, longname, pdg)
      type(particle_data_t), intent(out) :: prt
      type(string_t), intent(in) :: longname
      integer, intent(in) :: pdg
      prt%longname = longname
      prt%pdg = pdg
      prt%tex_name = ""
      prt%tex_anti = ""
    end subroutine particle_data_init
```

Copy quantum numbers from another particle. Do not compute the multiplicity
yet, because this depends on the association of the `mass_src` pointer.

⟨Models: procedures⟩+≡

```

      aval = aval_p // aval_a
    end function particle_data_get_colored_pdg
```

6.1.5 Vertex data

The vertex object contains an array of particle-data pointers, for which we need
a separate type. (We could use the flavor type defined in another module.)

   The program does not (yet?) make use of vertex definitions, so they are not
stored here.

⟨*Models: types*⟩+≡
```
    type :: particle_p
       type(particle_data_t), pointer :: p => null ()
    end type particle_p
```

⟨*Models: types*⟩+≡
```
    type :: vertex_t
       logical :: trilinear
       integer, dimension(:), allocatable :: pdg
       type(particle_p), dimension(:), allocatable :: prt
    end type vertex_t
```

Initialize using PDG codes. The model is used for finding particle data pointers
associated with the pdg codes.

⟨*Models: procedures*⟩+≡
```
    subroutine vertex_init (vtx, pdg, model)
      type(vertex_t), intent(out) :: vtx
      integer, dimension(:), intent(in) :: pdg
      type(model_t), intent(in), target, optional :: model
      integer :: i
      allocate (vtx%pdg (size (pdg)))
      allocate (vtx%prt (size (pdg)))
      vtx%trilinear = size (pdg) == 3
      vtx%pdg = pdg
      if (present (model)) then
```

```
            do i = 1, size (pdg)
               vtx%prt(i)%p => model_get_particle_ptr (model, pdg(i))
            end do
         end if
      end subroutine vertex_init
```

⟨*Models: procedures*⟩+≡
```
      subroutine vertex_write (vtx, unit)
        type(vertex_t), intent(in) :: vtx
        integer, intent(in), optional :: unit
        integer :: u, i
        u = output_unit (unit);  if (u < 0)  return
        write (u, "(3x,A)", advance="no")  "vertex"
        do i = 1, size (vtx%prt)
           if (associated (vtx%prt(i)%p)) then
              write (u, "(1x,A)", advance="no") &
                   '"' // char (particle_data_get_name &
                                  (vtx%prt(i)%p, vtx%pdg(i) < 0)) &
                      // '"'
           else
              write (u, "(1x,I7)", advance="no") vtx%pdg(i)
           end if
        end do
        write (u, *)
      end subroutine vertex_write
```

Single-particle lookup: Given a particle code, we return matching codes if
present, otherwise zero. Actually, we return the antiparticles of the matching
codes, as appropriate for computing splittings.

  If the `radiative` flag is not set, we eliminate radiative decays. These have
the properties that the initial particle coincides with one of the outgoing parti-
cles.

⟨*Models: procedures*⟩+≡
```
      subroutine vertex_get_match (vtx, pdg1, pdg2, radiative)
        type(vertex_t), intent(in) :: vtx
        integer, intent(in) :: pdg1
        integer, dimension(:), allocatable, intent(out) :: pdg2
        logical, intent(in) :: radiative
        integer :: i, j
        do i = 1, size (vtx%pdg)
           if (vtx%pdg(i) == pdg1) then
              allocate (pdg2 (size (vtx%pdg) - 1))
              do j = 1, i-1
                 pdg2(j) = anti (j)
              end do
              do j = i, size (pdg2)
                 pdg2(j) = anti (j+1)
              end do
              exit
           end if
        end do
        if (allocated (pdg2)) then
           if (.not. radiative .and. any (pdg2 == pdg1))  deallocate (pdg2)
```

```
        end if
contains
  function anti (i) result (pdg)
    integer, intent(in) :: i
    integer :: pdg
    if (vtx%prt(i)%p%has_antiparticle) then
       pdg = - vtx%pdg(i)
    else
       pdg = vtx%pdg(i)
    end if
  end function anti
end subroutine vertex_get_match
```

6.1.6 Vertex lookup table

The vertex lookup table is a hash table: given two particle codes, we check
which codes are allowed for the third one.

The size of the hash table should be large enough that collisions are rare. We
first select a size based on the number of vertices (multiplied by six because all
permutations count), with some margin, and then choose the smallest integer
power of two larger than this.

⟨*Limits: public parameters*⟩+≡
```
    integer, parameter, public :: VERTEX_TABLE_SCALE_FACTOR = 60
```

⟨*Models: procedures*⟩+≡
```
    function vertex_table_size (n_vtx) result (n)
      integer(i32) :: n
      integer, intent(in) :: n_vtx
      integer :: i, s
      s = VERTEX_TABLE_SCALE_FACTOR * n_vtx
      n = 1
      do i = 1, 31
         n = ishft (n, 1)
         s = ishft (s,-1)
         if (s == 0)  exit
      end do
    end function vertex_table_size
```

The specific hash function takes two particle codes (arbitrary integers) and
returns a 32-bit integer. It makes use of the universal function `hash` which
operates on a byte array.

⟨*Models: procedures*⟩+≡
```
    function hash2 (pdg1, pdg2)
      integer(i32) :: hash2
      integer, intent(in) :: pdg1, pdg2
      integer(i8), dimension(1) :: mold
      hash2 = hash (transfer ((/pdg1, pdg2/), mold))
    end function hash2
```

Each entry in the vertex table stores the two particle codes and an array of possibilities for the third code.

⟨*Models: types*⟩+≡
```
type :: vertex_table_entry_t
   integer :: pdg1 = 0, pdg2 = 0
   integer :: n = 0
   integer, dimension(:), allocatable :: pdg3
end type vertex_table_entry_t
```

The vertex table:

⟨*Models: types*⟩+≡
```
type :: vertex_table_t
   type(vertex_table_entry_t), dimension(:), allocatable :: entry
   integer :: n_collisions = 0
   integer(i32) :: mask
end type vertex_table_t
```

Initializing the vertex table: This is done in two passes. First, we scan all permutations for all vertices and count the number of entries in each bucket of the hashtable. Then, the buckets are allocated accordingly and filled.

Collision resolution is done by just incrementing the hash value until an empty bucket is found. The vertex table size is fixed, since we know from the beginning the number of entries.

⟨*Models: procedures*⟩+≡
```
subroutine vertex_table_init (vt, prt, vtx)
  type(vertex_table_t), intent(out) :: vt
  type(particle_data_t), dimension(:), intent(in) :: prt
  type(vertex_t), dimension(:), intent(in) :: vtx
  integer :: n_vtx, vt_size, i, p1, p2, p3
  integer, dimension(3) :: p
  n_vtx = size (vtx)
  vt_size = vertex_table_size (count (vtx%trilinear))
  vt%mask = vt_size - 1
  allocate (vt%entry (0:vt_size-1))
  do i = 1, n_vtx
     if (vtx(i)%trilinear) then
        p = vtx(i)%pdg
        p1 = p(1);   p2 = p(2)
        call create (hash2 (p1, p2))
        if (p(2) /= p(3)) then
           p2 = p(3)
           call create (hash2 (p1, p2))
        end if
        if (p(1) /= p(2)) then
           p1 = p(2);   p2 = p(1)
           call create (hash2 (p1, p2))
           if (p(1) /= p(3)) then
              p2 = p(3)
              call create (hash2 (p1, p2))
           end if
        end if
        if (p(1) /= p(3)) then
```

```
                    p1 = p(3);   p2 = p(1)

6.1.7   Model data

A model object holds all information about parameters, particles, and vertices. For models that require an external program for parameter calculation, there is the pointer to a function that does this calculation, given the set of independent and derived parameters.

When reading a model, we create a parse tree. Parameter definitions are available via parse nodes. Since we may need those later when making model instances, we keep the whole parse tree in the model definition (but not in the instances).

⟨*Models: public*⟩+≡
```
  public :: model_t
```

⟨*Models: types*⟩+≡
```
  type :: model_t
    private
    type(string_t) :: name
    character(32) :: md5sum = ""
    type(parameter_t), dimension(:), allocatable :: par
    type(particle_data_t), dimension(:), allocatable :: prt
    type(vertex_t), dimension(:), allocatable :: vtx
```

```
    type(vertex_table_t) :: vt
    type(var_list_t) :: var_list
    type(string_t) :: dlname
    procedure(model_init_external_parameters), nopass, pointer :: &
         init_external_parameters => null ()
    type(dlaccess_t) :: dlaccess
    type(parse_tree_t) :: parse_tree
 contains
⟨Models: model: TBP⟩
end type model_t
```

This is the interface for a procedure that initializes the calculation of external parameters, given the array of all parameters.

⟨*Models: interfaces*⟩≡
```
    abstract interface
      subroutine model_init_external_parameters (par) bind (C)
        import
        real(c_default_float), dimension(*), intent(inout) :: par
      end subroutine model_init_external_parameters
    end interface
```

Initialization: Specify the number of parameters, particles, vertices and allocate memory. If an associated DL library is specified, load this library.

⟨*Models: procedures*⟩+≡
```
    subroutine model_init &
         (model, name, libname, os_data, n_par, n_prt, n_vtx)
      type(model_t), intent(inout) :: model
      type(string_t), intent(in) :: name, libname
      type(os_data_t), intent(in) :: os_data
      integer, intent(in) :: n_par, n_prt, n_vtx
      type(c_funptr) :: c_fptr
      type(string_t) :: libpath
      call model_basic_init (model, name, n_par, n_prt, n_vtx)
      if (libname /= "") then
         if (.not. os_data%use_testfiles) then
            libpath = os_data%whizard_models_libpath_local
            model%dlname = os_get_dlname ( &
              libpath // "/" // libname, os_data, ignore=.true.)
         end if
         if (model%dlname == "") then
            libpath = os_data%whizard_models_libpath
            model%dlname = os_get_dlname (libpath // "/" // libname, os_data)
         end if
      else
         model%dlname = ""
      end if
      if (model%dlname /= "") then
         if (.not. dlaccess_is_open (model%dlaccess)) then
            if (logging) &
                 call msg_message ("Loading model auxiliary library '" &
                 // char (libpath) // "/" // char (model%dlname) // "'")
            call dlaccess_init (model%dlaccess, os_data%whizard_models_libpath, &
                 model%dlname, os_data)
```

```
            if (dlaccess_has_error (model%dlaccess)) then
               call msg_message (char (dlaccess_get_error (model%dlaccess)))
               call msg_fatal ("Loading model auxiliary library '" &
                    // char (model%dlname) // "' failed")
               return
            end if
            c_fptr = dlaccess_get_c_funptr (model%dlaccess, &
                 var_str ("init_external_parameters"))
            if (dlaccess_has_error (model%dlaccess)) then
               call msg_message (char (dlaccess_get_error (model%dlaccess)))
               call msg_fatal ("Loading function from auxiliary library '" &
                    // char (model%dlname) // "' failed")
               return
            end if
            call c_f_procpointer (c_fptr, model% init_external_parameters)
         end if
      end if
    end subroutine model_init
```

For a model instance, we do not attempt to load a DL library. This is the core of the full initializer above.

⟨*Models: procedures*⟩+≡
```
    subroutine model_basic_init (model, name, n_par, n_prt, n_vtx)
      type(model_t), intent(inout) :: model
      type(string_t), intent(in) :: name
      integer, intent(in) :: n_par, n_prt, n_vtx
      model%name = name
      allocate (model%par (n_par))
      allocate (model%prt (n_prt))
      allocate (model%vtx (n_vtx))
    end subroutine model_basic_init
```

Finalization: The variable list contains allocated pointers, also the parse tree. We also close the DL access object, if any, that enables external parameter calculation.

⟨*Models: public*⟩+≡
```
    public :: model_final
```

⟨*Models: procedures*⟩+≡
```
    subroutine model_final (model)
      type(model_t), intent(inout) :: model
      integer :: i
      if (allocated (model%par)) then
         do i = 1, size (model%par)
            call parameter_final (model%par(i))
         end do
      end if
      call var_list_final (model%var_list)
      if (model%dlname /= "")  call dlaccess_final (model%dlaccess)
      call parse_tree_final (model%parse_tree)
    end subroutine model_final
```

Output. By default, the output is in the form of an input file. If `verbose` is true, for each derived parameter the definition (eval tree) is displayed, and the vertex hash table is shown.

    end function model_get_n_particles
```

Find the index that belongs to a particle.

⟨Models: procedures⟩+≡
```
    function model_get_particle_index (model, pdg) result (index)
      type(model_t), intent(in) :: model
      integer, intent(in) :: pdg
      integer :: index
      integer :: i
      do i = 1, size (model%prt)
         if (model%prt(i)%pdg == abs (pdg)) then
            index = i;  return
         end if
      end do
      write (msg_buffer, "(1x,A,1x,I0)")  "PDG code =", pdg
      call msg_message
      call msg_fatal (" Model '" // char (model%name) // "'" // &
            " has no particle with this PDG code")
    end function model_get_particle_index
```

Return a pointer to the particle-data object that belongs to the specified PDG
code or name.

⟨Models: public⟩+≡
```
    public :: model_get_particle_ptr
```

⟨Models: procedures⟩+≡
```
    function model_get_particle_ptr (model, pdg) result (prt)
      type(particle_data_t), pointer :: prt
      type(model_t), intent(in), target :: model
      integer, intent(in) :: pdg
      prt => null ()
      if (pdg /= UNDEFINED) then
         prt => model%prt(model_get_particle_index (model, pdg))
      end if
    end function model_get_particle_ptr
```

Test if a particle with the given PDG code exists in the model.

⟨Models: public⟩+≡
```
    public :: model_test_particle
```

⟨Models: procedures⟩+≡
```
    function model_test_particle (model, pdg) result (exists)
      logical :: exists

        call model_final (current%model)
        deallocate (current)
     end do
   end subroutine model_list_final
```

6.1.10 Model instances

A model instance is a copy of a model object. The parameters are true copies.
The particle data and the variable list pointers should point to the copy, so
modifying the parameters has only a local effect. Hence, we build them up
explicitly. The vertex array is also rebuilt, it contains particle pointers. Finally,
the vertex hash table can be copied directly since it contains no pointers.

The `multiplicity` entry depends on the association of the `mass_src` entry
and therefore has to be set at the end.

The instance must carry the `target` attribute.

⟨*Models: public*⟩+≡
```
   public :: model_init_instance
```

⟨*Models: procedures*⟩+≡
```
   subroutine model_init_instance (model, orig)

        end subroutine model_pointer_to_instance
```

6.1.11   Inclusive Processes

Automatically generate a list of possible final states for a given initial state
(currently: a single massive particle).

The current implementation is intended for simple 2- and 3-body decays
and will perform badly if used for other purposes. We generate all final states
recursively without caring about kinematics or doublers, sort each final state,
then transfer them all to an array. In this array, we mark all kinematically
forbidden channels and all doublers, to finally a packed version.

If the flag `radiative` is unset, we do look at kinematics for each branching:
a branching is omitted if either (a) all three

For temporary storage we need a list.

⟨*Models: types*⟩+≡
```
        type, extends (pdg_array_t) :: fs_entry_t
          type(fs_entry_t), pointer :: previous => null ()
          type(fs_entry_t), pointer :: next => null ()
        end type fs_entry_t
```

This is the wrapper type for the decay tree for the list of final states and the
final array.

⟨*Models: public*⟩+≡
```
        public :: fs_table_t
```

⟨*Models: types*⟩+≡
```
        type :: fs_table_t

Chapter 7

Quantum Numbers

We introduce separate types and modules for particle quantum numbers and use them for defining independent particles and entangled states.

helicities Types and methods for spin density matrices.

colors Dealing with colored particles, using the color-flow representation.

flavors PDG codes and particle properties, depends on the model.

quantum_states Quantum numbers and density matrices for entangled particle systems.

7.1 Helicities

This module defines types and tools for dealing with helicity information.

⟨`helicities.f90`⟩≡
  ⟨*File header*⟩

  ```
  module helicities
  ```

  ⟨*Use file utils*⟩

  ⟨*Standard module head*⟩

  ⟨*Helicities: public*⟩

  ⟨*Helicities: types*⟩

  ⟨*Helicities: interfaces*⟩

  ```
  contains
  ```

  ⟨*Helicities: procedures*⟩

  ```
  end module helicities
  ```

7.1.1 Helicity types

Helicities may be defined or undefined, corresponding to a polarized or unpolarized state. Each helicity is actually a pair of helicities, corresponding to an entry in the spin density matrix. Obviously, diagonal entries are distinguished. In addition, we have a ghost flag that would apply to FP ghosts in particular.

⟨*Helicities: public*⟩≡
  ```
  public :: helicity_t
  ```

⟨*Helicities: types*⟩≡
  ```
  type :: helicity_t
    private
    logical :: defined = .false.
    integer :: h1, h2
    logical :: ghost = .false.
  end type helicity_t
  ```

Initializers:

⟨*Helicities: public*⟩+≡
  ```
  public :: helicity_init
  ```

⟨*Helicities: interfaces*⟩≡
  ```
  interface helicity_init
    module procedure helicity_init0, helicity_init0g
    module procedure helicity_init1, helicity_init1g
    module procedure helicity_init2, helicity_init2g
  end interface
  ```

⟨*Helicities: procedures*⟩≡
```
    elemental subroutine helicity_init0 (hel)
      type(helicity_t), intent(out) :: hel
    end subroutine helicity_init0

    elemental subroutine helicity_init0g (hel, ghost)
      type(helicity_t), intent(out) :: hel
      logical, intent(in) :: ghost
      hel%ghost = ghost
    end subroutine helicity_init0g

    elemental subroutine helicity_init1 (hel, h)
      type(helicity_t), intent(out) :: hel
      integer, intent(in) :: h
      hel%defined = .true.
      hel%h1 = h
      hel%h2 = h
    end subroutine helicity_init1

    elemental subroutine helicity_init1g (hel, h, ghost)
      type(helicity_t), intent(out) :: hel
      integer, intent(in) :: h
      logical, intent(in) :: ghost
      call helicity_init1 (hel, h)
      hel%ghost = ghost
    end subroutine helicity_init1g

    elemental subroutine helicity_init2 (hel, h2, h1)
      type(helicity_t), intent(out) :: hel
      integer, intent(in) :: h1, h2
      hel%defined = .true.
      hel%h2 = h2
      hel%h1 = h1
    end subroutine helicity_init2

    elemental subroutine helicity_init2g (hel, h2, h1, ghost)
      type(helicity_t), intent(out) :: hel
      integer, intent(in) :: h1, h2
      logical, intent(in) :: ghost
      call helicity_init2 (hel, h2, h1)
      hel%ghost = ghost
    end subroutine helicity_init2g
```

Set the ghost property separately:

⟨*Helicities: public*⟩+≡
```
    public :: helicity_set_ghost
```

⟨*Helicities: procedures*⟩+≡
```
    elemental subroutine helicity_set_ghost (hel, ghost)
      type(helicity_t), intent(inout) :: hel
      logical, intent(in) :: ghost
      hel%ghost = ghost
    end subroutine helicity_set_ghost
```

Undefine:

⟨*Helicities: public*⟩+≡
```
    public :: helicity_undefine
```

⟨*Helicities: procedures*⟩+≡
```
    elemental subroutine helicity_undefine (hel)
      type(helicity_t), intent(inout) :: hel
      hel%defined = .false.
      hel%ghost = .false.
    end subroutine helicity_undefine
```

Diagonalize by removing the second entry (use with care!)

⟨*Helicities: public*⟩+≡
```
    public :: helicity_diagonalize
```

⟨*Helicities: procedures*⟩+≡
```
    elemental subroutine helicity_diagonalize (hel)
      type(helicity_t), intent(inout) :: hel
      hel%h2 = hel%h1
    end subroutine helicity_diagonalize
```

Output (no linebreak). No output if undefined.

⟨*Helicities: public*⟩+≡
```
    public :: helicity_write
```

⟨*Helicities: procedures*⟩+≡
```
    subroutine helicity_write (hel, unit)
      type(helicity_t), intent(in) :: hel
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      if (hel%defined) then
         if (hel%ghost) then
            write (u, "(A)", advance="no")  "h*("
         else
            write (u, "(A)", advance="no")  "h("
         end if
         write (u, "(I0)", advance="no")  hel%h1
         if (hel%h1 /= hel%h2) then
            write (u, "(A)", advance="no") "|"
            write (u, "(I0)", advance="no")  hel%h2
         end if
         write (u, "(A)", advance="no")  ")"
      else if (hel%ghost) then
         write (u, "(A)", advance="no")  "h*"
      end if
    end subroutine helicity_write
```

Binary I/O. Write contents only if defined.

⟨*Helicities: public*⟩+≡
```
    public :: helicity_write_raw
    public :: helicity_read_raw
```

⟨*Helicities: procedures*⟩+≡
```
    subroutine helicity_write_raw (hel, u)
      type(helicity_t), intent(in) :: hel
      integer, intent(in) :: u
      write (u) hel%defined
      if (hel%defined) then
         write (u) hel%h1, hel%h2
         write (u) hel%ghost
      end if
    end subroutine helicity_write_raw

    subroutine helicity_read_raw (hel, u, iostat)
      type(helicity_t), intent(out) :: hel
      integer, intent(in) :: u
      integer, intent(out), optional :: iostat
      read (u, iostat=iostat) hel%defined
      if (hel%defined) then
         read (u, iostat=iostat) hel%h1, hel%h2
         read (u, iostat=iostat) hel%ghost
      end if
    end subroutine helicity_read_raw
```

7.1.2 Predicates

Check if the helicity is defined:

⟨*Helicities: public*⟩+≡
```
    public :: helicity_is_defined
```
⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_is_defined (hel) result (defined)
      logical :: defined
      type(helicity_t), intent(in) :: hel
      defined = hel%defined
    end function helicity_is_defined
```

Return true if the two helicities are equal or the particle is unpolarized:

⟨*Helicities: public*⟩+≡
```
    public :: helicity_is_diagonal
```
⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_is_diagonal (hel) result (diagonal)
      logical :: diagonal
      type(helicity_t), intent(in) :: hel
      if (hel%defined) then
         diagonal = hel%h1 == hel%h2
      else
         diagonal = .true.
      end if
    end function helicity_is_diagonal
```

Return the ghost flag

⟨*Helicities: public*⟩+≡
```
    public :: helicity_is_ghost
```

⟨*Helicities: procedures*⟩+≡
```
elemental function helicity_is_ghost (hel) result (ghost)
  logical :: ghost
  type(helicity_t), intent(in) :: hel
  ghost = hel%ghost
end function helicity_is_ghost
```

7.1.3 Accessing contents

This returns a two-element array and thus cannot be elemental. The result is unpredictable if the helicity is undefined.

⟨*Helicities: public*⟩+≡
```
public :: helicity_get
```

⟨*Helicities: procedures*⟩+≡
```
pure function helicity_get (hel) result (h)
  integer, dimension(2) :: h
  type(helicity_t), intent(in) :: hel
  h(1) = hel%h2
  h(2) = hel%h1
end function helicity_get
```

7.1.4 Comparisons

When comparing helicities, if either one is undefined, they are considered to match. In other words, an unpolarized particle matches any polarization. In the `dmatch` variant, it matches only diagonal helicity.

The ghost flag is ignored when matching, but matters when testing for equality.

⟨*Helicities: public*⟩+≡
```
public :: operator(.match.)
public :: operator(.dmatch.)
public :: operator(==)
public :: operator(/=)
```

⟨*Helicities: interfaces*⟩+≡
```
interface operator(.match.)
  module procedure helicity_match
end interface
interface operator(.dmatch.)
  module procedure helicity_match_diagonal
end interface
interface operator(==)
  module procedure helicity_eq
end interface
interface operator(/=)
  module procedure helicity_neq
end interface
```

⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_match (hel1, hel2) result (eq)
      logical :: eq
      type(helicity_t), intent(in) :: hel1, hel2
      if (hel1%defined .and. hel2%defined) then
         eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
      else
         eq = .true.
      end if
    end function helicity_match

    elemental function helicity_match_diagonal (hel1, hel2) result (eq)
      logical :: eq
      type(helicity_t), intent(in) :: hel1, hel2
      if (hel1%defined .and. hel2%defined) then
         eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
      else if (hel1%defined) then
         eq = hel1%h1 == hel1%h2
      else if (hel2%defined) then
         eq = hel2%h1 == hel2%h2
      else
         eq = .true.
      end if
    end function helicity_match_diagonal
```

⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_eq (hel1, hel2) result (eq)
      logical :: eq
      type(helicity_t), intent(in) :: hel1, hel2
      if (hel1%defined .and. hel2%defined) then
         eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2) &
              .and. (hel1%ghost .eqv. hel2%ghost)
      else if (.not. hel1%defined .and. .not. hel2%defined) then
         eq = hel1%ghost .eqv. hel2%ghost
      else
         eq = .false.
      end if
    end function helicity_eq
```

⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_neq (hel1, hel2) result (neq)
      logical :: neq
      type(helicity_t), intent(in) :: hel1, hel2
      if (hel1%defined .and. hel2%defined) then
         neq = (hel1%h1 /= hel2%h1) .or. (hel1%h2 /= hel2%h2) &
              .or. (hel1%ghost .neqv. hel2%ghost)
      else if (.not. hel1%defined .and. .not. hel2%defined) then
         neq = hel1%ghost .neqv. hel2%ghost
      else
         neq = .true.
      end if
    end function helicity_neq
```

689

7.1.5 Tools

Merge two helicity objects by taking the first entry from the first and the second entry from the second argument. Makes sense only if the input helicities were defined and diagonal. The handling of ghost flags is not well-defined; one should verify beforehand that they match.

⟨*Helicities: public*⟩+≡
```
public :: operator(.merge.)
```

⟨*Helicities: interfaces*⟩+≡
```
interface operator(.merge.)
   module procedure merge_helicities
end interface
```

⟨*Helicities: procedures*⟩+≡
```
elemental function merge_helicities (hel1, hel2) result (hel)
  type(helicity_t) :: hel
  type(helicity_t), intent(in) :: hel1, hel2
  if (helicity_is_defined (hel1) .and. helicity_is_defined (hel2)) then
     call helicity_init2g (hel, hel2%h1, hel1%h1, hel1%ghost)
  else if (helicity_is_defined (hel1)) then
     hel = hel1
  else if (helicity_is_defined (hel2)) then
     hel = hel2
  end if
end function merge_helicities
```

7.2 Colors

This module defines a type and tools for dealing with color information.

Each particle can have zero or more (in practice, usually not more than two) color indices. Color indices are positive; flow direction can be determined from the particle nature.

While parton shower matrix elements are diagonal in color, some special applications (e.g., subtractions for NLO matrix elements) require non-diagonal color matrices.

⟨colors.f90⟩≡
  ⟨*File header*⟩

  `module colors`

  ⟨*Use kinds*⟩
  ⟨*Use file utils*⟩
    `use diagnostics !NODEP!`
    `use unit_tests`

  ⟨*Standard module head*⟩

  ⟨*Colors: public*⟩

  ⟨*Colors: types*⟩

  ⟨*Colors: interfaces*⟩

  `contains`

  ⟨*Colors: procedures*⟩

  ⟨*Colors: tests*⟩

  `end module colors`

7.2.1 The color type

A particle may have an arbitrary number of color indices (in practice, from zero to two, but more are possible). This object acts as a container.

The fact that color comes as an array prohibits elemental procedures in some places. (May add interfaces and multi versions where necessary.)

The color may be undefined; this corresponds to unallocated arrays.

NOTE: Due to a compiler bug in nagfor 5.2, we do not use allocatable but fixed-size arrays with dimension 2. Only nonzero entries count. This may be more efficient anyway, but gives up some flexibility. However, the squaring algorithm currently works only for singlets, (anti)triplets and octets anyway, so two components are enough.

⟨*Colors: public*⟩≡
    `public :: color_t`

⟨*Colors: types*⟩≡
    `type :: color_t`

691

```
      private
      integer, dimension(2) :: c1 = 0, c2 = 0
      logical :: ghost = .false.
    end type color_t
```

Initializers:

⟨*Colors: public*⟩+≡
```
    public :: color_init
```

⟨*Colors: interfaces*⟩≡
```
    interface color_init
       module procedure color_init_undefined, color_init_undefined_ghost
       module procedure color_init_array, color_init_array_ghost
       module procedure color_init_arrays, color_init_arrays_ghost
    end interface
```

Undefined color: array remains unallocated

⟨*Colors: procedures*⟩≡
```
    pure subroutine color_init_undefined (col)
      type(color_t), intent(out) :: col
    end subroutine color_init_undefined

    pure subroutine color_init_undefined_ghost (col, ghost)
      type(color_t), intent(out) :: col
      logical, intent(in) :: ghost
      col%ghost = ghost
    end subroutine color_init_undefined_ghost
```

This defines color from an arbitrary length color array, suitable for any representation. We may have two color arrays (non-diagonal matrix elements). This cannot be elemental. The third version assigns an array of colors, using a two-dimensional array as input.

⟨*Colors: procedures*⟩+≡
```
    pure subroutine color_init_array (col, c1)
      type(color_t), intent(out) :: col
      integer, dimension(:), intent(in) :: c1
      col%c1 = pack (c1, c1 /= 0, col%c1)
      col%c2 = col%c1
    end subroutine color_init_array

    pure subroutine color_init_array_ghost (col, c1, ghost)
      type(color_t), intent(out) :: col
      integer, dimension(:), intent(in) :: c1
      logical, intent(in) :: ghost
      call color_init_array (col, c1)
      col%ghost = ghost
    end subroutine color_init_array_ghost

    pure subroutine color_init_arrays (col, c1, c2)
      type(color_t), intent(out) :: col
      integer, dimension(:), intent(in) :: c1, c2
      if (size (c1) == size (c2)) then
```

```
            col%c1 = pack (c1, c1 /= 0, col%c1)
            col%c2 = pack (c2, c2 /= 0, col%c2)
         else if (size (c1) /= 0) then
            col%c1 = pack (c1, c1 /= 0, col%c1)
            col%c2 = col%c1
         else if (size (c2) /= 0) then
            col%c1 = pack (c2, c2 /= 0, col%c2)
            col%c2 = col%c1
         end if
      end subroutine color_init_arrays

      pure subroutine color_init_arrays_ghost (col, c1, c2, ghost)
        type(color_t), intent(out) :: col
        integer, dimension(:), intent(in) :: c1, c2
        logical, intent(in) :: ghost
        call color_init_arrays (col, c1, c2)
        col%ghost = ghost
      end subroutine color_init_arrays_ghost
```

This version is restricted to singlets, triplets, antitriplets, and octets: The input contains the color and anticolor index, each of the may be zero.

⟨*Colors: public*⟩+≡
```
      public :: color_init_col_acl
```

⟨*Colors: procedures*⟩+≡
```
      elemental subroutine color_init_col_acl (col, col_in, acl_in)
        type(color_t), intent(out) :: col
        integer, intent(in) :: col_in, acl_in
        integer, dimension(0) :: null_array
        select case (col_in)
        case (0)
           select case (acl_in)
           case (0)
              call color_init_array (col, null_array)
           case default
              call color_init_array (col, (/ -acl_in /))
           end select
        case default
           select case (acl_in)
           case (0)
              call color_init_array (col, (/ col_in /))
           case default
              call color_init_array (col, (/ col_in, -acl_in /))
           end select
        end select
      end subroutine color_init_col_acl
```

This version is used for the external interface. We convert a fixed-size array of colors (for each particle) to the internal form by packing only the nonzero entries.

⟨*Colors: public*⟩+≡
```
      public :: color_init_from_array
```

⟨*Colors: interfaces*⟩+≡
```
    interface color_init_from_array
       module procedure color_init_from_array1, color_init_from_array1g
       module procedure color_init_from_array2, color_init_from_array2g
    end interface
```

⟨*Colors: procedures*⟩+≡
```
    pure subroutine color_init_from_array1 (col, c1)
      type(color_t), intent(out) :: col
      integer, dimension(:), intent(in) :: c1
      logical, dimension(size(c1)) :: mask
      mask = c1 /= 0
      col%c1 = pack (c1, mask, col%c1)
      col%c2 = col%c1
    end subroutine color_init_from_array1

    pure subroutine color_init_from_array1g (col, c1, ghost)
      type(color_t), intent(out) :: col
      integer, dimension(:), intent(in) :: c1
      logical, intent(in) :: ghost
      call color_init_from_array1 (col, c1)
      col%ghost = ghost
    end subroutine color_init_from_array1g

    pure subroutine color_init_from_array2 (col, c1)
      integer, dimension(:,:), intent(in) :: c1
      type(color_t), dimension(size(c1,2)), intent(out) :: col
      integer :: i
      do i = 1, size (c1,2)
         call color_init_from_array1 (col(i), c1(:,i))
      end do
    end subroutine color_init_from_array2

    pure subroutine color_init_from_array2g (col, c1, ghost)
      integer, dimension(:,:), intent(in) :: c1
      type(color_t), dimension(size(c1,2)), intent(out) :: col
      logical, intent(in), dimension(:) :: ghost
      call color_init_from_array2 (col, c1)
      col%ghost = ghost
    end subroutine color_init_from_array2g
```

Set the ghost property

⟨*Colors: public*⟩+≡
```
    public :: color_set_ghost
```

⟨*Colors: procedures*⟩+≡
```
    elemental subroutine color_set_ghost (col, ghost)
      type(color_t), intent(inout) :: col
      logical, intent(in) :: ghost
      col%ghost = ghost
    end subroutine color_set_ghost
```

694

Undefine the color state:

⟨*Colors: public*⟩+≡
```
    public :: color_undefine
```

⟨*Colors: procedures*⟩+≡
```
    elemental subroutine color_undefine (col, undefine_ghost)
      type(color_t), intent(inout) :: col
      logical, intent(in), optional :: undefine_ghost
      col%c1 = 0
      col%c2 = 0
      if (present (undefine_ghost)) then

```

7.2.2 Predicates

Return the definition status

⟨*Colors: public*⟩+≡
```
    public :: color_is_defined
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_is_defined (col) result (defined)
      logical :: defined
      type(color_t), intent(in) :: col
      defined = any (col%c1 /= 0)
    end function color_is_defined
```

Diagonal color objects have only one array allocated:

⟨*Colors: public*⟩+≡
```
    public :: color_is_diagonal
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_is_diagonal (col) result (diagonal)
      logical :: diagonal
      type(color_t), intent(in) :: col
      if (color_is_defined (col)) then
          diagonal = all (col%c1 == col%c2)
      else
          diagonal = .true.
      end if
    end function color_is_diagonal
```

Return the ghost flag

⟨*Colors: public*⟩+≡
```
    public :: color_is_ghost
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_is_ghost (col) result (ghost)
      logical :: ghost
      type(color_t), intent(in) :: col
      ghost = col%ghost
    end function color_is_ghost
```

The ghost parity: true if the color-ghost flag is set.

⟨*Colors: interfaces*⟩+≡
```
    interface color_ghost_parity
       module procedure color_ghost_parity0
       module procedure color_ghost_parity1
    end interface
```

⟨*Colors: procedures*⟩+≡
```
    pure function color_ghost_parity0 (col) result (parity)
      type(color_t), intent(in) :: col
      logical :: parity
      parity = color_is_ghost (col)
    end function color_ghost_parity0

    pure function color_ghost_parity1 (col) result (parity)
      type(color_t), dimension(:), intent(in) :: col
      logical :: parity
      logical, dimension(size(col)) :: p
      integer :: i
      forall (i = 1:size(col))
         p(i) = color_ghost_parity0 (col(i))
      end forall
      parity = mod (count (p), 2) == 1
    end function color_ghost_parity1
```

7.2.3 Accessing contents

Return the number of color indices. We assume that it is identical for both arrays.

⟨*Colors: procedures*⟩+≡

```fortran
elemental function color_number (col) result (n)
  integer :: n
  type(color_t), intent(in) :: col
  n = count (col%c1 /= 0)
end function color_number
```

Return the (first) color/anticolor entry (assuming that color is diagonal). The result is a positive color index.

⟨*Colors: public*⟩+≡

```fortran
public :: color_get_col
public :: color_get_acl
```

⟨*Colors: procedures*⟩+≡

```fortran
elemental function color_get_col (col) result (c)
  integer :: c
  type(color_t), intent(in) :: col
  integer :: i
  do i = 1, size (col%c1)
     if (col%c1(i) > 0) then
        c = col%c1(i)
        return
     end if
  end do
  c = 0
end function color_get_col

elemental function color_get_acl (col) result (c)
  integer :: c
  type(color_t), intent(in) :: col
  integer :: i
  do i = 1, size (col%c1)
     if (col%c1(i) < 0) then
        c = - col%c1(i)
        return
     end if
  end do
  c = 0
end function color_get_acl
```

Return the color index with highest absolute value

⟨*Colors: public*⟩+≡

```fortran
public :: color_get_max_value
```

⟨*Colors: interfaces*⟩+≡

```fortran
interface color_get_max_value
   module procedure color_get_max_value0
   module procedure color_get_max_value1
   module procedure color_get_max_value2
end interface
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_get_max_value0 (col) result (cmax)
      integer :: cmax
      type(color_t), intent(in) :: col
      cmax = maxval (abs (col%c1))
    end function color_get_max_value0

    pure function color_get_max_value1 (col) result (cmax)
      integer :: cmax
      type(color_t), dimension(:), intent(in) :: col
      cmax = maxval (color_get_max_value0 (col))
    end function color_get_max_value1

    function color_get_max_value2 (col) result (cmax)
      integer :: cmax
      type(color_t), dimension(:,:), intent(in) :: col
      integer, dimension(size(col, 2)) :: cm
      integer :: i
      forall (i = 1:size(col, 2))
         cm(i) = color_get_max_value1 (col(:,i))
      end forall
      cmax = maxval (cm)
    end function color_get_max_value2
```

7.2.4 Comparisons

Similar to helicities, colors match if they are equal, or if either one is undefined.

⟨*Colors: public*⟩+≡
```
    public :: operator(.match.)
    public :: operator(==)
    public :: operator(/=)
```

⟨*Colors: interfaces*⟩+≡
```
    interface operator(.match.)
       module procedure color_match
    end interface
    interface operator(==)
       module procedure color_eq
    end interface
    interface operator(/=)
       module procedure color_neq
    end interface
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_match (col1, col2) result (eq)
      logical :: eq
      type(color_t), intent(in) :: col1, col2
      if (color_is_defined (col1) .and. color_is_defined (col2)) then
            eq = all (col1%c1 == col2%c1) .and. all (col1%c2 == col2%c2)
      else
         eq = .true.
      end if
```

```
    end function color_match

    elemental function color_eq (col1, col2) result (eq)
      logical :: eq
      type(color_t), intent(in) :: col1, col2
      if (color_is_defined (col1) .and. color_is_defined (col2)) then
            eq = all (col1%c1 == col2%c1) .and. all (col1%c2 == col2%c2) &
                  .and. (col1%ghost .eqv. col2%ghost)
      else if (.not. color_is_defined (col1) &
         .and. .not. color_is_defined (col2)) then
         eq = col1%ghost .eqv. col2%ghost
      else
         eq = .false.
      end if
    end function color_eq
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_neq (col1, col2) result (neq)
      logical :: neq
      type(color_t), intent(in) :: col1, col2
      if (color_is_defined (col1) .and. color_is_defined (col2)) then
!        if (size (col1%c1) == size (col2%c1)) then
           neq = any (col1%c1 /= col2%c1) .or. any (col1%c2 /= col2%c2) &
                 .or. (col1%ghost .neqv. col2%ghost)
!        else
!           neq = .true.
!        end if
      else if (.not. color_is_defined (col1) &
         .and. .not. color_is_defined (col2)) then
         neq = col1%ghost .neqv. col2%ghost
      else
         neq = .true.
      end if
    end function color_neq
```

7.2.5 Tools

Shift color indices by a common offset.

⟨*Colors: public*⟩+≡
```
    public :: color_add_offset
```

⟨*Colors: procedures*⟩+≡
```
    elemental subroutine color_add_offset (col, offset)
      type(color_t), intent(inout) :: col
      integer, intent(in) :: offset
      where (col%c1 /= 0)  col%c1 = col%c1 + sign (offset, col%c1)
      where (col%c2 /= 0)  col%c2 = col%c2 + sign (offset, col%c2)
    end subroutine color_add_offset
```

Reassign color indices for an array of colored particle in canonical order. The
allocated size of the color map is such that two colors per particle can be acco-

modated.

⟨Colors: public⟩+≡

```
    public :: color_canonicalize
```

⟨Colors: procedures⟩+≡

```
    subroutine color_canonicalize (col)
      type(color_t), dimension(:), intent(inout) :: col
      integer, dimension(2*size(col)) :: map
      integer :: n_col, i, j, k
      n_col = 0
      do i = 1, size (col)
         do j = 1, size (col(i)%c1)
            if (col(i)%c1(j) /= 0) then
               k = find (abs (col(i)%c1(j)), map(:n_col))
               if (k == 0) then
                  n_col = n_col + 1
                  map(n_col) = abs (col(i)%c1(j))
                  k = n_col
               end if
               col(i)%c1(j) = sign (k, col(i)%c1(j))
            end if
            if (col(i)%c2(j) /= 0) then
               k = find (abs (col(i)%c2(j)), map(:n_col))
               if (k == 0) then
                  n_col = n_col + 1
                  map(n_col) = abs (col(i)%c2(j))
                  k = n_col
               end if
               col(i)%c2(j) = sign (k, col(i)%c2(j))
            end if
         end do
      end do
    contains
      function find (c, array) result (k)
        integer :: k
        integer, intent(in) :: c
        integer, dimension(:), intent(in) :: array
        integer :: i
        k = 0
        do i = 1, size (array)
           if (c == array (i)) then
              k = i
              return
           end if
        end do
      end function find
    end subroutine color_canonicalize
```

Return an array of different color indices from an array of colors. The last argument is a pseudo-color array, where the color entries correspond to the position of the corresponding index entry in the index array. The colors are assumed to be diagonal.

⟨Colors: procedures⟩+≡

```fortran
subroutine extract_color_line_indices (col, c_index, col_pos)
  type(color_t), dimension(:), intent(in) :: col
  integer, dimension(:), intent(out), allocatable :: c_index
  type(color_t), dimension(size(col)), intent(out) :: col_pos
  integer, dimension(:), allocatable :: c_tmp
  integer :: i, j, k, n, c
  allocate (c_tmp (sum (color_number (col))))
  n = 0
  SCAN1: do i = 1, size (col)
     SCAN2: do j = 1, 2
        c = abs (col(i)%c1(j))
        if (c /= 0) then
           do k = 1, n
              if (c_tmp(k) == c) then
                 col_pos(i)%c1(j) = k
                 cycle SCAN2
              end if
           end do
           n = n + 1
           c_tmp(n) = c
           col_pos(i)%c1(j) = n
        end if
     end do SCAN2
  end do SCAN1
  allocate (c_index (n))
  c_index = c_tmp(1:n)
end subroutine extract_color_line_indices
```

Given a color array, pairwise contract the color lines in all possible ways and return the resulting array of arrays. The input color array must be diagonal, and each color should occur exactly twice, once as color and once as anticolor.

Gluon entries with equal color and anticolor are explicitly excluded.

This algorithm is generic, but for long arrays it is neither efficient, nor does it avoid duplicates. It is intended for small arrays, in particular for the state matrix of a structure-function pair.

⟨*Colors: public*⟩+≡
```fortran
public :: color_array_make_contractions
```

⟨*Colors: procedures*⟩+≡
```fortran

end function compute_color_factor
```

We have a pair of color index arrays which corresponds to a squared matrix element. We want to determine the number of color loops in this square matrix element. So we first copy the colors (stored in a single color array with a pair of color lists in each entry) to a temporary where the color indices are shifted by some offset. We then recursively follow each loop, starting at the first color that has the offset, resetting the first color index to the loop index and each further index to zero as we go. We check that (a) each color index occurs twice within the left (right) color array, (b) the loops are closed, so we always come back to a line which has the loop index.

In order for the algorithm to work we have to conjugate the colors of initial state particles (one for decays, two for scatterings) into their corresponding

anticolors of outgoing particles.

7.2.7 The Madgraph color model

This section describes the method for matrix element and color flow calculation within Madgraph.

For each Feynman diagram, the colorless amplitude for a specified helicity and momentum configuration (in- and out- combined) is computed:

$$A_d(p, h) \tag{7.1}$$

Inserting color, the squared matrix element for definite helicity and momentum is

$$M^2(p, h) = \sum_{dd'} A_d(p, h) \, C_{dd'} A_{d'}^*(p, h) \tag{7.2}$$

where $C_{dd'}$ describes the color interference of the two diagrams A_d and A'_d, which is independent of momentum and helicity and can be calculated for each Feynman diagram pair by reducing it to the corresponding color graph. Obviously, one could combine all diagrams with identical color structure, such that the index d runs only over different color graphs. For colorless diagrams all elements of $C_{dd'}$ are equal to unity.

The hermitian matrix $C_{dd'}$ is diagonalized once and for all, such that it can be written in the form

$$C_{dd'} = \sum_\lambda c_d^\lambda \lambda \, c_d^{\lambda *}, \tag{7.3}$$

where the eigenvectors c_d are normalized,

$$\sum_d |c_d^\lambda|^2 = 1, \tag{7.4}$$

and the λ values are the corresponding eigenvalues. In the colorless case, this means $c_d = 1/\sqrt{N_d}$ for all diagrams (N_d = number of diagrams), and $\lambda = N_d$ is the only nonzero eigenvalue.

Consequently, the squared matrix element for definite helicity and momentum can also be written as

$$M^2(p, h) = \sum_\lambda A_\lambda(p, h) \, \lambda \, A_\lambda(p, h)^* \tag{7.5}$$

with

$$A_\lambda(p, h) = \sum_d c_d^\lambda A_d(p, h). \tag{7.6}$$

For generic spin density matrices, this is easily generalized to

$$M^2(p, h, h') = \sum_\lambda A_\lambda(p, h)\, \lambda\, A_\lambda(p, h')^* \tag{7.7}$$

To determine the color flow probabilities of a given momentum-helicity configuration, the color flow amplitudes are calculated as

$$a_f(p, h) = \sum_d \beta_d^f A_d(p, h), \tag{7.8}$$

where the coefficients β_d^f describe the amplitude for a given Feynman diagram (or color graph) d to correspond to a definite color flow f. They are computed from $C_{dd'}$ by transforming this matrix into the color flow basis and neglecting all off-diagonal elements. Again, these coefficients do not depend on momentum or helicity and can therefore be calculated in advance. This gives the color flow transition matrix

$$F^f(p, h, h') = a_f(p, h)\, a_f^*(p, h') \tag{7.9}$$

which is assumed diagonal in color flow space and is separate from the color-summed transition matrix M^2. They are, however, equivalent (up to a factor) to leading order in $1/N_c$, and using the color flow transition matrix is appropriate for matching to hadronization.

Note that the color flow transition matrix is not normalized at this stage. To make use of it, we have to fold it with the in-state density matrix to get a pseudo density matrix

$$\hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}') = \sum_{h_{\text{in}} h_{\text{in}}'} F^f(p, h, h')\, \rho_{\text{in}}(p, h_{\text{in}}, h_{\text{in}}') \tag{7.10}$$

which gets a meaning only after contracted with projections on the outgoing helicity states k_{out}, given as linear combinations of helicity states with the unitary coefficient matrix $c(k_{\text{out}}, h_{\text{out}})$. Then the probability of finding color flow f when the helicity state k_{out} is measured is given by

$$P^f(p, k_{\text{out}}) = Q^f(p, k_{\text{out}}) / \sum_f Q^f(p, k_{\text{out}}) \tag{7.11}$$

where

$$Q^f(p, k_{\text{out}}) = \sum_{h_{\text{out}} h_{\text{out}}'} c(k_{\text{out}}, h_{\text{out}})\, \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}')\, c^*(k_{\text{out}}, h_{\text{out}}') \tag{7.12}$$

However, if we can assume that the out-state helicity basis is the canonical one, we can throw away the off diagonal elements in the color flow density matrix and normalize the ones on the diagonal to obtain

$$P^f(p, h_{\text{out}}) = \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}) / \sum_f \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h_{\text{out}}) \tag{7.13}$$

Finally, the color-summed out-state density matrix is computed by the scattering formula

$$\rho_{\text{out}}(p, h_{\text{out}}, h'_{\text{out}}) = \sum_{h_{\text{in}} h'_{\text{in}}} M^2(p, h, h') \, \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}) \tag{7.14}$$

$$= \sum_{h_{\text{in}} h'_{\text{in}} \lambda} A_\lambda(p, h) \, \lambda \, A_\lambda(p, h')^* \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}), \tag{7.15}$$

The trace of ρ_{out} is the squared matrix element, summed over all internal degrees of freedom. To get the squared matrix element for a definite helicity k_{out} and color flow f, one has to project the density matrix onto the given helicity state and multiply with $P^f(p, k_{\text{out}})$.

For diagonal helicities the out-state density reduces to

$$\rho_{\text{out}}(p, h_{\text{out}}) = \sum_{h_{\text{in}} \lambda} \lambda |A_\lambda(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \tag{7.16}$$

Since no basis transformation is involved, we can use the normalized color flow probability $P^f(p, h_{\text{out}})$ and express the result as

$$\rho_{\text{out}}^f(p, h_{\text{out}}) = \rho_{\text{out}}(p, h_{\text{out}}) \, P^f(p, h_{\text{out}}) \tag{7.17}$$

$$= \sum_{h_{\text{in}} \lambda} \frac{|a^f(p, h)|^2}{\sum_f |a^f(p, h)|^2} \lambda |A_\lambda(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \tag{7.18}$$

From these considerations, the following calculation strategy can be derived:

- Before the first event is generated, the color interference matrix $C_{dd'}$ is computed and diagonalized, so the eigenvectors c_d^λ, eigenvalues λ and color flow coefficients β_d^f are obtained. In practice, these calculations are done when the matrix element code is generated, and the results are hardcoded in the matrix element subroutine as `DATA` statements.

- For each event, one loops over helicities once and stores the matrices $A_\lambda(p, h)$ and $a^f(p, h)$. The allowed color flows, helicity combinations and eigenvalues are each labeled by integer indices, so one has to store complex matrices of dimension $N_\lambda \times N_h$ and $N_f \times N_h$, respectively.

- The further strategy depends on the requested information.

  1. If colorless diagonal helicity amplitudes are required, the eigenvalues $A_\lambda(p, h)$ are squared, summed with weight λ, and the result contracted with the in-state probability vector $\rho_{\text{in}}(p, h_{\text{in}})$. The result is a probability vector $\rho_{\text{out}}(p, h_{\text{out}})$.

  2. For colored diagonal helicity amplitudes, the color coefficients $a^f(p, h)$ are also squared and used as weights to obtain the color-flow probability vector $\rho_{\text{out}}^f(p, h_{\text{out}})$.

  3. For colorless non-diagonal helicity amplitudes, we contract the tensor product of $A_\lambda(p, h)$ with $A_\lambda(p, h')$, weighted with λ, with the correlated in-state density matrix, to obtain a correlated out-state density matrix.

713

4. In the general (colored, non-diagonal) case, we do the same as in the colorless case, but return the un-normalized color flow density matrix $\hat{\rho}^f_{\text{out}}(p, h_{\text{out}}, h'_{\text{out}})$ in addition. When the relevant helicity basis is known, the latter can be used by the caller program to determine flow probabilities. (In reality, we assume the canonical basis and reduce the correlated out-state density to its diagonal immediately.)

7.3 Flavors: Particle properties

This module contains a type for holding the flavor code, and all functions that depend on the model, i.e., that determine particle properties.

The PDG code is packed in a special `flavor` type. (This prohibits meaningless operations, and it allows for a different implementation, e.g., some non-PDG scheme internally, if appropiate at some point.) In addition, the flavor object holds a pointer to a `particle_data` object which is centrally stored (as part of a physics model). In this way, all particle data can be accessed using just the `flv` object without having to carry them around.

The pointer component imposes a technical restriction: Assignment of flavor objects cannot be used, directly or indirectly, in pure, and thus in elemental procedures.

7.3.1 The flavor type

The flavor type is an integer representing the PDG code, or undefined (zero). Negative codes represent antiflavors.

For full generality, and analogy with helicity and color, we allow for non-diagonal flavor indices in density matrices. This is probably academic; an obscure application is the definition of proper isospin states.

Further properties of the given flavor can be retrieved via the particle-data pointer, if it is associated.

⟨*Flavors: public*⟩≡
  ```
    public :: flavor_t
```

⟨*Flavors: types*⟩≡

```
type :: flavor_t
   private
   integer :: f = UNDEFINED
   type(particle_data_t), pointer :: prt => null ()
end type flavor_t
```

Initializer form. If the model is assigned, the procedure is impure, therefore we have to define a separate array version.

⟨*Flavors: public*⟩+≡

```
public :: flavor_init
```

⟨*Flavors: interfaces*⟩≡

```
interface flavor_init
   module procedure flavor_init0_empty
   module procedure flavor_init0
   module procedure flavor_init0_particle_data
   module procedure flavor_init0_model
   module procedure flavor_init0_name_model
   module procedure flavor_init1_model
   module procedure flavor_init1_name_model
   module procedure flavor_init2_model
   module procedure flavor_init_aval_model
end interface
```

⟨*Flavors: procedures*⟩≡

```
elemental subroutine flavor_init0_empty (flv)
  type(flavor_t), intent(out) :: flv
end subroutine flavor_init0_empty

elemental subroutine flavor_init0 (flv, f)
  type(flavor_t), intent(out) :: flv
  integer, intent(in) :: f
  flv%f = f
end subroutine flavor_init0

subroutine flavor_init0_particle_data (flv, particle_data)
  type(flavor_t), intent(out) :: flv
  type(particle_data_t), intent(in), target :: particle_data
  flv%f = particle_data_get_pdg (particle_data)
  flv%prt => particle_data
end subroutine flavor_init0_particle_data

subroutine flavor_init0_model (flv, f, model)
  type(flavor_t), intent(out) :: flv
  integer, intent(in) :: f
  type(model_t), intent(in), target :: model
  flv%f = f
  flv%prt => model_get_particle_ptr (model, f)
end subroutine flavor_init0_model

subroutine flavor_init1_model (flv, f, model)
  type(flavor_t), dimension(:), intent(out) :: flv
  integer, dimension(:), intent(in) :: f
  type(model_t), intent(in), target :: model
```

716

```
      integer :: i
      do i = 1, size (f)
         call flavor_init0_model (flv(i), f(i), model)
      end do
   end subroutine flavor_init1_model

   subroutine flavor_init2_model (flv, f, model)
      type(flavor_t), dimension(:,:), intent(out) :: flv
      integer, dimension(:,:), intent(in) :: f
      type(model_t), intent(in), target :: model
      integer :: i
      do i = 1, size (f, 2)
         call flavor_init1_model (flv(:,i), f(:,i), model)
      end do
   end subroutine flavor_init2_model

   subroutine flavor_init0_name_model (flv, name, model)
      type(flavor_t), intent(out) :: flv
      type(string_t), intent(in) :: name
      type(model_t), intent(in), target :: model
      flv%f = model_get_particle_pdg (model, name)
      flv%prt => model_get_particle_ptr (model, flv%f)
   end subroutine flavor_init0_name_model

   subroutine flavor_init1_name_model (flv, name, model)
      type(flavor_t), dimension(:), intent(out) :: flv
      type(string_t), dimension(:), intent(in) :: name
      type(model_t), intent(in), target :: model
      integer :: i
      do i = 1, size (name)
         call flavor_init0_name_model (flv(i), name(i), model)
      end do
   end subroutine flavor_init1_name_model
```

This version transforms a PDG array value into a flavor array. The flavor array
must be allocatable.

⟨Flavors: procedures⟩+≡
```
   subroutine flavor_init_aval_model (flv, aval, model)
      type(flavor_t), dimension(:), intent(out), allocatable :: flv
      type(pdg_array_t), intent(in) :: aval
      type(model_t), intent(in), target :: model
      integer, dimension(:), allocatable :: pdg
      pdg = aval
      allocate (flv (size (pdg)))
      call flavor_init (flv, pdg, model)
   end subroutine flavor_init_aval_model
```

Undefine the flavor state:

⟨Flavors: public⟩+≡
```
   public :: flavor_undefine
```

⟨Flavors: procedures⟩+≡
```
   elemental subroutine flavor_undefine (flv)
```

```
      type(flavor_t), intent(inout) :: flv
      flv%f = UNDEFINED
      flv%prt => null ()
   end subroutine flavor_undefine
```

Output: dense, no linebreak

⟨*Flavors: public*⟩+≡
```
    public :: flavor_write
```

⟨*Flavors: procedures*⟩+≡
```
    subroutine flavor_write (flv, unit)
      type(flavor_t), intent(in) :: flv
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      if (associated (flv%prt)) then
         write (u, "(A)", advance="no")  "f("
      else
         write (u, "(A)", advance="no")  "p("
      end if
      write (u, "(I0)", advance="no")  flv%f
      write (u, "(A)", advance="no")  ")"
    end subroutine flavor_write
```

Binary I/O. Currently, the model information is not written/read, so after reading the particle-data pointer is empty.

⟨*Flavors: public*⟩+≡
```
    public :: flavor_write_raw
    public :: flavor_read_raw
```

⟨*Flavors: procedures*⟩+≡
```
    subroutine flavor_write_raw (flv, u)
      type(flavor_t), intent(in) :: flv
      integer, intent(in) :: u
      write (u) flv%f
    end subroutine flavor_write_raw

    subroutine flavor_read_raw (flv, u, iostat)
      type(flavor_t), intent(out) :: flv
      integer, intent(in) :: u
      integer, intent(out), optional :: iostat
      read (u, iostat=iostat) flv%f
    end subroutine flavor_read_raw
```

Assignment

Default assignment of flavor objects is possible, but cannot be used in pure procedures, because a pointer assignment is involved.

Assign the particle pointer separately. This cannot be elemental, so we define a scalar and an array version explicitly. We refer to an array of flavors, not an array of models.

⟨*Flavors: public*⟩+≡

```
    public :: flavor_set_model
```

⟨*Flavors: interfaces*⟩+≡
```
    interface flavor_set_model
       module procedure flavor_set_model_single
       module procedure flavor_set_model_array
       module procedure flavor_set_model_array2
    end interface
```

⟨*Flavors: procedures*⟩+≡
```
    subroutine flavor_set_model_single (flv, model)
      type(flavor_t), intent(inout) :: flv
      type(model_t), intent(in), target :: model
      if (flv%f /= UNDEFINED) &
           flv%prt => model_get_particle_ptr (model, flv%f)
    end subroutine flavor_set_model_single

    subroutine flavor_set_model_array (flv, model)
      type(flavor_t), dimension(:), intent(inout) :: flv
      type(model_t), intent(in), target :: model
      integer :: i
      do i = 1, size (flv)
         if (flv(i)%f /= UNDEFINED) &
              flv(i)%prt => model_get_particle_ptr (model, flv(i)%f)
      end do
    end subroutine flavor_set_model_array

    subroutine flavor_set_model_array2 (flv, model)
      type(flavor_t), dimension(:,:), intent(inout) :: flv
      type(model_t), intent(in), target :: model
      integer :: i, j
      do i = 1, size (flv, 2)
         do j = 1, size (flv, 1)
            if (flv(j,i)%f /= UNDEFINED) &
                 flv(j,i)%prt => model_get_particle_ptr (model, flv(j,i)%f)
         end do
      end do
    end subroutine flavor_set_model_array2
```

Predicates

Return the definition status

⟨*Flavors: public*⟩+≡
```
    public :: flavor_is_defined
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_is_defined (flv) result (defined)
      logical :: defined
      type(flavor_t), intent(in) :: flv
      defined = flv%f /= UNDEFINED
    end function flavor_is_defined
```

719

Check for valid flavor (including undefined):

⟨*Flavors: public*⟩+≡
```
    public :: flavor_is_valid
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_is_valid (flv) result (valid)
      logical :: valid
      type(flavor_t), intent(in) :: flv
      valid = flv%f /= INVALID
    end function flavor_is_valid
```

Return true if the particle-data pointer is associated. (Debugging aid)

⟨*Flavors: public*⟩+≡
```
    public :: flavor_is_associated
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_is_associated (flv) result (flag)
      logical :: flag
      type(flavor_t), intent(in) :: flv
      flag = associated (flv%prt)
    end function flavor_is_associated
```

Accessing contents

With the exception of the PDG code, all particle properties are accessible only via the `prt` pointer. If this is unassigned, some access function will crash.

Return the flavor as an integer

⟨*Flavors: public*⟩+≡
```
    public :: flavor_get_pdg
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_get_pdg (flv) result (f)
      integer :: f
      type(flavor_t), intent(in) :: flv
      f = flv%f
    end function flavor_get_pdg
```

Return the flavor of the antiparticle

⟨*Flavors: public*⟩+≡
```
    public :: flavor_get_pdg_anti
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_get_pdg_anti (flv) result (f)
      integer :: f
      type(flavor_t), intent(in) :: flv
      if (associated (flv%prt)) then
         if (particle_data_has_antiparticle (flv%prt)) then
            f = -flv%f
         else
            f = flv%f
         end if
      else
         f = 0
```

```
      end if
    end function flavor_get_pdg_anti
```

Absolute value:

⟨*Flavors: public*⟩+≡

         neq = .false.
      else
         neq = .true.
      end if
    end function flavor_neq
```

Tools

Merge two flavor indices. This works only if both are equal or either one is
undefined, because we have no off-diagonal flavor entries. Otherwise, generate
an invalid flavor.

We cannot use elemental procedures because of the pointer component.

⟨*Flavors: public*⟩+≡

```
    public :: operator(.merge.)
```

⟨*Flavors: interfaces*⟩+≡
```
    interface operator(.merge.)
       module procedure merge_flavors0
       module procedure merge_flavors1
    end interface
```

⟨*Flavors: procedures*⟩+≡
```
    function merge_flavors0 (flv1, flv2) result (flv)
      type(flavor_t) :: flv
      type(flavor_t), intent(in) :: flv1, flv2
      if (flavor_is_defined (flv1) .and. flavor_is_defined (flv2)) then
         if (flv1 == flv2) then
            flv = flv1
         else
            flv%f = INVALID
         end if
      else if (flavor_is_defined (flv1)) then
         flv = flv1
      else if (flavor_is_defined (flv2)) then
         flv = flv2
      end if
    end function merge_flavors0

    function merge_flavors1 (flv1, flv2) result (flv)
      type(flavor_t), dimension(:), intent(in) :: flv1, flv2
      type(flavor_t), dimension(size(flv1)) :: flv
      integer :: i
      do i = 1, size (flv1)
         flv(i) = flv1(i) .merge. flv2(i)
      end do
    end function merge_flavors1
```

Generate consecutive color indices for a given flavor. The indices are counted starting with the stored value of c, so new indices are created each time this (impure) function is called. The counter can be reset by the optional argument `c_seed` if desired. The optional flag **reverse** is used only for octets. If set, the color and anticolor entries of the octet particle are exchanged.

⟨*Flavors: public*⟩+≡
```
    public :: color_from_flavor
```

⟨*Flavors: interfaces*⟩+≡
```
    interface color_from_flavor
       module procedure color_from_flavor0
       module procedure color_from_flavor1
    end interface
```

⟨*Flavors: procedures*⟩+≡
```
    function color_from_flavor0 (flv, c_seed, reverse) result (col)
      type(color_t) :: col
      type(flavor_t), intent(in) :: flv
      integer, intent(in), optional :: c_seed
      logical, intent(in), optional :: reverse
      integer, save :: c = 1
      logical :: rev
```

```
      if (present (c_seed))  c = c_seed
      rev = .false.;  if (present (reverse)) rev = reverse
      select case (flavor_get_color_type (flv))
      case (1)
      case (3)
         call color_init (col, (/ c /));  c = c + 1
      case (-3)
         call color_init (col, (/-c /));  c = c + 1
      case (8)
         if (rev) then
            call color_init (col, (/ c+1, -c /));  c = c + 2
         else
            call color_init (col, (/ c, -(c+1) /));  c = c + 2
         end if
      end select
   end function color_from_flavor0

   function color_from_flavor1 (flv, c_seed, reverse) result (col)
      type(flavor_t), dimension(:), intent(in) :: flv
      integer, intent(in), optional :: c_seed
      logical, intent(in), optional :: reverse
      type(color_t), dimension(size(flv)) :: col
      integer :: i
      col(1) = color_from_flavor0 (flv(1), c_seed, reverse)
      do i = 2, size (flv)
         col(i) = color_from_flavor0 (flv(i), reverse=reverse)
      end do
   end function color_from_flavor1
```

This procedure returns the flavor object for the antiparticle. The antiparticle code may either be the same code or its negative.

⟨*Flavors: public*⟩+≡
```
   public :: flavor_anti
```

⟨*Flavors: procedures*⟩+≡
```
   function flavor_anti (flv) result (aflv)
     type(flavor_t) :: aflv
     type(flavor_t), intent(in) :: flv
     if (flavor_has_antiparticle (flv)) then
        aflv%f = - flv%f
     else
        aflv%f = flv%f
     end if
     aflv%prt => flv%prt
   end function flavor_anti
```

7.4 Quantum numbers

This module collects helicity, color, and flavor in a single type and defines procedures

7.4.3 Accessing contents

Color and helicity can be done by elemental functions. Flavor needs explicit specifics because of the pointer assignment.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_get_flavor
    public :: quantum_numbers_get_color
    public :: quantum_numbers_get_helicity
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface quantum_numbers_get_flavor
       module procedure quantum_numbers_get_flavor0
       module procedure quantum_numbers_get_flavor1
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    function quantum_numbers_get_flavor0 (qn) result (flv)
      type(flavor_t) :: flv
      type(quantum_numbers_t), intent(in) :: qn
      flv = qn%f
    end function quantum_numbers_get_flavor0

    function quantum_numbers_get_flavor1 (qn) result (flv)
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
      type(flavor_t), dimension(size(qn)) :: flv
      integer :: i
      do i = 1, size (qn)
         flv(i) = qn(i)%f
      end do
    end function quantum_numbers_get_flavor1

    elemental function quantum_numbers_get_color (qn) result (col)
      type(color_t) :: col
      type(quantum_numbers_t), intent(in) :: qn
      col = qn%c
    end function quantum_numbers_get_color

    elemental function quantum_numbers_get_helicity (qn) result (hel)
      type(helicity_t) :: hel
      type(quantum_numbers_t), intent(in) :: qn
      hel = qn%h
    end function quantum_numbers_get_helicity
```

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_set_flavor
    public :: quantum_numbers_set_color
    public :: quantum_numbers_set_helicity
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface quantum_numbers_set_flavor
       module procedure quantum_numbers_set_flavor0
       module procedure quantum_numbers_set_flavor1
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡

```
subroutine quantum_numbers_set_flavor0 (qn, flv)
  type(quantum_numbers_t), intent(inout) :: qn
  type(flavor_t), intent(in) :: flv
  qn%f = flv
end subroutine quantum_numbers_set_flavor0

subroutine quantum_numbers_set_flavor1 (qn, flv)
  type(quantum_numbers_t), dimension(:), intent(inout) :: qn
  type(flavor_t), dimension(:), intent(in) :: flv
  integer :: i
  do i = 1, size (flv)
     qn(i)%f = flv(i)
  end do
end subroutine quantum_numbers_set_flavor1

elemental subroutine quantum_numbers_set_color (qn, col)

  qn%h = hel
end subroutine quantum_numbers_set_helicity
```

This just resets the ghost property of the color/helicity part:

⟨*Quantum numbers: public*⟩+≡

```
public :: quantum_numbers_set_color_ghost
public :: quantum_numbers_set_helicity_ghost
```

⟨*Quantum numbers: procedures*⟩+≡

```
elemental subroutine quantum_numbers_set_color_ghost (qn, ghost)
  type(quantum_numbers_t), intent(inout) :: qn
  logical, intent(in) :: ghost
  call color_set_ghost (qn%c, ghost)
end subroutine quantum_numbers_set_color_ghost

elemental subroutine quantum_numbers_set_helicity_ghost (qn, ghost)
  type(quantum_numbers_t), intent(inout) :: qn
  logical, intent(in) :: ghost
  call helicity_set_ghost (qn%h, ghost)
end subroutine quantum_numbers_set_helicity_ghost
```

Assign a model to the flavor part of quantum numbers.

⟨*Quantum numbers: public*⟩+≡

```
public :: quantum_numbers_set_model
```

⟨*Quantum numbers: interfaces*⟩+≡

```
interface quantum_numbers_set_model
   module procedure quantum_numbers_set_model_single
   module procedure quantum_numbers_set_model_array
```

```
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    subroutine quantum_numbers_set_model_single (qn, model)
      type(quantum_numbers_t), intent(inout) :: qn
      type(model_t), intent(in), target :: model
      call flavor_set_model (qn%f, model)
    end subroutine quantum_numbers_set_model_single

    subroutine quantum_numbers_set_model_array (qn, model)
      type(quantum_numbers_t), dimension(:), intent(inout) :: qn
      type(model_t), intent(in), target :: model
      call flavor_set_model (qn%f, model)
    end subroutine quantum_numbers_set_model_array
```

This is a convenience function: return the color type for the flavor (array).

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_get_color_type
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_get_color_type (qn) result (color_type)
      integer :: color_type
      type(quantum_numbers_t), intent(in) :: qn
      color_type = flavor_get_color_type (qn%f)
    end function quantum_numbers_get_color_type
```

7.4.4 Predicates

Check if the flavor index is valid (including UNDEFINED).

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_are_valid
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_are_valid (qn) result (valid)
      logical :: valid
      type(quantum_numbers_t), intent(in) :: qn
      valid = flavor_is_valid (qn%f)
    end function quantum_numbers_are_valid
```

Check if the flavor part has its particle-data pointer associated (debugging aid).

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_are_associated
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_are_associated (qn) result (flag)
      logical :: flag
      type(quantum_numbers_t), intent(in) :: qn
      flag = flavor_is_associated (qn%f)
    end function quantum_numbers_are_associated
```

Check if the helicity and color quantum numbers are diagonal. (Unpolarized/colorless also counts as diagonal.) Flavor is diagonal by definition.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_are_diagonal
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_are_diagonal (qn) result (diagonal)
      logical :: diagonal
      type(quantum_numbers_t), intent(in) :: qn
      diagonal = helicity_is_diagonal (qn%h) .and. color_is_diagonal (qn%c)
    end function quantum_numbers_are_diagonal
```

Check if the color and/or helicity part has the ghost property.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_is_color_ghost
    public :: quantum_numbers_is_helicity_ghost
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_is_color_ghost (qn) result (ghost)
      logical :: ghost
      type(quantum_numbers_t), intent(in) :: qn
      ghost = color_is_ghost (qn%c)
    end function quantum_numbers_is_color_ghost

    elemental function quantum_numbers_is_helicity_ghost (qn) result (ghost)
      logical :: ghost
      type(quantum_numbers_t), intent(in) :: qn
      ghost = helicity_is_ghost (qn%h)
    end function quantum_numbers_is_helicity_ghost
```

7.4.5 Comparisons

Matching and equality is derived from the individual quantum numbers. The variant `fhmatch` matches only flavor and helicity. The variant `dhmatch` matches only diagonal helicity, if the matching helicity is undefined.

⟨*Quantum numbers: public*⟩+≡
```
    public :: operator(.match.)
    public :: operator(.fmatch.)
    public :: operator(.fhmatch.)
    public :: operator(.dhmatch.)
    public :: operator(==)
    public :: operator(/=)
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface operator(.match.)
       module procedure quantum_numbers_match
    end interface
    interface operator(.fmatch.)
       module procedure quantum_numbers_match_f
    end interface
    interface operator(.fhmatch.)
       module procedure quantum_numbers_match_fh
    end interface
```

```
      interface operator(.dhmatch.)
         module procedure quantum_numbers_match_hel_diag
      end interface
      interface operator(==)
         module procedure quantum_numbers_eq
      end interface
      interface operator(/=)
         module procedure quantum_numbers_neq
      end interface
```

⟨*Quantum numbers: procedures*⟩+≡

```
      elemental function quantum_numbers_match (qn1, qn2) result (match)
        logical :: match
        type(quantum_numbers_t), intent(in) :: qn1, qn2
        match = (qn1%f .match. qn2%f) .and. &
              (qn1%c .match. qn2%c) .and. &
              (qn1%h .match. qn2%h)
      end function quantum_numbers_match

      elemental function quantum_numbers_match_f (qn1, qn2) result (match)
        logical :: match
        type(quantum_numbers_t), intent(in) :: qn1, qn2
        match = (qn1%f .match. qn2%f)
      end function quantum_numbers_match_f

      elemental function quantum_numbers_match_fh (qn1, qn2) result (match)
        logical :: match
        type(quantum_numbers_t), intent(in) :: qn1, qn2
        match = (qn1%f .match. qn2%f) .and. &
              (qn1%h .match. qn2%h)
      end function quantum_numbers_match_fh

      elemental function quantum_numbers_match_hel_diag (qn1, qn2) result (match)
        logical :: match
        type(quantum_numbers_t), intent(in) :: qn1, qn2
        match = (qn1%f .match. qn2%f) .and. &
              (qn1%c .match. qn2%c) .and. &
              (qn1%h .dmatch. qn2%h)
      end function quantum_numbers_match_hel_diag

      elemental function quantum_numbers_eq (qn1, qn2) result (eq)
        logical :: eq
        type(quantum_numbers_t), intent(in) :: qn1, qn2
        eq = (qn1%f == qn2%f) .and. &
              (qn1%c == qn2%c) .and. &
              (qn1%h == qn2%h)
      end function quantum_numbers_eq

      elemental function quantum_numbers_neq (qn1, qn2) result (neq)
        logical :: neq
        type(quantum_numbers_t), intent(in) :: qn1, qn2
        neq = (qn1%f /= qn2%f) .or. &
              (qn1%c /= qn2%c) .or. &
              (qn1%h /= qn2%h)
      end function quantum_numbers_neq
```

Two sets of quantum numbers are compatible if the individual quantum numbers are compatible, depending on the mask. Flavor has to match, regardless of the flavor mask.

If the color flag is set, color is compatible if the ghost property is identical. If the color flag is unset, color has to be identical. I.e., if the flag is set, the color amplitudes can interfere. If it is not set, they must be identical, and there must be no ghost. The latter property is used for expanding physical color flows.

Helicity is compatible if the mask is unset, otherwise it has to match. This determines if two amplitudes can be multiplied (no mask) or traced (mask).

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_are_compatible
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_are_compatible (qn1, qn2, mask) &
       result (flag)
      logical :: flag
      type(quantum_numbers_t), intent(in) :: qn1, qn2
      type(quantum_numbers_mask_t), intent(in) :: mask
      if (mask%h .or. mask%hd) then
         flag = (qn1%f .match. qn2%f) .and. (qn1%h .match. qn2%h)
      else
         flag = (qn1%f .match. qn2%f)
      end if
      if (mask%c) then
         flag = flag .and. (color_is_ghost (qn1%c) .eqv. color_is_ghost (qn2%c))
      else
         flag = flag .and. &
              .not. (color_is_ghost (qn1%c) .or. color_is_ghost (qn2%c)) .and. &
              (qn1%c == qn2%c)
      end if
    end function quantum_numbers_are_compatible
```

This is the analog for a single quantum-number set. We just check for color ghosts; they are excluded if the color mask is unset (color-flow expansion).

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_are_physical
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_are_physical (qn, mask) result (flag)
      logical :: flag
      type(quantum_numbers_t), intent(in) :: qn
      type(quantum_numbers_mask_t), intent(in) :: mask
      if (mask%c) then
         flag = .true.
      else
         flag = .not. color_is_ghost (qn%c)
      end if
    end function quantum_numbers_are_physical
```

7.4.6 Operations

Inherited from the color component: reassign color indices in canonical order.

⟨*Quantum numbers: public*⟩+≡
```
public :: quantum_numbers_canonicalize_color
```

⟨*Quantum numbers: procedures*⟩+≡
```
subroutine quantum_numbers_canonicalize_color (qn)
  type(quantum_numbers_t), dimension(:), intent(inout) :: qn
  call color_canonicalize (qn%c)
end subroutine quantum_numbers_canonicalize_color
```

Inherited from the color component: make a color map for two matching quantum-number arrays.

⟨*Quantum numbers: public*⟩+≡
```
public :: quantum_numbers_set_color_map
```

⟨*Quantum numbers: procedures*⟩+≡
```
subroutine quantum_numbers_set_color_map (map, qn1, qn2)
  integer, dimension(:,:), intent(out), allocatable :: map
  type(quantum_numbers_t), dimension(:), intent(in) :: qn1, qn2
  call set_color_map (map, qn1%c, qn2%c)
end subroutine quantum_numbers_set_color_map
```

Inherited from the color component: translate the color part using a color-map array

⟨*Quantum numbers: public*⟩+≡
```
public :: quantum_numbers_translate_color
```

⟨*Quantum numbers: interfaces*⟩+≡
```
interface quantum_numbers_translate_color
   module procedure quantum_numbers_translate_color0
   module procedure quantum_numbers_translate_color1
end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
subroutine quantum_numbers_translate_color0 (qn, map, offset)
  type(quantum_numbers_t), intent(inout) :: qn
  integer, dimension(:,:), intent(in) :: map
  integer, intent(in), optional :: offset
  call color_translate (qn%c, map, offset)
end subroutine quantum_numbers_translate_color0

subroutine quantum_numbers_translate_color1 (qn, map, offset)
  type(quantum_numbers_t), dimension(:), intent(inout) :: qn
  integer, dimension(:,:), intent(in) :: map
  integer, intent(in), optional :: offset
  call color_translate (qn%c, map, offset)
end subroutine quantum_numbers_translate_color1
```

Inherited from the color component: return the color index with highest absolute value

⟨*Quantum numbers: public*⟩+≡
```
public :: quantum_numbers_get_max_color_value
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface quantum_numbers_get_max_color_value
       module procedure quantum_numbers_get_max_color_value0
       module procedure quantum_numbers_get_max_color_value1
       module procedure quantum_numbers_get_max_color_value2
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    function quantum_numbers_get_max_color_value0 (qn) result (cmax)
      integer :: cmax
      type(quantum_numbers_t), intent(in) :: qn
      cmax = color_get_max_value (qn%c)
    end function quantum_numbers_get_max_color_value0

    function quantum_numbers_get_max_color_value1 (qn) result (cmax)
      integer :: cmax
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
      cmax = color_get_max_value (qn%c)
    end function quantum_numbers_get_max_color_value1

    function quantum_numbers_get_max_color_value2 (qn) result (cmax)
      integer :: cmax
      type(quantum_numbers_t), dimension(:,:), intent(in) :: qn
      cmax = color_get_max_value (qn%c)
    end function quantum_numbers_get_max_color_value2
```

Inherited from the color component: add an offset to the indices of the color
part

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_add_color_offset
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental subroutine quantum_numbers_add_color_offset (qn, offset)
      type(quantum_numbers_t), intent(inout) :: qn
      integer, intent(in) :: offset
      call color_add_offset (qn%c, offset)
    end subroutine quantum_numbers_add_color_offset
```

Given a quantum number array, return all possible color contractions, leaving
the other quantum numbers intact.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_number_array_make_color_contractions
```

⟨*Quantum numbers: procedures*⟩+≡
```
    subroutine quantum_number_array_make_color_contractions (qn_in, qn_out)
      type(quantum_numbers_t), dimension(:), intent(in) :: qn_in
      type(quantum_numbers_t), dimension(:,:), intent(out), allocatable :: qn_out
      type(color_t), dimension(:,:), allocatable :: col
      integer :: i
      call color_array_make_contractions (qn_in%c, col)
      allocate (qn_out (size (col, 1), size (col, 2)))
      do i = 1, size (qn_out, 2)
         qn_out(:,i)%f = qn_in%f
```

```
        qn_out(:,i)%c = col(:,i)
        qn_out(:,i)%h = qn_in%h
      end do
    end subroutine quantum_number_array_make_color_contractions
```

Inherited from the color component: invert the color, switching particle/antiparticle.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_invert_color
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental subroutine quantum_numbers_invert_color (qn)
      type(quantum_numbers_t), intent(inout) :: qn
      call color_invert (qn%c)
    end subroutine quantum_numbers_invert_color
```

Merge two quantum number sets: for each entry, if both are defined, combine them to an off-diagonal entry (meaningful only if the input was diagonal). If either entry is undefined, take the defined one.

For flavor, off-diagonal entries are invalid, so both flavors must be equal, otherwise an invalid flavor is inserted.

⟨*Quantum numbers: public*⟩+≡
```
    public :: operator(.merge.)
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface operator(.merge.)
       module procedure merge_quantum_numbers0
       module procedure merge_quantum_numbers1
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    function merge_quantum_numbers0 (qn1, qn2) result (qn3)
      type(quantum_numbers_t) :: qn3
      type(quantum_numbers_t), intent(in) :: qn1, qn2
      qn3%f = qn1%f .merge. qn2%f
      qn3%c = qn1%c .merge. qn2%c
      qn3%h = qn1%h .merge. qn2%h
    end function merge_quantum_numbers0

    function merge_quantum_numbers1 (qn1, qn2) result (qn3)
      type(quantum_numbers_t), dimension(:), intent(in) :: qn1, qn2
      type(quantum_numbers_t), dimension(size(qn1)) :: qn3
      qn3%f = qn1%f .merge. qn2%f
      qn3%c = qn1%c .merge. qn2%c
      qn3%h = qn1%h .merge. qn2%h
    end function merge_quantum_numbers1
```

7.4.7 The quantum number mask

The quantum numbers mask is true for quantum numbers that should be ignored or summed over. The three mandatory entries correspond to flavor, color, and helicity, respectively.

743

There is an additional entry `cg`: If false, the color-ghosts property should be kept even if color is ignored. This is relevant only if `c` is set, otherwise it is always false.

The flag `hd` tells that only diagonal entries in helicity should be kept. If `h` is set, `hd` is irrelevant and will be kept `.false.`

⟨*Quantum numbers: public*⟩+≡
```
public :: quantum_numbers_mask_t
```

⟨*Quantum numbers: types*⟩+≡
```
type :: quantum_numbers_mask_t
  private
  logical :: f = .false.
  logical :: c = .false.
  logical :: cg = .false.
  logical :: h = .false.
  logical :: hd = .false.
end type quantum_numbers_mask_t
```

Define a quantum number mask: Constructor form

⟨*Quantum numbers: public*⟩+≡
```
public :: new_quantum_numbers_mask
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental function new_quantum_numbers_mask &
    (mask_f, mask_c, mask_h, mask_cg, mask_hd) result (mask)
  type(quantum_numbers_mask_t) :: mask
  logical, intent(in) :: mask_f, mask_c, mask_h
  logical, intent(in), optional :: mask_cg
  logical, intent(in), optional :: mask_hd
  call quantum_numbers_mask_init &
      (mask, mask_f, mask_c, mask_h, mask_cg, mask_hd)
end function new_quantum_numbers_mask
```

Define quantum numbers: Initializer form

⟨*Quantum numbers: public*⟩+≡
```
public :: quantum_numbers_mask_init
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental subroutine quantum_numbers_mask_init &
    (mask, mask_f, mask_c, mask_h, mask_cg, mask_hd)
  type(quantum_numbers_mask_t), intent(out) :: mask
  logical, intent(in) :: mask_f, mask_c, mask_h
  logical, intent(in), optional :: mask_cg, mask_hd
  mask%f = mask_f
  mask%c = mask_c
  mask%h = mask_h
  if (present (mask_cg)) then
     if (mask%c)  mask%cg = mask_cg
  else
     mask%cg = mask_c
  end if
  if (present (mask_hd)) then
     if (.not. mask%h)  mask%hd = mask_hd
  end if
```

```
      end subroutine quantum_numbers_mask_init
```

Write a quantum numbers mask

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_mask_write
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface quantum_numbers_mask_write
       module procedure quantum_numbers_mask_write_single
       module procedure quantum_numbers_mask_write_array
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    subroutine quantum_numbers_mask_write_single (mask, unit)
      type(quantum_numbers_mask_t), intent(in) :: mask
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      write (u, "(A)", advance="no") "["
      write (u, "(L1)", advance="no")  mask%f
      write (u, "(L1)", advance="no")  mask%c
      if (.not.mask%cg)  write (u, "('g')", advance="no")
      write (u, "(L1)", advance="no")  mask%h
      if (mask%hd)  write (u, "('d')", advance="no")
      write (u, "(A)", advance="no") "]"
    end subroutine quantum_numbers_mask_write_single

    subroutine quantum_numbers_mask_write_array (mask, unit)
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
      integer, intent(in), optional :: unit
      integer :: u, i
      u = output_unit (unit);  if (u < 0)  return
      write (u, "(A)", advance="no") "["
      do i = 1, size (mask)
         if (i > 1)  write (u, "(A)", advance="no")  "/"
         write (u, "(L1)", advance="no")  mask(i)%f
         write (u, "(L1)", advance="no")  mask(i)%c
         if (.not.mask(i)%cg)  write (u, "('g')", advance="no")
         write (u, "(L1)", advance="no")  mask(i)%h
         if (mask(i)%hd)  write (u, "('d')", advance="no")
      end do
      write (u, "(A)", advance="no") "]"
    end subroutine quantum_numbers_mask_write_array
```

7.4.8   Setting mask components

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_mask_set_flavor
    public :: quantum_numbers_mask_set_color
    public :: quantum_numbers_mask_set_helicity
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental subroutine quantum_numbers_mask_set_flavor (mask, mask_f)
      type(quantum_numbers_mask_t), intent(inout) :: mask
```

```
    logical, intent(in) :: mask_f
    mask%f = mask_f
  end subroutine quantum_numbers_mask_set_flavor

  elemental subroutine quantum_numbers_mask_set_color (mask, mask_c, mask_cg)
    type(quantum_numbers_mask_t), intent(inout) :: mask
    logical, intent(in) :: mask_c
    logical, intent(in), optional :: mask_cg
    mask%c = mask_c
    if (present (mask_cg)) then
       if (mask%c)  mask%cg = mask_cg
    else
       mask%cg = mask_c
    end if
  end subroutine quantum_numbers_mask_set_color

  elemental subroutine quantum_numbers_mask_set_helicity (mask, mask_h, mask_hd)
    type(quantum_numbers_mask_t), intent(inout) :: mask
    logical, intent(in) :: mask_h
    logical, intent(in), optional :: mask_hd
    mask%h = mask_h
    if (present (mask_hd)) then
       if (.not. mask%h)  mask%hd = mask_hd
    end if
  end subroutine quantum_numbers_mask_set_helicity
```

The following routines assign part of a mask, depending on the flags given.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_mask_assign
```

⟨*Quantum numbers: procedures*⟩+≡
```
  elemental subroutine quantum_numbers_mask_assign &
       (mask, mask_in, flavor, color, helicity)
    type(quantum_numbers_mask_t), intent(inout) :: mask
    type(quantum_numbers_mask_t), intent(in) :: mask_in
    logical, intent(in), optional :: flavor, color, helicity
    if (present (flavor)) then
       if (flavor) then
          mask%f = mask_in%f
       end if
    end if
    if (present (color)) then
       if (color) then
          mask%c = mask_in%c
          mask%cg = mask_in%cg
       end if
    end if
    if (present (helicity)) then
       if (helicity) then
          mask%h = mask_in%h
          mask%hd = mask_in%hd
       end if
    end if
  end subroutine quantum_numbers_mask_assign
```

746

7.4.9 Mask predicates

Return true if either one of the entries is set:

⟨*Quantum numbers: public*⟩+≡
```
    public :: any
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface any
       module procedure quantum_numbers_mask_any
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    function quantum_numbers_mask_any (mask) result (match)
      logical :: match
      type(quantum_numbers_mask_t), intent(in) :: mask
      match = mask%f .or. mask%c .or. mask%h .or. mask%hd
    end function quantum_numbers_mask_any
```

7.4.10 Operators

The OR operation is applied to all components.

⟨*Quantum numbers: public*⟩+≡
```
    public :: operator(.or.)
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface operator(.or.)
       module procedure quantum_numbers_mask_or
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_mask_or (mask1, mask2) result (mask)
       type(quantum_numbers_mask_t) :: mask
       type(quantum_numbers_mask_t), intent(in) :: mask1, mask2
       mask%f = mask1%f .or. mask2%f
       mask%c = mask1%c .or. mask2%c
       if (mask%c)  mask%cg = mask1%cg .or. mask2%cg
       mask%h = mask1%h .or. mask2%h
       if (.not. mask%h)  mask%hd = mask1%hd .or. mask2%hd
     end function quantum_numbers_mask_or
```

7.4.11 Mask comparisons

Return true if the two masks are equivalent / differ:

⟨*Quantum numbers: public*⟩+≡
```
    public :: operator(.eqv.)
    public :: operator(.neqv.)
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface operator(.eqv.)
       module procedure quantum_numbers_mask_eqv
    end interface
    interface operator(.neqv.)
       module procedure quantum_numbers_mask_neqv
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_mask_eqv (mask1, mask2) result (eqv)
      logical :: eqv
      type(quantum_numbers_mask_t), intent(in) :: mask1, mask2
      eqv = (mask1%f .eqv. mask2%f) .and. &
            (mask1%c .eqv. mask2%c) .and. &
            (mask1%cg .eqv. mask2%cg) .and. &
            (mask1%h .eqv. mask2%h) .and. &
            (mask1%hd .eqv. mask2%hd)
    end function quantum_numbers_mask_eqv

    elemental function quantum_numbers_mask_neqv (mask1, mask2) result (neqv)
      logical :: neqv
      type(quantum_numbers_mask_t), intent(in) :: mask1, mask2
      neqv = (mask1%f .neqv. mask2%f) .or. &
            (mask1%c .neqv. mask2%c) .or. &
            (mask1%cg .neqv. mask2%cg) .or. &
            (mask1%h .neqv. mask2%h) .or. &
            (mask1%hd .neqv. mask2%hd)
    end function quantum_numbers_mask_neqv
```

7.4.12 Apply a mask

Applying a mask to the quantum number object means undefining those entries
where the mask is set. The others remain unaffected.

The `hd` mask has the special property that it "diagonalizes" helicity, i.e., the
second helicity entry is dropped and the result is a diagonal helicity quantum
number.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_undefine
    public :: quantum_numbers_undefined
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface quantum_numbers_undefined
       module procedure quantum_numbers_undefined0
       module procedure quantum_numbers_undefined1
       module procedure quantum_numbers_undefined11
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental subroutine quantum_numbers_undefine (qn, mask)
      type(quantum_numbers_t), intent(inout) :: qn
      type(quantum_numbers_mask_t), intent(in) :: mask
      if (mask%f)  call flavor_undefine (qn%f)
      if (mask%c)  call color_undefine (qn%c, undefine_ghost=mask%cg)
```

```
      if (mask%h) then
         call helicity_undefine (qn%h)
      else if (mask%hd) then
         if (.not. helicity_is_diagonal (qn%h)) then
            call helicity_diagonalize (qn%h)
         end if
      end if
   end subroutine quantum_numbers_undefine

   function quantum_numbers_undefined0 (qn, mask) result (qn_new)
      type(quantum_numbers_t), intent(in) :: qn
      type(quantum_numbers_mask_t), intent(in) :: mask
      type(quantum_numbers_t) :: qn_new
      qn_new = qn
      call quantum_numbers_undefine (qn_new, mask)
   end function quantum_numbers_undefined0

   function quantum_numbers_undefined1 (qn, mask) result (qn_new)
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
      type(quantum_numbers_mask_t), intent(in) :: mask
      type(quantum_numbers_t), dimension(size(qn)) :: qn_new
      qn_new = qn
      call quantum_numbers_undefine (qn_new, mask)
   end function quantum_numbers_undefined1

   function quantum_numbers_undefined11 (qn, mask) result (qn_new)
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
      type(quantum_numbers_t), dimension(size(qn)) :: qn_new
      qn_new = qn
      call quantum_numbers_undefine (qn_new, mask)
   end function quantum_numbers_undefined11
```

Return true if the input quantum number set has entries that would be removed by the applied mask, e.g., if polarization is defined but `mask%h` is set:

⟨*Quantum numbers: public*⟩+≡
```
   public :: quantum_numbers_are_redundant
```

⟨*Quantum numbers: procedures*⟩+≡
```
   elemental function quantum_numbers_are_redundant (qn, mask) &
        result (redundant)
      logical :: redundant
      type(quantum_numbers_t), intent(in) :: qn
      type(quantum_numbers_mask_t), intent(in) :: mask
      redundant = .false.
      if (mask%f) then
         redundant = flavor_is_defined (qn%f)
      end if
      if (mask%c) then
         redundant = color_is_defined (qn%c)
      end if
      if (mask%h) then
         redundant = helicity_is_defined (qn%h)
      else if (mask%hd) then
```

```
        redundant = .not. helicity_is_diagonal (qn%h)
      end if
    end function quantum_numbers_are_redundant
```

Return true if the helicity flag is set or the diagonal-helicity flag is set.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_mask_diagonal_helicity
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_mask_diagonal_helicity (mask) &
        result (flag)
      logical :: flag
      type(quantum_numbers_mask_t), intent(in) :: mask
      flag = mask%h .or. mask%hd
    end function quantum_numbers_mask_diagonal_helicity
```

7.5 State matrices

This module deals with the internal state of a particle system, i.e., with its density matrix in flavor, color, and helicity space.

7.5.1 Nodes of the quantum state trie

A quantum state object represents an unnormalized density matrix, i.e., an array of possibilities for flavor, color, and helicity indices with associated complex values. Physically, the trace of this matrix is the summed squared matrix element for an interaction, and the matrix elements divided by this value correspond to the flavor-color-helicity density matrix. (Flavor and color are diagonal.)

We store density matrices as tries, that is, as trees where each branching represents the possible quantum numbers of a particle. The first branching is the first particle in the system. A leaf (the node corresponding to the last particle) contains the value of the matrix element.

Each node contains a flavor, color, and helicity entry. Note that each of those entries may be actually undefined, so we can also represent, e.g., unpolarized particles.

The value is meaningful only for leaves, which have no child nodes. There is a pointer to the parent node which allows for following the trie downwards from a leaf, it is null for a root node. The child nodes are implemented as a list, so there is a pointer to the first and last child, and each node also has a `next` pointer to the next sibling.

The root node does not correspond to a particle, only its children do. The quantum numbers of the root node are irrelevant and will not be set. However, we use a common type for the three classes (root, branch, leaf); they may easily be distinguished by the association status of parent and child.

Node type

The node is linked in all directions: the parent, the first and last in the list of children, and the previous and next sibling. This allows us for adding and removing nodes and whole branches anywhere in the trie. (Circular links are not allowed, however.). The node holds its associated set of quantum numbers. The integer index, which is set only for leaf nodes, is the index of the corresponding matrix element value within the state matrix.

Temporarily, matrix-element values may be stored within a leaf node. This is used during state-matrix factorization. When the state matrix is `freeze`d, these values are transferred to the matrix-element array within the host state matrix.

⟨*State matrices: types*⟩≡

```
type :: node_t
   private
   type(quantum_numbers_t) :: qn
   type(node_t), pointer :: parent => null ()
   type(node_t), pointer :: child_first => null ()
   type(node_t), pointer :: child_last => null ()
   type(node_t), pointer :: next => null ()
   type(node_t), pointer :: previous => null ()
   integer :: me_index = 0
   integer, dimension(:), allocatable :: me_count
   complex(default) :: me = 0
end type node_t
```

Operations on nodes

Recursively deallocate all children of the current node. This includes any values associated with the children.

⟨*State matrices: procedures*⟩≡

```
pure recursive subroutine node_delete_offspring (node)
   type(node_t), pointer :: node
   type(node_t), pointer :: child
   child => node%child_first
   do while (associated (child))
      node%child_first => node%child_first%next
      call node_delete_offspring (child)
      deallocate (child)
      child => node%child_first
   end do
```

```
      node%child_last => null ()
   end subroutine node_delete_offspring
```

Remove a node including its offspring. Adjust the pointers of parent and siblings, if necessary.

⟨*State matrices: procedures*⟩+≡
```
   pure subroutine node_delete (node)
     type(node_t), pointer :: node
     call node_delete_offspring (node)
     if (associated (node%previous)) then
        node%previous%next => node%next
     else if (associated (node%parent)) then
        node%parent%child_first => node%next
     end if
     if (associated (node%next)) then
        node%next%previous => node%previous
     else if (associated (node%parent)) then
        node%parent%child_last => node%previous
     end if
     deallocate (node)
   end subroutine node_delete
```

Append a child node

⟨*State matrices: procedures*⟩+≡
```
   subroutine node_append_child (node, child)
     type(node_t), target, intent(inout) :: node
     type(node_t), pointer :: child
     allocate (child)
     if (associated (node%child_last)) then
        node%child_last%next => child
        child%previous => node%child_last
     else
        node%child_first => child
     end if
     node%child_last => child
     child%parent => node
   end subroutine node_append_child
```

I/O

Output of a single node, no recursion. We print the quantum numbers in square brackets, then the value (if any).

⟨*State matrices: procedures*⟩+≡
```
   subroutine node_write (node, me_array, verbose, unit, testflag)
     type(node_t), intent(in) :: node
     complex(default), dimension(:), intent(in), optional :: me_array
     logical, intent(in), optional :: verbose, testflag
     integer, intent(in), optional :: unit
     logical :: verb
     integer :: u
     character(len=7) :: fmt
```

```
        call pac_fmt (fmt, FMT_19, FMT_17, testflag)
        verb = .false.;  if (present (verbose)) verb = verbose
        u = output_unit (unit);  if (u < 0)  return
        call quantum_numbers_write (node%qn, u)
        if (node%me_index /= 0) then
            write (u, "(A,I0,A)", advance="no")  " => ME(", node%me_index, ")"
            if (present (me_array)) then
                write (u, "(A)", advance="no")  " = "
                write (u, "('(',"  // fmt // "',',"  // fmt // "',')')", &
                    advance="no") pacify_complex (me_array(node%me_index))
            end if
        end if
        write (u, *)
        if (verb) then
            call ptr_write ("parent     ", node%parent)
            call ptr_write ("child_first", node%child_first)
            call ptr_write ("child_last ", node%child_last)
            call ptr_write ("next       ", node%next)
            call ptr_write ("previous   ", node%previous)
        end if
    contains
      subroutine ptr_write (label, node)
        character(*), intent(in) :: label
        type(node_t), pointer :: node
        if (associated (node)) then
            write (u, "(10x,A,1x,'->',1x)", advance="no") label
            call quantum_numbers_write (node%qn, u)
            write (u, *)
        end if
      end subroutine ptr_write
    end subroutine node_write
```

Recursive output of a node:

⟨*State matrices: procedures*⟩+≡

```
    recursive subroutine node_write_rec (node, me_array, verbose, &
          indent, unit, testflag)
      type(node_t), intent(in), target :: node
      complex(default), dimension(:), intent(in), optional :: me_array
      logical, intent(in), optional :: verbose, testflag
      integer, intent(in), optional :: indent
      integer, intent(in), optional :: unit
      type(node_t), pointer :: current
      logical :: verb
      integer :: i, u
      verb = .false.;  if (present (verbose))  verb = verbose
      i = 0;  if (present (indent)) i = indent
      u = output_unit (unit);  if (u < 0)  return
      current => node%child_first
      do while (associated (current))
          write (u, "(A)", advance="no")  repeat (" ", i)
          call node_write (current, me_array, verbose=verb, &
            unit=u, testflag=testflag)
          call node_write_rec (current, me_array, verbose=verb, &
            indent=i+2, unit=u, testflag = testflag)
```

```
          current => current%next
       end do
    end subroutine node_write_rec
```

Binary I/O. Matrix elements are written only for leaf nodes.

⟨*State matrices: procedures*⟩+≡

```
    recursive subroutine node_write_raw_rec (node, u)

         do while (associated (child))
            child%previous => node%child_last
            node%child_last => child
            child => child%next
         end do
      else
         read (u, iostat=iostat)  node%me_index
         read (u, iostat=iostat)  node%me
      end if
      if (associated_next) then
         allocate (node%next)
         call node_read_raw_rec (node%next, u, parent, iostat=iostat)
```

```
      end if
    end subroutine node_read_raw_rec
```

7.5.2 State matrix

Definition

The quantum state object is a container that keeps and hides the root node.
For direct accessibility of values, they are stored in a separate array. The leaf
nodes of the quantum-number tree point to those values, once the state matrix
is finalized.

The `norm` component is redefined if a common factor is extracted from all
nodes.

⟨*State matrices: public*⟩≡
```
    public :: state_matrix_t
```

⟨*State matrices: types*⟩+≡
```
    type :: state_matrix_t
      private
      type(node_t), pointer :: root => null ()
      integer :: depth = 0
      integer :: n_matrix_elements = 0
      logical :: leaf_nodes_store_values = .false.
      integer :: n_counters = 0
      complex(default), dimension(:), allocatable :: me
      real(default) :: norm = 1
    end type state_matrix_t
```

This initializer allocates the root node but does not fill anything. We declare
whether values are stored within the nodes during state-matrix construction,
and how many counters should be maintained (default: none).

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_init
```

⟨*State matrices: procedures*⟩+≡
```
    elemental subroutine state_matrix_init (state, store_values, n_counters)
      type(state_matrix_t), intent(out) :: state
      logical, intent(in), optional :: store_values
      integer, intent(in), optional :: n_counters
      allocate (state%root)
      if (present (store_values)) &
         state%leaf_nodes_store_values = store_values
      if (present (n_counters)) state%n_counters = n_counters
    end subroutine state_matrix_init
```

This recursively deletes all children of the root node, restoring the initial state.
The matrix element array is not finalized, since it does not contain physical
entries, just pointers.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_final
```

⟨*State matrices: procedures*⟩+≡
```
    elemental subroutine state_matrix_final (state)
      type(state_matrix_t), intent(inout) :: state
      if (allocated (state%me))  deallocate (state%me)
      if (associated (state%root))  call node_delete (state%root)
      state%depth = 0
      state%n_matrix_elements = 0
    end subroutine state_matrix_final
```

Output: Present the tree as a nested list with appropriate indentation.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_write
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_write (state, unit, write_value_list, &
         verbose, testflag)
      type(state_matrix_t), intent(in) :: state
      logical, intent(in), optional :: write_value_list, verbose, testflag
      integer, intent(in), optional :: unit
      complex(default) :: me_dum
      character(len=7) :: fmt
      integer :: u
      integer :: i
      call pac_fmt (fmt, FMT_19, FMT_17, testflag)
      u = output_unit (unit);  if (u < 0)  return
      write (u, "(1x,A," // fmt // ")") "State matrix:  norm = ", state%norm
      if (associated (state%root)) then
         if (allocated (state%me)) then
            call node_write_rec (state%root, state%me, verbose=verbose, &
               indent=1, unit=u, testflag=testflag)
         else
            call node_write_rec (state%root, verbose=verbose, indent=1, &
               unit=u, testflag=testflag)
         end if
      end if
      if (present (write_value_list)) then
         if (write_value_list .and. allocated (state%me)) then

                  me_dum = &
                       cmplx (real(me_dum), 0._default, kind=default)
               end if
               write (u, "('('," // fmt // ",',','," // fmt // &
                  ",')')")  me_dum
            end do
         end if
      end if
    end subroutine state_matrix_write
```

Binary I/O. The auxiliary matrix-element array is not written, but reconstructed after reading the tree.

Note: To be checked. Might be broken, don't use (unless trivial).

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_write_raw
    public :: state_matrix_read_raw
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_write_raw (state, u)
      type(state_matrix_t), intent(in) :: state
      integer, intent(in) :: u
      logical :: associated_root
      associated_root = associated (state%root)
      write (u) associated_root
      if (associated_root) then
         write (u) state%depth
         write (u) state%norm
         call node_write_raw_rec (state%root, u)
      end if
    end subroutine state_matrix_write_raw

    subroutine state_matrix_read_raw (state, u, iostat)

         call state_matrix_freeze (state)
      end if
    end subroutine state_matrix_read_raw
```

Properties of the quantum state

A state is defined if its root is allocated:

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_is_defined
```

⟨*State matrices: procedures*⟩+≡
```
    elemental function state_matrix_is_defined (state) result (defined)
      logical :: defined
      type(state_matrix_t), intent(in) :: state
      defined = associated (state%root)
    end function state_matrix_is_defined
```

A state is empty if its depth is zero:

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_is_empty
```

⟨*State matrices: procedures*⟩+≡
```
    elemental function state_matrix_is_empty (state) result (flag)
      logical :: flag
      type(state_matrix_t), intent(in) :: state
      flag = state%depth == 0
    end function state_matrix_is_empty
```

Return the number of matrix-element values.
⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_get_n_matrix_elements
```

⟨*State matrices: procedures*⟩+≡
```
    function state_matrix_get_n_matrix_elements (state) result (n)
      integer :: n
      type(state_matrix_t), intent(in) :: state
      n = state%n_matrix_elements
    end function state_matrix_get_n_matrix_elements
```

Return the number of leaves. This can be larger than the number of independent matrix elements.
⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_get_n_leaves
```

⟨*State matrices: procedures*⟩+≡
```
    function state_matrix_get_n_leaves (state) result (n)
      integer :: n
      type(state_matrix_t), intent(in) :: state
      type(state_iterator_t) :: it
      n = 0
      call state_iterator_init (it, state)
      do while (state_iterator_is_valid (it))
         n = n + 1
         call state_iterator_advance (it)
      end do
    end function state_matrix_get_n_leaves
```

Return the depth:
⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_get_depth
```

⟨*State matrices: procedures*⟩+≡
```
    function state_matrix_get_depth (state) result (depth)
      integer :: depth
      type(state_matrix_t), intent(in) :: state
      depth = state%depth
    end function state_matrix_get_depth
```

Return the norm:
⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_get_norm
```

⟨*State matrices: procedures*⟩+≡
```
    function state_matrix_get_norm (state) result (norm)
      real(default) :: norm
      type(state_matrix_t), intent(in) :: state
      norm = state%norm
    end function state_matrix_get_norm
```

Retrieving contents

Return the quantum number array, using an index. We have to scan the state
matrix since there is no shortcut.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_get_quantum_numbers
```

⟨*State matrices: procedures*⟩+≡
```
    function state_matrix_get_quantum_numbers (state, i) result (qn)
      type(state_matrix_t), intent(in), target :: state
      integer, intent(in) :: i
      type(quantum_numbers_t), dimension(state%depth) :: qn
      type(state_iterator_t) :: it
      integer :: k
      k = 0
      call state_iterator_init (it, state)
      do while (state_iterator_is_valid (it))
         k = k + 1
         if (k == i) then
            qn = state_iterator_get_quantum_numbers (it)
            return
         end if
         call state_iterator_advance (it)
      end do
    end function state_matrix_get_quantum_numbers
```

Return a single matrix element using its index. Works only if the shortcut array
is allocated.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_get_matrix_element
```

⟨*State matrices: procedures*⟩+≡
```
    function state_matrix_get_matrix_element (state, i) result (me)
      complex(default) :: me
      type(state_matrix_t), intent(in) :: state
      integer, intent(in) :: i
      if (allocated (state%me)) then
         me = state%me(i)
      else
         me = 0
      end if
    end function state_matrix_get_matrix_element
```

Return the color index with maximum absolute value that is present within the state matrix.

⟨*State matrices: public*⟩+≡
```
public :: state_matrix_get_max_color_value
```

⟨*State matrices: procedures*⟩+≡
```
function state_matrix_get_max_color_value (state) result (cmax)
  integer :: cmax
  type(state_matrix_t), intent(in) :: state
  if (associated (state%root)) then
     cmax = node_get_max_color_value (state%root)
  else
     cmax = 0
  end if
contains
  recursive function node_get_max_color_value (node) result (cmax)
    integer :: cmax
    type(node_t), intent(in), target :: node
    type(node_t), pointer :: current
    cmax = quantum_numbers_get_max_color_value (node%qn)
    current => node%child_first
    do while (associated (current))
       cmax = max (cmax, node_get_max_color_value (current))
       current => current%next
    end do
  end function node_get_max_color_value
end function state_matrix_get_max_color_value
```

Building the quantum state

The procedure generates a branch associated to the input array of quantum numbers. If the branch exists already, it is used.

Optionally, we set the matrix-element index, a value (which may be added to the previous one), and increment one of the possible counters. We may also return the matrix element index of the current node.

⟨*State matrices: public*⟩+≡
```
public :: state_matrix_add_state
```

⟨*State matrices: procedures*⟩+≡
```
subroutine state_matrix_add_state &
     (state, qn, index, value, sum_values, counter_index, me_index)
  type(state_matrix_t), intent(inout) :: state
  type(quantum_numbers_t), dimension(:), intent(in) :: qn
  integer, intent(in), optional :: index
  complex(default), intent(in), optional :: value
  logical, intent(in), optional :: sum_values
  integer, intent(in), optional :: counter_index
  integer, intent(out), optional :: me_index
  logical :: set_index, get_index, add
  set_index = present (index)
  get_index = present (me_index)
  add = .false.;  if (present (sum_values))  add = sum_values
  if (state%depth == 0) then
```

```fortran
        state%depth = size (qn)
     else if (state%depth /= size (qn)) then
        call state_matrix_write (state)
        call msg_bug ("State matrix: depth mismatch")
     end if
     if (size (qn) > 0)  call node_make_branch (state%root, qn)
  contains
     recursive subroutine node_make_branch (parent, qn)
        type(node_t), pointer :: parent
        type(quantum_numbers_t), dimension(:), intent(in) :: qn
        type(node_t), pointer :: child
        logical :: match
        match = .false.

           child%qn = qn(1)
        end if
        select case (size (qn))
        case (1)
           if (.not. match) then
              state%n_matrix_elements = state%n_matrix_elements + 1
              child%me_index = state%n_matrix_elements
           end if
           if (set_index) then
              child%me_index = index
           end if
           if (get_index) then
              me_index = child%me_index
           end if
           if (present (counter_index)) then
              if (.not. allocated (child%me_count)) then
                 allocate (child%me_count (state%n_counters))
                 child%me_count = 0
              end if
              child%me_count(counter_index) = child%me_count(counter_index) + 1
           end if
           if (present (value)) then
              if (add) then
                 child%me = child%me + value
              else
                 child%me = value
              end if
           end if
        case (2:)
           call node_make_branch (child, qn(2:))
        end select
     end subroutine node_make_branch
  end subroutine state_matrix_add_state
```

Remove irrelevant flavor/color/helicity labels and the corresponding branchings.
The masks indicate which particles are affected; the masks length should co-
incide with the depth of the trie (without the root node). Recursively scan
the whole tree, starting from the leaf nodes and working up to the root node.
If a mask entry is set for the current tree level, scan the children there. For
each child within that level make a new empty branch where the masked quan-
tum number is undefined. Then recursively combine all following children with
matching quantum number into this new node and move on.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_collapse
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_collapse (state, mask)
      type(state_matrix_t), intent(inout) :: state
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
      type(state_matrix_t) :: red_state
      if (state_matrix_is_defined (state)) then
         call state_matrix_reduce (state, mask, red_state)
         call state_matrix_final (state)
         state = red_state
      end if
    end subroutine state_matrix_collapse
```

Transform the given state matrix into a reduced state matrix where some quan-
tum numbers are removed, as indicated by the mask. The procedure creates a
new state matrix, so the old one can be deleted after this if it is no longer used.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_reduce
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_reduce (state, mask, red_state)
      type(state_matrix_t), intent(in), target :: state
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
      type(state_matrix_t), intent(out) :: red_state
      type(state_iterator_t) :: it
      type(quantum_numbers_t), dimension(size(mask)) :: qn
      call state_matrix_init (red_state)
      call state_iterator_init (it, state)
      do while (state_iterator_is_valid (it))
         qn = state_iterator_get_quantum_numbers (it)
         call quantum_numbers_undefine (qn, mask)
         call state_matrix_add_state (red_state, qn)
         call state_iterator_advance (it)
      end do
    end subroutine state_matrix_reduce
```

This subroutine sets up the matrix-element array. The leaf nodes aquire the
index values that point to the appropriate matrix-element entry.

We recursively scan the trie. Once we arrive at a leaf node, the index is
increased and associated to that node. Finally, we allocate the matrix-element
array with the appropriate size.

If matrix element values are temporarily stored within the leaf nodes, we scan the state again and transfer them to the matrix-element array.

⟨*State matrices: public*⟩+≡

```
    public :: state_matrix_freeze
```

⟨*State matrices: interfaces*⟩≡

```
    interface state_matrix_freeze
       module procedure state_matrix_freeze1
       module procedure state_matrix_freeze2
    end interface
```

⟨*State matrices: procedures*⟩+≡

```
    subroutine state_matrix_freeze1 (state)
      type(state_matrix_t), intent(inout), target :: state
      type(state_iterator_t) :: it
      if (associated (state%root)) then
         if (allocated (state%me))  deallocate (state%me)
         allocate (state%me (state%n_matrix_elements))
         state%me = 0
      end if
      if (state%leaf_nodes_store_values) then
         call state_iterator_init (it, state)
         do while (state_iterator_is_valid (it))
            state%me(state_iterator_get_me_index (it)) &
                 = state_iterator_get_matrix_element (it)
            call state_iterator_advance (it)
         end do
         state%leaf_nodes_store_values = .false.
      end if
    end subroutine state_matrix_freeze1

    subroutine state_matrix_freeze2 (state)
      type(state_matrix_t), dimension(:), intent(inout), target :: state
      integer :: i
      do i = 1, size (state)
         call state_matrix_freeze1 (state(i))
      end do
    end subroutine state_matrix_freeze2
```

Direct access to the value array

Several methods for setting a value directly are summarized in this generic:

⟨*State matrices: public*⟩+≡

```
    public :: state_matrix_set_matrix_element
```

⟨*State matrices: interfaces*⟩+≡

```
    interface state_matrix_set_matrix_element
       module procedure state_matrix_set_matrix_element_qn
       module procedure state_matrix_set_matrix_element_all
       module procedure state_matrix_set_matrix_element_array
       module procedure state_matrix_set_matrix_element_single
       module procedure state_matrix_set_matrix_element_clone
    end interface
```

Set a value that corresponds to a quantum number array:

⟨State matrices: procedures⟩+≡

```
subroutine state_matrix_set_matrix_element_qn (state, qn, value)
  type(state_matrix_t), intent(inout) :: state
  type(quantum_numbers_t), dimension(:), intent(in) :: qn
  complex(default), intent(in) :: value
  type(state_iterator_t) :: it
  if (.not. allocated (it%state%me)) then
     allocate (it%state%me (size(qn)))
  end if
  call state_iterator_init (it, state)
  do while (state_iterator_is_valid (it))
     if (all (qn == state_iterator_get_quantum_numbers (it))) then
        call state_iterator_set_matrix_element (it, value)
        return
     end if
     call state_iterator_advance (it)
  end do
end subroutine state_matrix_set_matrix_element_qn
```

Set all matrix elements to a single value

⟨State matrices: procedures⟩+≡

```
subroutine state_matrix_set_matrix_element_all (state, value)
  type(state_matrix_t), intent(inout) :: state
  complex(default), intent(in) :: value
  if (.not. allocated (state%me)) then
     allocate (state%me (state%n_matrix_elements))
  end if
  state%me = value
end subroutine state_matrix_set_matrix_element_all
```

Set the matrix-element array directly.

⟨State matrices: procedures⟩+≡

```
subroutine state_matrix_set_matrix_element_array (state, value)
  type(state_matrix_t), intent(inout) :: state
  complex(default), dimension(:), intent(in) :: value
  if (.not. allocated (state%me)) then
     allocate (state%me (size (value)))
  end if
  state%me = value
end subroutine state_matrix_set_matrix_element_array

pure subroutine state_matrix_set_matrix_element_single (state, i, value)
  type(state_matrix_t), intent(inout) :: state
  integer, intent(in) :: i
  complex(default), intent(in) :: value
  if (.not. allocated (state%me)) then
     allocate (state%me (state%n_matrix_elements))
  end if
  state%me(i) = value
end subroutine state_matrix_set_matrix_element_single
```

Clone the matrix elements from another (matching) state matrix.

⟨State matrices: procedures⟩+≡
```
    subroutine state_matrix_set_matrix_element_clone (state, state1)
      type(state_matrix_t), intent(inout) :: state
      type(state_matrix_t), intent(in) :: state1
      if (.not. allocated (state1%me)) return
      if (.not. allocated (state%me)) allocate (state%me (size (state1%me)))
      state%me = state1%me
    end subroutine state_matrix_set_matrix_element_clone
```

Add a value to a matrix element

⟨State matrices: public⟩+≡
```
    public :: state_matrix_add_to_matrix_element
```

⟨State matrices: procedures⟩+≡
```
    subroutine state_matrix_add_to_matrix_element (state, i, value)
      type(state_matrix_t), intent(inout) :: state
      integer, intent(in) :: i
      complex(default), intent(in) :: value
      state%me(i) = state%me(i) + value
    end subroutine state_matrix_add_to_matrix_element
```

7.5.3 State iterators

Accessing the quantum state from outside is best done using a specialized itera-
tor, i.e., a pointer to a particular branch of the quantum state trie. Technically,
the iterator contains a pointer to a leaf node, but via parent pointers it allows
to access the whole branch where the leaf is attached. For quick access, we also
keep the branch depth (which is assumed to be universal for a quantum state).

⟨State matrices: public⟩+≡
```
    public :: state_iterator_t
```

⟨State matrices: types⟩+≡
```
    type :: state_iterator_t
      private
      integer :: depth = 0
      type(state_matrix_t), pointer :: state => null ()
      type(node_t), pointer :: node => null ()
    end type state_iterator_t
```

The initializer: Point at the first branch. Note that this cannot be pure, thus
not be elemental, because the iterator can be used to manipulate data in the
state matrix.

⟨State matrices: public⟩+≡
```
    public :: state_iterator_init
```

⟨State matrices: procedures⟩+≡
```
    subroutine state_iterator_init (it, state)
      type(state_iterator_t), intent(out) :: it
      type(state_matrix_t), intent(in), target :: state
      it%state => state
      it%depth = state%depth
```

```
      if (state_matrix_is_defined (state)) then
         it%node => state%root
         do while (associated (it%node%child_first))
            it%node => it%node%child_first
         end do
      else
         it%node => null ()
      end if
   end subroutine state_iterator_init
```

Go forward. Recursively programmed: if the next node does not exist, go back to the parent node and look at its successor (if present), etc.

There is a possible pitfall in the implementation: If the dummy pointer argument to the `find_next` routine is used directly, we still get the correct result for the iterator, but calling the recursion on `node%parent` means that we manipulate a parent pointer in the original state in addition to the iterator. Making a local copy of the pointer avoids this. Using pointer intent would be helpful, but we do not yet rely on this F2003 feature.

⟨*State matrices: public*⟩+≡
```
    public :: state_iterator_advance
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_iterator_advance (it)
      type(state_iterator_t), intent(inout) :: it
      call find_next (it%node)
    contains
      recursive subroutine find_next (node_in)
        type(node_t), intent(in), target :: node_in
        type(node_t), pointer :: node
        node => node_in
        if (associated (node%next)) then
           node => node%next
           do while (associated (node%child_first))
              node => node%child_first
           end do
           it%node => node
        else if (associated (node%parent)) then
           call find_next (node%parent)
        else
           it%node => null ()
        end if
      end subroutine find_next
    end subroutine state_iterator_advance
```

If all has been scanned, the iterator is at an undefined state. Check for this:

⟨*State matrices: public*⟩+≡
```
    public :: state_iterator_is_valid
```

⟨*State matrices: procedures*⟩+≡
```
    function state_iterator_is_valid (it) result (defined)
      logical :: defined
      type(state_iterator_t), intent(in) :: it
      defined = associated (it%node)
```

```
      end function state_iterator_is_valid
```

Return the matrix-element index that corresponds to the current node

⟨*State matrices: public*⟩+≡
```
    public :: state_iterator_get_me_index
```

⟨*State matrices: procedures*⟩+≡
```
    function state_iterator_get_me_index (it) result (n)
      integer :: n
      type(state_iterator_t), intent(in) :: it
      n = it%node%me_index
    end function state_iterator_get_me_index
```

Return the number of times this quantum-number state has been added (noting that it is physically inserted only the first time). Note that for each state, there is an array of counters.

⟨*State matrices: public*⟩+≡
```
    public :: state_iterator_get_me_count
```

⟨*State matrices: procedures*⟩+≡
```
    function state_iterator_get_me_count (it) result (n)
      integer, dimension(:), allocatable :: n
      type(state_iterator_t), intent(in) :: it
      if (allocated (it%node%me_count)) then
         allocate (n (size (it%node%me_count)))
         n = it%node%me_count
      else
         allocate (n (0))
      end if
    end function state_iterator_get_me_count
```

Use the iterator to retrieve quantum-number information:

⟨*State matrices: public*⟩+≡
```
    public :: state_iterator_get_quantum_numbers
    public :: state_iterator_get_flavor
    public :: state_iterator_get_color
    public :: state_iterator_get_helicity
```

⟨*State matrices: interfaces*⟩+≡
```
    interface state_iterator_get_quantum_numbers
       module procedure state_iterator_get_qn_multi
       module procedure state_iterator_get_qn_slice
       module procedure state_iterator_get_qn_range
       module procedure state_iterator_get_qn_single
    end interface

    interface state_iterator_get_flavor
       module procedure state_iterator_get_flv_multi
       module procedure state_iterator_get_flv_slice
       module procedure state_iterator_get_flv_range
       module procedure state_iterator_get_flv_single
    end interface
```

```
interface state_iterator_get_color
   module procedure state_iterator_get_col_multi
   module procedure state_iterator_get_col_slice
   module procedure state_iterator_get_col_range
   module procedure state_iterator_get_col_single
end interface

interface state_iterator_get_helicity
   module procedure state_iterator_get_hel_multi
   module procedure state_iterator_get_hel_slice
   module procedure state_iterator_get_hel_range
   module procedure state_iterator_get_hel_single
end interface
```

These versions return the whole quantum number array

⟨*State matrices: procedures*⟩+≡

```
function state_iterator_get_qn_multi (it) result (qn)
  type(state_iterator_t), intent(in) :: it
  type(quantum_numbers_t), dimension(it%depth) :: qn

         it%state%me(it%node%me_index) = value
      end if
    end subroutine state_iterator_set_matrix_element
```

7.5.4   Operations on quantum states

Return a deep copy of a state matrix.

⟨*State matrices: public*⟩+≡
```
    public :: assignment(=)
```

⟨*State matrices: interfaces*⟩+≡
```
    interface assignment(=)
       module procedure state_matrix_assign
    end interface
```

⟨*State matrices: procedures*⟩+≡

```
subroutine state_matrix_assign (state_out, state_in)
  type(state_matrix_t), intent(out) :: state_out
  type(state_matrix_t), intent(in), target :: state_in
  type(state_iterator_t) :: it
  if (.not. state_matrix_is_defined (state_in))  return
  call state_matrix_init (state_out)
  call state_iterator_init (it, state_in)
  do while (state_iterator_is_valid (it))
     call state_matrix_add_state (state_out, &
           state_iterator_get_quantum_numbers (it), &
           state_iterator_get_me_index (it))
     call state_iterator_advance (it)
  end do
  if (allocated (state_in%me)) then
     allocate (state_out%me (size (state_in%me)))
     state_out%me = state_in%me
  end if
end subroutine state_matrix_assign
```

Determine the indices of all diagonal matrix elements.

⟨*State matrices: public*⟩+≡

```
public :: state_matrix_get_diagonal_entries
```

⟨*State matrices: procedures*⟩+≡

```
subroutine state_matrix_get_diagonal_entries (state, i)
  type(state_matrix_t), intent(in) :: state
  integer, dimension(:), allocatable, intent(out) :: i
  integer, dimension(state%n_matrix_elements) :: tmp
  integer :: n
  type(state_iterator_t) :: it
  n = 0
  call state_iterator_init (it, state)
  do while (state_iterator_is_valid (it))
     if (all (quantum_numbers_are_diagonal ( &
           state_iterator_get_quantum_numbers (it)))) then

        tmp(n) = state_iterator_get_me_index (it)
     end if
     call state_iterator_advance (it)
  end do
  allocate (i(n))
  if (n > 0) i = tmp(:n)
end subroutine state_matrix_get_diagonal_entries
```

Normalize all matrix elements, i.e., multiply by a common factor. Assuming that the factor is nonzero, of course.

⟨*State matrices: public*⟩+≡

```
public :: state_matrix_renormalize
```

⟨*State matrices: procedures*⟩+≡

```
subroutine state_matrix_renormalize (state, factor)
  type(state_matrix_t), intent(inout) :: state
  complex(default), intent(in) :: factor
```

```
      state%me = state%me * factor
    end subroutine state_matrix_renormalize
```

Renormalize the state matrix by its trace, if nonzero. The renormalization is
reflected in the state-matrix norm.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_normalize_by_trace
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_normalize_by_trace (state)
      type(state_matrix_t), intent(inout) :: state
      real(default) :: trace
      trace = state_matrix_trace (state)
      if (trace /= 0) then
         state%me = state%me / trace
         state%norm = state%norm * trace
      end if
    end subroutine state_matrix_normalize_by_trace
```

Analogous, but renormalize by maximal (absolute) value.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_normalize_by_max
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_normalize_by_max (state)
      type(state_matrix_t), intent(inout) :: state
      real(default) :: m
      m = maxval (abs (state%me))
      if (m /= 0) then
         state%me = state%me / m
         state%norm = state%norm * m
      end if
    end subroutine state_matrix_normalize_by_max
```

Explicitly set the norm of a state matrix.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_set_norm
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_set_norm (state, norm)
      type(state_matrix_t), intent(inout) :: state
      real(default), intent(in) :: norm
      state%norm = norm
    end subroutine state_matrix_set_norm
```

Return the sum of all matrix element values.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_sum
```

⟨*State matrices: procedures*⟩+≡
```
    function state_matrix_sum (state) result (value)
      complex(default) :: value
      type(state_matrix_t), intent(in) :: state
```

```
      value = sum (state%me)
    end function state_matrix_sum
```

Return the trace of a state matrix, i.e., the sum over all diagonal values. If
`qn_in` is provided, only branches that match this quantum-numbers array are
considered.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_trace
```

⟨*State matrices: procedures*⟩+≡
```
    function state_matrix_trace (state, qn_in) result (trace)
      complex(default) :: trace
      type(state_matrix_t), intent(in), target :: state
      type(quantum_numbers_t), dimension(:), intent(in), optional :: qn_in
      type(quantum_numbers_t), dimension(:), allocatable :: qn
      type(state_iterator_t) :: it

            end if
         end if
         if (all (quantum_numbers_are_diagonal (qn))) then
            trace = trace + state_iterator_get_matrix_element (it)
         end if
         call state_iterator_advance (it)
      end do
    end function state_matrix_trace
```

Append new states which are color-contracted versions of the existing states.
The matrix element index of each color contraction coincides with the index of
its origin, so no new matrix elements are generated. After this operation, no
`freeze` must be performed anymore.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_add_color_contractions
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_add_color_contractions (state)
      type(state_matrix_t), intent(inout), target :: state
      type(state_iterator_t) :: it
      type(quantum_numbers_t), dimension(:,:), allocatable :: qn
      type(quantum_numbers_t), dimension(:,:), allocatable :: qn_con
      integer, dimension(:), allocatable :: me_index
      integer :: depth, n_me, i, j
      depth = state_matrix_get_depth (state)
      n_me = state_matrix_get_n_matrix_elements (state)
      allocate (qn (depth, n_me))
      allocate (me_index (n_me))
      i = 0
```

```
      call state_iterator_init (it, state)
      do while (state_iterator_is_valid (it))
         i = i + 1
         qn(:,i) = state_iterator_get_quantum_numbers (it)
         me_index(i) = state_iterator_get_me_index (it)
         call state_iterator_advance (it)
      end do
      do i = 1, n_me
         call quantum_number_array_make_color_contractions (qn(:,i), qn_con)
         do j = 1, size (qn_con, 2)
            call state_matrix_add_state (state, qn_con(:,j), index = me_index(i))
         end do
      end do
   end subroutine state_matrix_add_color_contractions
```

This procedure merges two state matrices of equal depth. For each quantum
number (flavor, color, helicity), we take the entry from the first argument where
defined, otherwise the second one. (If both are defined, we get an off-diagonal
matrix.) The resulting trie combines the information of the input tries in all
possible ways. Note that values are ignored, all values in the result are zero.

⟨*State matrices: public*⟩+≡
```
   public :: merge_state_matrices
```

⟨*State matrices: procedures*⟩+≡
```
   subroutine merge_state_matrices (state1, state2, state3)
     type(state_matrix_t), intent(in), target :: state1, state2
     type(state_matrix_t), intent(out) :: state3
     type(state_iterator_t) :: it1, it2
     type(quantum_numbers_t), dimension(state1%depth) :: qn1, qn2
     if (state1%depth /= state2%depth) then
        call state_matrix_write (state1)
        call state_matrix_write (state2)
        call msg_bug ("State matrices merge impossible: incompatible depths")
     end if
     call state_matrix_init (state3)
     call state_iterator_init (it1, state1)
     do while (state_iterator_is_valid (it1))

           call state_matrix_add_state &
                (state3, qn1 .merge. qn2)
           call state_iterator_advance (it2)
        end do
        call state_iterator_advance (it1)
     end do
     call state_matrix_freeze (state3)
   end subroutine merge_state_matrices
```

Multiply matrix elements from two state matrices. Choose the elements as
given by the integer index arrays, multiply them and store the sum of products

776

in the indicated matrix element. The suffixes mean: c=conjugate first factor; f=include weighting factor.

Note that the `dot_product` intrinsic function conjugates its first complex argument. This is intended for the `c` suffix case, but must be reverted for the plain-product case.

We provide analogous subroutines for just summing over state matrix entries. The `evaluate_sum` variant includes the state-matrix norm in the evaluation, the `evaluate_me_sum` takes into account just the matrix elements proper.

⟨*State matrices: public*⟩+≡
```
    public :: state_matrix_evaluate_product

```

```
      state%me(i) = &
           sum (state1%me(index1)) * state1%norm
    end subroutine state_matrix_evaluate_sum

    pure subroutine state_matrix_evaluate_me_sum (state, i, state1, index1)
      type(state_matrix_t), intent(inout) :: state
      integer, intent(in) :: i
      type(state_matrix_t), intent(in) :: state1
      integer, dimension(:), intent(in) :: index1
      state%me(i) = sum (state1%me(index1))
    end subroutine state_matrix_evaluate_me_sum
```

Outer product (of states and matrix elements):

⟨*State matrices: public*⟩+≡
```
    public :: outer_multiply
```

⟨*State matrices: interfaces*⟩+≡
```
    interface outer_multiply
       module procedure outer_multiply_pair
       module procedure outer_multiply_array
    end interface
```

This procedure constructs the outer product of two state matrices.

⟨*State matrices: procedures*⟩+≡
```
    subroutine outer_multiply_pair (state1, state2, state3)
      type(state_matrix_t), intent(in), target :: state1, state2
      type(state_matrix_t), intent(out) :: state3
      type(state_iterator_t) :: it1, it2
      type(quantum_numbers_t), dimension(state1%depth) :: qn1
      type(quantum_numbers_t), dimension(state2%depth) :: qn2
      type(quantum_numbers_t), dimension(state1%depth+state2%depth) :: qn3
      complex(default) :: val1, val2
      call state_matrix_init (state3, store_values=.true.)
      call state_iterator_init (it1, state1)
      do while (state_iterator_is_valid (it1))
         qn1 = state_iterator_get_quantum_numbers (it1)
         val1 = state_iterator_get_matrix_element (it1)
         call state_iterator_init (it2, state2)
         do while (state_iterator_is_valid (it2))
            qn2 = state_iterator_get_quantum_numbers (it2)
            val2 = state_iterator_get_matrix_element (it2)
            qn3(:state1%depth) = qn1
            qn3(state1%depth+1:) = qn2
            call state_matrix_add_state (state3, qn3, value=val1 * val2)
            call state_iterator_advance (it2)
         end do
         call state_iterator_advance (it1)
      end do
      call state_matrix_freeze (state3)
    end subroutine outer_multiply_pair
```

This executes the above routine iteratively for an arbitrary number of state
matrices.

778

⟨*State matrices: procedures*⟩+≡

```
subroutine outer_multiply_array (state_in, state_out)
  type(state_matrix_t), dimension(:), intent(in), target :: state_in
  type(state_matrix_t), intent(out) :: state_out
  type(state_matrix_t), dimension(:), allocatable, target :: state_tmp
  integer :: i, n
  n = size (state_in)

     call outer_multiply_pair (state_tmp(n-2), state_in(n), state_out)
     call state_matrix_final (state_tmp)
  end select
end subroutine outer_multiply_array
```

7.5.5   Factorization

In physical events, the state matrix is factorized into single-particle state matrices. This is essentially a measurement.

In a simulation, we select one particular branch of the state matrix with a probability that is determined by the matrix elements at the leaves. (This makes sense only if the state matrix represents a squared amplitude.) The selection is based on a (random) value x between 0 and one that is provided as the third argument.

For flavor and color, we select a unique value for each particle. For polarization, we have three options (modes). Option 1 is to drop helicity information altogether and sum over all diagonal helicities. Option 2 is to select a unique diagonal helicity in the same way as flavor and color. Option 3 is, for each particle, to trace over all remaining helicities in order to obtain an array of independent single-particle helicity matrices.

Only branches that match the given quantum-number array qn_in, if present, are considered. For this array, color is ignored.

If the optional correlated_state is provided, it is assigned the correlated density matrix for the selected flavor-color branch, so multi-particle spin correlations remain available even if they are dropped in the single-particle density matrices.

The algorithm is as follows: First, we determine the normalization by summing over all diagonal matrix elements. In a second scan, we select one of the diagonal matrix elements by a cumulative comparison with the normalized random number. In the corresponding quantum number array, we undefine the

helicity entries. Then, we scan the third time. For each branch that matches the selected quantum number array (i.e., definite flavor and color, arbitrary helicity), we determine its contribution to any of the single-particle state matrices. The matrix-element value is added if all other quantum numbers are diagonal, while the helicity of the chosen particle may be arbitrary; this helicity determines the branch in the single-particle state.

As a result, flavor and color quantum numbers are selected with the correct probability. Within this subset of states, each single-particle state matrix results from tracing over all other particles. Note that the single-particle state matrices are not normalized.

The flag ok is set to false if the matrix element sum is zero, so factorization is not possible. This can happen if an event did not pass cuts.

7.6   Interactions

This module defines the `interaction_t` type. It is an extension of the `state_matrix_t`
type.

The state matrix is a representation of a multi-particle density matrix. It
implements all possible flavor, color, and quantum-number assignments of the
entries in a generic density matrix, and it can hold a complex matrix element
for each entry. (Note that this matrix can hold non-diagonal entries in color
and helicity space.) The `interaction_t` object associates this with a list of
momenta, such that the whole object represents a multi-particle state.

The `interaction_t` holds information about which particles are incoming,
virtual (i.e., kept for the records), or outgoing. Each particle can be associated
to a source within another interaction. This allows us to automatically fill those
interaction momenta which have been computed or defined elsewhere. It also
contains internal parent-child relations and flags for (virtual) particles which
are to be treated as resonances.

A quantum-number mask array summarizes, for each particle within the
interaction, the treatment of flavor, color, or helicity (expose or ignore). A list
of locks states which particles are bound to have an identical quantum-number
mask. This is useful when the mask is changed at one place.

7.6.1 External interaction links

Each particle in an interaction can have a link to a corresponding particle in another interaction. This allows to fetch the momenta of incoming or virtual particles from the interaction where they are defined. The link object consists of a pointer to the interaction and an index.

⟨*Interactions: types*⟩≡
```
    type :: external_link_t
      private
      type(interaction_t), pointer :: int => null ()
      integer :: i
    end type external_link_t
```

Set an external link.

⟨*Interactions: procedures*⟩≡
```
    subroutine external_link_set (link, int, i)
      type(external_link_t), intent(out) :: link
      type(interaction_t), target, intent(in) :: int
      integer, intent(in) :: i
      if (i /= 0) then
         link%int => int
         link%i = i
      end if
    end subroutine external_link_set
```

Reassign an external link to a new interaction (which should be an image of the original target).

⟨*Interactions: procedures*⟩+≡
```
    subroutine external_link_reassign (link, int_src, int_target)
      type(external_link_t), intent(inout) :: link
      type(interaction_t), intent(in) :: int_src
      type(interaction_t), intent(in), target :: int_target
```

```
    if (associated (link%int)) then
       if (link%int%tag == int_src%tag)  link%int => int_target
    end if
end subroutine external_link_reassign
```

Return true if the link is set

⟨*Interactions: procedures*⟩+≡
```
function external_link_is_set (link) result (flag)
  logical :: flag
  type(external_link_t), intent(in) :: link
  flag = associated (link%int)
end function external_link_is_set
```

Return the interaction pointer.

⟨*Interactions: public*⟩≡
```
public :: external_link_get_ptr
```

⟨*Interactions: procedures*⟩+≡
```
function external_link_get_ptr (link) result (int)
  type(interaction_t), pointer :: int
  type(external_link_t), intent(in) :: link
  int => link%int
end function external_link_get_ptr
```

Return the index within that interaction

⟨*Interactions: public*⟩+≡
```
public :: external_link_get_index
```

⟨*Interactions: procedures*⟩+≡
```
function external_link_get_index (link) result (i)
  integer :: i
  type(external_link_t), intent(in) :: link
  i = link%i
end function external_link_get_index
```

Return a pointer to the momentum of the corresponding particle. If there is no
association, return a null pointer.

⟨*Interactions: procedures*⟩+≡
```
function external_link_get_momentum_ptr (link) result (p)
  type(vector4_t), pointer :: p
  type(external_link_t), intent(in) :: link
  if (associated (link%int)) then
     p => link%int%p(link%i)
  else
     p => null ()
  end if
end function external_link_get_momentum_ptr
```

7.6.2 Internal relations

In addition to the external links, particles within the interaction have parent-child relations. Here, more than one link is possible, and we set up an array.

⟨*Interactions: types*⟩+≡
```
type :: internal_link_list_t
  private
  integer :: length = 0
  integer, dimension(:), allocatable :: link
 contains
 ⟨Interactions: internal link list: TBP⟩
end type internal_link_list_t
```

Output, non-advancing.

⟨*Interactions: internal link list: TBP*⟩≡
```
procedure :: write => internal_link_list_write
```

⟨*Interactions: procedures*⟩+≡
```
subroutine internal_link_list_write (object, unit)
  class(internal_link_list_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, i
  u = output_unit (unit)
  do i = 1, object%length
     write (u, "(1x,I0)", advance="no")  object%link(i)
  end do
end subroutine internal_link_list_write
```

Append an item. Start with an array size of 2 and double the size if necessary.

⟨*Interactions: internal link list: TBP*⟩+≡
```
procedure :: append => internal_link_list_append
```

⟨*Interactions: procedures*⟩+≡
```
subroutine internal_link_list_append (link_list, link)
  class(internal_link_list_t), intent(inout) :: link_list
  integer, intent(in) :: link
  integer :: l
  integer, dimension(:), allocatable :: tmp
  l = link_list%length
  if (allocated (link_list%link)) then
     if (l == size (link_list%link)) then
        allocate (tmp (2 * l))
        tmp(:l) = link_list%link
        call move_alloc (from = tmp, to = link_list%link)
     end if
  else
     allocate (link_list%link (2))
  end if
  l = l + 1
  link_list%link(l) = link
  link_list%length = l
end subroutine internal_link_list_append
```

Return true if the link list is nonempty:

⟨Interactions: internal link list: TBP⟩+≡
```
    procedure :: has_entries => internal_link_list_has_entries
```

⟨Interactions: procedures⟩+≡
```
    function internal_link_list_has_entries (link_list) result (flag)
      class(internal_link_list_t), intent(in) :: link_list
      logical :: flag
      flag = link_list%length > 0
    end function internal_link_list_has_entries
```

Return the list length

⟨Interactions: internal link list: TBP⟩+≡
```
    procedure :: get_length => internal_link_list_get_length
```

⟨Interactions: procedures⟩+≡
```
    function internal_link_list_get_length (link_list) result (length)
      class(internal_link_list_t), intent(in) :: link_list
      integer :: length
      length = link_list%length
    end function internal_link_list_get_length
```

Return an entry.

⟨Interactions: internal link list: TBP⟩+≡
```
    procedure :: get_link => internal_link_list_get_link
```

⟨Interactions: procedures⟩+≡
```
    function internal_link_list_get_link (link_list, i) result (link)
      class(internal_link_list_t), intent(in) :: link_list
      integer, intent(in) :: i
      integer :: link
      if (i <= link_list%length) then
         link = link_list%link(i)
      else
         call msg_bug ("Internal link list: out of bounds")
      end if
    end function internal_link_list_get_link
```

7.6.3 The interaction type

An interaction is an entangled system of particles. Thus, the interaction object consists of two parts: the subevent, and the quantum state which technically is a trie. The subnode levels beyond the trie root node are in correspondence to the subevent, so both should be traversed in parallel.

The subevent is implemented as an allocatable array of four-momenta. The first `n_in` particles are incoming, `n_vir` particles in-between can be kept for bookkeeping, and the last `n_out` particles are outgoing.

Distinct interactions are linked by their particles: for each particle, we have the possibility of links to corresponding particles in other interactions. Furthermore, for bookkeeping purposes we have a self-link array `relations` where the parent-child relations are kept, and a flag array `resonant` which is set for an intermediate resonance.

Each momentum is associated with masks for flavor, color, and helicity. If a mask entry is set, the associated quantum number is to be ignored for that particle. If any mask has changed, the flag `update` is set.

We can have particle pairs locked together. If this is the case, the corresponding mask entries are bound to be equal. This is useful for particles that go through the interaction.

The interaction tag serves bookkeeping purposes. In particular, it identifies links in printout.

⟨*Interactions: public*⟩+≡
```
public :: interaction_t
```

⟨*Interactions: types*⟩+≡
```
type :: interaction_t
  private
  integer :: tag = 0
  type(state_matrix_t) :: state_matrix
  integer :: n_in = 0
  integer :: n_vir = 0
  integer :: n_out = 0
  integer :: n_tot = 0
  logical, dimension(:), allocatable :: p_is_known
  type(vector4_t), dimension(:), allocatable :: p
  type(external_link_t), dimension(:), allocatable :: source
  type(internal_link_list_t), dimension(:), allocatable :: parents
  type(internal_link_list_t), dimension(:), allocatable :: children
  logical, dimension(:), allocatable :: resonant
  type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
  integer, dimension(:), allocatable :: hel_lock
  logical :: update_state_matrix = .false.
  logical :: update_values = .false.
end type interaction_t
```

Initialize the particle array with a fixed size. The first `n_in` particles are incoming, the rest outgoing. Masks are optional. There is also an optional tag. The interaction still needs fixing the values, but that is to be done after all branches have been added.

Interaction tags are assigned consecutively, using a `save`d variable local to this procedure. If desired, we can provide a seed for the interaction tags. Such a seed should be positive. The default seed is one. `tag=0` indicates an empty interaction.

If `set_relations` is set and true, we establish parent-child relations for all incoming and outgoing particles. Virtual particles are skipped; this option is normally used only for interations without virtual particles.

⟨*Interactions: public*⟩+≡
```
public :: interaction_init
```

⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_init &
    (int, n_in, n_vir, n_out, &
     tag, resonant, mask, hel_lock, set_relations, store_values)
  type(interaction_t), intent(out) :: int
  integer, intent(in) :: n_in, n_vir, n_out
  integer, intent(in), optional :: tag
```

```
      logical, dimension(:), intent(in), optional :: resonant
      type(quantum_numbers_mask_t), dimension(:), intent(in), optional :: mask
      integer, dimension(:), intent(in), optional :: hel_lock
      logical, intent(in), optional :: set_relations, store_values
      logical :: set_rel
      integer :: i, j
      set_rel = .false.;  if (present (set_relations))  set_rel = set_relations
      call interaction_set_tag (int, tag)
      call state_matrix_init (int%state_matrix, store_values)
      int%n_in = n_in
      int%n_vir = n_vir
      int%n_out = n_out
      int%n_tot = n_in + n_vir + n_out
      allocate (int%p_is_known (int%n_tot))
      int%p_is_known = .false.
      allocate (int%p (int%n_tot))
      allocate (int%source (int%n_tot))
      allocate (int%parents (int%n_tot))
      allocate (int%children (int%n_tot))
      allocate (int%resonant (int%n_tot))
      if (present (resonant)) then
         int%resonant = resonant
      else
         int%resonant = .false.
      end if
      allocate (int%mask (int%n_tot))
      allocate (int%hel_lock (int%n_tot))
      if (present (mask)) then
         int%mask = mask
      end if
      if (present (hel_lock)) then
         int%hel_lock = hel_lock
      else
         int%hel_lock = 0
      end if
      int%update_state_matrix = .false.
      int%update_values = .true.
      if (set_rel) then
         do i = 1, n_in
            do j = 1, n_out
               call interaction_relate (int, i, n_in + j)
            end do
         end do
      end if
    end subroutine interaction_init
```

Set or create a unique tag for the interaction. Without interaction, reset the tag counter.

⟨*Interactions: procedures*⟩+≡

```
    subroutine interaction_set_tag (int, tag)
      type(interaction_t), intent(inout), optional :: int
      integer, intent(in), optional :: tag
      integer, save :: stored_tag = 1
```

```
   if (present (int)) then
      if (present (tag)) then
         int%tag = tag
      else
         int%tag = stored_tag
         stored_tag = stored_tag + 1
      end if
   else if (present (tag)) then
      stored_tag = tag
   else
      stored_tag = 1
   end if
end subroutine interaction_set_tag
```

The public interface for the previous procedure only covers the reset functionality.

⟨*Interactions: public*⟩+≡
```
   public :: reset_interaction_counter
```

⟨*Interactions: procedures*⟩+≡
```
   subroutine reset_interaction_counter (tag)
     integer, intent(in), optional :: tag
     call interaction_set_tag (tag=tag)
   end subroutine reset_interaction_counter
```

Finalizer: The state-matrix object contains pointers.

⟨*Interactions: public*⟩+≡
```
   public :: interaction_final
```

⟨*Interactions: procedures*⟩+≡
```
   elemental subroutine interaction_final (int)
     type(interaction_t), intent(inout) :: int
     call state_matrix_final (int%state_matrix)
   end subroutine interaction_final
```

Output. The verbose option refers to the state matrix output.

⟨*Interactions: public*⟩+≡
```
   public :: interaction_write
```

⟨*Interactions: procedures*⟩+≡

```

7.6.4 Methods inherited from the state matrix member

Until F2003 is standard, we cannot implement inheritance directly. Therefore, we need wrappers for "inherited" methods.

Make a new branch in the state matrix if it does not yet exist. This is not just a wrapper but it introduces the interaction mask: where a quantum number is masked, it is not transferred but set undefined. After this, the value array has to be updated.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_add_state
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_add_state &
        (int, qn, index, value, sum_values, counter_index, me_index)

      complex(default), intent(in), optional :: value
      logical, intent(in), optional :: sum_values
      integer, intent(in), optional :: counter_index
      integer, intent(out), optional :: me_index
      type(quantum_numbers_t), dimension(size(qn)) :: qn_tmp
      qn_tmp = qn
```

```
        call quantum_numbers_undefine (qn_tmp, int%mask)
        call state_matrix_add_state &
              (int%state_matrix, qn_tmp, index, value, sum_values, &
              counter_index, me_index)
        int%update_values = .true.
      end subroutine interaction_add_state
```

Freeze the quantum state: First collapse the quantum state, i.e., remove quantum numbers if any mask has changed, then fix the array of value pointers.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_freeze
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_freeze (int)
      type(interaction_t), intent(inout) :: int
      if (int%update_state_matrix) then
         call state_matrix_collapse (int%state_matrix, int%mask)
         int%update_state_matrix = .false.
         int%update_values = .true.
      end if
      if (int%update_values) then
         call state_matrix_freeze (int%state_matrix)
         int%update_values = .false.
      end if
    end subroutine interaction_freeze
```

Return true if the state matrix is empty.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_is_empty
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_is_empty (int) result (flag)
      logical :: flag
      type(interaction_t), intent(in) :: int
      flag = state_matrix_is_empty (int%state_matrix)
    end function interaction_is_empty
```

Get the number of values stored in the state matrix:

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_n_matrix_elements
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_n_matrix_elements (int) result (n)
      integer :: n
      type(interaction_t), intent(in) :: int
      n = state_matrix_get_n_matrix_elements (int%state_matrix)
    end function interaction_get_n_matrix_elements
```

Get the norm of the state matrix (if the norm has been taken out, otherwise this would be unity).

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_norm
```

⟨*Interactions: procedures*⟩+≡
```
function interaction_get_norm (int) result (norm)
  real(default) :: norm
  type(interaction_t), intent(in) :: int
  norm = state_matrix_get_norm (int%state_matrix)
end function interaction_get_norm
```

Get the quantum number array that corresponds to a given index.
⟨*Interactions: public*⟩+≡
```
public :: interaction_get_quantum_numbers
```
⟨*Interactions: procedures*⟩+≡
```
function interaction_get_quantum_numbers (int, i) result (qn)
  type(quantum_numbers_t), dimension(:), allocatable :: qn
  type(interaction_t), intent(in), target :: int
  integer, intent(in) :: i
  allocate (qn (state_matrix_get_depth (int%state_matrix)))
  qn = state_matrix_get_quantum_numbers (int%state_matrix, i)
end function interaction_get_quantum_numbers
```

Get the matrix element that corresponds to a set of quantum numbers, a given index, or return the whole array.
⟨*Interactions: public*⟩+≡
```
public :: interaction_get_matrix_element
```
⟨*Interactions: procedures*⟩+≡
```
function interaction_get_matrix_element (int, i) result (me)
  complex(default) :: me
  type(interaction_t), intent(in) :: int
  integer, intent(in) :: i
  me = state_matrix_get_matrix_element (int%state_matrix, i)
end function interaction_get_matrix_element
```

Set the complex value(s) stored in the quantum state.
⟨*Interactions: public*⟩+≡
```
public :: interaction_set_matrix_element
```
⟨*Interactions: interfaces*⟩+≡
```
interface interaction_set_matrix_element
   module procedure interaction_set_matrix_element_qn
   module procedure interaction_set_matrix_element_all
   module procedure interaction_set_matrix_element_array
   module procedure interaction_set_matrix_element_single
   module procedure interaction_set_matrix_element_clone
end interface
```
Indirect access via the quantum number array:
⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_set_matrix_element_qn (int, qn, val)
  type(interaction_t), intent(inout) :: int
  type(quantum_numbers_t), dimension(:), intent(in) :: qn
  complex(default), intent(in) :: val
  call state_matrix_set_matrix_element (int%state_matrix, qn, val)
end subroutine interaction_set_matrix_element_qn
```

799

Set all entries of the matrix-element array to a given value.

⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_set_matrix_element_all (int, value)
  type(interaction_t), intent(inout) :: int
  complex(default), intent(in) :: value
  call state_matrix_set_matrix_element (int%state_matrix, value)
end subroutine interaction_set_matrix_element_all
```

Set the matrix-element array directly.

⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_set_matrix_element_array (int, value)
  type(interaction_t), intent(inout) :: int
  complex(default), dimension(:), intent(in) :: value
  call state_matrix_set_matrix_element (int%state_matrix, value)
end subroutine interaction_set_matrix_element_array

pure subroutine interaction_set_matrix_element_single (int, i, value)
  type(interaction_t), intent(inout) :: int
  integer, intent(in) :: i
  complex(default), intent(in) :: value
  call state_matrix_set_matrix_element (int%state_matrix, i, value)
end subroutine interaction_set_matrix_element_single
```

Clone from another (matching) interaction.

⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_set_matrix_element_clone (int, int1)
  type(interaction_t), intent(inout) :: int
  type(interaction_t), intent(in) :: int1
  call state_matrix_set_matrix_element (int%state_matrix, int1%state_matrix)
end subroutine interaction_set_matrix_element_clone
```

Get the indices of any diagonal matrix elements.

⟨*Interactions: public*⟩+≡
```
public :: interaction_get_diagonal_entries
```

⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_get_diagonal_entries (int, i)
  type(interaction_t), intent(in) :: int
  integer, dimension(:), allocatable, intent(out) :: i
  call state_matrix_get_diagonal_entries (int%state_matrix, i)
end subroutine interaction_get_diagonal_entries
```

Renormalize the state matrix by its trace, if nonzero. The renormalization is reflected in the state-matrix norm.

⟨*Interactions: public*⟩+≡
```
public :: interaction_normalize_by_trace
```

⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_normalize_by_trace (int)
  type(interaction_t), intent(inout) :: int
  call state_matrix_normalize_by_trace (int%state_matrix)
end subroutine interaction_normalize_by_trace
```

Analogous, but renormalize by maximal (absolute) value.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_normalize_by_max
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_normalize_by_max (int)
      type(interaction_t), intent(inout) :: int
      call state_matrix_normalize_by_max (int%state_matrix)
    end subroutine interaction_normalize_by_max
```

Explicitly set the norm value (of the state matrix).

⟨*Interactions: public*⟩+≡
```
    public :: interaction_set_norm
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_set_norm (int, norm)
      type(interaction_t), intent(inout) :: int
      real(default), intent(in) :: norm
      call state_matrix_set_norm (int%state_matrix, norm)
    end subroutine interaction_set_norm
```

Return the maximum absolute value of color indices.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_max_color_value
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_max_color_value (int) result (cmax)
      integer :: cmax
      type(interaction_t), intent(in) :: int
      cmax = state_matrix_get_max_color_value (int%state_matrix)
    end function interaction_get_max_color_value
```

Factorize the state matrix into single-particle state matrices, the branch selection depending on a (random) value between 0 and 1; optionally also return a correlated state matrix.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_factorize
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_factorize &
        (int, mode, x, ok, single_state, correlated_state, qn_in)
      type(interaction_t), intent(in), target :: int
      integer, intent(in) :: mode
      real(default), intent(in) :: x
      logical, intent(out) :: ok
      type(state_matrix_t), &
          dimension(:), allocatable, intent(out) :: single_state
      type(state_matrix_t), intent(out), optional :: correlated_state
      type(quantum_numbers_t), dimension(:), intent(in), optional :: qn_in
      call state_matrix_factorize &
          (int%state_matrix, mode, x, ok, single_state, correlated_state, qn_in)
    end subroutine interaction_factorize
```

Sum all matrix element values

⟨*Interactions: public*⟩+≡
```
    public :: interaction_sum
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_sum (int) result (value)
      complex(default) :: value
      type(interaction_t), intent(in) :: int
      value = state_matrix_sum (int%state_matrix)
    end function interaction_sum
```

Append new states which are color-contracted versions of the existing states. The matrix element index of each color contraction coincides with the index of its origin, so no new matrix elements are generated. After this operation, no **freeze** must be performed anymore.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_add_color_contractions
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_add_color_contractions (int)
      type(interaction_t), intent(inout) :: int
      call state_matrix_add_color_contractions (int%state_matrix)
    end subroutine interaction_add_color_contractions
```

Multiply matrix elements from two interactions. Choose the elements as given by the integer index arrays, multiply them and store the sum of products in the indicated matrix element. The suffixes mean: c=conjugate first factor; f=include weighting factor.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_evaluate_product
    public :: interaction_evaluate_product_cf
    public :: interaction_evaluate_square_c

    end function interaction_get_state_matrix_ptr
```

Return the array of resonance flags

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_resonance_flags
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_resonance_flags (int) result (resonant)
      type(interaction_t), intent(in) :: int
      logical, dimension(size(int%resonant)) :: resonant
      resonant = int%resonant
    end function interaction_get_resonance_flags
```

Return the quantum-numbers mask (or part of it)

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_mask
```

⟨*Interactions: interfaces*⟩+≡
```
    interface interaction_get_mask
       module procedure interaction_get_mask_all
       module procedure interaction_get_mask_slice
    end interface
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_mask_all (int) result (mask)
      type(interaction_t), intent(in) :: int
      type(quantum_numbers_mask_t), dimension(size(int%mask)) :: mask
      mask = int%mask
    end function interaction_get_mask_all

    function interaction_get_mask_slice (int, index) result (mask)
      type(interaction_t), intent(in) :: int
      integer, dimension(:), intent(in) :: index
      type(quantum_numbers_mask_t), dimension(size(index)) :: mask
      mask = int%mask(index)
    end function interaction_get_mask_slice
```

Compute the invariant mass squared of the incoming particles (if any, otherwise outgoing).

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_s
```

⟨*Interactions: procedures*⟩+≡
```
function interaction_get_s (int) result (s)
  real(default) :: s
  type(interaction_t), intent(in) :: int
  if (int%n_in /= 0) then
     s = sum (int%p(:int%n_in)) ** 2
  else
     s = sum (int%p(int%n_vir+1:)) ** 2
  end if
end function interaction_get_s
```

Compute the Lorentz transformation that transforms the incoming particles from the center-of-mass frame to the lab frame where they are given. If the c.m. mass squared is negative or zero, return the identity.

⟨*Interactions: public*⟩+≡
```
public :: interaction_get_cm_transformation
```

⟨*Interactions: procedures*⟩+≡
```
function interaction_get_cm_transformation (int) result (lt)
  type(lorentz_transformation_t) :: lt
  type(interaction_t), intent(in) :: int
  type(vector4_t) :: p_cm
  real(default) :: s
  if (int%n_in /= 0) then
     p_cm = sum (int%p(:int%n_in))
  else
     p_cm = sum (int%p(int%n_vir+1:))
  end if
  s = p_cm ** 2
  if (s > 0) then
     lt = boost (p_cm, sqrt (s))
  else
     lt = identity
  end if
end function interaction_get_cm_transformation
```

Return flavor, momentum, and position of the first outgoing unstable particle present in the interaction. Note that we need not iterate through the state matrix; if there is an unstable particle, it will be present in all state-matrix entries.

⟨*Interactions: public*⟩+≡
```
public :: interaction_get_unstable_particle
```

⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_get_unstable_particle (int, flv, p, i)
  type(interaction_t), intent(in), target :: int
  type(flavor_t), intent(out) :: flv
  type(vector4_t), intent(out) :: p
  integer, intent(out) :: i
  type(state_iterator_t) :: it
  type(flavor_t), dimension(int%n_tot) :: flv_array
  call state_iterator_init (it, int%state_matrix)
  flv_array = state_iterator_get_flavor (it)
```

```
        do i = int%n_in + int%n_vir + 1, int%n_tot
          if (.not. flavor_is_stable (flv_array(i))) then
            flv = flv_array(i)
            p = int%p(i)
            return
          end if
        end do
      end subroutine interaction_get_unstable_particle
```

Return the complete set of *outgoing* flavors, assuming that the flavor quantum number is not suppressed.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_flv_out
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_get_flv_out (int, flv)
      type(interaction_t), intent(in), target :: int

        call state_iterator_advance (it)
      end do
    end subroutine interaction_get_flv_out
```

7.6.6 Modifying contents

Set the quantum numbers mask.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_set_mask
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_set_mask (int, mask)
      type(interaction_t), intent(inout) :: int
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
      int%mask = mask
      int%update_state_matrix = .true.
    end subroutine interaction_set_mask
```

Merge a particular mask entry, respecting a possible helicity lock for this entry. We apply an OR relation, which means that quantum numbers are summed over if either of the two masks requires it.

⟨*Interactions: procedures*⟩+≡

```
subroutine interaction_merge_mask_entry (int, i, mask)
  type(interaction_t), intent(inout) :: int
  integer, intent(in) :: i
  type(quantum_numbers_mask_t), intent(in) :: mask
  type(quantum_numbers_mask_t) :: mask_tmp
  integer :: ii
  ii = idx (int, i)
  if (int%mask(ii) .neqv. mask) then
     int%mask(ii) = int%mask(ii) .or. mask
     if (int%hel_lock(ii) /= 0) then
        call quantum_numbers_mask_assign (mask_tmp, mask, helicity=.true.)
        int%mask(int%hel_lock(ii)) = int%mask(int%hel_lock(ii)) .or. mask_tmp
     end if
  end if
  int%update_state_matrix = .true.
end subroutine interaction_merge_mask_entry
```

Fill the momenta array, do not care about the quantum numbers of particles.

⟨*Interactions: public*⟩+≡

```
public :: interaction_reset_momenta
public :: interaction_set_momenta
public :: interaction_set_momentum
```

⟨*Interactions: procedures*⟩+≡

```
subroutine interaction_reset_momenta (int)
  type(interaction_t), intent(inout) :: int
  int%p = vector4_null
  int%p_is_known = .true.
end subroutine interaction_reset_momenta

subroutine interaction_set_momenta (int, p, outgoing)
  type(interaction_t), intent(inout) :: int

     int%p(index) = p(i)
     int%p_is_known(index) = .true.
  end do
end subroutine interaction_set_momenta

subroutine interaction_set_momentum (int, p, i, outgoing)
  type(interaction_t), intent(inout) :: int
  type(vector4_t), intent(in) :: p
  integer, intent(in) :: i
  logical, intent(in), optional :: outgoing
  integer :: index
  index = idx (int, i, outgoing)
  int%p(index) = p
```

```
        int%p_is_known(index) = .true.
      end subroutine interaction_set_momentum
```

This more sophisticated version of setting values is used for structure functions, in particular if nontrivial flavor, color, and helicity may be present: set values selectively for the given flavors. If there is more than one flavor, scan the interaction and check for a matching flavor at the specified particle location. If it matches, insert the value that corresponds to this flavor.

⟨*Interactions: public*⟩+≡
```
      public :: interaction_set_flavored_values
```

⟨*Interactions: procedures*⟩+≡
```
      subroutine interaction_set_flavored_values (int, value, flv_in, pos)
        type(interaction_t), intent(inout) :: int
        complex(default), dimension(:), intent(in) :: value
        type(flavor_t), dimension(:), intent(in) :: flv_in
        integer, intent(in) :: pos
        type(state_iterator_t) :: it

        else
           call state_iterator_init (it, int%state_matrix)
           do while (state_iterator_is_valid (it))
              flv = state_iterator_get_flavor (it, pos)
              SCAN_FLV: do i = 1, size (value)
                 if (flv == flv_in(i)) then
                    call state_iterator_set_matrix_element (it, value(i))
                    exit SCAN_FLV
                 end if
              end do SCAN_FLV
              call state_iterator_advance (it)
           end do
        end if
      end subroutine interaction_set_flavored_values
```

7.6.7   Handling Linked interactions

Store relations between corresponding particles within one interaction. The first particle is the parent, the second one the child. Links are established in both directions.

These relations have no effect on the propagation of momenta etc., they are rather used for mother-daughter relations in event output.

⟨*Interactions: public*⟩+≡
```
      public :: interaction_relate
```

⟨*Interactions: procedures*⟩+≡
```
      subroutine interaction_relate (int, i1, i2)
        type(interaction_t), intent(inout), target :: int
        integer, intent(in) :: i1, i2
        if (i1 /= 0 .and. i2 /= 0) then
```

```
      call int%children(i1)%append (i2)
      call int%parents(i2)%append (i1)
    end if
  end subroutine interaction_relate
```

Transfer internal parent-child relations defined within interaction `int1` to a new interaction `int` where the particle indices are mapped to. Some particles in `int1` may have no image in `int`. In that case, a child entry maps to zero, and we skip this relation.

Also transfer resonance flags.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_transfer_relations
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_transfer_relations (int1, int2, map)
      type(interaction_t), intent(in) :: int1
      type(interaction_t), intent(inout), target :: int2
      integer, dimension(:), intent(in) :: map
      integer :: i, j, k
      do i = 1, size (map)
        do j = 1, int1%parents(i)%get_length ()
          k = int1%parents(i)%get_link (j)
          call interaction_relate (int2, map(k), map(i))
        end do
        if (map(i) /= 0) then
          int2%resonant(map(i)) = int1%resonant(i)
        end if
      end do
    end subroutine interaction_transfer_relations
```

Make up internal parent-child relations for the particle(s) that are connected to a new interaction `int`.

If `resonant` is defined and true, the connections are marked as resonant in the result interaction

⟨*Interactions: public*⟩+≡
```
    public :: interaction_relate_connections
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_relate_connections &
        (int, int_in, connection_index, &
         map, map_connections, resonant)
      type(interaction_t), intent(inout), target :: int
      type(interaction_t), intent(in) :: int_in
      integer, dimension(:), intent(in) :: connection_index
      integer, dimension(:), intent(in) :: map, map_connections
      logical, intent(in), optional :: resonant
      logical :: reson
      integer :: i, j, i2, k2
      reson = .false.;  if (present (resonant))  reson = resonant
      do i = 1, size (map_connections)
        k2 = connection_index(i)
        do j = 1, int_in%children(k2)%get_length ()
          i2 = int_in%children(k2)%get_link (j)
```

```
        call interaction_relate (int, map_connections(i), map(i2))
      end do
      int%resonant(map_connections(i)) = reson
    end do
  end subroutine interaction_relate_connections
```

Return the number of source/target links of the internal connections of particle
i.
⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_n_children
    public :: interaction_get_n_parents
```
⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_n_children (int, i) result (n)
      integer :: n
      type(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      n = int%children(i)%get_length ()
    end function interaction_get_n_children

    function interaction_get_n_parents (int, i) result (n)
      integer :: n
      type(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      n = int%parents(i)%get_length ()
    end function interaction_get_n_parents
```

Return the source/target links of the internal connections of particle i as an
array.
⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_children
    public :: interaction_get_parents
```
⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_children (int, i) result (idx)
      integer, dimension(:), allocatable :: idx
      type(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      integer :: k, l
      l = int%children(i)%get_length ()
      allocate (idx (l))
      do k = 1, l
          idx(k) = int%children(i)%get_link (k)
      end do
    end function interaction_get_children

    function interaction_get_parents (int, i) result (idx)
      integer, dimension(:), allocatable :: idx
      type(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      integer :: k, l
      l = int%parents(i)%get_length ()
      allocate (idx (l))
      do k = 1, l
```

```
        idx(k) = int%parents(i)%get_link (k)
      end do
    end function interaction_get_parents
```

Add a source link from an interaction to a corresponding particle within another
interaction. These links affect the propagation of particles: the two linked
particles are considered as the same particle, outgoing and incoming.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_set_source_link
```

⟨*Interactions: interfaces*⟩+≡
```
    interface interaction_set_source_link
       module procedure interaction_set_source_link_int
    end interface
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_set_source_link_int (int, i, int1, i1)
      type(interaction_t), intent(inout) :: int
      integer, intent(in) :: i
      type(interaction_t), intent(in), target :: int1
      integer, intent(in) :: i1
      if (i /= 0)  call external_link_set (int%source(i), int1, i1)
    end subroutine interaction_set_source_link_int
```

Reassign links to a new interaction (which is an image of the current interaction).

⟨*Interactions: public*⟩+≡
```
    public :: interaction_reassign_links
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_reassign_links (int, int_src, int_target)
      type(interaction_t), intent(inout) :: int
      type(interaction_t), intent(in) :: int_src
      type(interaction_t), intent(in), target :: int_target
      integer :: i
      if (allocated (int%source)) then
        do i = 1, size (int%source)
           call external_link_reassign (int%source(i), int_src, int_target)
        end do
      end if
    end subroutine interaction_reassign_links
```

Since links are one-directional, if we want to follow them backwards we have
to scan all possibilities. This procedure returns the index of the particle within
int which points to the particle i1 within interaction int1. If unsuccessful,
return zero.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_find_link
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_find_link (int, int1, i1) result (i)
      integer :: i
      type(interaction_t), intent(in) :: int, int1
      integer, intent(in) :: i1
      type(interaction_t), pointer :: int_tmp
```

```
        do i = 1, int%n_tot
           int_tmp => external_link_get_ptr (int%source(i))
           if (int_tmp%tag == int1%tag) then
              if (external_link_get_index (int%source(i)) == i1)  return
           end if
        end do
        i = 0
     end function interaction_find_link
```

The inverse: return interaction pointer and index for the ultimate source of i
within int.

⟨*Interactions: public*⟩+≡
```
     public :: interaction_find_source
```

⟨*Interactions: procedures*⟩+≡
```
     subroutine interaction_find_source (int, i, int1, i1)
       type(interaction_t), intent(in) :: int
       integer, intent(in) :: i
       type(interaction_t), intent(out), pointer :: int1
       integer, intent(out) :: i1
       type(external_link_t) :: link
       link = interaction_get_ultimate_source (int, i)
       int1 => external_link_get_ptr (link)
       i1 = external_link_get_index (link)
     end subroutine interaction_find_source
```

Follow source links recursively to return the ultimate source of a particle.

⟨*Interactions: procedures*⟩+≡
```
     function interaction_get_ultimate_source (int, i) result (link)
       type(external_link_t) :: link
       type(interaction_t), intent(in) :: int
       integer, intent(in) :: i
       type(interaction_t), pointer :: int_src
       integer :: i_src
       link = int%source(i)
       if (external_link_is_set (link)) then
          do
             int_src => external_link_get_ptr (link)
             i_src = external_link_get_index (link)
             if (external_link_is_set (int_src%source(i_src))) then
                link = int_src%source(i_src)
             else
                exit
             end if
          end do
       end if
     end function interaction_get_ultimate_source
```

Update mask entries by merging them with corresponding masks in interactions
linked to the current one. The mask determines quantum numbers which are
summed over.

Note that both the mask of the current interaction and the mask of the

linked interaction are updated (side effect!). This ensures that both agree for
the linked particle.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_exchange_mask
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_exchange_mask (int)
      type(interaction_t), intent(inout) :: int
      integer :: i, index_link
      type(interaction_t), pointer :: int_link
      do i = 1, int%n_tot
         if (external_link_is_set (int%source(i))) then
            int_link => external_link_get_ptr (int%source(i))
            index_link = external_link_get_index (int%source(i))
            call interaction_merge_mask_entry &
                 (int, i, int_link%mask(index_link))
            call interaction_merge_mask_entry &
                 (int_link, index_link, int%mask(i))
         end if
      end do
      call interaction_freeze (int)
    end subroutine interaction_exchange_mask
```

Copy momenta from interactions linked to the current one.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_receive_momenta
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_receive_momenta (int)
      type(interaction_t), intent(inout) :: int
      integer :: i, index_link
      type(interaction_t), pointer :: int_link
      do i = 1, int%n_tot
         if (external_link_is_set (int%source(i))) then
            int_link => external_link_get_ptr (int%source(i))
            index_link = external_link_get_index (int%source(i))
            call interaction_set_momentum (int, int_link%p(index_link), i)
         end if
      end do
    end subroutine interaction_receive_momenta
```

The inverse operation: Copy momenta back to the interactions linked to the
current one.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_send_momenta
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_send_momenta (int)
      type(interaction_t), intent(in) :: int
      integer :: i, index_link
      type(interaction_t), pointer :: int_link
      do i = 1, int%n_tot
         if (external_link_is_set (int%source(i))) then
            int_link => external_link_get_ptr (int%source(i))
```

```
                index_link = external_link_get_index (int%source(i))
                call interaction_set_momentum (int_link, int%p(i), index_link)
            end if
        end do
    end subroutine interaction_send_momenta
```

For numerical comparisons: pacify all momenta in an interaction.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_pacify_momenta
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_pacify_momenta (int, acc)
      type(interaction_t), intent(inout) :: int
      real(default), intent(in) :: acc
      integer :: i
      do i = 1, int%n_tot
         call pacify (int%p(i), acc)
      end do
    end subroutine interaction_pacify_momenta
```

7.6.8   Recovering connections

When creating an evaluator for two interactions, we have to know by which
particles they are connected. The connection indices can be determined if we
have two linked interactions. We assume that `int1` is the source and `int2` the
target, so the connections of interest are stored within `int2`. A connection is
found if either the source is `int1`, or the (ultimate) source of a particle within
`int2` coincides with the (ultimate) source of a aparticle within `int1`. The result
is an array of index pairs.

To make things simple, we scan the interaction twice, once for counting hits,
then allocate the array, then scan again and store the connections.

The connections are scanned for `int2`, which has sources in `int1`. It may
happen that the order of connections is interchanged (crossed). We require the
indices in `int1` to be sorted, so we reorder both index arrays correspondingly
before returning them. (After this, the indices in `int2` may be out of order.)

    subroutine interaction_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
    ⟨Interactions: execute tests⟩
    end subroutine interaction_test
```

Generate an interaction of a polarized virtual photon and a colored quark which
may be either up or down. Remove the quark polarization. Generate another
interaction for the quark radiating a photon and link this to the first interation.
The radiation ignores polarization; transfer this information to the first inter-
action to simplify it. Then, transfer the momentum to the radiating quark and
perform a splitting.

⟨*Interactions: execute tests*⟩≡

```

7.7 Matrix element evaluation

The `evaluator_t` type is an extension of the `interaction_t` type. It represents either a density matrix as the square of a transition matrix element, or the product of two density matrices. Usually, some quantum numbers are summed over in the result.

The `interaction_t` subobject represents a multi-particle interaction with incoming, virtual, and outgoing particles and the associated (not necessarily diagonal) density matrix of quantum state. When the evaluator is initialized, this interaction is constructed from the input interaction(s).

In addition, the initialization process sets up a multiplication table. For each matrix element of the result, it states which matrix elements are to be taken from the input interaction(s), multiplied (optionally, with an additional weight factor) and summed over.

Eventually, to a processes we associate a chain of evaluators which are to be evaluated sequentially. The physical event and its matrix element value(s) can be extracted from the last evaluator in such a chain.

Evaluators are constructed only once (as long as this is possible) during an initialization step. Then, for each event, momenta are computed and transferred among evaluators using the links within the interaction subobject. The multiplication tables enable fast evaluation of the result without looking at quantum numbers anymore.

  ⟨*Evaluators: parameters*⟩

  ⟨*Evaluators: types*⟩

  ⟨*Evaluators: interfaces*⟩

```
    contains

⟨Evaluators: procedures⟩

⟨Evaluators: tests⟩

    end module evaluators
```

7.7.1 Array of pairings

The evaluator contains an array of `pairing_array` objects. This makes up the multiplication table.

Each pairing array contains two list of matrix element indices and a list of numerical factors. The matrix element indices correspond to the input interactions. The corresponding matrix elements are to be multiplied and optionally multiplied by a factor. The results are summed over to yield one specific matrix element of the result evaluator.

⟨Evaluators: types⟩≡
```
    type :: pairing_array_t
       integer, dimension(:), allocatable :: i1, i2
       complex(default), dimension(:), allocatable :: factor
    end type pairing_array_t
```

⟨Evaluators: procedures⟩≡
```
    elemental subroutine pairing_array_init (pa, n, has_i2, has_factor)
      type(pairing_array_t), intent(out) :: pa
      integer, intent(in) :: n
      logical, intent(in) :: has_i2, has_factor
      allocate (pa%i1 (n))
      if (has_i2)  allocate (pa%i2 (n))
      if (has_factor)  allocate (pa%factor (n))
    end subroutine pairing_array_init
```

7.7.2 The evaluator type

Possible variants of evaluators:

⟨Evaluators: parameters⟩≡
```
    integer, parameter :: &
         EVAL_UNDEFINED = 0, &
         EVAL_PRODUCT = 1, &
         EVAL_SQUARED_FLOWS = 2, &
         EVAL_SQUARE_WITH_COLOR_FACTORS = 3, &
         EVAL_COLOR_CONTRACTION = 4, &
         EVAL_IDENTITY = 5, &
         EVAL_QN_SUM = 6
```

The evaluator type contains the result interaction and an array of pairing lists, one for each matrix element in the result interaction.

⟨Evaluators: public⟩≡
```
    public :: evaluator_t
```

⟨*Evaluators: types*⟩+≡
```
type :: evaluator_t
   private
   integer :: type = EVAL_UNDEFINED
   type(interaction_t), pointer :: int_in1 => null ()
   type(interaction_t), pointer :: int_in2 => null ()
   type(interaction_t) :: int
   type(pairing_array_t), dimension(:), allocatable :: pairing_array
 contains
 ⟨Evaluators: evaluator: TBP⟩
end type evaluator_t
```

```

7.7.3 Auxiliary structures for evaluator creation

Creating an evaluator that properly handles all quantum numbers requires some bookkeeping. In this section, we define several auxiliary types and methods that organize and simplify this task. More structures are defined within the specific initializers (as local types and internal subroutines).

These types are currently implemented in a partial object-oriented way: We define some basic methods for initialization etc. here, but the evaluator routines below do access their internals as well. This simplifies some things such as index addressing using array slices, at the expense of losing some clarity.

Index mapping

Index mapping are abundant when constructing an evaluator. To have arrays of index mappings, we define this:

⟨*Evaluators: types*⟩+≡
```
   type :: index_map_t
      integer, dimension(:), allocatable :: entry
   end type index_map_t
```

⟨*Evaluators: procedures*⟩+≡
```
   elemental subroutine index_map_init (map, n)
     type(index_map_t), intent(out) :: map
     integer, intent(in) :: n
     allocate (map%entry (n))
   end subroutine index_map_init
```

⟨*Evaluators: procedures*⟩+≡
```
   function index_map_exists (map) result (flag)
     logical :: flag
     type(index_map_t), intent(in) :: map
     flag = allocated (map%entry)
   end function index_map_exists
```

⟨*Evaluators: interfaces*⟩+≡
```
   interface size
      module procedure index_map_size
   end interface
```

⟨*Evaluators: procedures*⟩+≡
```
function index_map_size (map) result (s)
  integer :: s
  type(index_map_t), intent(in) :: map
  if (allocated (map%entry)) then
     s = size (map%entry)
  else
     s = 0
  end if
end function index_map_size
```

⟨*Evaluators: interfaces*⟩+≡
```
interface assignment(=)
   module procedure index_map_assign_int
   module procedure index_map_assign_array
end interface
```

⟨*Evaluators: procedures*⟩+≡
```
elemental subroutine index_map_assign_int (map, ival)
  type(index_map_t), intent(inout) :: map
  integer, intent(in) :: ival
  map%entry = ival
end subroutine index_map_assign_int

subroutine index_map_assign_array (map, array)
  type(index_map_t), intent(inout) :: map
  integer, dimension(:), intent(in) :: array
  map%entry = array
end subroutine index_map_assign_array
```

⟨*Evaluators: procedures*⟩+≡
```
elemental subroutine index_map_set_entry (map, i, ival)
  type(index_map_t), intent(inout) :: map
  integer, intent(in) :: i
  integer, intent(in) :: ival
  map%entry(i) = ival
end subroutine index_map_set_entry
```

⟨*Evaluators: procedures*⟩+≡
```
elemental function index_map_get_entry (map, i) result (ival)
  integer :: ival
  type(index_map_t), intent(in) :: map
  integer, intent(in) :: i
  ival = map%entry(i)
end function index_map_get_entry
```

Index mapping (two-dimensional)

This is a variant with a square matrix instead of an array.

⟨*Evaluators: types*⟩+≡
```
type :: index_map2_t
```

```
      integer :: s = 0
      integer, dimension(:,:), allocatable :: entry
    end type index_map2_t
```

⟨*Evaluators: procedures*⟩+≡
```
    elemental subroutine index_map2_init (map, n)
      type(index_map2_t), intent(out) :: map
      integer, intent(in) :: n
      map%s = n

      s = size (mask%entry)
    end function prt_mask_size
```

Quantum number containers

Trivial transparent containers:

⟨*Evaluators: types*⟩+≡

```
    type :: qn_list_t
      type(quantum_numbers_t), dimension(:,:), allocatable :: qn
    end type qn_list_t

    type :: qn_mask_array_t
      type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
    end type qn_mask_array_t
```

Auxiliary structures: connection entries

This type is used as intermediate storage when computing the product of two evaluators or the square of an evaluator. The quantum-number array `qn` corresponds to the particles common to both interactions, but irrelevant quantum numbers (color) masked out. The index arrays `index_in` determine the entries in the input interactions that contribute to this connection. `n_index` is the size of these arrays, and `count` is used while filling the entries. Finally, the quantum-number arrays `qn_in_list` are the actual entries in the input interaction that contribute. In the product case, they exclude the connected quantum numbers.

Each evaluator has its own `connection_table` which contains an array of `connection_entry` objects, but also has stuff that specifically applies to the evaluator type. Hence, we do not generalize the `connection_table_t` type.

The filling procedure `connection_entry_add_state` is specific to the various evaluator types.

⟨*Evaluators: types*⟩+≡
```
type :: connection_entry_t
   type(quantum_numbers_t), dimension(:), allocatable :: qn_conn
   integer, dimension(:), allocatable :: n_index
   integer, dimension(:), allocatable :: count
   type(index_map_t), dimension(:), allocatable :: index_in
   type(qn_list_t), dimension(:), allocatable :: qn_in_list
end type connection_entry_t
```

⟨*Evaluators: procedures*⟩+≡
```
subroutine connection_entry_init &
    (entry, n_count, n_map, qn_conn, count, n_rest)

        end if
        call quantum_numbers_write (entry%qn_in_list(i)%qn(:,j), unit)
        write (u, *)
     end do
  end do
end subroutine connection_entry_write
```

Color handling

For managing color-factor computation, we introduce this local type. The `index`
is the index in the color table that corresponds to a given matrix element index
in the input interaction. The `col` array stores the color assignments in rows.
The `factor` array associates a complex number with each pair of arrays in the
color table. The `factor_is_known` array reveals whether a given factor is known
already or still has to be computed.

⟨*Evaluators: types*⟩+≡
```
type :: color_table_t
   integer, dimension(:), allocatable :: index
   type(color_t), dimension(:,:), allocatable :: col
   logical, dimension(:,:), allocatable :: factor_is_known
   complex(default), dimension(:,:), allocatable :: factor
end type color_table_t
```

This is the initializer. We extract the color states from the given state matrices,
establish index mappings between the two states (implemented by the array
`me_index`), make an array of color states, and initialize the color-factor table.
The latter is two-dimensional (includes interference) and not yet filled.

⟨*Evaluators: procedures*⟩+≡
```
subroutine color_table_init (color_table, state, n_tot)
  type(color_table_t), intent(out) :: color_table
  type(state_matrix_t), intent(in) :: state
  integer, intent(in) :: n_tot
  type(state_iterator_t) :: it
```

```
      type(quantum_numbers_t), dimension(:), allocatable :: qn
      type(state_matrix_t) :: state_col
      integer :: index, n_col_state
      allocate (color_table%index &
          (state_matrix_get_n_matrix_elements (state)))
      color_table%index = 0
      allocate (qn (n_tot))
      call state_matrix_init (state_col)
      call state_iterator_init (it, state)
      do while (state_iterator_is_valid (it))
         index = state_iterator_get_me_index (it)
         call quantum_numbers_init (qn, col = state_iterator_get_color (it))
         call state_matrix_add_state (state_col, qn, &
             me_index = color_table%index(index))
         call state_iterator_advance (it)
      end do
      n_col_state = state_matrix_get_n_matrix_elements (state_col)
      allocate (color_table%col (n_tot, n_col_state))
      call state_iterator_init (it, state_col)
      do while (state_iterator_is_valid (it))
         index = state_iterator_get_me_index (it)
         color_table%col(:,index) = state_iterator_get_color (it)
         call state_iterator_advance (it)
      end do
      call state_matrix_final (state_col)
      allocate (color_table%factor_is_known (n_col_state, n_col_state))
      allocate (color_table%factor (n_col_state, n_col_state))
      color_table%factor_is_known = .false.
    end subroutine color_table_init
```

Output (debugging use):

⟨*Evaluators: procedures*⟩+≡

```
    subroutine color_table_write (color_table, unit)
      type(color_table_t), intent(in) :: color_table
      integer, intent(in), optional :: unit
      integer :: i, j
      integer :: u
      u = output_unit (unit)
      write (u, *) "Color table:"
      if (allocated (color_table%index)) then
         write (u, *) "  Index mapping state => color table:"
         do i = 1, size (color_table%index)
            write (u, "(3x,I0,2x,I0,2x)")  i, color_table%index(i)
         end do
         write (u, *) "  Color table:"
         do i = 1, size (color_table%col, 2)
            write (u, "(3x,I0,2x)", advance = "no")  i
            call color_write (color_table%col(:,i), unit)
            write (u, *)
         end do
         write (u, *) "  Defined color factors:"
         do i = 1, size (color_table%factor, 1)
            do j = 1, size (color_table%factor, 2)
                if (color_table%factor_is_known(i,j)) then
```

```
                write (u, *)  i, j, color_table%factor(i,j)
              end if
          end do
        end do
      end if
  end subroutine color_table_write
```

This subroutine sets color factors, based on information from the hard matrix element: the list of pairs of color-flow indices (in the basis of the matrix element code), the list of corresponding factors, and the list of mappings from the matrix element index in the input interaction to the color-flow index in the hard matrix element object.

We first determine the mapping of color-flow indices from the hard matrix element code to the current color table. The mapping could be nontrivial because the latter is derived from iterating over a state matrix, which may return states in non-canonical order. The translation table can be determined because we have, for the complete state matrix, both the mapping to the hard interaction (the input `col_index_hi`) and the mapping to the current color table (the component `color_table%index`).

Once this mapping is known, we scan the list of index pairs `color_flow_index` and translate them to valid color-table index pairs. For this pair, the color factor is set using the corresponding entry in the list `col_factor`.

⟨*Evaluators: procedures*⟩+≡
```
  subroutine color_table_set_color_factors (color_table, &
      col_flow_index, col_factor, col_index_hi)
    type(color_table_t), intent(inout) :: color_table
    integer, dimension(:,:), intent(in) :: col_flow_index
    complex(default), dimension(:), intent(in) :: col_factor
    integer, dimension(:), intent(in) :: col_index_hi
    integer, dimension(:), allocatable :: hi_to_ct
    integer :: n_cflow
    integer :: hi_index, me_index, ct_index, cf_index
    integer, dimension(2) :: hi_index_pair, ct_index_pair
    n_cflow = size (col_index_hi)
    if (size (color_table%index) /= n_cflow) &
        call msg_bug ("Mismatch between hard matrix element and color table")
    allocate (hi_to_ct (n_cflow))
    do me_index = 1, size (color_table%index)
       ct_index = color_table%index(me_index)
       hi_index = col_index_hi(me_index)
       hi_to_ct(hi_index) = ct_index
    end do
    do cf_index = 1, size (col_flow_index, 2)
       hi_index_pair = col_flow_index(:,cf_index)
       ct_index_pair = hi_to_ct(hi_index_pair)
       color_table%factor(ct_index_pair(1), ct_index_pair(2)) = &
            col_factor(cf_index)
       color_table%factor_is_known(ct_index_pair(1), ct_index_pair(2)) = .true.
    end do
  end subroutine color_table_set_color_factors
```

This function returns a color factor, given two indices which point to the matrix

elements of the initial state matrix. Internally, we can map them to the corresponding indices in the color table. As a side effect, we store the color factor in the color table for later lookup. (I.e., this function is impure.)

⟨*Evaluators: procedures*⟩+≡

```
function color_table_get_color_factor (color_table, index1, index2, nc) &
     result (factor)
  real(default) :: factor

  else
     factor = compute_color_factor &
          (color_table%col(:,i1), color_table%col(:,i2), nc)
     color_table%factor(i1,i2) = factor
     color_table%factor_is_known(i1,i2) = .true.
     ! print *, "  computed : ", factor                  !!! Debugging
  end if
 end function color_table_get_color_factor
```

7.7.4 Creating an evaluator: Matrix multiplication

The evaluator for matrix multiplication is the most complicated variant.

The initializer takes two input interactions and constructs the result evaluator, which consists of the interaction and the multiplication table for the product (or convolution) of the two. Normally, the input interactions are connected by one or more common particles (e.g., decay, structure function convolution).

In the result interaction, quantum numbers of the connections can be summed over. This is determined by the `qn_mask_conn` argument. The `qn_mask_rest` argument is its analog for the other particles within the result interaction. (E.g., for the trace of the state matrix, all quantum numbers are summed over.) Finally, the `connections_are_resonant` argument tells whether the connecting particles should be marked as resonant in the final event record. This is useful for decays.

The algorithm consists of the following steps:

1. `find_connections`: Find the particles which are connected, i.e., common to both input interactions. Either they are directly linked, or both are linked to a common source.

2. `compute_index_bounds_and_mappings`: Compute the mappings of particle indices from the input interactions to the result interaction. There is a separate mapping for the connected particles.

834

3. `accumulate_connected_states`: Create an auxiliary state matrix which lists the possible quantum numbers for the connected particles. When building this matrix, count the number of times each assignment is contained in any of the input states and, for each of the input states, record the index of the matrix element within the new state matrix. For the connected particles, reassign color indices such that no color state is present twice in different color-index assignment. Note that helicity assignments of the connected state can be (and will be) off-diagonal, so no spin correlations are lost in decays.

   Do this for both input interactions.

4. `allocate_connection_entries`: Allocate a table of connections. Each table row corresponds to one state in the auxiliary matrix, and to multiple states of the input interactions. It collects all states of the unconnected particles in the two input interactions that are associated with the particular state (quantum-number assignment) of the connected particles.

5. `fill_connection_table`: Fill the table of connections by scanning both input interactions. When copying states, reassign color indices for the unconnected particles such that they match between all involved particle sets (interaction 1, interaction 2, and connected particles).

6. `make_product_interaction`: Scan the table of connections we have just built. For each entry, construct all possible pairs of states of the unconnected particles and combine them with the specific connected-particle state. This is a possible quantum-number assignment of the result interaction. Now mask all quantum numbers that should be summed over, and append this to the result state matrix. Record the matrix element index of the result. We now have the result interaction.

7. `make_pairing_array`: First allocate the pairing array with the number of entries of the result interaction. Then scan the table of connections again. For each entry, record the indices of the matrix elements which have to be multiplied and summed over in order to compute this particular matrix element. This makes up the multiplication table.

8. `record_links`: Transfer all source pointers from the input interactions to the result interaction. Do the same for the internal parent-child relations and resonance assignments. For the connected particles, make up appropriate additional parent-child relations. This allows for fetching momenta from other interactions when a new event is filled, and to reconstruct the event history when the event is analyzed.

After all this is done, for each event, we just have to evaluate the pairing arrays (multiplication tables) in order to compute the result matrix elements in their proper positions. The quantum-number assignments remain fixed from now on.

7.7.5   Creating an evaluator: square

The generic initializer for an evaluator that squares a matrix element. Depending on the provided mask, we select the appropriate specific initializer for either diagonal or non-diagonal helicity density matrices.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_init_square
```

⟨*Evaluators: procedures*⟩+≡
```
    subroutine evaluator_init_square (eval, int_in, qn_mask, &

    end if
  end subroutine evaluator_init_square
```

Color-summed squared matrix (diagonal helicities)

The initializer for an evaluator that squares a matrix element, including color factors. The mask must be such that off-diagonal matrix elements are excluded.

If `color_flows` is set, the evaluator keeps color-flow entries separate and drops all interfering color structures. The color factors are set to unity in this case.

There is only one input interaction. The quantum-number mask is an array, one entry for each particle, so they can be treated individually. For academic purposes, we allow for the number of colors being different from three (but 3 is the default).

The algorithm is analogous to multiplication, with a few notable differences:

1. The connected particles are known, the correspondence is one-to-one. All particles are connected, and the mapping of indices is trivial, which simplifies the following steps.

2. `accumulate_connected_states`: The matrix of connected states encompasses all particles, but color indices are removed. However, ghost states are still kept separate from physical color states. No color-index reassignment is necessary.

3. The table of connections contains single index and quantum-number arrays instead of pairs of them. They are paired with themselves in all possible ways.

4. `make_squared_interaction`: Now apply the predefined quantum-numbers mask, which usually collects all color states (physical and ghosts), and possibly a helicity sum.

5. `make_pairing_array`: For each pair of input states, compute the color factor (including a potential ghost-parity sign) and store this in the pairing array together with the matrix-element indices for multiplication.

6. `record_links`: This is again trivial due to the one-to-one correspondence.

Copy with additional contracted color states

This evaluator involves no square or multiplication, its matrix elements are
just copies of the (single) input interaction. However, the state matrix of the
interaction contains additional states that have color indices contracted. This
is used for copies of the beam or structure-function interactions that need to
match the hard interaction also in the case where its color indices coincide.

Auxiliary procedure for initialization

This will become a standard procedure in F2008. The result is true if the number of true values in the mask is odd. We use the function for determining the ghost parity of a quantum-number array.

⟨*Evaluators: procedures*⟩+≡
```
    function parity (mask)
      logical :: parity
      logical, dimension(:) :: mask
      integer :: i
      parity = .false.
      do i = 1, size (mask)
         if (mask(i))  parity = .not. parity
      end do
    end function parity
```

7.7.6   Accessing contents

Return the interaction component, as a pointer to avoid any copying.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_get_int_ptr
```

⟨*Evaluators: procedures*⟩+≡
```
    function evaluator_get_int_ptr (eval) result (int)
      type(interaction_t), pointer :: int
      type(evaluator_t), intent(in), target :: eval
      int => eval%int
    end function evaluator_get_int_ptr
```

7.7.7 Inherited procedures

Return true if the state matrix within the interaction is empty.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_is_empty
```

⟨*Evaluators: procedures*⟩+≡
```
    function evaluator_is_empty (eval) result (flag)
      logical :: flag
      type(evaluator_t), intent(in) :: eval
      flag = interaction_is_empty (eval%int)
    end function evaluator_is_empty
```

Return the integer tag.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_get_tag
```

⟨*Evaluators: procedures*⟩+≡
```
    function evaluator_get_tag (eval) result (tag)
      integer :: tag
      type(evaluator_t), intent(in) :: eval
      tag = interaction_get_tag (eval%int)
    end function evaluator_get_tag
```

Get the norm of the state matrix (if the norm has been taken out, otherwise this would be unity).

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_get_norm
```

⟨*Evaluators: procedures*⟩+≡
```
    function evaluator_get_norm (eval) result (norm)
      real(default) :: norm
      type(evaluator_t), intent(in) :: eval
      norm = interaction_get_norm (eval%int)
    end function evaluator_get_norm
```

Return the number of particles.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_get_n_tot
    public :: evaluator_get_n_in
    public :: evaluator_get_n_vir
    public :: evaluator_get_n_out
```

⟨*Evaluators: procedures*⟩+≡
```
    function evaluator_get_n_tot (eval) result (n_tot)
      integer :: n_tot
      type(evaluator_t), intent(in) :: eval
      n_tot = interaction_get_n_tot (eval%int)
    end function evaluator_get_n_tot

    function evaluator_get_n_in (eval) result (n_in)
      integer :: n_in
      type(evaluator_t), intent(in) :: eval
      n_in = interaction_get_n_in (eval%int)
```

```
    end function evaluator_get_n_in

    function evaluator_get_n_vir (eval) result (n_vir)
      integer :: n_vir
      type(evaluator_t), intent(in) :: eval
      n_vir = interaction_get_n_vir (eval%int)
    end function evaluator_get_n_vir

    function evaluator_get_n_out (eval) result (n_out)
      integer :: n_out
      type(evaluator_t), intent(in) :: eval
      n_out = interaction_get_n_out (eval%int)
    end function evaluator_get_n_out
```

Return a specific matrix element.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_get_matrix_element
```

⟨*Evaluators: procedures*⟩+≡
```
    function evaluator_get_matrix_element (eval, i) result (value)
      complex(default) :: value
      type(evaluator_t), intent(in) :: eval
      integer :: i
      value = interaction_get_matrix_element (eval%int, i)
    end function evaluator_get_matrix_element
```

Sum all matrix element values.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_sum
```

⟨*Evaluators: procedures*⟩+≡
```
    function evaluator_sum (eval) result (value)
      complex(default) :: value
      type(evaluator_t), intent(in) :: eval
      value = interaction_sum (eval%int)
    end function evaluator_sum
```

Renormalize the state matrix by its trace, if nonzero. The renormalization is
reflected in the state-matrix norm.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_normalize_by_trace
```

⟨*Evaluators: procedures*⟩+≡
```
    subroutine evaluator_normalize_by_trace (eval)
      type(evaluator_t), intent(inout) :: eval
      call interaction_normalize_by_trace (eval%int)
    end subroutine evaluator_normalize_by_trace
```

Analogous, but renormalize by maximal (absolute) value.

⟨*Evaluators: public*⟩+≡
```

      call interaction_get_unstable_particle (eval%int, flv, p, i)
    end subroutine evaluator_get_unstable_particle
```

7.7.8 Deleting the evaluator

Only the interaction component needs finalization.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_final
```

⟨*Evaluators: procedures*⟩+≡
```
    elemental subroutine evaluator_final (eval)
      type(evaluator_t), intent(inout) :: eval
      call interaction_final (eval%int)
    end subroutine evaluator_final
```

7.7.9 Creating an evaluator: identity

The identity evaluator creates a copy of the first input evaluator; the second input is not used.

All particles link back to the input evaluatorand the internal relations are copied. As evaluation does take a shortcut by cloning the matrix elements, the pairing array is not used and does not have to be set up.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_init_identity
```

⟨*Evaluators: interfaces*⟩+≡
```
    interface evaluator_init_identity
       module procedure evaluator_init_identity_i

        call evaluator_init_identity_i (eval, eval1%int)
      end subroutine evaluator_init_identity_e
```

7.7.10 Creating an evaluator: quantum number sum

This evaluator operates on the diagonal of a density matrix and sums over the
quantum numbers specified by the mask. The optional argument `drop` allows
to drop a particle from the resulting density matrix. The handling of virtuals
is not completely sane, especially in connection with dropping particles.

When summing over matrix element entries, we keep the separation into
entries and normalization (in the corresponding evaluation routine below).

⟨*Evaluators: public*⟩+≡
```
      public :: evaluator_init_qn_sum
```

⟨*Evaluators: interfaces*⟩+≡
```
      interface evaluator_init_qn_sum
         module procedure evaluator_init_qn_sum_i
         module procedure evaluator_init_qn_sum_e
      end interface
```

⟨*Evaluators: procedures*⟩+≡
```

7.7.11 Evaluation

When the input interactions (which are pointed to in the pairings stored within the evaluator) are filled with values, we can activate the evaluator, i.e., calculate the result values which are stored in the interaction.

The evaluation of matrix elements can be done in parallel. A `forall` construct is not appropriate, however. We would need `do concurrent` here. Nev-

ertheless, the evaluation functions are marked as `pure`.

⟨*Evaluators: evaluator: TBP*⟩+≡
```
    procedure :: evaluate => evaluator_evaluate
```

⟨*Evaluators: procedures*⟩+≡
```
    subroutine evaluator_evaluate (eval)

```

7.7.12 Unit tests

Test: Create two interactions. The interactions are twofold connected. The first connection has a helicity index that is kept, the second connection has a helicity index that is summed over. Concatenate the interactions in an evaluator, which thus contains a result interaction. Fill the input interactions with values,

activate the evaluator and print the result.

Chapter 8

Particles

In this chapter, we deal with particles which have well-defined quantum numbers. While within interactions, all correlations are manifest, a particle array is derived by selecting a particular quantum number set. This involves tracing over all other particles, as far as polarization is concerned. Thus, a particle has definite flavor, color, and a single-particle density matrix for polarization.

8.1 Polarization

Particle polarization is determined by a particular quantum state which has just helicity information. For defining polarizations, we adopt the phase convention for a spin-1/2 particle that

$$\rho = \tfrac{1}{2}(1 + \vec{\alpha} \cdot \vec{\sigma}) \tag{8.1}$$

with the polarization axis $\vec{\alpha}$. Using this, we define

1. Trivial polarization: $\vec{\alpha} = 0$. [This is unpolarized, but distinct from the particular undefined polarization matrix which has the same meaning.]

2. Circular polarization: $\vec{\alpha}$ points in $\pm z$ direction.

3. Transversal polarization: $\vec{\alpha}$ points orthogonal to the z direction, with a phase ϕ that is 0 for the x axis, and $\pi/2 = 90°$ for the y axis. For antiparticles, the phase switches sign, corresponding to complex conjugation.

4. Axis polarization, where we explicitly give $\vec{\alpha}$.

For higher spin, we retain this definition, but apply it to the two components with maximum and minimum weight. For massless particles, this is sufficient. For massive particles, we add the possibilities:

5. Longitudinal polarization: Only the 0-component is set. This is possible only for bosons.

6. Diagonal polarization: Explicitly specify all components in the helicity basis.

Obviously, this does not exhaust the possible density matrices for higher spin, but it should cover all practical applications.

  ⟨*Polarizations: public*⟩

  ⟨*Polarizations: types*⟩

  ⟨*Polarizations: interfaces*⟩

  contains

  ⟨*Polarizations: procedures*⟩

  ⟨*Polarizations: tests*⟩

  end module polarizations

8.1.1 The polarization type

This is not an extension, but rather a restriction of the quantum state. Flavor and color are ignored, there is just a one-particle helicity density matrix.

⟨*Polarizations: public*⟩≡
    public :: polarization_t

⟨*Polarizations: types*⟩≡
    type :: polarization_t
       logical :: polarized = .false.
       integer :: spin_type = 0
       integer :: multiplicity = 0
       type(state_matrix_t) :: state
    end type polarization_t

8.1.2 Basic initializer and finalizer

We need the particle flavor for determining the allowed helicity values. The density matrix is not set, but prepared to be filled later. This is private.

⟨*Polarizations: procedures*⟩≡
```
elemental subroutine polarization_init (pol, flv)
  type(polarization_t), intent(out) :: pol
  type(flavor_t), intent(in) :: flv
  pol%spin_type = flavor_get_spin_type (flv)
  pol%multiplicity = flavor_get_multiplicity (flv)
  call state_matrix_init (pol%state, store_values = .true.)
end subroutine polarization_init
```

The finalizer has to be public. The quantum state contains memory allocated to pointers.

⟨*Polarizations: public*⟩+≡
```
public :: polarization_final
```

⟨*Polarizations: procedures*⟩+≡
```
elemental subroutine polarization_final (pol)
  type(polarization_t), intent(inout) :: pol
  call state_matrix_final (pol%state)
end subroutine polarization_final
```

8.1.3 I/O

⟨*Polarizations: public*⟩+≡
```
public :: polarization_write
```

⟨*Polarizations: procedures*⟩+≡
```
subroutine polarization_write (pol, unit)
  type(polarization_t), intent(in) :: pol
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit);  if (u < 0)  return
  write (u, "(1x,A,I1,A,I1,A)")  &
       "Polarization: [spin_type = ", pol%spin_type, &
       ", mult = ", pol%multiplicity, "]"
  call state_matrix_write (pol%state, unit=unit)
end subroutine polarization_write
```

Defined assignment: deep copy

⟨*Polarizations: public*⟩+≡
```
public :: assignment(=)
```

⟨*Polarizations: interfaces*⟩≡
```
interface assignment(=)
   module procedure polarization_assign
end interface
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_assign (pol_out, pol_in)
      type(polarization_t), intent(out) :: pol_out
      type(polarization_t), intent(in) :: pol_in
      pol_out%polarized = pol_in%polarized
      pol_out%spin_type = pol_in%spin_type
      pol_out%multiplicity = pol_in%multiplicity
      pol_out%state = pol_in%state
    end subroutine polarization_assign
```

Binary I/O.
    Note: currently disabled; state matrix raw I/O questionable.

⟨*Polarizations: public*⟩+≡
```
    public :: polarization_write_raw
    public :: polarization_read_raw
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_write_raw (pol, u)
      type(polarization_t), intent(in) :: pol
      integer, intent(in) :: u
      write (u) pol%polarized
      write (u) pol%spin_type
      write (u) pol%multiplicity
      if (state_matrix_is_defined (pol%state)) then
         call msg_bug ("Write polarization (raw): nontrivial state matrix not supported yet")
      else
         call state_matrix_write_raw (pol%state, u)
      end if
    end subroutine polarization_write_raw

    subroutine polarization_read_raw (pol, u, iostat)
      type(polarization_t), intent(out) :: pol
      integer, intent(in) :: u
      integer, intent(out), optional :: iostat
      read (u, iostat=iostat) pol%polarized
      read (u, iostat=iostat) pol%spin_type
      read (u, iostat=iostat) pol%multiplicity
      call state_matrix_read_raw (pol%state, u, iostat=iostat)
    end subroutine polarization_read_raw
```

8.1.4 Accessing contents

Return true if the particle is polarized. This is the case if the first (and only) entry in the quantum state has undefined helicity.

⟨*Polarizations: public*⟩+≡
```
    public :: polarization_is_polarized
```

⟨*Polarizations: procedures*⟩+≡
```
    elemental function polarization_is_polarized (pol) result (polarized)
      logical :: polarized
      type(polarization_t), intent(in) :: pol
      polarized = pol%polarized
```

```
      end function polarization_is_polarized
```

Return true if the polarization is diagonal, i.e., all entries in the density matrix are diagonal.

⟨*Polarizations: public*⟩+≡
```
    public :: polarization_is_diagonal
```

⟨*Polarizations: interfaces*⟩+≡
```
    interface polarization_is_diagonal
       module procedure polarization_is_diagonal0
       module procedure polarization_is_diagonal1
    end interface
```

⟨*Polarizations: procedures*⟩+≡
```
    function polarization_is_diagonal0 (pol) result (diagonal)
      logical :: diagonal
      type(polarization_t), intent(in) :: pol
      type(state_iterator_t) :: it
      diagonal = .true.
      call state_iterator_init (it, pol%state)
      do while (state_iterator_is_valid (it))
         diagonal = all (quantum_numbers_are_diagonal &
              (state_iterator_get_quantum_numbers (it)))
         if (.not. diagonal) exit
         call state_iterator_advance (it)
      end do
    end function polarization_is_diagonal0

    function polarization_is_diagonal1 (pol) result (diagonal)
      type(polarization_t), dimension(:), intent(in) :: pol
      logical, dimension(size(pol)) :: diagonal
      integer :: i
      do i = 1, size (pol)
         diagonal(i) = polarization_is_diagonal0 (pol(i))
      end do
    end function polarization_is_diagonal1
```

8.1.5   Initialization from state matrix

Here, the state matrix is already known (but not necessarily normalized). The result will be either unpolarized, or a normalized spin density matrix.

⟨*Polarizations: public*⟩+≡
```
    public :: polarization_init_state_matrix
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_init_state_matrix (pol, state)
      type(polarization_t), intent(out) :: pol
      type(state_matrix_t), intent(in), target :: state
      type(state_iterator_t) :: it
      type(flavor_t) :: flv
      type(helicity_t) :: hel
      type(quantum_numbers_t), dimension(1) :: qn
```

```
   complex(default) :: value, t
   call state_iterator_init (it, state)
   flv = state_iterator_get_flavor (it, 1)

```

8.1.6 Specific initializers

Unpolarized particle, no helicity labels in the density matrix. The value is
specified as $1/N$, where N is the multiplicity.

Exception: for left-handed or right-handed particles (neutrinos), polarization
is always circular with fraction unity.

⟨*Polarizations: public*⟩+≡
```

     end if
   end subroutine polarization_init_unpolarized
```

Unpolarized particle, but explicit density matrix with helicity states allocated according to given flavor. Note that fermions have even spin type, bosons odd. The spin density matrix entries are scaled by `fraction`. This is used for initializing other polarizations:

$$\rho(f) = \frac{|f|}{N}\mathbf{1}.$$

      call state_matrix_freeze (pol%state)
```

```
      call state_matrix_set_matrix_element (pol%state, value)
    end subroutine polarization_init_trivial
```

The following three modes are useful mainly for spin-1/2 particle and massless particles of any nonzero spin. Only the highest-weight components are filled.

Circular polarization: The density matrix of the two highest-weight states is

$$\rho(f) = \frac{1-|f|}{2}\mathbf{1} + |f| \times \begin{cases} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}, & f > 0; \\ \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}, & f < 0, \end{cases}$$

If the polarization fraction $|f|$ is unity, we need only one entry in the density matrix.

⟨*Polarizations: public*⟩+≡
```
    public :: polarization_init_circular
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_init_circular (pol, flv, fraction)
      type(polarization_t), intent(out) :: pol
      type(flavor_t), intent(in) :: flv
      real(default), intent(in) :: fraction
      type(helicity_t), dimension(2) :: hel
      type(quantum_numbers_t), dimension(1) :: qn
      complex(default) :: value
      integer :: hmax
      call polarization_init (pol, flv)
      pol%polarized = .true.
      hmax = pol%spin_type / 2
      call helicity_init (hel(1), hmax)
      call helicity_init (hel(2),-hmax)
      if (abs (fraction) /= 1) then
         value = (1 + fraction) / 2
         call quantum_numbers_init (qn(1), hel(1))
         call state_matrix_add_state (pol%state, qn, value=value)
         value = (1 - fraction) / 2
         call quantum_numbers_init (qn(1), hel(2))
         call state_matrix_add_state (pol%state, qn, value=value)
      else
         value = abs (fraction)
         if (fraction > 0) then
            call quantum_numbers_init (qn(1), hel(1))
         else
            call quantum_numbers_init (qn(1), hel(2))
         end if
         call state_matrix_add_state (pol%state, qn, value=value)
      end if
      call state_matrix_freeze (pol%state)
    end subroutine polarization_init_circular
```

Transversal polarization is analogous to circular, but we get a density matrix

$$\rho(f, \phi) = \frac{1 - |f|}{2} \mathbf{1} + \frac{|f|}{2} \begin{pmatrix} 1 & e^{-i\phi} \\ e^{i\phi} & 1 \end{pmatrix}.$$

The phase is $\phi = 0$ for the x-axis, $\phi = 90°$ for the y axis as polarization vector. For an antiparticle, the phase switches sign, and for $f < 0$, the off-diagonal elements switch sign.

⟨*Polarizations: public*⟩+≡
```
    public :: polarization_init_transversal
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_init_transversal (pol, flv, phi, fraction)
      type(polarization_t), intent(inout) :: pol
      type(flavor_t), intent(in) :: flv
      real(default), intent(in) :: phi, fraction
      call polarization_init_axis &
           (pol, flv, fraction * (/ cos (phi), sin (phi), 0._default/))
    end subroutine polarization_init_transversal
```

For axis polarization, we again set only the entries with maximum weight.

$$\rho(f, \phi) = \frac{1}{2} \begin{pmatrix} 1 + \alpha_3 & \alpha_1 - i\alpha_2 \\ \alpha_1 + i\alpha_2 & 1 - \alpha_3 \end{pmatrix}.$$

For an antiparticle, α_2 switches sign (complex conjugate).

⟨*Polarizations: public*⟩+≡
```
    public :: polarization_init_axis

8.1.7   Operations

Combine polarization states by computing the outer product of the state matrices.

⟨*Polarizations: public*⟩+≡
```
    public :: combine_polarization_states
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine combine_polarization_states (pol, state)
      type(polarization_t), dimension(:), intent(in), target :: pol
      type(state_matrix_t), intent(out) :: state
      call outer_multiply (pol%state, state)
    end subroutine combine_polarization_states
```

Transform a polarization density matrix into a polarization vector. This is possible without information loss only for spin-1/2 and for massless particles. To get a unique answer in all cases, we consider only the components with highest weight. Obviously, this loses the longitudinal component of a massive vector, for instance.

This is the inverse operation of `polarization_init_axis` above, where the polarization fraction is set to unity.

⟨*Polarizations: public*⟩+≡

         phi = 0
      end if
   end subroutine polarization_to_angles
```

8.1.8 Sparse Matrix

We introduce a simpler implementation of a sparse matrix that should represent
polarization. It consists of an integer array that represents the index values,
and a complex array that represents the nonvanishing entries. The number of
nonvanishing entries must be known for initialization, but the entries are filled
one at a time.

This should eventually replace the more baroque polarization definition
above, but in the first stage we introduce it just as an intermediage storage
container.

Here is a base type without the special properties of a spin-density matrix.

⟨*Polarizations: public*⟩+≡
```
   public :: smatrix_t
```

⟨*Polarizations: types*⟩+≡
```
   type :: smatrix_t
     private
     integer :: dim = 0
     integer :: n_entry = 0
     integer, dimension(:,:), allocatable :: index
     complex(default), dimension(:), allocatable :: value
    contains
   ⟨Polarizations: smatrix: TBP⟩
   end type smatrix_t
```

Output.

⟨*Polarizations: smatrix: TBP*⟩≡
```
   procedure :: write => smatrix_write
```

⟨*Polarizations: procedures*⟩+≡
```
   subroutine smatrix_write (object, unit, indent)
     class(smatrix_t), intent(in) :: object
     integer, intent(in), optional :: unit, indent
     integer :: u, i, ind
     u = output_unit (unit)
     ind = 0;  if (present (indent))  ind = indent
     if (allocated (object%value)) then
```

```
            if (size (object%value) > 0) then
               do i = 1, object%n_entry
                  write (u, "(1x,A,'@(')", advance="no")  repeat ("  ", ind)
                  write (u, "(SP,9999(I2.1,':',1x))", advance="no") &
                       object%index(:,i)
                  write (u, "('(',"  // FMT_19 // ",',',"  // FMT_19 // &
                       ",')')')")  object%value(i)
               end do
            else
               write (u, "(1x,A)", advance="no")  repeat ("  ", ind)
               write (u, "(A)")  "[empty matrix]"
            end if
         else
            write (u, "(1x,A)", advance="no")  repeat ("  ", ind)
            write (u, "(A)")  "[undefined matrix]"
         end if
       end subroutine smatrix_write
```

Initialization: allocate arrays to the correct size. We specify both the dimension
of the matrix (if different from two, this is rather a generic tensor) and the
number of nonvanishing entries.

⟨*Polarizations: smatrix: TBP*⟩+≡
```
    procedure :: init => smatrix_init
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine smatrix_init (smatrix, dim, n_entry)
      class(smatrix_t), intent(out) :: smatrix
      integer, intent(in) :: dim
      integer, intent(in) :: n_entry
      smatrix%dim = dim
      smatrix%n_entry = n_entry
      allocate (smatrix%index (dim, n_entry))
      allocate (smatrix%value (n_entry))
    end subroutine smatrix_init
```

Fill: one entry at a time.

⟨*Polarizations: smatrix: TBP*⟩+≡
```
    procedure :: set_entry => smatrix_set_entry
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine smatrix_set_entry (smatrix, i, index, value)
      class(smatrix_t), intent(inout) :: smatrix
      integer, intent(in) :: i
      integer, dimension(:), intent(in) :: index
      complex(default), intent(in) :: value
      smatrix%index(:,i) = index
      smatrix%value(i) = value
    end subroutine smatrix_set_entry
```

8.1.9   Polarization Matrix

As an extension of the more generic `smatrix` type, we implement a proper
spin-density matrix. After the matrix has been filled, we can fix spin type and

multiplicity for a particle, check the matrix for consistency, and normalize it if
necessary.

⟨*Polarizations: public*⟩+≡
```
    public :: pmatrix_t
```

⟨*Polarizations: types*⟩+≡
```
    type, extends (smatrix_t) :: pmatrix_t
      private
      integer :: spin_type = 0
      integer :: multiplicity = 0
      logical :: massive = .true.
      integer :: chirality = 0
      real(default) :: degree = 1
      logical :: pure = .false.
    contains
    ⟨Polarizations: pmatrix: TBP⟩
    end type pmatrix_t
```

Output, including extra data. (The `indent` argument is ignored.)

⟨*Polarizations: pmatrix: TBP*⟩≡
```
    procedure :: write => pmatrix_write
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine pmatrix_write (object, unit, indent)
      class(pmatrix_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
      integer :: u
      u = output_unit (unit)
      write (u, "(1x,A)")  "Polarization: spin density matrix"
      write (u, "(3x,A,I0)")  "spin type     = ", object%spin_type
      write (u, "(3x,A,I0)")  "multiplicity  = ", object%multiplicity
      write (u, "(3x,A,L1)")  "massive       = ", object%massive
      write (u, "(3x,A,I0)")  "chirality     = ", object%chirality
      write (u, "(3x,A,F10.7)")  "pol.degree    =", object%degree
      write (u, "(3x,A,L1)")  "pure state    = ", object%pure
      call object%smatrix_t%write (u, 1)
    end subroutine pmatrix_write
```

This assignment is trivial, but must be coded explicitly.

⟨*Polarizations: pmatrix: TBP*⟩+≡
```
    generic :: assignment(=) => pmatrix_assign_from_smatrix
    procedure, private :: pmatrix_assign_from_smatrix
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine pmatrix_assign_from_smatrix (pmatrix, smatrix)
      class(pmatrix_t), intent(out) :: pmatrix
      type(smatrix_t), intent(in) :: smatrix
      pmatrix%smatrix_t = smatrix
    end subroutine pmatrix_assign_from_smatrix
```

Declare spin, multiplicity, and polarization degree. Check whether all entries
fit, and whether this is a valid matrix.

The required properties are:

1. all entries apply to the given spin and mass type

2. the diagonal is real

3. only the upper of corresponding off-diagonal elements is specified, i.e., the row index is less than the column index

4. the trace is nonnegative and equal to the polarization degree (the remainder, proportional to the unit matrix, is understood to be present)

5. the trace of the matrix square is positive and less or equal to the trace of the matrix itself, which is the polarization degree. (If it is equal, we are dealing with a pure state).

⟨*Polarizations: pmatrix: TBP*⟩+≡
```
procedure :: normalize => pmatrix_normalize
```

⟨*Polarizations: procedures*⟩+≡
```

8.2.1 The particle type

Particle status codes

The overall status codes (incoming/outgoing etc.) are inherited from the module `subevents`.

Polarization status:

⟨*Particles: parameters*⟩≡
```
integer, parameter, public :: PRT_UNPOLARIZED = 0
integer, parameter, public :: PRT_DEFINITE_HELICITY = 1
integer, parameter, public :: PRT_GENERIC_POLARIZATION = 2
```

Definition

The quantum numbers are flavor (from which invariant particle properties can be derived), color, and polarization. The particle may be unpolarized. In this case, `hel` and `pol` are unspecified. If it has a definite helicity, the `hel` component is defined. If it has a generic polarization, the `pol` component is defined. For each particle we store the four-momentum and the invariant mass squared, i.e., the squared norm of the four-momentum. There is also an optional list of parent and child particles, for bookkeeping in physical events.

⟨*Particles: public*⟩≡
```
public :: particle_t
```

⟨*Particles: types*⟩≡
```
type :: particle_t
   private
   integer :: status = PRT_UNDEFINED
   integer :: polarization = PRT_UNPOLARIZED
   type(flavor_t) :: flv
   type(color_t) :: col
   type(helicity_t) :: hel
   type(polarization_t) :: pol
   type(vector4_t) :: p = vector4_null
   real(default) :: p2 = 0
   integer, dimension(:), allocatable :: parent
   integer, dimension(:), allocatable :: child
 end type particle_t
```

Particle initializers:

⟨*Particles: interfaces*⟩≡
```
interface particle_init
   module procedure particle_init_particle
   module procedure particle_init_state
   module procedure particle_init_hepmc
end interface
```

Copy a particle. (Deep copy) The excludes the parent-child relations.

⟨*Particles: procedures*⟩≡
```
subroutine particle_init_particle (prt_out, prt_in)
  type(particle_t), intent(out) :: prt_out
  type(particle_t), intent(in) :: prt_in
  prt_out%status = prt_in%status
  prt_out%polarization = prt_in%polarization
  prt_out%flv = prt_in%flv
  prt_out%col = prt_in%col
  prt_out%hel = prt_in%hel
  prt_out%pol = prt_in%pol
  prt_out%p = prt_in%p
  prt_out%p2 = prt_in%p2
end subroutine particle_init_particle
```

Initialize a particle using a single-particle state matrix which determines flavor, color, and polarization. The state matrix must have unique flavor and color. The factorization mode determines whether the particle is unpolarized, has definite helicity, or generic polarization. This mode is translated into the polarization status.

⟨*Particles: procedures*⟩+≡
```
subroutine particle_init_state (prt, state, status, mode)
  type(particle_t), intent(out) :: prt
  type(state_matrix_t), intent(in) :: state
  integer, intent(in) :: status, mode
  type(state_iterator_t) :: it
  prt%status = status
  call state_iterator_init (it, state)
  prt%flv = state_iterator_get_flavor (it, 1)
  if (flavor_is_beam_remnant (prt%flv))  prt%status = PRT_BEAM_REMNANT
  prt%col = state_iterator_get_color (it, 1)
  select case (mode)
  case (FM_SELECT_HELICITY)
     prt%hel = state_iterator_get_helicity (it, 1)
     prt%polarization = PRT_DEFINITE_HELICITY
  case (FM_FACTOR_HELICITY)
     call polarization_init_state_matrix (prt%pol, state)
     prt%polarization = PRT_GENERIC_POLARIZATION
  end select
end subroutine particle_init_state
```

Initialize a particle from a HepMC particle object. The model is necessary for making a fully qualified flavor component. We have the additional flag

polarized which tells whether the polarization information should be interpreted or ignored, and the lookup array of barcodes. Note that the lookup array is searched linearly, a possible bottleneck for large particle arrays. If necessary, the barcode array could be replaced by a hash table.

⟨*Particles: procedures*⟩+≡

```
subroutine particle_init_hepmc (prt, hprt, model, polarization, barcode)
  type(particle_t), intent(out) :: prt
  type(hepmc_particle_t), intent(in) :: hprt

    end function particle_get_p2
```

8.2.2 Particle sets

A particle set is what is usually called an event: an array of particles. The
individual particle entries carry momentum, quantum numbers, polarization,
and optionally connections. There is (also optionally) a correlated state-density
matrix that maintains spin correlations that are lost in the individual particle
entries.

⟨*Particles: public*⟩+≡
```
    public :: particle_set_t
```

⟨*Particles: types*⟩+≡
```
    type :: particle_set_t
       ! private
       integer :: n_beam = 0
       integer :: n_in  = 0
       integer :: n_vir = 0
       integer :: n_out = 0
       integer :: n_tot = 0
       type(particle_t), dimension(:), allocatable :: prt
       type(state_matrix_t) :: correlated_state
    end type particle_set_t
```

A particle set can be initialized from an interaction or from a HepMC event record.

⟨*Particles: public*⟩+≡
```
    public :: particle_set_init
```

⟨*Particles: interfaces*⟩+≡
```
    interface particle_set_init
       module procedure particle_set_init_interaction
       module procedure particle_set_init_hepmc
    end interface
```

When a particle set is initialized from a given interaction, we have to determine the branch within the original state matrix that fixes the particle quantum numbers. This is done with the appropriate probabilities, based on a random number `x`. The `mode` determines whether the individual particles become unpolarized, or take a definite (diagonal) helicity, or acquire single-particle polarization matrices. The flag `keep_correlations` tells whether the spin-correlation matrix is to be calculated and stored in addition to the particles. The flag `keep_virtual` tells whether virtual particles should be dropped. Note that if virtual particles are dropped, the spin-correlation matrix makes no sense, and parent-child relations are not set.

For a correct disentangling of color and flavor (in the presence of helicity), we consider two interactions. `int` has no color information, and is used to select a flavor state. Consequently, we trace over helicities here. `int_flows` contains color-flow and potentially helicity information, but is useful only after the flavor combination has been chosen. So this interaction is used to select helicity and color, but restricted to the selected flavor combination.

`int` and `int_flows` may be identical if there is only a single (or no) color flow. If there is just a single flavor combination, `x(1)` can be set to zero.

The current algorithm of evaluator convolution requires that the beam particles are assumed outgoing (in the beam interaction) and become virtual in all derived interactions. In the particle set they should be re-identified as incoming. The optional integer `n_incoming` can be used to perform this correction.

The flag `is_valid` is false if factorization of the state is not possible, in particular if the squared matrix element is zero.

⟨*Particles: procedures*⟩+≡
```
    subroutine particle_set_init_interaction &
         (particle_set, is_valid, int, int_flows, mode, x, &
          keep_correlations, keep_virtual, n_incoming)
      type(particle_set_t), intent(out) :: particle_set

          write (u, "(3x,A)") "[empty]"
       end if
    end subroutine particle_set_write
```

8.2.3 I/O formats

Here, we define input/output of particle sets in various formats. This is the right place since particle sets contain most of the event information.

All write/read routines take as first argument the object, as second argument the I/O unit which in this case is a mandatory argument. Then follow further event data.

Internal binary format

This format is supposed to contain the complete information, so the particle data set can be fully reconstructed. The exception is the model part of the particle flavors; this is unassigned for the flavor values read from file.

NOTE: The input routine for a nontrivial state matrix is broken

⟨*Particles: public*⟩+≡
```

HepMC format

The master output function fills a HepMC GenEvent object that is already initialized, but has no vertices in it.

We first set up the vertex lists and enter the vertices into the HepMC event. Then, we assign first all incoming particles and then all outgoing particles to their associated vertices. Particles which have neither parent nor children entries (this should not happen) are dropped.

Finally, we insert the beam particles. If there are none, use the incoming particles instead. Transform a particle into a `hepmc_particle` object, including color and polarization. The HepMC status is equivalent to the HEPEVT status, in particular: $0 =$ null entry, $1 =$ physical particle, $2 =$ decayed/fragmented SM hadron, tau or muon, $3 =$ other unphysical particle entry, $4 =$ incoming particles, $11 =$ intermediate resonance such as squarks. The use of 11 for intermediate resonances is as done by HERWIG, see http://herwig.hepforge.org/trac/wiki/FaQs.

Transform a particle set into HEPEVT-compatible form. In this form, for each
particle, the parents and the children are contiguous in the particle array. Usu-
ally, this requires to clone some particles.

We do not know in advance how many particles the canonical form will have.
To be on the safe side, allocate four times the original size.

Reconstruct the momenta within an interaction object from a particle set. We start from the incoming particles, which should be stored at the beginning. (The number of incoming particles is provided separately, so we do not need to analyze the interaction or particle set for this.) We follow their children down the tree until the interaction is exhausted.

This implies that the particle set may contain a longer tree (e.g., decay chains) than the interaction. The remainder of the tree is simply ignored.

The detailed ordering of the subsequent sub-interactions may differ between the interaction and the particle set. However, within each sub-interaction, the ordering of particles must match.

It may happen that the particle set lacks beam and remnant particles which are present in the interaction. In this case, the beam particles (the first two entries in the interaction) will not be filled. However, we can use the source link of the beam particles to recover their momenta from the actual beam interaction (which is stored somewhere else), and then recover the beam-remnant momenta as the difference of the beam and parton momenta.

```

This reconstructs the hard interaction from a particle set. First the particle set
is reduced to the incoming partons, then we add the direct children of those.
The interaction and particle set should match in their array sizes. If we find a
permutation of the particle flavors that matches one of the given flavor states,
the assignment of momenta is made accordingly.

```

Given a particle set with an arbitrary ordering of particles, we need the permutation that yields an ordering that is present in the state matrix. This can be found by examining the flavor table. The result is a permutation of the PDG array that matches a row in the flavor table. If ok is returned false, no match was found.

⟨*Particles: procedures*⟩+≡

```
    subroutine find_flavor_ordering (flv_state, pdg, n_in, perm, ok)

```

This procedure reconstructs an array of vertex indices from the parent-child information in the particle entries, according to the HepMC scheme. For each particle, we determine which vertex it comes from and which vertex it goes to. We return the two arrays and the maximum vertex index.

For each particle in the list, we first check its parents. If for any parent the vertex where it goes to is already known, this vertex index is assigned as the current 'from' vertex. Otherwise, a new index is created, assigned as the current 'from' vertex, and as the 'to' vertex for all parents.

Then, the analogous procedure is done for the children.

         call pacify (pset%prt(i))
      end do
    end subroutine pacify_particle_set
```

8.2.5 Unit tests

Set up a chain of production and decay and factorize the result into particles.
The process is $d\bar{d} \to Z \to q\bar{q}$.

⟨*Particles: public*⟩+≡
```
    public :: particles_test
```

⟨*Particles: procedures*⟩+≡
```

Chapter 9

Initial State

9.1 Beam structure

This module stores the beam structure definition as it is declared in the SIN-DARIN script. The structure definition is not analyzed, just recorded for later use.

We do not capture any numerical parameters, just names of particles and structure functions.

⟨**beam_structures.f90**⟩≡
  ⟨*File header*⟩

  ```
  module beam_structures
```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
  ⟨*Use file utils*⟩
  ```
    use limits, only: FMT_19 !NODEP!
    use diagnostics !NODEP!
    use lorentz !NODEP!
    use unit_tests

    use variables
    use polarizations
```

  ⟨*Standard module head*⟩

  ⟨*Beam structures: public*⟩

  ⟨*Beam structures: types*⟩

  ⟨*Beam structures: interfaces*⟩

  ```
  contains
```

  ⟨*Beam structures: procedures*⟩

  ⟨*Beam structures: tests*⟩

```
    end module beam_structures
```

9.1.1   Beam structure elements

An entry in a beam-structure record consists of a string that denotes a type of structure function.

⟨*Beam structures: types*⟩≡
```
    type :: beam_structure_entry_t
      logical :: is_valid = .false.
      type(string_t) :: name
     contains
     ⟨Beam structures: beam structure entry: TBP⟩
    end type beam_structure_entry_t
```

Output.

⟨*Beam structures: beam structure entry: TBP*⟩≡
```
    procedure :: to_string => beam_structure_entry_to_string
```

⟨*Beam structures: procedures*⟩≡
```
    function beam_structure_entry_to_string (object) result (string)
      class(beam_structure_entry_t), intent(in) :: object
      type(string_t) :: string
      if (object%is_valid) then
         string = object%name
      else
         string = "none"
      end if
    end function beam_structure_entry_to_string
```

A record in the beam-structure sequence denotes either a structure-function entry, a pair of such entries, or a pair spectrum.

⟨*Beam structures: types*⟩+≡
```
    type :: beam_structure_record_t
      type(beam_structure_entry_t), dimension(:), allocatable :: entry
    end type beam_structure_record_t
```

9.1.2   Beam structure type

The beam-structure object contains the beam particle(s) as simple strings. The sequence of records indicates the structure functions by name. No numerical parameters are stored.

⟨*Beam structures: public*⟩≡
```
    public :: beam_structure_t
```

⟨*Beam structures: types*⟩+≡
```
    type :: beam_structure_t
      private
      integer :: n_beam = 0
      type(string_t), dimension(:), allocatable :: prt
      type(beam_structure_record_t), dimension(:), allocatable :: record
      type(smatrix_t), dimension(:), allocatable :: smatrix
```

```
      real(default), dimension(:), allocatable :: pol_f
      real(default), dimension(:), allocatable :: p
      real(default), dimension(:), allocatable :: theta
      real(default), dimension(:), allocatable :: phi
    contains
    ⟨Beam structures: beam structure: TBP⟩
    end type beam_structure_t
```

The finalizer deletes all contents explicitly, so we can continue with an empty
beam record. (It is not needed for deallocation.) We have distinct finalizers for
the independent parts of the beam structure.

⟨*Beam structures: beam structure: TBP*⟩≡
```
    procedure :: final_sf => beam_structure_final_sf
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_final_sf (object)
      class(beam_structure_t), intent(inout) :: object
      if (allocated (object%prt))  deallocate (object%prt)
      if (allocated (object%record))  deallocate (object%record)
      object%n_beam = 0
    end subroutine beam_structure_final_sf
```

Output. The actual information fits in a single line, therefore we can provide a
`to_string` method. The `show` method also lists the current values of relevant
global variables.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: write => beam_structure_write
    procedure :: to_string => beam_structure_to_string
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_write (object, unit)
      class(beam_structure_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u, i
      u = output_unit (unit)
      write (u, "(1x,A,A)")  "Beam structure: ", char (object%to_string ())

         end do
      else
         allocate (beam_structure%record (0))
      end if
   end subroutine beam_structure_init_sf
```

Set an entry, specified by record number and entry number.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
   procedure :: set_sf => beam_structure_set_sf
```

⟨*Beam structures: procedures*⟩+≡
```
   subroutine beam_structure_set_sf (beam_structure, i, j, name)
     class(beam_structure_t), intent(inout) :: beam_structure
     integer, intent(in) :: i, j
     type(string_t), intent(in) :: name
     associate (entry => beam_structure%record(i)%entry(j))
       entry%name = name
       entry%is_valid = .true.
     end associate
   end subroutine beam_structure_set_sf
```

Expand the beam-structure object. (i) For a pair spectrum, keep the entry. (ii) For a single-particle structure function written as a single entry, replace this by a record with two entries. (ii) For a record with two nontrivial entries, separate this into two records with one trivial entry each.

To achieve this, we need a function that tells us whether an entry is a spectrum or a structure function. It returns 0 for a trivial entry, 1 for a single-particle structure function, and 2 for a two-particle spectrum.

⟨*Beam structures: interfaces*⟩≡
```
   abstract interface
     function strfun_mode_fun (name) result (n)
       import
       type(string_t), intent(in) :: name
       integer :: n
     end function strfun_mode_fun
   end interface
```

Algorithm: (1) Mark entries as invalid where necessary. (2) Count the number of entries that we will need. (3) Expand and copy entries to a new record array. (4) Replace the old array by the new one.

⟨*Beam structures: beam structure: TBP*⟩+≡
```

     end do
  call move_alloc (from = new, to = beam_structure%record)
end subroutine beam_structure_expand
```

9.1.3   Polarization

To record polarization, we provide an allocatable array of `smatrix` objects,
sparse matrices. The polarization structure is independent of the structure-
function setup, they are combined only when an actual beam object is con-
structed.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: final_pol => beam_structure_final_pol
    procedure :: init_pol => beam_structure_init_pol
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_final_pol (beam_structure)
      class(beam_structure_t), intent(inout) :: beam_structure
      if (allocated (beam_structure%smatrix))  deallocate (beam_structure%smatrix)
      if (allocated (beam_structure%pol_f))  deallocate (beam_structure%pol_f)
    end subroutine beam_structure_final_pol

    subroutine beam_structure_init_pol (beam_structure, n)
      class(beam_structure_t), intent(inout) :: beam_structure
      integer, intent(in) :: n
      if (allocated (beam_structure%smatrix))  deallocate (beam_structure%smatrix)
      allocate (beam_structure%smatrix (n))
      if (.not. allocated (beam_structure%pol_f)) &
           allocate (beam_structure%pol_f (n), source = 1._default)
    end subroutine beam_structure_init_pol
```

Directly copy the spin density matrices.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: set_smatrix => beam_structure_set_smatrix
```

⟨Beam structures: procedures⟩+≡
```
    subroutine beam_structure_set_smatrix (beam_structure, i, smatrix)
      class(beam_structure_t), intent(inout) :: beam_structure
      integer, intent(in) :: i
      type(smatrix_t), intent(in) :: smatrix
      beam_structure%smatrix(i) = smatrix
    end subroutine beam_structure_set_smatrix
```

Initialize one of the spin density matrices manually.
⟨Beam structures: beam structure: TBP⟩+≡
```
    procedure :: init_smatrix => beam_structure_init_smatrix
```
⟨Beam structures: procedures⟩+≡
```
    subroutine beam_structure_init_smatrix (beam_structure, i, n_entry)
      class(beam_structure_t), intent(inout) :: beam_structure
      integer, intent(in) :: i
      integer, intent(in) :: n_entry
      call beam_structure%smatrix(i)%init (2, n_entry)
    end subroutine beam_structure_init_smatrix
```

Set a polarization entry.
⟨Beam structures: beam structure: TBP⟩+≡
```
    procedure :: set_sentry => beam_structure_set_sentry
```
⟨Beam structures: procedures⟩+≡
```
    subroutine beam_structure_set_sentry &
        (beam_structure, i, i_entry, index, value)
      class(beam_structure_t), intent(inout) :: beam_structure
      integer, intent(in) :: i
      integer, intent(in) :: i_entry
      integer, dimension(:), intent(in) :: index
      complex(default), intent(in) :: value
      call beam_structure%smatrix(i)%set_entry (i_entry, index, value)
    end subroutine beam_structure_set_sentry
```

Set the array of polarization fractions.
⟨Beam structures: beam structure: TBP⟩+≡
```
    procedure :: set_pol_f => beam_structure_set_pol_f
```
⟨Beam structures: procedures⟩+≡
```
    subroutine beam_structure_set_pol_f (beam_structure, f)
      class(beam_structure_t), intent(inout) :: beam_structure
      real(default), dimension(:), intent(in) :: f
      if (allocated (beam_structure%pol_f))  deallocate (beam_structure%pol_f)
      allocate (beam_structure%pol_f (size (f)), source = f)
    end subroutine beam_structure_set_pol_f
```

9.1.4   Beam momenta

By default, beam momenta are deduced from the `sqrts` value or from the mass of the decaying particle, assuming a c.m. setup. Here we set them explicitly.
⟨Beam structures: beam structure: TBP⟩+≡
```
    procedure :: final_mom => beam_structure_final_mom
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_final_mom (beam_structure)
      class(beam_structure_t), intent(inout) :: beam_structure
      if (allocated (beam_structure%p))  deallocate (beam_structure%p)
      if (allocated (beam_structure%theta))  deallocate (beam_structure%theta)
      if (allocated (beam_structure%phi))  deallocate (beam_structure%phi)
    end subroutine beam_structure_final_mom
```

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: set_momentum => beam_structure_set_momentum
    procedure :: set_theta => beam_structure_set_theta
    procedure :: set_phi => beam_structure_set_phi
```
⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_set_momentum (beam_structure, p)
      class(beam_structure_t), intent(inout) :: beam_structure
      real(default), dimension(:), intent(in) :: p
      if (allocated (beam_structure%p))  deallocate (beam_structure%p)
      allocate (beam_structure%p (size (p)), source = p)
    end subroutine beam_structure_set_momentum

    subroutine beam_structure_set_theta (beam_structure, theta)
      class(beam_structure_t), intent(inout) :: beam_structure
      real(default), dimension(:), intent(in) :: theta
      if (allocated (beam_structure%theta))  deallocate (beam_structure%theta)
      allocate (beam_structure%theta (size (theta)), source = theta)
    end subroutine beam_structure_set_theta

    subroutine beam_structure_set_phi (beam_structure, phi)
      class(beam_structure_t), intent(inout) :: beam_structure
      real(default), dimension(:), intent(in) :: phi
      if (allocated (beam_structure%phi))  deallocate (beam_structure%phi)
      allocate (beam_structure%phi (size (phi)), source = phi)
    end subroutine beam_structure_set_phi
```

9.1.5 Get contents

Look at the incoming particles. We may also have the case that beam particles
are not specified, but polarization.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: is_set => beam_structure_is_set
    procedure :: get_n_beam => beam_structure_get_n_beam
    procedure :: get_prt => beam_structure_get_prt
```
⟨*Beam structures: procedures*⟩+≡
```
    function beam_structure_is_set (beam_structure) result (flag)
      class(beam_structure_t), intent(in) :: beam_structure
      logical :: flag
      flag = beam_structure%n_beam > 0 .or. beam_structure%asymmetric ()
    end function beam_structure_is_set

    function beam_structure_get_n_beam (beam_structure) result (n)
      class(beam_structure_t), intent(in) :: beam_structure
```

```
      integer :: n
      n = beam_structure%n_beam
    end function beam_structure_get_n_beam

    function beam_structure_get_prt (beam_structure) result (prt)
      class(beam_structure_t), intent(in) :: beam_structure
      type(string_t), dimension(:), allocatable :: prt
      allocate (prt (size (beam_structure%prt)))
      prt = beam_structure%prt
    end function beam_structure_get_prt
```

Return the number of records.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: get_n_record => beam_structure_get_n_record
```

⟨*Beam structures: procedures*⟩+≡
```
    function beam_structure_get_n_record (beam_structure) result (n)
      class(beam_structure_t), intent(in) :: beam_structure
      integer :: n
      if (allocated (beam_structure%record)) then
         n = size (beam_structure%record)
      else
         n = 0
      end if
    end function beam_structure_get_n_record
```

Return an array consisting of the beam indices affected by the valid entries within a record. After expansion, there should be exactly one valid entry per record.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: get_i_entry => beam_structure_get_i_entry
```

⟨*Beam structures: procedures*⟩+≡
```
    function beam_structure_get_i_entry (beam_structure, i) result (i_entry)

Expansion

Provide a function that tells, for the dummy structure function names used here, whether they are considered a two-particle spectrum or a single-particle structure function:

⟨*Beam structures: tests*⟩+≡
```
    function test_strfun_mode (name) result (n)
      type(string_t), intent(in) :: name
      integer :: n
      select case (char (name))
      case ("a");  n = 2
      case ("b");  n = 1
      case default;  n = 0
      end select
    end function test_strfun_mode
```

⟨*Beam structures: execute tests*⟩+≡
```
    call test (beam_structures_3, "beam_structures_3", &
        "beam structure expansion", &
        u, results)
```

⟨*Beam structures: tests*⟩+≡
```
    subroutine beam_structures_3 (u)
      integer, intent(in) :: u
      type(beam_structure_t) :: beam_structure
      type(string_t) :: s

      write (u, "(A)")  "* Test output: beam_structures_3"

9.2.1 Beam data

The beam data type contains beam data for one or two beams, depending on whether we are dealing with beam collisions or particle decay. In addition, it holds the c.m. energy `sqrts`, the Lorentz transformation `L` that transforms the c.m. system into the lab system, and the pair of c.m. momenta.

⟨*Beams: public*⟩≡
```
    public :: beam_data_t
```

⟨*Beams: types*⟩≡
```
    type :: beam_data_t
       logical :: initialized = .false.
       integer :: n = 0
       type(flavor_t), dimension(:), allocatable :: flv
       real(default), dimension(:), allocatable :: mass
       type(pmatrix_t), dimension(:), allocatable :: pmatrix
       logical :: lab_is_cm_frame = .true.
       type(vector4_t), dimension(:), allocatable :: p_cm
       type(vector4_t), dimension(:), allocatable :: p
       type(lorentz_transformation_t), allocatable  :: L_cm_to_lab
       real(default) :: sqrts = 0
       character(32) :: md5sum = ""
     contains
     ⟨Beams: beam data: TBP⟩
    end type beam_data_t
```

Generic initializer. This is called by the specific initializers below. Initialize either for decay or for collision.

⟨*Beams: procedures*⟩≡
```
    subroutine beam_data_init (beam_data, n)
      type(beam_data_t), intent(out) :: beam_data
      integer, intent(in) :: n
      beam_data%n = n
      allocate (beam_data%flv (n))
      allocate (beam_data%mass (n))
      allocate (beam_data%pmatrix (n))
      allocate (beam_data%p_cm (n))
      allocate (beam_data%p (n))
      beam_data%initialized = .true.
    end subroutine beam_data_init
```

Finalizer: needed for the polarization components of the beams.

⟨*Beams: public*⟩+≡
```
    public :: beam_data_final
```

⟨*Beams: procedures*⟩+≡
```
    subroutine beam_data_final (beam_data)
      type(beam_data_t), intent(inout) :: beam_data
      beam_data%initialized = .false.
    end subroutine beam_data_final
```

The verbose (default) version is for debugging. The short version is for screen
output in the UI.

⟨*Beams: public*⟩+≡
```
    public :: beam_data_write
```

⟨*Beams: beam data: TBP*⟩≡
```
    procedure :: write => beam_data_write
```

            call msg_bug ("Beam data: invalid beam structure object")
         end select
      end if
    end subroutine beam_data_init_structure
```

9.2.3   Initializers: collisions

This is the simplest one: just the two flavors, c.m. energy, polarization. Color
is inferred from flavor. Beam momenta and c.m. momenta coincide.

⟨*Beams: public*⟩+≡
```fortran
    public :: beam_data_init_sqrts
```

⟨*Beams: procedures*⟩+≡
```fortran
    subroutine beam_data_init_sqrts (beam_data, sqrts, flv, smatrix, pol_f)
      type(beam_data_t), intent(out) :: beam_data
      real(default), intent(in) :: sqrts
```

```
type(flavor_t), dimension(:), intent(in) :: flv
type(smatrix_t), dimension(:), intent(in), optional :: smatrix
real(default), dimension(:), intent(in), optional :: pol_f
real(default), dimension(size(flv)) :: E, p
call beam_data_init (beam_data, size (flv))
beam_data%sqrts = sqrts
beam_data%lab_is_cm_frame = .true.
select case (beam_data%n)
case (1)
   E = sqrts;  p = 0
   beam_data%p_cm = vector4_moving (E, p, 3)
   beam_data%p = beam_data%p_cm
case (2)
   beam_data%p_cm = colliding_momenta (sqrts, flavor_get_mass (flv))
   beam_data%p = colliding_momenta (sqrts, flavor_get_mass (flv))
end select
call beam_data_finish_initialization (beam_data, flv, smatrix, pol_f)
end subroutine beam_data_init_sqrts
```

This version sets beam momenta directly, assuming that they are asymmetric,
i.e., lab frame and c.m. frame do not coincide. Polarization info is deferred to a
common initializer.

The Lorentz transformation that we compute here is not actually used in
the calculation; instead, it will be recomputed for each event in the subroutine
`phs_set_incoming_momenta`. We compute it here for the nominal beam setup
nevertheless, so we can print it and, in particular, include it in the MD5 sum.

⟨*Beams: public*⟩+≡
```
public :: beam_data_init_momenta
```

⟨*Beams: procedures*⟩+≡
```
subroutine beam_data_init_momenta (beam_data, p3, flv, smatrix, pol_f)
  type(beam_data_t), intent(out) :: beam_data
  type(vector3_t), dimension(:), intent(in) :: p3
  type(flavor_t), dimension(:), intent(in) :: flv
  type(smatrix_t), dimension(:), intent(in), optional :: smatrix
  real(default), dimension(:), intent(in), optional :: pol_f
  type(vector4_t) :: p0

  allocate (p_cm_rot (beam_data%n))
  p_cm_rot = inverse (L_boost) * p
```

971

```
        allocate (beam_data%L_cm_to_lab)
        select case (beam_data%n)
        case (1)
           beam_data%L_cm_to_lab = L_boost
           beam_data%p_cm = vector4_at_rest (beam_data%sqrts)
        case (2)
           L_rot = rotation_to_2nd (3, space_part (p_cm_rot(1)))
           beam_data%L_cm_to_lab = L_boost * L_rot
           beam_data%p_cm = &
                colliding_momenta (beam_data%sqrts, flavor_get_mass (flv))
        end select
        call beam_data_finish_initialization (beam_data, flv, smatrix, pol_f)
      end subroutine beam_data_init_momenta
```

Final steps: If requested, rotate the beams in the lab frame, and set the beam-data components.

⟨*Beams: procedures*⟩+≡

```
      subroutine beam_data_finish_initialization (beam_data, flv, smatrix, pol_f)
        type(beam_data_t), intent(inout) :: beam_data
        type(flavor_t), dimension(:), intent(in) :: flv
        type(smatrix_t), dimension(:), intent(in), optional :: smatrix
        real(default), dimension(:), intent(in), optional :: pol_f
        integer :: i
        do i = 1, beam_data%n
           beam_data%flv(i) = flv(i)
           beam_data%mass(i) = flavor_get_mass (flv(i))
           if (present (smatrix)) then
              if (size (smatrix) /= beam_data%n) &
                   call msg_fatal ("Beam data: &
                   &polarization density array has wrong dimension")
              beam_data%pmatrix(i) = smatrix(i)
              if (present (pol_f)) then
                 if (size (pol_f) /= size (smatrix)) &
                      call msg_fatal ("Beam data: &
                      &polarization fraction array has wrong dimension")
                 call beam_data%pmatrix(i)%normalize (flv(i), pol_f(i))
              else
                 call beam_data%pmatrix(i)%normalize (flv(i), 1._default)
              end if
           else
              call beam_data%pmatrix(i)%init (2, 0)
              call beam_data%pmatrix(i)%normalize (flv(i), 0._default)
           end if
        end do
        call beam_data_compute_md5sum (beam_data)
      end subroutine beam_data_finish_initialization
```

The MD5 sum is stored within the beam-data record, so it can be checked for integrity in subsequent runs.

⟨*Beams: procedures*⟩+≡

```
      subroutine beam_data_compute_md5sum (beam_data)
        type(beam_data_t), intent(inout) :: beam_data
        integer :: unit
```

```
    unit = free_unit ()
    open (unit = unit, status = "scratch", action = "readwrite")
    call beam_data_write (beam_data, unit, write_md5sum = .false., &
        verbose = .true.)
    rewind (unit)
    beam_data%md5sum = md5sum (unit)
    close (unit)
  end subroutine beam_data_compute_md5sum
```

9.2.4 Initializers: decays

This is the simplest one: decay in rest frame. We need just flavor and polarization. Color is inferred from flavor. Beam momentum and c.m. momentum coincide.

⟨*Beams: public*⟩+≡
```
    public :: beam_data_init_decay
```

⟨*Beams: procedures*⟩+≡
```
    subroutine beam_data_init_decay (beam_data, flv, smatrix, pol_f, rest_frame)
      type(beam_data_t), intent(out) :: beam_data
      type(flavor_t), dimension(1), intent(in) :: flv
      type(smatrix_t), dimension(1), intent(in), optional :: smatrix
      real(default), dimension(:), intent(in), optional :: pol_f
      logical, intent(in), optional :: rest_frame
      real(default), dimension(1) :: m
      m = flavor_get_mass (flv)
      if (present (smatrix)) then
         call beam_data_init_sqrts (beam_data, m(1), flv, smatrix, pol_f)
      else
         call beam_data_init_sqrts (beam_data, m(1), flv, smatrix, pol_f)
      end if
      if (present (rest_frame))  beam_data%lab_is_cm_frame = rest_frame
    end subroutine beam_data_init_decay
```

9.2.5 Sanity check

After the beams have been set, the initial-particle masses may have been modified. This can be checked here.

⟨*Beams: public*⟩+≡
```
    public :: beam_data_masses_are_consistent
```

⟨*Beams: procedures*⟩+≡
```
    function beam_data_masses_are_consistent (beam_data) result (flag)
      logical :: flag
      type(beam_data_t), intent(in) :: beam_data
      flag = all (beam_data%mass == flavor_get_mass (beam_data%flv))
    end function beam_data_masses_are_consistent
```

9.2.6 The beams type

Beam objects are interaction objects that contain the actual beam data including polarization and density matrix. For collisions, the beam object actually contains two beams.

⟨*Beams: public*⟩+≡
```
    public :: beam_t
```

⟨*Beams: types*⟩+≡
```
    type :: beam_t
       private
       type(interaction_t) :: int
    end type beam_t
```

The constructor contains code that converts beam data into the (entangled) particle-pair quantum state. First, we set the number of particles and polarization mask. (The polarization mask is handed over to all later interactions, so if helicity is diagonal or absent, this fact is used when constructing the hard-interaction events.) Then, we construct the entangled state that combines helicity, flavor and color of the two particles (where flavor and color are unique, while several helicity states are possible). Then, we transfer this state together with the associated values from the spin density matrix into the `interaction_t` object.

⟨*Beams: public*⟩+≡
```
    public :: beam_init
```

⟨*Beams: procedures*⟩+≡
```
    subroutine beam_init (beam, beam_data)
      type(beam_t), intent(out) :: beam
      type(beam_data_t), intent(in), target :: beam_data
      type(quantum_numbers_mask_t), dimension(beam_data%n) :: mask
      type(state_matrix_t), target :: state_hel, state_fc, state_tmp
      type(state_iterator_t) :: it_hel, it_tmp
      type(quantum_numbers_t), dimension(:), allocatable :: qn
      type(polarization_t), dimension(:), allocatable :: pol
      integer :: i
      mask = new_quantum_numbers_mask (.false., .false., &
           .not. beam_data%pmatrix%is_polarized (), &
           mask_hd = beam_data%pmatrix%is_diagonal ())
      call interaction_init &
           (beam%int, 0, 0, beam_data%n, mask=mask, store_values=.true.)
      allocate (pol (beam_data%n))
      do i = 1, size (pol)
         call polarization_init_pmatrix (pol(i), beam_data%pmatrix(i))
      end do
      call combine_polarization_states (pol, state_hel)
      do i = 1, size (pol)
         call polarization_final (pol(i))
      end do
      allocate (qn (beam_data%n))
      call quantum_numbers_init &

10.1.1 Momentum splitting

Let us consider first an incoming parton with momentum k and invariant mass squared $s = k^2$ that splits into two partons with momenta q, p and invariant masses $t = q^2$ and $u = p^2$. (This is an abuse of the Mandelstam notation. t is actually the momentum transfer, assuming that p is radiated and q initiates the hard process.) The energy is split among the partons such that if $E = k^0$, we have $q^0 = xE$ and $p^0 = \bar{x}E$, where $\bar{x} \equiv 1 - x$.

We define the angle θ as the polar angle of p w.r.t. the momentum axis of the incoming momentum k. Ignoring azimuthal angle, we can write the four-momenta in the basis (E, p_T, p_L) as

$$k = \begin{pmatrix} E \\ 0 \\ p \end{pmatrix}, \qquad p = \begin{pmatrix} \bar{x}E \\ \bar{x}\bar{p}\sin\theta \\ \bar{x}\bar{p}\cos\theta \end{pmatrix}, \qquad q = \begin{pmatrix} xE \\ -\bar{x}\bar{p}\sin\theta \\ p - \bar{x}\bar{p}\cos\theta \end{pmatrix}, \qquad (10.1)$$

where the first two mass-shell conditions are

$$p^2 = E^2 - s, \qquad \bar{p}^2 = E^2 - \frac{u}{\bar{x}^2}. \qquad (10.2)$$

The second condition implies that, for positive u, $\bar{x}^2 > u/E^2$, or equivalently

$$x < 1 - \sqrt{u}/E. \qquad (10.3)$$

We are interested in the third mass-shell conditions: s and u are fixed, so we need t as a function of $\cos\theta$:

$$t = -2\bar{x}\left(E^2 - p\bar{p}\cos\theta\right) + s + u. \qquad (10.4)$$

Solving for $\cos\theta$, we get

$$\cos\theta = \frac{2\bar{x}E^2 + t - s - u}{2\bar{x}p\bar{p}}. \qquad (10.5)$$

We can compute $\sin\theta$ numerically as $\sin^2\theta = 1 - \cos^2\theta$, but it is important to reexpress this in view of numerical stability. To this end, we first determine the bounds for t. The cosine must be between -1 and 1, so the bounds are

$$t_0 = -2\bar{x}\left(E^2 + p\bar{p}\right) + s + u, \qquad (10.6)$$
$$t_1 = -2\bar{x}\left(E^2 - p\bar{p}\right) + s + u. \qquad (10.7)$$

Computing $\sin^2\theta$ from $\cos\theta$ above, we observe that the numerator is a quadratic polynomial in t which has the zeros t_0 and t_1, while the common denominator is given by $(2\bar{x}p\bar{p})^2$. Hence, we can write

$$\sin^2\theta = -\frac{(t - t_0)(t - t_1)}{(2\bar{x}p\bar{p})^2} \qquad \text{and} \qquad \cos\theta = \frac{(t - t_0) + (t - t_1)}{4\bar{x}p\bar{p}}, \qquad (10.8)$$

which is free of large cancellations near $t = t_0$ or $t = t_1$.

If all is massless, i.e., $s = u = 0$, this simplifies to

$$t_0 = -4\bar{x}E^2, \qquad\qquad\qquad t_1 = 0, \qquad (10.9)$$
$$\sin^2\theta = -\frac{t}{\bar{x}E^2}\left(1 + \frac{t}{4\bar{x}E^2}\right), \qquad \cos\theta = 1 + \frac{t}{2\bar{x}E^2}. \qquad (10.10)$$

Here is the implementation. First, we define a container for the kinematical integration limits and some further data.

⟨*SF aux: public*⟩≡
```
    public :: splitting_data_t
```

⟨*SF aux: types*⟩≡
```
    type :: splitting_data_t
      private
      logical :: collinear = .false.

      real(default) :: phi = 0
     contains
     ⟨SF aux: splitting data: TBP⟩
    end type splitting_data_t
```

I/O for debugging:

⟨*SF aux: splitting data: TBP*⟩≡
```
    procedure :: write => splitting_data_write
```

⟨*SF aux: procedures*⟩≡
```
    subroutine splitting_data_write (d, unit)
      class(splitting_data_t), intent(in) :: d
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      write (u, "(A)") "Splitting data:"
      write (u, "(2x,A,L1)")  "collinear = ", d%collinear
  1   format (2x,A,1x,ES15.8)
      write (u, 1) "x0   =", d%x0
      write (u, 1) "x    =", d%x
      write (u, 1) "xb   =", d%xb
      write (u, 1) "x1   =", d%x1
      write (u, 1) "t0   =", d%t0
      write (u, 1) "t    =", d%t
      write (u, 1) "t1   =", d%t1
      write (u, 1) "phi0 =", d%phi0
      write (u, 1) "phi  =", d%phi
      write (u, 1) "phi1 =", d%phi1
      write (u, 1) "E    =", d%E
      write (u, 1) "p    =", d%p
      write (u, 1) "pb   =", d%pb
      write (u, 1) "s    =", d%s
      write (u, 1) "u    =", d%u
      write (u, 1) "m2   =", d%m2
    end subroutine splitting_data_write
```

10.1.2 Constant data

This is the initializer for the data. The input consists of the incoming momentum, its invariant mass squared, and the invariant mass squared of the radiated particle. $m2$ is the *physical* mass squared of the outgoing particle. The t bounds depend on the chosen x value and cannot be determined yet.

⟨*SF aux: splitting data: TBP*⟩+≡
```
    procedure :: init => splitting_data_init
```

⟨*SF aux: procedures*⟩+≡
```
    subroutine splitting_data_init (d, k, mk2, mr2, mo2, collinear)
      class(splitting_data_t), intent(out) :: d
      type(vector4_t), intent(in) :: k
      real(default), intent(in) :: mk2, mr2, mo2
      logical, intent(in), optional :: collinear
      if (present (collinear))  d%collinear = collinear
      d%E = energy (k)
      d%x1 = 1 - sqrt (max (mr2, 0._default)) / d%E
      d%p = sqrt (d%E**2 - mk2)
      d%s = mk2
      d%u = mr2
      d%m2 = mo2
    end subroutine splitting_data_init
```

Retrieve the x bounds, if needed for x sampling. Generating an x value is done by the caller, since this is the part that depends on the nature of the structure function.

⟨*SF aux: splitting data: TBP*⟩+≡
```
    procedure :: get_x_bounds => splitting_get_x_bounds
```

⟨*SF aux: procedures*⟩+≡
```
    function splitting_get_x_bounds (d) result (x)
      class(splitting_data_t), intent(in) :: d
      real(default), dimension(2) :: x
      x = [ d%x0, d%x1 ]
    end function splitting_get_x_bounds
```

Now set the momentum fraction and compute t_0 and t_1.

[The calculation of t_1 is subject to numerical problems. The exact formula is ($s = m_i^2$, $u = m_r^2$)

$$t_1 = -2\bar{x}E^2 + m_i^2 + m_r^2 + 2\bar{x}\sqrt{E^2 - m_i^2}\,\sqrt{E^2 - m_r^2/\bar{x}^2}. \qquad (10.11)$$

The structure-function paradigm is useful only if $E \gg m_i, m_r$. In a Taylor expansion for large E, the leading term cancels. The expansion of the square roots (to subleading order) yields

$$t_1 = xm_i^2 - \frac{x}{\bar{x}}m_r^2. \qquad (10.12)$$

There are two cases of interest: $m_i = m_o$ and $m_r = 0$,

$$t_1 = xm_o^2 \qquad (10.13)$$

986

and $m_i = m_r$ and $m_o = 0$,

$$t_1 = -\frac{x^2}{\bar{x}}m_i^2. \tag{10.14}$$

In both cases, $t_1 \leq m_o^2$.]

That said, it turns out that taking the t_1 evaluation at face value leads to less problems than the approximation. We express the angles in terms of $t - t_0$ and $t - t_1$. Numerical noise in t_1 can then be tolerated.

⟨*SF aux: splitting data: TBP*⟩+≡
```
    procedure :: set_t_bounds => splitting_set_t_bounds
```

⟨*SF aux: procedures*⟩+≡
```
    elemental subroutine splitting_set_t_bounds (d, x, xb)
      class(splitting_data_t), intent(inout) :: d
      real(default), intent(in), optional :: x, xb
      real(default) :: tp, tm
      if (present (x))  d%x = x
      if (present (xb)) d%xb = xb
      if (d%xb /= 0) then
         d%pb = sqrt (max (d%E**2 - d%u / d%xb**2, 0._default))
      else
         d%pb = 0
      end if
      tp = -2 * d%xb * d%E**2 + d%s + d%u
      tm = -2 * d%xb * d%p * d%pb
      d%t0 = tp + tm
      d%t1 = tp - tm
      d%t = d%t1
    end subroutine splitting_set_t_bounds
```

10.1.3   Sampling recoil

Compute a value for the momentum transfer t, using a random number r. We assume a logarithmic distribution for $t - m^2$, corresponding to the propagator $1/(t - m^2)$ with the physical mass m for the outgoing particle. Optionally, we can narrow the kinematical bounds.

If all three masses in the splitting vanish, the upper limit for t is zero. In that case, the t value is set to zero and the splitting will be collinear.

⟨*SF aux: splitting data: TBP*⟩+≡
```
    procedure :: sample_t => splitting_sample_t
```

⟨*SF aux: procedures*⟩+≡
```
    subroutine splitting_sample_t (d, r, t0, t1)
      class(splitting_data_t), intent(inout) :: d
      real(default), intent(in) :: r
      real(default), intent(in), optional :: t0, t1
      real(default) :: tt0, tt1, tt0m, tt1m
      if (d%collinear) then
         d%t = d%t1
      else
         tt0 = d%t0;  if (present (t0))  tt0 = max (t0, tt0)
         tt1 = d%t1;  if (present (t1))  tt1 = min (t1, tt1)
         tt0m = tt0 - d%m2
```

```
            tt1m = tt1 - d%m2
            if (tt0m < 0 .and. tt1m < 0 .and. abs(tt0m) > &
                  epsilon(tt0m) .and. abs(tt1m) > epsilon(tt0m)) then
               d%t = d%m2 + tt0m * exp (r * log (tt1m / tt0m))
            else
               d%t = tt1
            end if
         end if
      end subroutine splitting_sample_t
```

The inverse operation: Given t, we recover the value of r that would have produced this value.

⟨SF aux: splitting data: TBP⟩+≡
```
      procedure :: inverse_t => splitting_inverse_t
```

⟨SF aux: procedures⟩+≡
```
      subroutine splitting_inverse_t (d, r, t0, t1)
        class(splitting_data_t), intent(in) :: d
        real(default), intent(out) :: r
        real(default), intent(in), optional :: t0, t1
        real(default) :: tt0, tt1, tt0m, tt1m
        if (d%collinear) then
           r = 0
        else
           tt0 = d%t0;  if (present (t0))  tt0 = max (t0, tt0)
           tt1 = d%t1;  if (present (t1))  tt1 = min (t1, tt1)
           tt0m = tt0 - d%m2
           tt1m = tt1 - d%m2
           if (tt0m < 0 .and. tt1m < 0) then
               r = log ((d%t - d%m2) / tt0m) / log (tt1m / tt0m)
           else
               r = 0
           end if
        end if
      end subroutine splitting_inverse_t
```

This is trivial, but provided for convenience:

⟨SF aux: splitting data: TBP⟩+≡
```
      procedure :: sample_phi => splitting_sample_phi
```

⟨SF aux: procedures⟩+≡
```
      subroutine splitting_sample_phi (d, r)
        class(splitting_data_t), intent(inout) :: d
        real(default), intent(in) :: r
        if (d%collinear) then
           d%phi = 0
        else
           d%phi = (1-r) * d%phi0 + r * d%phi1
        end if
      end subroutine splitting_sample_phi
```

Inverse:

⟨SF aux: splitting data: TBP⟩+≡
```
      procedure :: inverse_phi => splitting_inverse_phi
```

⟨*SF aux: procedures*⟩+≡
```
    subroutine splitting_inverse_phi (d, r)
      class(splitting_data_t), intent(in) :: d
      real(default), intent(out) :: r
      if (d%collinear) then
         r = 0
      else
         r = (d%phi - d%phi0) / (d%phi1 - d%phi0)
      end if
    end subroutine splitting_inverse_phi
```

10.1.4 Splitting

In this function, we actually perform the splitting. The incoming momentum k is split into (if no recoil) $q_1 = (1 - x)k$ and $q_2 = xk$.

Apart from the splitting data, we need the incoming momentum k, the momentum transfer t, and the azimuthal angle ϕ. The momentum fraction x is already known here.

Alternatively, we can split without recoil. The azimuthal angle is irrelevant, and the momentum transfer is always equal to the upper limit t_1, so the polar angle is zero. Obviously, if there are nonzero masses it is not possible to keep both energy-momentum conservation and at the same time all particles on shell. We choose for dropping the on-shell condition here.

⟨*SF aux: splitting data: TBP*⟩+≡
```
    procedure :: split_momentum => splitting_split_momentum
```

⟨*SF aux: procedures*⟩+≡
```
    function splitting_split_momentum (d, k) result (q)
      class(splitting_data_t), intent(in) :: d
      type(vector4_t), dimension(2) :: q
      type(vector4_t), intent(in) :: k
      real(default) :: st2, ct2, st, ct, cp, sp
      type(lorentz_transformation_t) :: rot
      real(default) :: tt0, tt1, den
      type(vector3_t) :: kk, q1, q2
      if (d%collinear) then
         if (d%s == 0 .and. d%u == 0) then
            q(1) = d%xb * k
            q(2) = d%x * k
         else
            kk = space_part (k)
            q1 = d%xb * (d%pb / d%p) * kk
            q2 = kk - q1
            q(1) = vector4_moving (d%xb * d%E, q1)
            q(2) = vector4_moving (d%x * d%E, q2)

    end function splitting_split_momentum
```

Momenta generated by splitting will in general be off-shell. They are on-shell only if they are collinear and massless. This subroutine puts them on shell by brute force, violating either momentum or energy conservation. The direction of three-momentum is always retained.

If the energy is below mass shell, we return a zero momentum.

⟨*SF aux: parameters*⟩≡

Momentum splitting: massless radiation

Compute momentum splitting for generic kinematics. It turns out that for $x = 0.5$, where $t - m^2$ is the geometric mean between its upper and lower bounds (this can be directly seen from the logarithmic distribution in the function `sample_t` for $r \equiv x = 1 - x = 0.5$), we arrive at an exact number $t = -0.15$ for the given input values.

10.2 Mappings for structure functions

In this module, we provide a wrapper for useful mappings of the unit (hyper-)square that we can apply to a set of structure functions.

In some cases it is useful, or even mandatory, to map the MC input parameters nontrivially onto a set of structure functions for the two beams. In all cases considered here, instead of $x_1, x_2, \ldots$ as parameters for the beams, we generate one parameter that is equal, or related to, the product $x_1 x_2 \cdots$ (so it directly corresponds to $\sqrt{s}$). The other parameters describe the distribution of energy (loss) between beams and radiations.

    use unit_tests
  ```

  ⟨*Standard module head*⟩

  ⟨*SF mappings: public*⟩

  ⟨*SF mappings: parameters*⟩

  ⟨*SF mappings: types*⟩

  ⟨*SF mappings: interfaces*⟩

  ```
  contains
  ```

  ⟨*SF mappings: procedures*⟩

  ⟨*SF mappings: tests*⟩

  ```
  end module sf_mappings
  ```

10.2.1 Base type

First, we define an abstract base type for the mapping. In all cases we need to store the indices of the parameters on which the mapping applies. Additional parameters can be stored in the extensions of this type.

⟨*SF mappings: public*⟩≡
  ```
      public :: sf_mapping_t
  ```

⟨*SF mappings: types*⟩≡
  ```
      type, abstract :: sf_mapping_t
         integer, dimension(:), allocatable :: i
       contains
  ```

⟨*SF mappings: sf mapping: TBP*⟩
```
end type sf_mapping_t
```

The output routine is deferred:

⟨*SF mappings: sf mapping: TBP*⟩≡
```
procedure (sf_mapping_write), deferred :: write
```

⟨*SF mappings: interfaces*⟩≡
```
abstract interface
   subroutine sf_mapping_write (object, unit)
     import
     class(sf_mapping_t), intent(in) :: object
     integer, intent(in), optional :: unit
   end subroutine sf_mapping_write
end interface
```

Initializer for the base type. The array of parameter indices is allocated but initialized to zero.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
procedure :: base_init => sf_mapping_base_init
```

⟨*SF mappings: procedures*⟩≡
```
subroutine sf_mapping_base_init (mapping, n_par)
  class(sf_mapping_t), intent(out) :: mapping
  integer, intent(in) :: n_par
  allocate (mapping%i (n_par))
  mapping%i = 0
end subroutine sf_mapping_base_init
```

Set an index value.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
procedure :: set_index => sf_mapping_set_index
```

⟨*SF mappings: procedures*⟩+≡
```
subroutine sf_mapping_set_index (mapping, j, i)
  class(sf_mapping_t), intent(inout) :: mapping
  integer, intent(in) :: j, i
  mapping%i(j) = i
end subroutine sf_mapping_set_index
```

Return the dimensionality, i.e., the number of parameters.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
procedure :: get_n_dim => sf_mapping_get_n_dim
```

⟨*SF mappings: procedures*⟩+≡
```
function sf_mapping_get_n_dim (mapping) result (n)
  class(sf_mapping_t), intent(in) :: mapping
  integer :: n
  n = size (mapping%i)
end function sf_mapping_get_n_dim
```

Computation: the values `p` are the input parameters, the values `r` are the output parameters. The values `rb` are defined as $\bar{r} = 1 - r$, but provided explicitly. They allow us to avoid numerical problems near $r = 1$.

The extra parameter `x_free` indicates that the total energy has already been renormalized by this factor. We have to take such a factor into account in a resonance or on-shell mapping.

The Jacobian is `f`. We modify only the two parameters indicated by the indices `i`.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
    procedure (sf_mapping_compute), deferred :: compute
```

⟨*SF mappings: interfaces*⟩+≡
```
    abstract interface
      subroutine sf_mapping_compute (mapping, r, rb, f, p, pb, x_free)
        import
        class(sf_mapping_t), intent(inout) :: mapping
        real(default), dimension(:), intent(out) :: r, rb
        real(default), intent(out) :: f
        real(default), dimension(:), intent(in) :: p, pb
        real(default), intent(inout), optional :: x_free
      end subroutine sf_mapping_compute
    end interface
```

The inverse mapping. Use `r` and/or `rb` to reconstruct `p` and also compute `f`.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
    procedure (sf_mapping_inverse), deferred :: inverse
```

⟨*SF mappings: interfaces*⟩+≡
```
    abstract interface
      subroutine sf_mapping_inverse (mapping, r, rb, f, p, pb, x_free)
        import
        class(sf_mapping_t), intent(inout) :: mapping
        real(default), dimension(:), intent(in) :: r, rb
        real(default), intent(out) :: f
        real(default), dimension(:), intent(out) :: p, pb
        real(default), intent(inout), optional :: x_free
      end subroutine sf_mapping_inverse
    end interface
```

10.2.2 Methods for self-tests

This is a shorthand for: inject parameters, compute the mapping, display results, compute the inverse, display again. We provide an output format for the parameters and, optionally, a different output format for the Jacobians.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
    procedure :: check => sf_mapping_check
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_mapping_check (mapping, u, p_in, pb_in, fmt_p, fmt_f)
      class(sf_mapping_t), intent(inout) :: mapping
      integer, intent(in) :: u
      real(default), dimension(:), intent(in) :: p_in, pb_in
```

```
      character(*), intent(in) :: fmt_p
      character(*), intent(in), optional :: fmt_f
      real(default), dimension(size(p_in)) :: p, pb, r, rb
      real(default) :: f, tolerance
      tolerance = 1.5E-17
      p = p_in
      pb= pb_in
      call mapping%compute (r, rb, f, p, pb)
      call pacify (p, tolerance)
      call pacify (pb, tolerance)
      call pacify (r, tolerance)
      call pacify (rb, tolerance)
      write (u, "(3x,A,9(1x," // fmt_p // "))")  "p =", p
      write (u, "(3x,A,9(1x," // fmt_p // "))")  "pb=", pb

      write (u, "(3x,A,9(1x," // fmt_p // "))")  "rb=", rb
      if (present (fmt_f)) then
         write (u, "(3x,A,9(1x," // fmt_f // "))")  "f =", f
      else
         write (u, "(3x,A,9(1x," // fmt_p // "))")  "f =", f
      end if
      write (u, *)
      write (u, "(3x,A,9(1x," // fmt_p // "))")  "*r=", product (r)
    end subroutine sf_mapping_check
```

This is a consistency check for the self-tests: the integral over the unit square
should be unity. We estimate this by a simple binning and adding up the values;
this should be sufficient for a self-test.

The argument is the requested number of sampling points. We take the
square root for binning in both dimensions, so the precise number might be
different.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
    procedure :: integral => sf_mapping_integral
```

⟨*SF mappings: procedures*⟩+≡
```
    function sf_mapping_integral (mapping, n_calls) result (integral)
      class(sf_mapping_t), intent(inout) :: mapping
      integer, intent(in) :: n_calls
      real(default) :: integral
```

```
integer :: n_dim, n_bin, k
real(default), dimension(:), allocatable :: p, pb, r, rb
integer, dimension(:), allocatable :: ii
real(default) :: dx, f, s

n_dim = mapping%get_n_dim ()
allocate (p (n_dim))
allocate (pb(n_dim))
allocate (r (n_dim))
allocate (rb(n_dim))
allocate (ii(n_dim))
n_bin = nint (real (n_calls, default) ** (1._default / n_dim))
dx = 1._default / n_bin
s = 0
ii = 1

SAMPLE: do
   do k = 1, n_dim
      p(k)  = ii(k) * dx - dx/2

         pb(mapping%i(j)) = 1 - p2(j)
      end do
    end subroutine sf_s_mapping_inverse
```

10.2.4 Implementation: resonance pair mapping

This maps the unit square (r_1, r_2) such that p_1 is the product $r_1 r_2$, while p_2 is related to the ratio, then it maps p_1 to itself according to a Breit-Wigner shape, i.e., a flat prior distribution in p_1 results in a Breit-Wigner distribution. Mass and width of the BW are rescaled by the energy, thus dimensionless fractions.

⟨*SF mappings: public*⟩+≡
```
    public :: sf_res_mapping_t

  pb(mapping%i(1)) = 1 - p1m
  p (mapping%i(2)) = p2(2)
  pb(mapping%i(2)) = 1 - p2(2)
  f = fbw * f2
end subroutine sf_res_mapping_inverse
```

10.2.5   Implementation: on-shell mapping

This is a degenerate version of the unit-square mapping where the product $r_1 r_2$ is constant. This product is given by the rescaled squared mass. We introduce an artificial first parameter p_1 to keep the counting, but nothing depends on it. The second parameter is the same p_2 as for the standard unit-square mapping for $\alpha = 1$, it parameterizes the ratio of r_1 and r_2.

⟨SF mappings: public⟩+≡
```
public :: sf_os_mapping_t
```

⟨SF mappings: types⟩+≡
```
type, extends (sf_mapping_t) :: sf_os_mapping_t
  real(default) :: m = 0
  real(default) :: lm2 = 0
 contains
```
⟨SF mappings: sf on-shell mapping: TBP⟩
```
end type sf_os_mapping_t
```

Output.

⟨SF mappings: sf on-shell mapping: TBP⟩≡
```
procedure :: write => sf_os_mapping_write
```

⟨SF mappings: procedures⟩+≡
```
subroutine sf_os_mapping_write (object, unit)
  class(sf_os_mapping_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
```

```
    write (u, "(1x,A)", advance="no")  "map"
    if (any (object%i /= 0)) then
        write (u, "('(',I0,',',I0,')')", advance="no")  object%i
    end if
    write (u, "(A,F7.5,A)")  ": on-shell (", object%m, ")"
end subroutine sf_os_mapping_write
```

Initialize: index pair and dimensionless mass parameter.

⟨*SF mappings: sf on-shell mapping: TBP*⟩+≡
```
    procedure :: init => sf_os_mapping_init
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_os_mapping_init (mapping, m)
      class(sf_os_mapping_t), intent(out) :: mapping
      real(default), intent(in) :: m
      call mapping%base_init (2)
      mapping%m = m
      mapping%lm2 = abs (2 * log (mapping%m))
    end subroutine sf_os_mapping_init
```

Apply mapping. The `x_free` parameter rescales the total energy, which must be accounted for in the enclosed mapping.

⟨*SF mappings: sf on-shell mapping: TBP*⟩+≡
```
    procedure :: compute => sf_os_mapping_compute
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_os_mapping_compute (mapping, r, rb, f, p, pb, x_free)
      class(sf_os_mapping_t), intent(inout) :: mapping
      real(default), dimension(:), intent(out) :: r, rb
      real(default), intent(out) :: f
      real(default), dimension(:), intent(in) :: p, pb
      real(default), intent(inout), optional :: x_free
      real(default), dimension(2) :: r2, p2
      integer :: j
      p2 = p(mapping%i)
      call map_on_shell (r2, f, p2, mapping%lm2, x_free)
      r = p
      rb= pb
      do j = 1, 2
         r (mapping%i(j)) = r2(j)
         rb(mapping%i(j)) = 1 - r2(j)
      end do
    end subroutine sf_os_mapping_compute
```

Apply inverse. The irrelevant parameter p_1 is always set zero.

⟨*SF mappings: sf on-shell mapping: TBP*⟩+≡
```
    procedure :: inverse => sf_os_mapping_inverse
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_os_mapping_inverse (mapping, r, rb, f, p, pb, x_free)
      class(sf_os_mapping_t), intent(inout) :: mapping
      real(default), dimension(:), intent(in) :: r, rb
      real(default), intent(out) :: f
```

```
      real(default), dimension(:), intent(out) :: p, pb
      real(default), intent(inout), optional :: x_free
      real(default), dimension(2) :: p2, r2
      r2 = r(mapping%i)
      call map_on_shell_inverse (r2, f, p2, mapping%lm2, x_free)
      p = r
      pb= rb
      p (mapping%i(1)) = p2(1)
      pb(mapping%i(1)) = 1 - p2(1)
      p (mapping%i(2)) = p2(2)
      pb(mapping%i(2)) = 1 - p2(2)
    end subroutine sf_os_mapping_inverse
```

10.2.6   Implementation: endpoint mapping

This maps the unit square (r_1, r_2) such that p_1 is the product $r_1 r_2$, while p_2 is related to the ratio. Furthermore, we enhance the region at $r_1 = 1$ and $r_2 = 1$, which translates into $p_1 = 1$ and $p_2 = 0, 1$. The enhancement is such that any power-like singularity is caught. This is useful for beamstrahlung spectra.

In addition, we allow for a delta-function singularity in r_1 and/or r_2. The singularity is smeared to an interval of width ϵ. If nonzero, we distinguish the kinematical momentum fractions r_i from effective values x_i, which should go into the structure-function evaluation. A bin of width ϵ in r is mapped to $x = 1$ exactly, while the interval $(0, 1-\epsilon)$ is mapped to $(0, 1)$ in x. The Jacobian reflects this distinction, and the logical `in_peak` allows for an unambiguous distinction.

The delta-peak fraction is used only for the integration self-test.

⟨*SF mappings: public*⟩+≡
```
    public :: sf_ep_mapping_t
```

⟨*SF mappings: types*⟩+≡
```
    type, extends (sf_mapping_t) :: sf_ep_mapping_t
      real(default) :: a = 1
    contains
    ⟨SF mappings: sf endpoint mapping: TBP⟩
    end type sf_ep_mapping_t
```

Output.

⟨*SF mappings: sf endpoint mapping: TBP*⟩≡
```
    procedure :: write => sf_ep_mapping_write
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_ep_mapping_write (object, unit)
      class(sf_ep_mapping_t), intent(in) :: object
      integer, intent(in), optional :: unit

10.2.7 Implementation: endpoint mapping with resonance

Like the endpoint mapping for p_2, but replace the endpoint mapping by a Breit-Wigner mapping for p_1. This covers resonance production in the presence of beamstrahlung.

If the flag `resonance` is unset, we skip the resonance mapping, so the parameter p_1 remains equal to $r_1 r_2$, as in the standard s-channel mapping.

⟨*SF mappings: public*⟩+≡
```
   public :: sf_epr_mapping_t
```

⟨*SF mappings: types*⟩+≡
```
   type, extends (sf_mapping_t) :: sf_epr_mapping_t
     real(default) :: a = 1
     real(default) :: m = 0
     real(default) :: w = 0
     logical :: resonance = .true.
    contains
    ⟨SF mappings: sf endpoint/res mapping: TBP⟩
   end type sf_epr_mapping_t
```

Output.

⟨*SF mappings: sf endpoint/res mapping: TBP*⟩≡
```
   procedure :: write => sf_epr_mapping_write
```

⟨*SF mappings: procedures*⟩+≡
```
   subroutine sf_epr_mapping_write (object, unit)
     class(sf_epr_mapping_t), intent(in) :: object
     integer, intent(in), optional :: unit
     integer :: u

10.2.9 Implementation: ISR endpoint mapping

Similar to the endpoint mapping above: This maps the unit square (r_1, r_2) such that p_1 is the product $r_1 r_2$, while p_2 is related to the ratio. Furthermore, we enhance the region at $r_1 = 1$ and $r_2 = 1$, which translates into $p_1 = 1$ and $p_2 = 0, 1$.

The enhancement is such that ISR singularity $(1 - x)^{-1+\epsilon}$ is flattened. This would be easy in one dimension, but becomes nontrivial in two dimensions.

10.2.11   Implementation: ISR on-shell mapping

Similar to the endpoint mapping above: This maps the unit square (r_1, r_2) such that p_1 is ignored while the product $r_1 r_2$ is constant. p_2 is related to the ratio. Furthermore, we enhance the region at $r_1 = 1$ and $r_2 = 1$, which translates into $p_1 = 1$ and $p_2 = 0, 1$.

The enhancement is such that ISR singularity $(1 - x)^{-1+\epsilon}$ is flattened. This would be easy in one dimension, but becomes nontrivial in two dimensions.

    end subroutine sf_ei_mapping_inverse
```

10.2.13   Implementation: Endpoint + ISR + resonance

This is a combination of endpoint (i.e., beamstrahlung) and ISR power mapping, adapted for an s-channel resonance. The first two internal parameters apply to the beamstrahlung spectrum, the last two to the ISR function for the first and second beam, respectively. The first and third parameters are the result of an overall resonance mapping, so on the outside, the first parameter is the total momentum fraction, the third one describes the distribution between beamstrahlung and ISR.

      f = f0 * f1 * f2
    end subroutine sf_eio_mapping_inverse
```

10.2.15 Basic formulas

Standard mapping of the unit square

This mapping of the unit square is appropriate in particular for structure functions which are concentrated at the lower end. Instead of a rectangular grid, one set of grid lines corresponds to constant parton c.m. energy. The other set is chosen such that the jacobian is only mildly singular ($\ln x$ which is zero at $x = 1$), corresponding to an initial concentration of sampling points at the maximum energy. If `power` is greater than one (the default), points are also concentrated at the lower end.

The formula is (`power`$=\alpha$):

$$r_1 = (p_1^{p_2})^\alpha \tag{10.15}$$

$$r_2 = (p_1^{1-p_2})^\alpha \tag{10.16}$$

$$f = \alpha^2 p_1^{\alpha-1} |\log p_1| \tag{10.17}$$

and for the default case $\alpha = 1$:

$$r_1 = p_1^{p_2} \tag{10.18}$$

$$r_2 = p_1^{1-p_2} \tag{10.19}$$

$$f = |\log p_1| \tag{10.20}$$

⟨*SF mappings: procedures*⟩+≡
```
subroutine map_unit_square (r, factor, p, power)
  real(default), dimension(2), intent(out) :: r
  real(default), intent(out) :: factor
  real(default), dimension(2), intent(in) :: p
  real(default), intent(in), optional :: power
  real(default) :: xx, yy
  factor = 1
  xx = p(1)
  yy = p(2)
  if (present(power)) then
     if (p(1) > 0 .and. power > 1) then
        xx = p(1)**power
        factor = factor * power * xx / p(1)
     end if
  end if
  if (xx /= 0) then
     r(1) = xx ** yy
     r(2) = xx / r(1)
     factor = factor * abs (log (xx))
  else
     r = 0
  end if
end subroutine map_unit_square
```

This is the inverse mapping.

⟨*SF mappings: procedures*⟩+≡
```
subroutine map_unit_square_inverse (r, factor, p, power)
  real(kind=default), dimension(2), intent(in) :: r
```

```
      real(kind=default), intent(out) :: factor
      real(kind=default), dimension(2), intent(out) :: p
      real(kind=default), intent(in), optional :: power
      real(kind=default) :: lg, xx, yy
      factor = 1
      xx = r(1) * r(2)
      if (xx /= 0) then
         lg = log (xx)
         if (lg /= 0) then
            yy = log (r(1)) / lg
         else
            yy = 0
         end if
         p(2) = yy
         factor = factor * abs (lg)
         if (present(power)) then
            p(1) = xx**(1._default/power)
            factor = factor * power * xx / p(1)
         else
            p(1) = xx
         end if
      else
         p = 0
      end if
   end subroutine map_unit_square_inverse
```

Precise mapping of the unit square

A more precise version (with unit power parameter). This version should be numerically stable near $x = 1$ and $y = 0, 1$. The formulas are again

$$r_1 = p_1^{p_2}, \qquad r_2 = p_1^{\bar{p}_2}, \qquad f = -\log p_1 \qquad (10.21)$$

but we compute both r_i and $\bar{r}_i$ simultaneously and make direct use of both p_i and $\bar{p}_i$ as appropriate.

⟨*SF mappings: procedures*⟩+≡
```
   subroutine map_unit_square_prec (r, rb, factor, p, pb)
     real(default), dimension(2), intent(out) :: r
     real(default), dimension(2), intent(out) :: rb
     real(default), intent(out) :: factor
     real(default), dimension(2), intent(in) :: p
     real(default), dimension(2), intent(in) :: pb
     if (p(1) > 0.5_default) then
        call compute_prec_xy_1 (r(1), rb(1), p(1), pb(1), p (2))
        call compute_prec_xy_1 (r(2), rb(2), p(1), pb(1), pb(2))
        factor = - log_prec (p(1), pb(1))
     else if (p(1) > 0) then
        call compute_prec_xy_0 (r(1), rb(1), p(1), pb(1), p (2))
        call compute_prec_xy_0 (r(2), rb(2), p(1), pb(1), pb(2))
        factor = - log_prec (p(1), pb(1))
     else
        r  = 0
        rb = 1
```

```
        factor = 0
      end if
    end subroutine map_unit_square_prec
```

This is the inverse mapping.

⟨*SF mappings: procedures*⟩+≡
```
    subroutine map_unit_square_inverse_prec (r, rb, factor, p, pb)
      real(default), dimension(2), intent(in) :: r
      real(default), dimension(2), intent(in) :: rb
      real(default), intent(out) :: factor
      real(default), dimension(2), intent(out) :: p
      real(default), dimension(2), intent(out) :: pb
      call inverse_prec_x (r, rb, p(1), pb(1))
      if (all (r > 0)) then
         if (rb(1) < rb(2)) then
            call inverse_prec_y (r, rb, p(2), pb(2))
         else
            call inverse_prec_y ([r(2),r(1)], [rb(2),rb(1)], pb(2), p(2))
         end if
         factor = - log_prec (p(1), pb(1))
      else
         p(1)  = 0
         pb(1) = 1
         p(2)  = 0.5_default
         pb(2) = 0.5_default
         factor = 0
      end if
    end subroutine map_unit_square_inverse_prec
```

This is an auxiliary function: evaluate the expression $\bar{z} = 1 - x^y$ in a numerically stable way. Instabilities occur for $y = 0$ and $x = 1$. The idea is to replace the bracket by the first terms of its Taylor expansion around $x = 1$ (read $\bar{x} \equiv 1 - x$)

$$1 - x^y = y\bar{x}\left(1 + \frac{1}{2}(1 - y)\bar{x} + \frac{1}{6}(2 - y)(1 - y)\bar{x}^2\right) \qquad (10.22)$$

whenever this is the better approximation. Actually, the relative numerical error of the exact formula is about $\eta/(y\bar{x})$ where η is given by `epsilon(KIND)` in Fortran. The relative error of the approximation is better than the last included term divided by $(y\bar{x})$.

The first subroutine computes z and $\bar{z}$ near $x = 1$ where $\log x$ should be expanded, the second one near $x = 0$ where $\log x$ can be kept.

⟨*SF mappings: procedures*⟩+≡
```
    subroutine compute_prec_xy_1 (z, zb, x, xb, y)
      real(default), intent(out) :: z, zb
      real(default), intent(in) :: x, xb, y
      real(default) :: a1, a2, a3
      a1 = y * xb
      a2 = a1 * (1 - y) * xb / 2
      a3 = a2 * (2 - y) * xb / 3
      if (abs (a3) < epsilon (a3)) then
         zb = a1 + a2 + a3
         z = 1 - zb
```

```
    else
        z = x ** y
        zb = 1 - z
    end if
end subroutine compute_prec_xy_1

subroutine compute_prec_xy_0 (z, zb, x, xb, y)
    real(default), intent(out) :: z, zb
    real(default), intent(in) :: x, xb, y
    real(default) :: a1, a2, a3, lx
    lx = -log (x)
    a1 = y * lx
    a2 = a1 * y * lx / 2
    a3 = a2 * y * lx / 3
    if (abs (a3) < epsilon (a3)) then
        zb = a1 + a2 + a3
        z = 1 - zb
    else
        z = x ** y
        zb = 1 - z
    end if
end subroutine compute_prec_xy_0
```

For the inverse calculation, we evaluate $x = r_1 r_2$ in a stable way. Since it is just a polynomial, the expansion near $x = 1$ is analytically exact, and we don't need to choose based on precision.

⟨*SF mappings: procedures*⟩+≡
```
subroutine inverse_prec_x (r, rb, x, xb)
    real(default), dimension(2), intent(in) :: r, rb
    real(default), intent(out) :: x, xb
    real(default) :: a0, a1
    a0 = rb(1) + rb(2)
    a1 = rb(1) * rb(2)
    if (a0 > 0.5_default) then
        xb = a0 - a1
        x = 1 - xb
    else
        x = r(1) * r(2)
        xb = 1 - x
    end if
end subroutine inverse_prec_x
```

The inverse calculation for the relative momentum fraction

$$y = \frac{1}{1 + \frac{\log r_2}{\log r_1}} \tag{10.23}$$

is slightly more complicated. We should take the precise form of the logarithm, so we are safe near $r_i = 1$. A series expansion is required if $r_1 \ll r_2$, since then y becomes small. (We assume $r_1 < r_2$ here; for the opposite case, the arguments can be exchanged.)

⟨*SF mappings: procedures*⟩+≡
```
subroutine inverse_prec_y (r, rb, y, yb)
```

```fortran
    real(default), dimension(2), intent(in) :: r, rb
    real(default), intent(out) :: y, yb
    real(default) :: log1, log2, a1, a2, a3
    log1 = log_prec (r(1), rb(1))
    log2 = log_prec (r(2), rb(2))
    a1 = - rb(1) / log2
    a2 = - rb(1) ** 2 * (1 / log2**2 + 1 / (2 * log2))
    a3 = - rb(1) ** 3 * (1 / log2**3 + 1 / log2**2 + 1 / (3 * log2))
    if (abs (a3) < epsilon (a3)) then
       y  = a1 + a2 + a3
       yb = 1 - y
    else
       y  = 1 / (1 + log2/log1)
       yb = 1 / (1 + log1/log2)
    end if
  end subroutine inverse_prec_y
```

We also need an evaluation of $\log x$ which is stable near $x = 1$.

⟨*SF mappings: public*⟩+≡
```fortran
    public :: log_prec
```

⟨*SF mappings: procedures*⟩+≡
```fortran
    function log_prec (x, xb) result (lx)
      real(default), intent(in) :: x, xb
      real(default) :: a1, a2, a3, lx
      a1 = xb
      a2 = a1 * xb / 2
      a3 = a2 * xb * 2 / 3
      if (abs (a3) < epsilon (a3)) then
         lx = - a1 - a2 - a3
      else
         lx = log (x)
      end if
    end function log_prec
```

Mapping for on-shell s-channel

The limiting case, if the product $r_1 r_2$ is fixed for on-shell production. The parameter p_1 is ignored. In the inverse mapping, it is returned zero.

The parameter `x_free`, if present, rescales the total energy. If it is less than one, the rescaled mass parameter m^2 should be increased accordingly.

⟨*SF mappings: procedures*⟩+≡
```fortran
    subroutine map_on_shell (r, factor, p, lm2, x_free)
      real(default), dimension(2), intent(out) :: r
      real(default), intent(out) :: factor
      real(default), dimension(2), intent(in) :: p
      real(default), intent(in) :: lm2
      real(default), intent(in), optional :: x_free
      real(default) :: lx
      lx = lm2;  if (present (x_free))  lx = lx + log (x_free)
      r(1) = exp (- p(2) * lx)
      r(2) = exp (- (1 - p(2)) * lx)
```

```
      factor = lx
    end subroutine map_on_shell

    subroutine map_on_shell_inverse (r, factor, p, lm2, x_free)
      real(default), dimension(2), intent(in) :: r
      real(default), intent(out) :: factor
      real(default), dimension(2), intent(out) :: p
      real(default), intent(in) :: lm2
      real(default), intent(in), optional :: x_free
      real(default) :: lx
      lx = lm2;  if (present (x_free))  lx = lx + log (x_free)
      p(1) = 0
      p(2) = abs (log (r(1))) / lx
      factor = lx
    end subroutine map_on_shell_inverse
```

This is the standard Breit-Wigner mapping. We apply it to a single variable, independently of or in addition to a unit-square mapping. We assume here that the limits for the variable are 0 and 1, and that the mass m and width w are rescaled appropriately, so they are dimensionless and usually between 0 and 1.

If `x_free` is set, it rescales the total energy and thus mass and width, since these are defined with respect to the total energy.

⟨*SF mappings: procedures*⟩+≡

```
    subroutine map_breit_wigner (r, factor, p, m, w, x_free)
      real(default), intent(out) :: r
      real(default), intent(out) :: factor
      real(default), intent(in) :: p
      real(default), intent(in) :: m
      real(default), intent(in) :: w
      real(default), intent(in), optional :: x_free
      real(default) :: m2, mw, a1, a2, a3, z, tmp
      m2 = m ** 2
      mw = m * w
      if (present (x_free)) then
         m2 = m2 / x_free
         mw = mw / x_free
      end if
      a1 = atan (- m2 / mw)
      a2 = atan ((1 - m2) / mw)
      a3 = (a2 - a1) * mw
      z = (1-p) * a1 + p * a2
      if (-pi/2 < z .and. z < pi/2) then
         tmp = tan (z)
         r = max (m2 + mw * tmp, 0._default)
         factor = a3 * (1 + tmp ** 2)
      else
         r = 0
         factor = 0
      end if
    end subroutine map_breit_wigner

    subroutine map_breit_wigner_inverse (r, factor, p, m, w, x_free)
      real(default), intent(in) :: r
```

```
      real(default), intent(out) :: factor
      real(default), intent(out) :: p
      real(default), intent(in) :: m
      real(default), intent(in) :: w
      real(default) :: m2, mw, a1, a2, a3, tmp
      real(default), intent(in), optional :: x_free
      m2 = m ** 2
      mw = m * w
      if (present (x_free)) then
         m2 = m2 / x_free
         mw = mw / x_free
      end if
      a1 = atan (- m2 / mw)
      a2 = atan ((1 - m2) / mw)
      a3 = (a2 - a1) * mw
      tmp = (r - m2) / mw
      p = (atan (tmp) - a1) / (a2 - a1)
      factor = a3 * (1 + tmp ** 2)
    end subroutine map_breit_wigner_inverse
```

Mapping with endpoint enhancement

This is a mapping which is close to the unit mapping, except that at the end-point(s), the output values are exponentially enhanced.

$$y = \tanh(a \tan(\frac{\pi}{2}x)) \tag{10.24}$$

We have two variants: one covers endpoints at 0 and 1 symmetrically, while the other one (which essentially maps one-half of the range), covers only the endpoint at 1.

⟨*SF mappings: procedures*⟩+≡

```
    subroutine map_endpoint_1 (x3, factor, x1, a)
      real(default), intent(out) :: x3, factor
      real(default), intent(in) :: x1
      real(default), intent(in) :: a
      real(default) :: x2
      if (abs (x1) < 1) then
         x2 = tan (x1 * pi / 2)
         x3 = tanh (a * x2)
         factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
      else
         x3 = x1
         factor = 0
      end if
    end subroutine map_endpoint_1

    subroutine map_endpoint_inverse_1 (x3, factor, x1, a)
      real(default), intent(in) :: x3
      real(default), intent(out) :: x1, factor
      real(default), intent(in) :: a
      real(default) :: x2
      if (abs (x3) < 1) then
```

```
          x2 = atanh (x3) / a
          x1 = 2 / pi * atan (x2)
          factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
       else
          x1 = x3
          factor = 0
       end if
    end subroutine map_endpoint_inverse_1

    subroutine map_endpoint_01 (x4, factor, x0, a)
      real(default), intent(out) :: x4, factor
      real(default), intent(in) :: x0
      real(default), intent(in) :: a
      real(default) :: x1, x3
      x1 = 2 * x0 - 1
      call map_endpoint_1 (x3, factor, x1, a)
      x4 = (x3 + 1) / 2
    end subroutine map_endpoint_01

    subroutine map_endpoint_inverse_01 (x4, factor, x0, a)
      real(default), intent(in) :: x4
      real(default), intent(out) :: x0, factor
      real(default), intent(in) :: a
      real(default) :: x1, x3
      x3 = 2 * x4 - 1
      call map_endpoint_inverse_1 (x3, factor, x1, a)
      x0 = (x1 + 1) / 2
    end subroutine map_endpoint_inverse_01
```

Mapping with endpoint enhancement (ISR)

This is another endpoint mapping. It is designed to flatten the ISR singularity
which is of power type at $x = 1$, i.e., if

$$\sigma = \int_0^1 dx\, f(x)\, G(x) = \int_0^1 dx\, \epsilon (1 - x)^{-1+\epsilon} G(x), \qquad (10.25)$$

we replace this by

$$r = x^\epsilon \quad \Longrightarrow \quad \sigma = \int_0^1 dr\, G(1 - (1 - r)^{1/\epsilon}). \qquad (10.26)$$

We expect that ϵ is small.

The actual mapping is $r \to x$ (so x emerges closer to 1). The Jacobian that
we return is thus $1/f(x)$. We compute the mapping in terms of $\bar{x} \equiv 1 - x$, so
we can achieve the required precision. Because some compilers show quite wild
numeric fluctuations, we internally convert numeric types to explicit `double`
precision.

⟨*SF mappings: public*⟩+≡
```
    public :: map_power_1
    public :: map_power_inverse_1
```

⟨*SF mappings: procedures*⟩+≡

```fortran
    subroutine map_power_1 (xb, factor, rb, eps)
      real(default), intent(out) :: xb, factor
      real(default), intent(in) :: rb
      real(double) :: rb_db, factor_db, eps_db, xb_db
      real(default), intent(in) :: eps
      rb_db = real (rb, kind=double)
      eps_db = real (eps, kind=double)
      xb_db = rb_db ** (1 / eps_db)
      if (rb_db > 0) then
         factor_db = xb_db / rb_db / eps_db
         factor = real (factor_db, kind=default)
      else
         factor = 0
      end if
      xb = real (xb_db, kind=default)
    end subroutine map_power_1

    subroutine map_power_inverse_1 (xb, factor, rb, eps)
      real(default), intent(in) :: xb
      real(default), intent(out) :: rb, factor
      real(double) :: xb_db, factor_db, eps_db, rb_db
      real(default), intent(in) :: eps
      xb_db = real (xb, kind=double)
      eps_db = real (eps, kind=double)
      rb_db = xb_db ** eps_db
      if (xb_db > 0) then
         factor_db = xb_db / rb_db / eps_db
         factor = real (factor_db, kind=default)
      else
         factor = 0
      end if
      rb = real (rb_db, kind=default)
    end subroutine map_power_inverse_1
```

Here we apply a power mapping to both endpoints. We divide the interval in two equal halves and apply the power mapping for the nearest endpoint, either 0 or 1.

⟨*SF mappings: procedures*⟩+≡

```fortran
    subroutine map_power_01 (y, yb, factor, r, eps)
      real(default), intent(out) :: y, yb, factor
      real(default), intent(in) :: r
      real(default), intent(in) :: eps
      real(default) :: u, ub, zp, zm
      u = 2 * r - 1
      if (u > 0) then
         ub = 2 * (1 - r)
         call map_power_1 (zm, factor, ub, eps)
         zp = 2 - zm
      else if (u < 0) then
         ub = 2 * r
         call map_power_1 (zp, factor, ub, eps)
         zm = 2 - zp
```

1048

```
    else
       factor = 1 / eps
       zp = 1
       zm = 1
    end if
    y  = zp / 2
    yb = zm / 2
  end subroutine map_power_01

  subroutine map_power_inverse_01 (y, yb, factor, r, eps)
    real(default), intent(in) :: y, yb
    real(default), intent(out) :: r, factor
    real(default), intent(in) :: eps
    real(default) :: ub, zp, zm
    zp = 2 * y
    zm = 2 * yb
    if (zm < zp) then
       call map_power_inverse_1 (zm, factor, ub, eps)
       r = 1 - ub / 2
    else if (zp < zm) then
       call map_power_inverse_1 (zp, factor, ub, eps)
       r = ub / 2
    else
       factor = 1 / eps
       ub = 1
       r = ub / 2
    end if
  end subroutine map_power_inverse_01
```

Structure-function channels

A structure-function chain parameterization (channel) may contain a mapping
that applies to multiple structure functions. This is described by an extension
of the `sf_mapping_t` type. In addition, it may contain mappings that apply
to (other) individual structure functions. The details of these mappings are
implementation-specific.

The `sf_channel_t` type combines this information. It contains an array of
map codes, one for each structure-function entry. The code values are:

none MC input parameters r directly become energy fractions x

single default mapping for a single structure-function entry

multi/s map $r \to x$ such that one MC input parameter is $\hat{s}/s$

multi/resonance as before, adapted to s-channel resonance

multi/on-shell as before, adapted to an on-shell particle in the s channel

multi/endpoint like multi/s, but enhance the region near $r_i = 1$

multi/endpoint/res endpoint mapping with resonance

multi/endpoint/os endpoint mapping for on-shell

1049

multi/power/os like multi/endpoint, regulating a power singularity

⟨*SF mappings: parameters*⟩≡
```
integer, parameter :: SFMAP_NONE = 0
integer, parameter :: SFMAP_SINGLE = 1
integer, parameter :: SFMAP_MULTI_S = 2
integer, parameter :: SFMAP_MULTI_RES = 3
integer, parameter :: SFMAP_MULTI_ONS = 4
integer, parameter :: SFMAP_MULTI_EP = 5
integer, parameter :: SFMAP_MULTI_EPR = 6
integer, parameter :: SFMAP_MULTI_EPO = 7
integer, parameter :: SFMAP_MULTI_IP = 8
integer, parameter :: SFMAP_MULTI_IPR = 9
integer, parameter :: SFMAP_MULTI_IPO = 10
integer, parameter :: SFMAP_MULTI_EI = 11
```

Then, it contains an allocatable entry for the multi mapping. This entry holds the MC-parameter indices on which the mapping applies (there may be more than one MC parameter per structure-function entry) and any parameters associated with the mapping.

There can be only one multi-mapping per channel.

⟨*SF mappings: public*⟩+≡
```
public :: sf_channel_t
```

⟨*SF mappings: types*⟩+≡
```
type :: sf_channel_t
   integer, dimension(:), allocatable :: map_code
   class(sf_mapping_t), allocatable :: multi_mapping
 contains
 ⟨SF mappings: sf channel: TBP⟩
 end type sf_channel_t
```

The output format prints a single character for each structure-function entry and, if applicable, an account of the mapping parameters.

⟨*SF mappings: sf channel: TBP*⟩≡
```
procedure :: write => sf_channel_write
```

⟨*SF mappings: procedures*⟩+≡
```
subroutine sf_channel_write (object, unit)
  class(sf_channel_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, i
  u = output_unit (unit)
  if (allocated (object%map_code)) then
    do i = 1, size (object%map_code)
       select case (object%map_code (i))
       case (SFMAP_NONE)
          write (u, "(1x,A)", advance="no") "-"
       case (SFMAP_SINGLE)
          write (u, "(1x,A)", advance="no") "+"
       case (SFMAP_MULTI_S)
          write (u, "(1x,A)", advance="no") "s"
       case (SFMAP_MULTI_RES)
          write (u, "(1x,A)", advance="no") "r"
```

```
            case (SFMAP_MULTI_ONS)
               write (u, "(1x,A)", advance="no") "o"
            case (SFMAP_MULTI_EP)
               write (u, "(1x,A)", advance="no") "e"
            case (SFMAP_MULTI_EPR)
               write (u, "(1x,A)", advance="no") "p"
            case (SFMAP_MULTI_EPO)
               write (u, "(1x,A)", advance="no") "q"
            case (SFMAP_MULTI_IP)
               write (u, "(1x,A)", advance="no") "i"
            case (SFMAP_MULTI_IPR)
               write (u, "(1x,A)", advance="no") "i"
            case (SFMAP_MULTI_IPO)
               write (u, "(1x,A)", advance="no") "i"
            case (SFMAP_MULTI_EI)
               write (u, "(1x,A)", advance="no") "i"
            end select
         end do
      else
         write (u, "(1x,A)", advance="no") "-"
      end if
      if (allocated (object%multi_mapping)) then
         write (u, "(1x,'/')", advance="no")
         call object%multi_mapping%write (u)
      else
         write (u, *)
      end if
    end subroutine sf_channel_write
```

Initializer for a single `sf_channel` object.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: init => sf_channel_init
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_init (channel, n_strfun)
      class(sf_channel_t), intent(out) :: channel
      integer, intent(in) :: n_strfun
      allocate (channel%map_code (n_strfun))
      channel%map_code = SFMAP_NONE
    end subroutine sf_channel_init
```

Assignment. This merely copies intrinsic assignment, but apparently the latter is bugged in gfortran 4.6.3, causing memory corruption.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    generic :: assignment (=) => sf_channel_assign
    procedure :: sf_channel_assign
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_assign (copy, original)
      class(sf_channel_t), intent(out) :: copy
      type(sf_channel_t), intent(in) :: original
      allocate (copy%map_code (size (original%map_code)))
      copy%map_code = original%map_code
      if (allocated (original%multi_mapping)) then
```

```
          allocate (copy%multi_mapping, source = original%multi_mapping)
        end if
      end subroutine sf_channel_assign
```

This initializer allocates an array of channels with common number of structure-function entries, therefore it is not a type-bound procedure.

⟨*SF mappings: public*⟩+≡
```
      public :: allocate_sf_channels
```

⟨*SF mappings: procedures*⟩+≡
```
      subroutine allocate_sf_channels (channel, n_channel, n_strfun)
        type(sf_channel_t), dimension(:), intent(out), allocatable :: channel
        integer, intent(in) :: n_channel
        integer, intent(in) :: n_strfun
        integer :: c
        allocate (channel (n_channel))
        do c = 1, n_channel
           call channel(c)%init (n_strfun)
        end do
      end subroutine allocate_sf_channels
```

This marks a given subset of indices as single-mapping.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
      procedure :: activate_mapping => sf_channel_activate_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
      subroutine sf_channel_activate_mapping (channel, i_sf)
        class(sf_channel_t), intent(inout) :: channel
        integer, dimension(:), intent(in) :: i_sf
        channel%map_code(i_sf) = SFMAP_SINGLE
      end subroutine sf_channel_activate_mapping
```

This sets an s-channel multichannel mapping. The length of the `i_sf` array must be 2. The parameter indices are not yet set.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
      procedure :: set_s_mapping => sf_channel_set_s_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
      subroutine sf_channel_set_s_mapping (channel, i_sf, power)
        class(sf_channel_t), intent(inout) :: channel
        integer, dimension(:), intent(in) :: i_sf
        real(default), intent(in), optional :: power
        channel%map_code(i_sf) = SFMAP_MULTI_S
        allocate (sf_s_mapping_t :: channel%multi_mapping)
        select type (mapping => channel%multi_mapping)
        type is (sf_s_mapping_t)
           call mapping%init (power)
        end select
      end subroutine sf_channel_set_s_mapping
```

This sets an s-channel resonance multichannel mapping.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
      procedure :: set_res_mapping => sf_channel_set_res_mapping
```

1052

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_res_mapping (channel, i_sf, m, w)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in) :: m, w
      channel%map_code(i_sf) = SFMAP_MULTI_RES
      allocate (sf_res_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_res_mapping_t)
         call mapping%init (m, w)
      end select
    end subroutine sf_channel_set_res_mapping
```

This sets an s-channel on-shell multichannel mapping. The length of the `i_sf`
array must be 2. (The first parameter actually becomes an irrelevant dummy.)

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_os_mapping => sf_channel_set_os_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_os_mapping (channel, i_sf, m)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in) :: m
      channel%map_code(i_sf) = SFMAP_MULTI_ONS
      allocate (sf_os_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_os_mapping_t)
         call mapping%init (m)
      end select
    end subroutine sf_channel_set_os_mapping
```

This sets an s-channel endpoint mapping. The parameter a is the slope parameter (default 1); increasing it moves the endpoint region (at $x = 1$ to lower values in the input parameter. region even more.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_ep_mapping => sf_channel_set_ep_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_ep_mapping (channel, i_sf, a)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: a
      channel%map_code(i_sf) = SFMAP_MULTI_EP
      allocate (sf_ep_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_ep_mapping_t)
         call mapping%init (a = a)
      end select
    end subroutine sf_channel_set_ep_mapping
```

This sets a resonant endpoint mapping.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_epr_mapping => sf_channel_set_epr_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_epr_mapping (channel, i_sf, a, m, w)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in) :: a, m, w
      channel%map_code(i_sf) = SFMAP_MULTI_EPR
      allocate (sf_epr_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_epr_mapping_t)
         call mapping%init (a, m, w)
      end select
    end subroutine sf_channel_set_epr_mapping
```

This sets an on-shell endpoint mapping.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_epo_mapping => sf_channel_set_epo_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_epo_mapping (channel, i_sf, a, m)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in) :: a, m
      channel%map_code(i_sf) = SFMAP_MULTI_EPO
      allocate (sf_epo_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_epo_mapping_t)
         call mapping%init (a, m)
      end select
    end subroutine sf_channel_set_epo_mapping
```

This sets an s-channel power mapping, regulating a singularity of type $(1 - x)^{-1+\epsilon}$. The parameter ϵ depends on the structure function.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_ip_mapping => sf_channel_set_ip_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_ip_mapping (channel, i_sf, eps)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: eps
      channel%map_code(i_sf) = SFMAP_MULTI_IP
      allocate (sf_ip_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_ip_mapping_t)
         call mapping%init (eps)
      end select
    end subroutine sf_channel_set_ip_mapping
```

This sets an s-channel resonant power mapping, regulating a singularity of type $(1-x)^{-1+\epsilon}$ in the presence of an s-channel resonance. The parameter ϵ depends on the structure function.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_ipr_mapping => sf_channel_set_ipr_mapping
```

⟨SF mappings: procedures⟩+≡
```
subroutine sf_channel_set_ipr_mapping (channel, i_sf, eps, m, w)
  class(sf_channel_t), intent(inout) :: channel
  integer, dimension(:), intent(in) :: i_sf
  real(default), intent(in), optional :: eps, m, w
  channel%map_code(i_sf) = SFMAP_MULTI_IPR
  allocate (sf_ipr_mapping_t :: channel%multi_mapping)
  select type (mapping => channel%multi_mapping)
  type is (sf_ipr_mapping_t)
     call mapping%init (eps, m, w)
  end select
end subroutine sf_channel_set_ipr_mapping
```

This sets an on-shell power mapping, regulating a singularity of type $(1-x)^{-1+\epsilon}$ for the production of a single on-shell particle.. The parameter ϵ depends on the structure function.

⟨SF mappings: sf channel: TBP⟩+≡
```
procedure :: set_ipo_mapping => sf_channel_set_ipo_mapping
```

⟨SF mappings: procedures⟩+≡
```
subroutine sf_channel_set_ipo_mapping (channel, i_sf, eps, m)
  class(sf_channel_t), intent(inout) :: channel
  integer, dimension(:), intent(in) :: i_sf
  real(default), intent(in), optional :: eps, m
  channel%map_code(i_sf) = SFMAP_MULTI_IPO
  allocate (sf_ipo_mapping_t :: channel%multi_mapping)
  select type (mapping => channel%multi_mapping)
  type is (sf_ipo_mapping_t)
     call mapping%init (eps, m)
  end select
end subroutine sf_channel_set_ipo_mapping
```

This sets a combined endpoint/ISR mapping.

⟨SF mappings: sf channel: TBP⟩+≡
```
procedure :: set_ei_mapping => sf_channel_set_ei_mapping
```

⟨SF mappings: procedures⟩+≡
```
subroutine sf_channel_set_ei_mapping (channel, i_sf, a, eps)
  class(sf_channel_t), intent(inout) :: channel
  integer, dimension(:), intent(in) :: i_sf
  real(default), intent(in), optional :: a, eps
  channel%map_code(i_sf) = SFMAP_MULTI_EI
  allocate (sf_ei_mapping_t :: channel%multi_mapping)
  select type (mapping => channel%multi_mapping)
  type is (sf_ei_mapping_t)
     call mapping%init (a, eps)
  end select
end subroutine sf_channel_set_ei_mapping
```

This sets a combined endpoint/ISR mapping with resonance.

⟨SF mappings: sf channel: TBP⟩+≡
```
procedure :: set_eir_mapping => sf_channel_set_eir_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_eir_mapping (channel, i_sf, a, eps, m, w)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: a, eps, m, w
      channel%map_code(i_sf) = SFMAP_MULTI_EI
      allocate (sf_eir_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_eir_mapping_t)
         call mapping%init (a, eps, m, w)
      end select
    end subroutine sf_channel_set_eir_mapping
```

This sets a combined endpoint/ISR mapping, on-shell.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_eio_mapping => sf_channel_set_eio_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_eio_mapping (channel, i_sf, a, eps, m)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: a, eps, m
      channel%map_code(i_sf) = SFMAP_MULTI_EI
      allocate (sf_eio_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_eio_mapping_t)
         call mapping%init (a, eps, m)
      end select
    end subroutine sf_channel_set_eio_mapping
```

Return true if the mapping code at position `i_sf` is `SFMAP_SINGLE`.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: is_single_mapping => sf_channel_is_single_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    function sf_channel_is_single_mapping (channel, i_sf) result (flag)
      class(sf_channel_t), intent(in) :: channel
      integer, intent(in) :: i_sf
      logical :: flag
      flag = channel%map_code(i_sf) == SFMAP_SINGLE
    end function sf_channel_is_single_mapping
```

Return true if the mapping code at position `i_sf` is any of the `SFMAP_MULTI` mappings.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: is_multi_mapping => sf_channel_is_multi_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    function sf_channel_is_multi_mapping (channel, i_sf) result (flag)
      class(sf_channel_t), intent(in) :: channel
      integer, intent(in) :: i_sf
      logical :: flag
      select case (channel%map_code(i_sf))
```

```
      case (SFMAP_NONE, SFMAP_SINGLE)
         flag = .false.
      case default
         flag = .true.
      end select
   end function sf_channel_is_multi_mapping
```

Return true if there is any nontrivial mapping in any of the channels.

Note: we provide an explicit public function. gfortran 4.6.3 has problems with the alternative implementation as a type-bound procedure for an array base object.

⟨*SF mappings: public*⟩+≡
```

Check resonance mapping

Probe the resonance mapping of the unit square for different parameter values.
Also calculates integrals. For a finite number of bins, they differ slightly from
1, but the result is well-defined because we are not using random points.

The resonance mass is at $1/2$ the energy, the width is $1/10$.

⟨*SF mappings: execute tests*⟩+≡
```
      call test (sf_mappings_3, "sf_mappings_3", &
           "resonant pair mapping", &

write (u, "(A)")
write (u, "(A)")  "* Test output end: sf_mappings_3"

end subroutine sf_mappings_3
```

Check on-shell mapping

Probe the on-shell mapping of the unit square for different parameter values. Also calculates integrals. In this case, the Jacobian is constant and given by $|\log m^2|$, so this is also the value of the integral. The factor results from the variable change in the δ function $\delta(m^2 - x_1 x_2)$ which multiplies the cross section for the case at hand.

For the test, the (rescaled) resonance mass is set at $1/2$ the energy.

⟨*SF mappings: execute tests*⟩+≡

Check on-shell power mapping

Probe the power mapping of the unit square, adapted for single-particle production, for different parameter values. Also calculates integrals. For a finite number of bins, they differ slightly from 1, but the result is well-defined because we are not using random points.

⟨*SF mappings: execute tests*⟩+≡
