10.3.1 Abstract structure-function data type

This type should hold all configuration data for a specific type of structure
function. The base object is empty; the implementations will fill it.

⟨*SF base: public*⟩≡
```
    public :: sf_data_t
```

⟨*SF base: types*⟩≡
```
    type, abstract :: sf_data_t
     contains
     ⟨SF base: sf data: TBP⟩
    end type sf_data_t
```

Output.

⟨*SF base: sf data: TBP*⟩≡
```
    procedure (sf_data_write), deferred :: write
```

⟨*SF base: interfaces*⟩≡
```
    abstract interface
      subroutine sf_data_write (data, unit, verbose)
        import
        class(sf_data_t), intent(in) :: data
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
      end subroutine sf_data_write
    end interface
```

Return true if this structure function is in generator mode. In that case, all
parameters are free, otherwise bound. (We do not support mixed cases.) Default
is: no generator.

⟨*SF base: sf data: TBP*⟩+≡

```
      procedure :: is_generator => sf_data_is_generator
```
⟨*SF base: procedures*⟩≡
```
    function sf_data_is_generator (data) result (flag)
      class(sf_data_t), intent(in) :: data
      logical :: flag
      flag = .false.
    end function sf_data_is_generator
```

Return the number of input parameters that determine the structure function.
⟨*SF base: sf data: TBP*⟩+≡
```
    procedure (sf_data_get_int), deferred :: get_n_par
```
⟨*SF base: interfaces*⟩+≡
```
    abstract interface
      function sf_data_get_int (data) result (n)
        import
        class(sf_data_t), intent(in) :: data
        integer :: n
      end function sf_data_get_int
    end interface
```

Return the outgoing particle PDG codes for the current setup. The codes can
be an array of particles, for each beam.
⟨*SF base: sf data: TBP*⟩+≡
```
    procedure (sf_data_get_pdg_out), deferred :: get_pdg_out
```
⟨*SF base: interfaces*⟩+≡
```
    abstract interface
      subroutine sf_data_get_pdg_out (data, pdg_out)
        import
        class(sf_data_t), intent(in) :: data
        type(pdg_array_t), dimension(:), intent(inout) :: pdg_out
      end subroutine sf_data_get_pdg_out
    end interface
```

Allocate a matching structure function interaction object and properly initialize
it.
⟨*SF base: sf data: TBP*⟩+≡
```
    procedure (sf_data_allocate_sf_int), deferred :: allocate_sf_int
```
⟨*SF base: interfaces*⟩+≡
```
    abstract interface
      subroutine sf_data_allocate_sf_int (data, sf_int)
        import
        class(sf_data_t), intent(in) :: data
        class(sf_int_t), intent(inout), allocatable :: sf_int
      end subroutine sf_data_allocate_sf_int
    end interface
```

Return the PDF set index, if applicable. We implement a default method which
returns zero. The PDF (builtin and LHA) implementations will override this.
⟨*SF base: sf data: TBP*⟩+≡
```
    procedure :: get_pdf_set => sf_data_get_pdf_set
```

⟨*SF base: procedures*⟩+≡
```
    function sf_data_get_pdf_set (data) result (pdf_set)
      class(sf_data_t), intent(in) :: data
      integer :: pdf_set
      pdf_set = 0
    end function sf_data_get_pdf_set
```

10.3.2 Structure-function chain configuration

This is the data type that the `processes` module uses for setting up its structure-function chain. For each structure function described by the beam data, there is an entry. The `i` array indicates the beam(s) to which this structure function applies, and the `data` object contains the actual configuration data.

⟨*SF base: public*⟩+≡
```
    public :: sf_config_t
```

⟨*SF base: types*⟩+≡
```
    type :: sf_config_t
      integer, dimension(:), allocatable :: i
      class(sf_data_t), allocatable :: data
     contains
     ⟨SF base: sf config: TBP⟩
    end type sf_config_t
```

Output:

⟨*SF base: sf config: TBP*⟩≡
```
    procedure :: write => sf_config_write
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_config_write (object, unit)
      class(sf_config_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      if (allocated (object%i)) then
        write (u, "(1x,A,2(1x,I0))")  "Structure-function configuration: &
             &beam(s)", object%i
        if (allocated (object%data))  call object%data%write (u)
      else
        write (u, "(1x,A)")  "Structure-function configuration: [undefined]"
      end if
    end subroutine sf_config_write
```

Initialize.

⟨*SF base: sf config: TBP*⟩+≡
```
    procedure :: init => sf_config_init
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_config_init (sf_config, i_beam, sf_data)
      class(sf_config_t), intent(out) :: sf_config
      integer, dimension(:), intent(in) :: i_beam
      class(sf_data_t), intent(in) :: sf_data
```

```
        allocate (sf_config%i (size (i_beam)), source = i_beam)
        allocate (sf_config%data, source = sf_data)
    end subroutine sf_config_init
```

Return the PDF set, if any.

⟨*SF base: sf config: TBP*⟩+≡
```
    procedure :: get_pdf_set => sf_config_get_pdf_set
```

⟨*SF base: procedures*⟩+≡
```
    function sf_config_get_pdf_set (sf_config) result (pdf_set)
      class(sf_config_t), intent(in) :: sf_config
      integer :: pdf_set
      pdf_set = sf_config%data%get_pdf_set ()
    end function sf_config_get_pdf_set
```

10.3.3 Structure-function instance

The `sf_int_t` data type contains an `interaction_t` object (it is an extension of this type) and a pointer to the `sf_data_t` configuration data. This interaction, or copies of it, is used to implement structure-function kinematics and dynamics in the context of process evaluation.

The status code `status` tells whether the interaction is undefined, has defined kinematics (but matrix elements invalid), or is completely defined. There is also a status code for failure. The implementation is responsible for updating the status.

The entries `mi2`, `mr2`, and `mo2` hold the squared invariant masses of the incoming, radiated, and outgoing particle, respectively. They are supposed to be set upon initialization, but could also be varied event by event.

If the radiated or outgoing mass is nonzero, we may need to apply an on-shell projection. The projection mode is stored as `on_shell_mode`.

The array `beam_index` is the list of beams on which this structure function applies (1, 2, or both). The arrays `incoming`, `radiated`, and `outgoing` contain the indices of the respective particle sets within the interaction, for convenient lookup. The array `par_index` indicates the MC input parameters that this entry will use up in the structure-function chain. The first parameter (or the first two, for a spectrum) in this array determines the momentum fraction and is thus subject to global mappings.

In the abstract base type, we do not implement the data pointer. This allows us to restrict its type in the implementations.

⟨*SF base: public*⟩+≡
```
    public :: sf_int_t
```

⟨*SF base: types*⟩+≡
```
    type, abstract, extends (interaction_t) :: sf_int_t
      integer :: status = SF_UNDEFINED
      real(default), dimension(:), allocatable :: mi2
      real(default), dimension(:), allocatable :: mr2
      real(default), dimension(:), allocatable :: mo2
      integer :: on_shell_mode = KEEP_ENERGY
      logical :: qmin_defined = .false.
      logical :: qmax_defined = .false.
```

```
    real(default), dimension(:), allocatable :: qmin
    real(default), dimension(:), allocatable :: qmax
    integer, dimension(:), allocatable :: beam_index
    integer, dimension(:), allocatable :: incoming
    integer, dimension(:), allocatable :: radiated
    integer, dimension(:), allocatable :: outgoing
    integer, dimension(:), allocatable :: par_index
    integer, dimension(:), allocatable :: par_primary
  contains
  ⟨SF base: sf int: TBP⟩
  end type sf_int_t
```

Status codes. The codes that refer to links, masks, and connections, apply to structure-function chains only.

The status codes are public.

⟨*SF base: parameters*⟩≡
```
    integer, parameter, public :: SF_UNDEFINED = 0
    integer, parameter, public :: SF_INITIAL = 1
    integer, parameter, public :: SF_DONE_LINKS = 2
    integer, parameter, public :: SF_FAILED_MASK = 3
    integer, parameter, public :: SF_DONE_MASK = 4
    integer, parameter, public :: SF_FAILED_CONNECTIONS = 5
    integer, parameter, public :: SF_DONE_CONNECTIONS = 6
    integer, parameter, public :: SF_SEED_KINEMATICS = 10
    integer, parameter, public :: SF_FAILED_KINEMATICS = 11
    integer, parameter, public :: SF_DONE_KINEMATICS = 12
    integer, parameter, public :: SF_FAILED_EVALUATION = 13
    integer, parameter, public :: SF_EVALUATED = 20
```

Write a string version of the status code:

⟨*SF base: procedures*⟩+≡
```
    subroutine write_sf_status (status, u)
      integer, intent(in) :: status
      integer, intent(in) :: u
      select case (status)
      case (SF_UNDEFINED)
         write (u, "(1x,'[',A,']')")  "undefined"
      case (SF_INITIAL)
         write (u, "(1x,'[',A,']')")  "initialized"
      case (SF_DONE_LINKS)
         write (u, "(1x,'[',A,']')")  "links set"
      case (SF_FAILED_MASK)
         write (u, "(1x,'[',A,']')")  "mask mismatch"
      case (SF_DONE_MASK)
         write (u, "(1x,'[',A,']')")  "mask set"
      case (SF_FAILED_CONNECTIONS)
         write (u, "(1x,'[',A,']')")  "connections failed"
      case (SF_DONE_CONNECTIONS)
         write (u, "(1x,'[',A,']')")  "connections set"
      case (SF_SEED_KINEMATICS)
         write (u, "(1x,'[',A,']')")  "incoming momenta set"
      case (SF_FAILED_KINEMATICS)
         write (u, "(1x,'[',A,']')")  "kinematics failed"
```

```
      case (SF_DONE_KINEMATICS)
         write (u, "(1x,'[',A,']')")  "kinematics set"
      case (SF_FAILED_EVALUATION)
         write (u, "(1x,'[',A,']')")  "evaluation failed"
      case (SF_EVALUATED)
         write (u, "(1x,'[',A,']')")  "evaluated"
      end select
   end subroutine write_sf_status
```

Finalizer. Required because the base interaction needs a finalizer. We provide
an implementation, which need not be overwritten if the implementation does
not add finalizable subobjects.

⟨*SF base: sf int: TBP*⟩≡
```
   procedure :: final => sf_int_final
```

⟨*SF base: procedures*⟩+≡
```
   subroutine sf_int_final (object)
     class(sf_int_t), intent(inout) :: object
     call interaction_final (object%interaction_t)
   end subroutine sf_int_final
```

This is the basic output routine. Display status and interaction.

⟨*SF base: sf int: TBP*⟩+≡
```
   procedure :: base_write => sf_int_base_write
```

⟨*SF base: procedures*⟩+≡
```
   subroutine sf_int_base_write (object, unit, testflag)
     class(sf_int_t), intent(in) :: object
     integer, intent(in), optional :: unit
     logical, intent(in), optional :: testflag
     integer :: u
     u = output_unit (unit)
     write (u, "(1x,A)", advance="no")  "SF instance:"
     call write_sf_status (object%status, u)
     if (allocated (object%beam_index)) &
         write (u, "(3x,A,2(1x,I0))")  "beam      =", object%beam_index
     if (allocated (object%incoming)) &
         write (u, "(3x,A,2(1x,I0))")  "incoming  =", object%incoming

     if (allocated (object%par_index)) &
         write (u, "(3x,A,2(1x,I0))")  "parameter =", object%par_index
     if (object%qmin_defined) &
         write (u, "(3x,A,1x," // FMT_19 // ")")  "q_min     =", object%qmin
     if (object%qmax_defined) &
         write (u, "(3x,A,1x," // FMT_19 // ")")  "q_max     =", object%qmax
     call interaction_write (object%interaction_t, u, testflag = testflag)
   end subroutine sf_int_base_write
```

The type string identifies the structure function class, and possibly more details
about the structure function.

⟨*SF base: sf int: TBP*⟩+≡

```
        procedure (sf_int_type_string), deferred :: type_string
```
⟨*SF base: interfaces*⟩+≡
```
    abstract interface
       function sf_int_type_string (object) result (string)
         import
         class(sf_int_t), intent(in) :: object
         type(string_t) :: string
       end function sf_int_type_string
    end interface
```

Output of the concrete object. We should not forget to call the output routine
for the base type.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure (sf_int_write), deferred :: write
```
⟨*SF base: interfaces*⟩+≡
```
    abstract interface
       subroutine sf_int_write (object, unit, testflag)
         import
         class(sf_int_t), intent(in) :: object
         integer, intent(in), optional :: unit
         logical, intent(in), optional :: testflag
       end subroutine sf_int_write
    end interface
```

Basic initialization: set the invariant masses for the particles and initialize the
interaction. The caller should then add states to the interaction and freeze it.

The dimension of the mask should be equal to the sum of the dimensions
of the mass-squared arrays, which determine incoming, radiated, and outgoing
particles, respectively.

Optionally, we can define minimum and maximum values for the momen-
tum transfer to the outgoing particle(s). If all masses are zero, this is actually
required for non-collinear splitting.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure :: base_init => sf_int_base_init
```
⟨*SF base: procedures*⟩+≡
```
    subroutine sf_int_base_init &

        sf_int%outgoing = outgoing
      end subroutine sf_int_set_outgoing
```

Initialization. This proceeds via an abstract data object, which for the actual implementation should have the matching concrete type. Since all implementations have the same signature, we can prepare a deferred procedure. The data object will become the target of a corresponding pointer within the `sf_int_t` implementation.

This should call the previous procedure.

⟨*SF base: sf int: TBP*⟩+≡
```
      procedure (sf_int_init), deferred :: init
```

⟨*SF base: interfaces*⟩+≡
```
      abstract interface
        subroutine sf_int_init (sf_int, data)
          import
```

```
        class(sf_int_t), intent(out) :: sf_int
        class(sf_data_t), intent(in), target :: data
      end subroutine sf_int_init
    end interface
```

Complete initialization. This routine contains initializations that can only be performed after the interaction object got its final shape, i.e., redundant helicities have been eliminated by matching with beams and process.

The default implementation does nothing.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure :: setup_constants => sf_int_setup_constants
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_int_setup_constants (sf_int)
      class(sf_int_t), intent(inout) :: sf_int
    end subroutine sf_int_setup_constants
```

Set beam indices, i.e., the beam(s) on which this structure function applies.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure :: set_beam_index => sf_int_set_beam_index
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_int_set_beam_index (sf_int, beam_index)
      class(sf_int_t), intent(inout) :: sf_int
      integer, dimension(:), intent(in) :: beam_index
      allocate (sf_int%beam_index (size (beam_index)))
      sf_int%beam_index = beam_index
    end subroutine sf_int_set_beam_index
```

Set parameter indices, indicating which MC input parameters are to be used for evaluating this structure function.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure :: set_par_index => sf_int_set_par_index
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_int_set_par_index (sf_int, par_index)
      class(sf_int_t), intent(inout) :: sf_int
      integer, dimension(:), intent(in) :: par_index
      allocate (sf_int%par_index (size (par_index)))
      sf_int%par_index = par_index
    end subroutine sf_int_set_par_index
```

Initialize the structure-function kinematics, setting incoming momenta. We assume that array shapes match.

Three versions. The first version relies on the momenta being linked to another interaction. The second version sets the momenta explicitly. In the third version, we first compute momenta for the specified energies and store those.

⟨*SF base: sf int: TBP*⟩+≡
```

               k(j) = vector4_moving (E(j), &
                    (3-2*j) * sqrt (E(j)**2 - sf_int%mi2(j)), 3)
            end do
            call sf_int%seed_kinematics (k)
         end if
      end if
    end subroutine sf_int_seed_energies
```

Tell if in generator mode. By default, this is false. To be overridden where
appropriate; we may refer to the **is_generator** method of the **data** component
in the concrete type.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure :: is_generator => sf_int_is_generator
```
⟨*SF base: procedures*⟩+≡
```
    function sf_int_is_generator (sf_int) result (flag)
      class(sf_int_t), intent(in) :: sf_int
      logical :: flag
      flag = .false.
    end function sf_int_is_generator
```

Generate free parameters `r`. Parameters are free if they do not correspond to integration parameters (i.e., are bound), but are generated by the structure function object itself. By default, all parameters are bound, and the output values of this procedure will be discarded. With free parameters, we have to override this procedure.

The value `x_free` is the renormalization factor of the total energy that corresponds to the free parameters. If there are no free parameters, the procedure will not change its value, which starts as unity. Otherwise, the fraction is typically decreased, but may also be increased in some cases.

⟨*SF base: sf int: TBP*⟩+≡
```
procedure :: generate_free => sf_int_generate_free
```

⟨*SF base: procedures*⟩+≡
```
subroutine sf_int_generate_free (sf_int, r, rb,  x_free)
  class(sf_int_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(out) :: r, rb
  real(default), intent(inout) :: x_free
  r = 0
  rb= 1
end subroutine sf_int_generate_free
```

Complete the structure-function kinematics, derived from an input parameter (array) r between 0 and 1. The interaction momenta are calculated, and we return x (the momentum fraction), and f (the Jacobian factor for the map $r \to x$), if `map` is set.

If the `map` flag is unset, r and x values will coincide, and f will become unity. If it is set, the structure-function implementation chooses a convenient mapping from r to x with Jacobian f.

In the `inverse_kinematics` variant, we exchange the intent of `x` and `r`. The momenta are calculated only if the optional flag `set_momenta` is present and set.

⟨*SF base: sf int: TBP*⟩+≡

```

Single splitting: compute momenta, given x input parameters. We assume that the incoming momentum is set. The status code is set to `SF_FAILED_KINEMATICS` if the x array does not correspond to a valid momentum configuration. Otherwise, it is updated to `SF_DONE_KINEMATICS`.

We force the outgoing particle on-shell. The on-shell projection is determined by the `on_shell_mode`. The radiated particle should already be on shell.

The inverse procedure: we compute the x array from the momentum configura-
tion. In an overriding TBP, we may also set internal data that depend on this,
for convenience.

NOTE: Here and above, the single-particle case is treated in detail, allowing for non-collinearity and non-vanishing masses and nontrivial momentum-transfer bounds. For the pair case, we currently implement only collinear splitting and assume massless particles. This should be improved.

NOTE: We should also improve this in the sense of extracting both x and $\bar{x}$, where for the latter we may consult the beam remnant. The current implementation is not sensitive to small $\bar{x}$ values.

Apply the structure function, i.e., evaluate the interaction. For the calculation, we may use the stored momenta, any further information stored inside the `sf_int` implementation during kinematics setup, and the given energy scale. It may happen that for the given kinematics the value is not defined. This should be indicated by the status code.

  end if
end subroutine sf_int_get_values
```

10.3.5 Direct calculations

Compute a structure function value (array) directly, given an array of x values and a scale. If the energy is also given, we initialize the kinematics for that energy, otherwise take it from a previous run.

We assume that the E array has dimension n_in, and the x array has n_par.

⟨*SF base: sf int: TBP*⟩+≡

```
procedure :: compute_values => sf_int_compute_values
```

⟨*SF base: procedures*⟩+≡

```
subroutine sf_int_compute_values (sf_int, value, x, xb, scale, E)
  class(sf_int_t), intent(inout) :: sf_int

  real(default), dimension(size (x)) :: xx
  real(default) :: f
  if (present (E))  call sf_int%seed_kinematics (E)
  if (sf_int%status >= SF_SEED_KINEMATICS) then
     call sf_int%complete_kinematics (xx, f, x, xb, map=.false.)
     call sf_int%apply (scale)
     call sf_int%get_values (value)
     value = value * f
  else
     value = 0
  end if
end subroutine sf_int_compute_values
```

Compute just a single value for one of the states, i.e., throw the others away.

⟨*SF base: sf int: TBP*⟩+≡

```
procedure :: compute_value => sf_int_compute_value
```

⟨*SF base: procedures*⟩+≡

```
subroutine sf_int_compute_value &
     (sf_int, i_state, value, x, xb, scale, E)
```

```
   class(sf_int_t), intent(inout) :: sf_int
   integer, intent(in) :: i_state
   real(default), intent(out) :: value
   real(default), dimension(:), intent(in) :: x
   real(default), dimension(:), intent(in) :: xb
   real(default), intent(in) :: scale
   real(default), dimension(:), intent(in), optional :: E
   real(default), dimension(:), allocatable :: value_array
   if (sf_int%status >= SF_INITIAL) then
      allocate (value_array (sf_int%get_n_states ()))
      call sf_int%compute_values (value_array, x, xb, scale, E)
      value = value_array(i_state)
   else
      value = 0
   end if
 end subroutine sf_int_compute_value
```

10.3.6 Structure-function instance

This is a wrapper for `sf_int_t` objects, such that we can build an array with different structure-function types. The structure-function contains an array (a sequence) of `sf_int_t` objects.

The object, it holds the evaluator that connects the preceding part of the structure-function chain to the current interaction.

It also stores the input and output parameter values for the contained structure function. The `r` array has a second dimension, corresponding to the mapping channels in a multi-channel configuration. There is a Jacobian entry `f` for each channel. The corresponding logical array `mapping` tells whether we apply the mapping appropriate for the current structure function in this channel. The `x` parameter values (energy fractions) are common to all channels.

⟨*SF base: types*⟩+≡
```
   type :: sf_instance_t
      class(sf_int_t), allocatable :: int
      type(evaluator_t) :: eval
      real(default), dimension(:,:), allocatable :: r
      real(default), dimension(:,:), allocatable :: rb
      real(default), dimension(:), allocatable :: f
      logical, dimension(:), allocatable :: m
      real(default), dimension(:), allocatable :: x
   end type sf_instance_t
```

10.3.7 Structure-function chain

A chain is an array of structure functions `sf`, initiated by a beam setup. We do not use this directly for evaluation, but create instances with copies of the contained interactions.

`n_par` is the total number of parameters that is necessary for completely determining the structure-function chain. `n_bound` is the number of MC input parameters that are requested from the integrator. The difference of `n_par` and

1095

`n_bound` is the number of free parameters, which are generated by a structure-function object in generator mode.

⟨*SF base: public*⟩+≡

10.3.8 Chain instances

A structure-function chain instance contains copies of the interactions in the configuration chain, suitably linked to each other and connected by evaluators.

After initialization, `out_sf` should point, for each beam, to the last structure function that affects this beam. `out_sf_i` should indicate the index of the corresponding outgoing particle within that structure-function interaction.

Analogously, `out_eval` is the last evaluator in the structure-function chain, which contains the complete set of outgoing particles. `out_eval_i` should indicate the index of the outgoing particles, within that evaluator, which will initiate the collision.

When calculating actual kinematics, we fill the `p`, `r`, and `x` arrays and the `f` factor. The `p` array denotes the MC input parameters as they come from the random-number generator. The `r` array results from applying global mappings. The `x` array results from applying structure-function local mappings. The x values can be interpreted directly as momentum fractions (or angle fractions, where recoil is involved). The `f` factor is the Jacobian that results from applying all mappings.

The `mapping` entry may store a global mapping that is applied to a combination of x values and structure functions, as opposed to mappings that affect only a single structure function. It is applied before the latter mappings, in the transformation from the `p` array to the `r` array. For parameters affected by this mapping, we should ensure that they are not involved in a local mapping.

Initialize. This creates a copy of the interactions in the configuration chain, assumed to be properly initialized. In the copy, we allocate the p etc. arrays.

The brute-force assignment of the sf component would be straightforward, but at least gfortran 4.6.3 would like a more fine-grained copy. In any case, the copy is deep as far as allocatables are concerned, but for the contained interaction_t objects the copy is shallow, as long as we do not bind defined assignment to the type. Therefore, we have to re-assign the interaction_t components explicitly, this time calling the proper defined assignment. Fur-

thermore, we allocate the parameter arrays for each structure function.

Copy a channel-mapping object to the structure-function chain instance. We
assume that assignment is sufficient, i.e., any non-static components of the
`channel` object are allocatable und thus recursively copied.

   After the copy, we extract the single-entry mappings and activate them for
the individual structure functions. If there is a multi-entry mapping, we obtain
the corresponding MC parameter indices and set them in the copy of the channel
object.

Link the interactions in the chain. First, link the beam instance to its template in the configuration chain, which should have the appropriate momenta fixed.

Then, we follow the chain via the arrays `out_sf` and `out_sf_i`. The arrays are (up to) two-dimensional, the entries correspond to the beam particle(s). For each beam, the entry `out_sf` points to the last interaction that affected this beam, and `out_sf_i` is the out-particle index within that interaction. For the initial beam, `out_sf` is zero by definition.

For each entry in the chain, we scan the affected beams (one or two). We look for `out_sf` and link the out-particle there to the corresponding in-particle in the current interaction. Then, we update the entry in `out_sf` and `out_sf_i` to point to the current interaction.

Exchange the quantum-number masks between the interactions in the chain, so we can combine redundant entries and detect any obvious mismatch.

We proceed first in the forward direction and then backwards again.

After this is finished, we finalize initialization by calling the `setup_constants` method, which prepares constant data that depend on the matrix element structure.

        end if
    contains
        ⟨SF base: init evaluators: find outgoing particles⟩
    end subroutine sf_chain_instance_init_evaluators
```

This is an internal subroutine of the previous one: After evaluators are set, trace the outgoing particles to the last evaluator. We only need the first channel, all channels are equivalent for this purpose.

For each beam, the outgoing particle is located by `out_sf` (the structure-function object where it originates) and `out_sf_i` (the index within that object). This particle is referenced by the corresponding evaluator, which in turn is referenced by the next evaluator, until we are at the end of the chain. We can trace back references by `interaction_find_link`. Knowing that `out_eval` is the index of the last evaluator, we thus determine `out_eval_i`, the index of the outgoing particle within that evaluator.

⟨SF base: init evaluators: find outgoing particles⟩≡
```
    subroutine find_outgoing_particles ()
        type(interaction_t), pointer :: int, int_next
        integer :: i, j, out_sf, out_i
        chain%out_eval = size (chain%sf)
        do j = 1, size (chain%out_eval_i)
            out_sf = chain%out_sf(j)
            out_i = chain%out_sf_i(j)
            if (out_sf == 0) then
                int => beam_get_int_ptr (chain%beam_t)
                out_sf = 1
            else
                int => chain%sf(out_sf)%int%interaction_t
            end if

                out_i = interaction_find_link (int_next, int, out_i)
                int => int_next
```

```
            end do
         chain%out_eval_i(j) = out_i
      end do
   end subroutine find_outgoing_particles
```

Compute the kinematics in the chain instance. We can assume that the seed momenta are set in the configuration beams. Scanning the chain, we first transfer the incoming momenta. Then, the use up the MC input parameter array `p` to compute the radiated and outgoing momenta.

In the multi-channel case, `c_sel` is the channel which we use for computing the kinematics and the `x` values. In the other channels, we invert the kinematics in order to recover the corresponding rows in the `r` array, and the Jacobian `f`.

We first apply any global mapping to transform the input `p` into the array `r`. This is then given to the structure functions which compute the final array `x` and Jacobian factors `f`, which we multiply to obtain the overall Jacobian.

This is a variant of the previous procedure. We know the x parameters and reconstruct the momenta and the MC input parameters p. We do not need to select a channel.

Note: this is probably redundant, since the method we actually want starts from the momenta, recovers all x parameters, and then inverts mappings. See below `recover_kinematics`.

 end subroutine sf_chain_instance_inverse_kinematics
```

Recover the kinematics: assuming that the last evaluator has been filled with a valid set of momenta, we travel the momentum links backwards and fill the preceding evaluators and, as a side effect, interactions. We stop at the beam interaction.

After all momenta are set, apply the `inverse_kinematics` procedure above, suitably modified, to recover the x and p parameters and the Jacobian factors.

The `c_sel` (channel) argument is just used to mark a selected channel for the records, otherwise the recovery procedure is independent of this.

  integer :: i, j
  if (chain%status >= SF_DONE_KINEMATICS) then
     do j = 1, size (chain%out_sf)
        i = chain%out_sf(j)
        select case (i)
```

```
            case (0)
               int => beam_get_int_ptr (chain%beam_t)
            case default
               int => chain%sf(i)%int%interaction_t
            end select
            p(j) = interaction_get_momentum (int, chain%out_sf_i(j))
         end do
      end if
    end subroutine sf_chain_instance_get_out_momenta
```

Return a pointer to the last evaluator in the chain (to the interaction).

⟨*SF base: sf chain instance: TBP*⟩+≡
```
    procedure :: get_out_int_ptr => sf_chain_instance_get_out_int_ptr
```

⟨*SF base: procedures*⟩+≡
```
    function sf_chain_instance_get_out_int_ptr (chain) result (int)
      class(sf_chain_instance_t), intent(in), target :: chain
      type(interaction_t), pointer :: int
      if (chain%out_eval == 0) then
         int => beam_get_int_ptr (chain%beam_t)
      else
         int => evaluator_get_int_ptr (chain%sf(chain%out_eval)%eval)
      end if
    end function sf_chain_instance_get_out_int_ptr
```

Return the index of the j-th outgoing particle, within the last evaluator.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
    procedure :: get_out_i => sf_chain_instance_get_out_i
```

⟨*SF base: procedures*⟩+≡
```
    function sf_chain_instance_get_out_i (chain, j) result (i)
      class(sf_chain_instance_t), intent(in) :: chain
      integer, intent(in) :: j
      integer :: i
      i = chain%out_eval_i(j)
    end function sf_chain_instance_get_out_i
```

Return the mask for the outgoing particle(s), within the last evaluator.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
    procedure :: get_out_mask => sf_chain_instance_get_out_mask
```

⟨*SF base: procedures*⟩+≡
```
    function sf_chain_instance_get_out_mask (chain) result (mask)
      class(sf_chain_instance_t), intent(in), target :: chain
      type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
      type(interaction_t), pointer :: int
      allocate (mask (chain%config%n_in))
      int => chain%get_out_int_ptr ()
      mask = interaction_get_mask (int, chain%out_eval_i)
    end function sf_chain_instance_get_out_mask
```

1115

Return the array of MC input parameters that corresponds to channel `c`. This is the `p` array, the parameters before all mappings.

The `p` array may be deallocated. This should correspond to a zero-size `r` argument, so nothing to do then.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
procedure :: get_mcpar => sf_chain_instance_get_mcpar
```

⟨*SF base: procedures*⟩+≡
```
subroutine sf_chain_instance_get_mcpar (chain, c, r)
  class(sf_chain_instance_t), intent(in) :: chain
  integer, intent(in) :: c
  real(default), dimension(:), intent(out) :: r
  if (allocated (chain%p))  r = pack (chain%p(:,c), chain%bound)
end subroutine sf_chain_instance_get_mcpar
```

Return the Jacobian factor that corresponds to channel `c`.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
procedure :: get_f => sf_chain_instance_get_f
```

⟨*SF base: procedures*⟩+≡
```
function sf_chain_instance_get_f (chain, c) result (f)
  class(sf_chain_instance_t), intent(in) :: chain
  integer, intent(in) :: c
  real(default) :: f
  if (allocated (chain%f)) then
     f = chain%f(c)
  else
     f = 1
  end if
end function sf_chain_instance_get_f
```

Return the evaluation status.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
procedure :: get_status => sf_chain_instance_get_status
```

⟨*SF base: procedures*⟩+≡
```
function sf_chain_instance_get_status (chain) result (status)
  class(sf_chain_instance_t), intent(in) :: chain
  integer :: status
  status = chain%status
end function sf_chain_instance_get_status
```

10.3.10 Unit tests

⟨*SF base: public*⟩+≡
```
public :: sf_base_test
```

⟨*SF base: tests*⟩≡
```
subroutine sf_base_test (u, results)
  integer, intent(in) :: u
  type(test_results_t), intent(inout) :: results
```
⟨*SF base: execute tests*⟩
```
end subroutine sf_base_test
```

10.3.11 Test implementation: structure function

This is a template for the actual structure-function implementation which will be defined in separate modules.

Configuration data

The test structure function uses the `Test` model. It describes a scalar within an arbitrary initial particle, which is given in the initialization. The radiated particle is also a scalar, the same one, but we set its mass artificially to zero.

⟨*SF base: public*⟩+≡
```
    public :: sf_test_data_t
```

⟨*SF base: test types*⟩≡
```
    type, extends (sf_data_t) :: sf_test_data_t
      type(model_t), pointer :: model => null ()
      integer :: mode = 0
      type(flavor_t) :: flv_in
      type(flavor_t) :: flv_out
      type(flavor_t) :: flv_rad
      real(default) :: m = 0
      logical :: collinear = .true.
      real(default), dimension(:), allocatable :: qbounds
    contains
    ⟨SF base: sf test data: TBP⟩
    end type sf_test_data_t
```

Output.

10.3.12   Test implementation: pair spectrum

Another template, this time for a incoming particle pair, splitting into two radiated and two outgoing particles.

Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-function configuration: the incoming and all outgoing particles are test scalars.

We have two versions, one with radiated particles, one without.

⟨*SF base: test types*⟩+≡
```
   type, extends (sf_data_t) :: sf_test_spectrum_data_t
     type(model_t), pointer :: model => null ()
     type(flavor_t) :: flv_in
     type(flavor_t) :: flv_out
     type(flavor_t) :: flv_rad
     logical :: with_radiation = .true.
     real(default) :: m = 0
    contains
    ⟨SF base: sf test spectrum data: TBP⟩
   end type sf_test_spectrum_data_t
```

Output.

⟨*SF base: sf test spectrum data: TBP*⟩≡
```
   procedure :: write => sf_test_spectrum_data_write
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_test_spectrum_data_write (data, unit, verbose)
      class(sf_test_spectrum_data_t), intent(in) :: data
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: u
      u = output_unit (unit)
      write (u, "(1x,A)")  "SF test spectrum data:"
      write (u, "(3x,A,A)") "model     = ", char (data%model%get_name ())
      write (u, "(3x,A)", advance="no") "incoming  = "
      call flavor_write (data%flv_in, u);  write (u, *)
      write (u, "(3x,A)", advance="no") "outgoing  = "

      sf_int%status = SF_EVALUATED
    end subroutine sf_test_spectrum_apply
```

10.3.13 Test implementation: generator spectrum

A generator for two beams, no radiation (for simplicity).

Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-function configuration: the incoming and all outgoing particles are test scalars.

We have two versions, one with radiated particles, one without.

⟨*SF base: test types*⟩+≡
```
type, extends (sf_data_t) :: sf_test_generator_data_t
  type(model_t), pointer :: model => null ()
  type(flavor_t) :: flv_in
  type(flavor_t) :: flv_out
  type(flavor_t) :: flv_rad
  real(default) :: m = 0
contains
⟨SF base: sf test generator data: TBP⟩
end type sf_test_generator_data_t
```

Output.

⟨*SF base: sf test generator data: TBP*⟩≡
```
procedure :: write => sf_test_generator_data_write
```

⟨*SF base: procedures*⟩+≡
```
subroutine sf_test_generator_data_write (data, unit, verbose)
  class(sf_test_generator_data_t), intent(in) :: data
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose
  integer :: u
  u = output_unit (unit)
  write (u, "(1x,A)")  "SF test generator data:"
  write (u, "(3x,A,A)") "model     = ", char (data%model%get_name ())
  write (u, "(3x,A)", advance="no") "incoming  = "
  call flavor_write (data%flv_in, u);  write (u, *)
  write (u, "(3x,A)", advance="no") "outgoing  = "
  call flavor_write (data%flv_out, u);  write (u, *)
  write (u, "(3x,A," // FMT_19 // ")")  "mass      = ", data%m
end subroutine sf_test_generator_data_write
```

Initialization.

⟨*SF base: sf test generator data: TBP*⟩+≡
```
procedure :: init => sf_test_generator_data_init
```

⟨*SF base: procedures*⟩+≡
```
subroutine sf_test_generator_data_init (data, model, pdg_in)
  class(sf_test_generator_data_t), intent(out) :: data
  type(model_t), intent(in), target :: model
  type(pdg_array_t), intent(in) :: pdg_in
  data%model => model
  if (pdg_array_get (pdg_in, 1) /= 25) then
     call msg_fatal ("Test generator: input flavor must be 's'")
  end if
  call flavor_init (data%flv_in, 25, model)
  data%m = flavor_get_mass (data%flv_in)
  call flavor_init (data%flv_out, 25, model)
end subroutine sf_test_generator_data_init
```

This structure function is a generator.

⟨SF base: sf test generator data: TBP⟩+≡
```
    procedure :: is_generator => sf_test_generator_data_is_generator
```

⟨SF base: procedures⟩+≡
```
    function sf_test_generator_data_is_generator (data) result (flag)
      class(sf_test_generator_data_t), intent(in) :: data
      logical :: flag
      flag = .true.
    end function sf_test_generator_data_is_generator
```

Return the number of parameters: 2, since we have only collinear splitting here.

⟨SF base: sf test generator data: TBP⟩+≡
```
    procedure :: get_n_par => sf_test_generator_data_get_n_par
```

⟨SF base: procedures⟩+≡
```
    function sf_test_generator_data_get_n_par (data) result (n)
      class(sf_test_generator_data_t), intent(in) :: data
      integer :: n
      n = 2
    end function sf_test_generator_data_get_n_par
```

Return the outgoing particle PDG codes: 25

⟨SF base: sf test generator data: TBP⟩+≡
```
    procedure :: get_pdg_out => sf_test_generator_data_get_pdg_out
```

⟨SF base: procedures⟩+≡
```
    subroutine sf_test_generator_data_get_pdg_out (data, pdg_out)
      class(sf_test_generator_data_t), intent(in) :: data
      type(pdg_array_t), dimension(:), intent(inout) :: pdg_out
      pdg_out(1) = 25
      pdg_out(2) = 25
    end subroutine sf_test_generator_data_get_pdg_out
```

Allocate the matching interaction.

⟨SF base: sf test generator data: TBP⟩+≡
```
    procedure :: allocate_sf_int => &
        sf_test_generator_data_allocate_sf_int
```

⟨SF base: procedures⟩+≡
```
    subroutine sf_test_generator_data_allocate_sf_int (data, sf_int)
      class(sf_test_generator_data_t), intent(in) :: data
      class(sf_int_t), intent(inout), allocatable :: sf_int
      allocate (sf_test_generator_t :: sf_int)
    end subroutine sf_test_generator_data_allocate_sf_int
```

Interaction

⟨SF base: test types⟩+≡
```
    type, extends (sf_int_t) :: sf_test_generator_t
      type(sf_test_generator_data_t), pointer :: data => null ()
     contains
```

⟨*SF base: sf test generator: TBP*⟩
```
      end type sf_test_generator_t
```

⟨*SF base: sf test generator: TBP*⟩≡
```
      procedure :: type_string => sf_test_generator_type_string
```

⟨*SF base: procedures*⟩+≡
```
      function sf_test_generator_type_string (object) result (string)
        class(sf_test_generator_t), intent(in) :: object
        type(string_t) :: string
        string = "Test Generator"
      end function sf_test_generator_type_string
```

Output. Call the interaction routine after displaying the configuration.

⟨*SF base: sf test generator: TBP*⟩+≡
```
      procedure :: write => sf_test_generator_write
```

⟨*SF base: procedures*⟩+≡
```
      subroutine sf_test_generator_write (object, unit, testflag)
        class(sf_test_generator_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: testflag
        integer :: u
        u = output_unit (unit)
        if (associated (object%data)) then
           call object%data%write (u)
           call object%base_write (u, testflag)
        else
           write (u, "(1x,A)")  "SF test generator data: [undefined]"
        end if
      end subroutine sf_test_generator_write
```

Initialize. We know that `data` will be of concrete type `sf_test_generator_data_t`, but we have to cast this explicitly.

For this implementation, we set the incoming and outgoing masses equal to the physical particle mass. No radiation.

⟨*SF base: sf test generator: TBP*⟩+≡
```
      procedure :: init => sf_test_generator_init
```

⟨*SF base: procedures*⟩+≡
```
      subroutine sf_test_generator_init (sf_int, data)
        class(sf_test_generator_t), intent(out) :: sf_int
        class(sf_data_t), intent(in), target :: data
        type(quantum_numbers_mask_t), dimension(4) :: mask
        type(helicity_t) :: hel0
        type(quantum_numbers_t), dimension(4) :: qn
        mask = new_quantum_numbers_mask (.false., .false., .false.)
        select type (data)
        type is (sf_test_generator_data_t)
           call sf_int%base_init (mask(1:4), &
                [data%m**2, data%m**2], &
                [real(default) :: ], &
                [data%m**2, data%m**2])
           sf_int%data => data
```

```
      call helicity_init (hel0, 0)
      call quantum_numbers_init (qn(1), data%flv_in,  hel0)
      call quantum_numbers_init (qn(2), data%flv_in,  hel0)
      call quantum_numbers_init (qn(3), data%flv_out, hel0)
      call quantum_numbers_init (qn(4), data%flv_out, hel0)
      call interaction_add_state (sf_int%interaction_t, qn(1:4))
      call sf_int%set_incoming ([1,2])
      call sf_int%set_outgoing ([3,4])
      call interaction_freeze (sf_int%interaction_t)
    end select
    sf_int%status = SF_INITIAL
  end subroutine sf_test_generator_init
```

This structure function is a generator.

⟨*SF base: sf test generator: TBP*⟩+≡
```
    procedure :: is_generator => sf_test_generator_is_generator
```

⟨*SF base: procedures*⟩+≡
```
    function sf_test_generator_is_generator (sf_int) result (flag)
      class(sf_test_generator_t), intent(in) :: sf_int
      logical :: flag
      flag = sf_int%data%is_generator ()
    end function sf_test_generator_is_generator
```

Generate free parameters. This mock generator always produces the nubmers 0.8 and 0.5.

⟨*SF base: sf test generator: TBP*⟩+≡
```
    procedure :: generate_free => sf_test_generator_generate_free
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_test_generator_generate_free (sf_int, r, rb,  x_free)
      class(sf_test_generator_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: r, rb
      real(default), intent(inout) :: x_free
      r = [0.8, 0.5]
      rb= 1 - r
      x_free = x_free * product (r)
    end subroutine sf_test_generator_generate_free
```

Recover momentum fractions. Since the x values are free, we also set the `x_free` parameter.

⟨*SF base: sf test generator: TBP*⟩+≡
```
    procedure :: recover_x => sf_test_generator_recover_x
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_test_generator_recover_x (sf_int, x, x_free)
      class(sf_test_generator_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), intent(inout), optional :: x_free
      call sf_int%base_recover_x (x)
      if (present (x_free))  x_free = x_free * product (x)
    end subroutine sf_test_generator_recover_x
```

Set kinematics. Since this is a generator, just transfer input to output.

⟨*SF base: sf test generator: TBP*⟩+≡
```
    procedure :: complete_kinematics => sf_test_generator_complete_kinematics
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_test_generator_complete_kinematics (sf_int, x, f, r, rb, map)
      class(sf_test_generator_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), intent(out) :: f
      real(default), dimension(:), intent(in) :: r
      real(default), dimension(:), intent(in) :: rb
      logical, intent(in) :: map
      x = r
      f = 1
      call sf_int%reduce_momenta (x)
    end subroutine sf_test_generator_complete_kinematics
```

Compute inverse kinematics. Here, we start with the x array and compute the
"input" r values and the Jacobian f. After this, we can set momenta by the
same formula as for normal kinematics.

⟨*SF base: sf test generator: TBP*⟩+≡
```
    procedure :: inverse_kinematics => sf_test_generator_inverse_kinematics
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_test_generator_inverse_kinematics &
        (sf_int, x, f, r, rb, map, set_momenta)
      class(sf_test_generator_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(in) :: x
      real(default), intent(out) :: f
      real(default), dimension(:), intent(out) :: r
      real(default), dimension(:), intent(out) :: rb
      logical, intent(in) :: map
      logical, intent(in), optional :: set_momenta
      logical :: set_mom
      set_mom = .false.;  if (present (set_momenta))  set_mom = set_momenta
      r = x
      rb= 1 - x
      f = 1
      if (set_mom)  call sf_int%reduce_momenta (x)
    end subroutine sf_test_generator_inverse_kinematics
```

Apply the structure function. The matrix element becomes unity and the ap-
plication always succeeds.

⟨*SF base: sf test generator: TBP*⟩+≡
```
    procedure :: apply => sf_test_generator_apply
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_test_generator_apply (sf_int, scale)

Structure function instance configuration

We create a structure-function chain instance which implements a configured
structure-function chain. We link the momentum entries in the interactions and
compute kinematics.

   We do not actually connect the interactions and create evaluators. We skip
this step and manually advance the status of the chain instead.

⟨*SF base: execute tests*⟩+≡
```

10.4.1   Physics

The ISR structure function is in the most crude approximation (LLA without α corrections, i.e. ϵ^0)

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \qquad \text{with} \qquad \epsilon = \frac{\alpha}{\pi} q_e^2 \ln \frac{s}{m^2}, \qquad (10.27)$$

where m is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

Here, the form of ϵ results from the kinematical bounds for the momentum squared of the outgoing particle, which in the limit $m^2 \ll s$ are given by

$$t_0 = -2\bar{x}E(E+p) + m^2 \approx -\bar{x}s, \qquad (10.28)$$
$$t_1 = -2\bar{x}E(E-p) + m^2 \approx xm^2, \qquad (10.29)$$

so the integration over the propagator $1/(t-m^2)$ yields

$$\ln \frac{t_0 - m^2}{t_1 - m^2} = \ln \frac{s}{m^2}. \qquad (10.30)$$

In $f_0(x)$, there is an integrable singularity at $x = 1$ which does not spoil the integration, but would lead to an unbounded $f_{\max}$. Therefore, we map this singularity like

$$x = 1 - (1-x')^{1/\epsilon} \qquad (10.31)$$

such that

$$\int dx\, f_0(x) = \int dx' \qquad (10.32)$$

The structure function has three parameters: α, m_{in} of the incoming particle and s, the hard scale. Internally, we store the exponent ϵ which is the relevant parameter. (In conventional notation, $\epsilon = \beta/2$.) As defaults, we take the actual

1174

values of α (which is probably $\alpha(s)$), the actual mass m_{in} and the squared total c.m. energy s.

Including ϵ, ϵ^2, and ϵ^3 corrections, the successive approximation of the ISR structure function read

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \tag{10.33}$$

$$f_1(x) = g_1(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x) \tag{10.34}$$

$$f_2(x) = g_2(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x)$$
$$- \frac{\epsilon^2}{8}\left(\frac{1+3x^2}{1-x}\ln x + 4(1+x)\ln(1-x) + 5 + x\right) \tag{10.35}$$

$$f_3(x) = g_3(\epsilon) f_0(x) - \frac{\epsilon}{2}(1+x)$$
$$- \frac{\epsilon^2}{8}\left(\frac{1+3x^2}{1-x}\ln x + 4(1+x)\ln(1-x) + 5 + x\right)$$
$$- \frac{\epsilon^3}{48}\Bigg((1+x)\left[6\operatorname{Li}_2(x) + 12\ln^2(1-x) - 3\pi^2\right] + 6(x+5)\ln(1-x)$$
$$+ \frac{1}{1-x}\left[\frac{3}{2}(1+8x+3x^2)\ln x + 12(1+x^2)\ln x \ln(1-x)\right.$$
$$\left.- \frac{1}{2}(1+7x^2)\ln^2 x + \frac{1}{4}(39-24x-15x^2)\right]\Bigg) \tag{10.36}$$

where the successive approximations to the prefactor of the leading singularity

$$g(\epsilon) = \frac{\exp\left(\epsilon(-\gamma_E + \frac{3}{4})\right)}{\Gamma(1+\epsilon)}, \tag{10.37}$$

are given by

$$g_0(\epsilon) = 1 \tag{10.38}$$

$$g_1(\epsilon) = 1 + \frac{3}{4}\epsilon \tag{10.39}$$

$$g_2(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 \tag{10.40}$$

$$g_3(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 + \frac{27 - 24\pi^2 + 128\zeta(3)}{384}\epsilon^3, \tag{10.41}$$

where, numerically

$$\zeta(3) = 1.2020569031595942853997381 6151\ldots \tag{10.42}$$

Although one could calculate the function $g(\epsilon)$ exactly, truncating its Taylor expansion ensures the exact normalization of the truncated structure function at each given order:

$$\int_0^1 dx\, f_i(x) = 1 \qquad \text{for all } i. \tag{10.43}$$

Effectively, the $O(\epsilon)$ correction reduces the low-x tail of the structure function by 50% while increasing the coefficient of the singularity by $O(\epsilon)$. Relative

to this, the $O(\epsilon^2)$ correction slightly enhances $x > \frac{1}{2}$ compared to $x < \frac{1}{2}$. At $x = 0$, $f_2(x)$ introduces a logarithmic singularity which should be cut off at $x_0 = O(e^{-1/\epsilon})$: for lower x the perturbative series breaks down. The f_3 correction is slightly positive for low x values and negative near $x = 1$, where the Li$_2$ piece slightly softens the singularity at $x = 1$.

Instead of the definition for ϵ given above, it is customary to include a universal nonlogarithmic piece:

$$\epsilon = \frac{\alpha}{\pi} q_e^2 \left(\ln \frac{s}{m^2} - 1 \right) \tag{10.44}$$

10.4.2 Implementation

In the concrete implementation, the zeroth order mapping (10.31) is implemented, and the Jacobian is equal to $f_i(x)/f_0(x)$. This can be written as

$$\frac{f_0(x)}{f_0(x)} = 1 \tag{10.45}$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon - \frac{1 - x^2}{2(1 - x')} \tag{10.46}$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 - \frac{1 - x^2}{2(1 - x')}$$
$$- \frac{(1 + 3x^2)\ln x + (1 - x)\left(4(1 + x)\ln(1 - x) + 5 + x\right)}{8(1 - x')}\epsilon \tag{10.47}$$

For $x = 1$ (i.e., numerically indistinguishable from 1), this reduces to

$$\frac{f_0(x)}{f_0(x)} = 1 \tag{10.48}$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon \tag{10.49}$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 \tag{10.50}$$

The last line in (10.47) is zero for

$$x_{\min} = 0.0071405332973459283954987972019 \tag{10.51}$$

(Mathematica result), independent of ϵ. For x values less than this we ignore this correction because of the logarithmic singularity which should in principle be resummed.

```

10.4.4 The ISR object

The `isr_t` data type is a $1 \to 2$ interaction, i.e., we allow for single-photon emission only (but use the multi-photon resummed radiator function). The particles are ordered as (incoming, photon, outgoing).

There is no need to handle several flavors (and data blocks) in parallel, since ISR is always applied immediately after beam collision. (ISR for partons is accounted for by the PDFs themselves.) Polarization is carried through, i.e., we retain the polarization of the incoming particle and treat the emitted photon as unpolarized. Color is trivially carried through. This implies that particles 1 and 3 should be locked together. For ISR we don't need the q variable.

⟨*SF isr: types*⟩+≡
```
type, extends (sf_int_t) :: isr_t
   type(isr_data_t), pointer :: data => null ()
   real(default) :: x = 0
   real(default) :: xb= 0
 contains
 ⟨SF isr: isr: TBP⟩
end type isr_t
```

Type string: has to be here, but there is no string variable on which ISR depends. Hence, a dummy routine.

⟨*SF isr: isr: TBP*⟩≡
```
procedure :: type_string => isr_type_string
```

⟨*SF isr: procedures*⟩+≡
```
function isr_type_string (object) result (string)

```

10.4.5   Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ were trivial. The ISR structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value.

The structure function implementation applies the above mapping to the input (random) number `r` to generate the momentum fraction `x` and the function value `f`. For numerical stability reasons, we also output `xb`, which is $\bar{x} = 1 - x$.

For the ISR structure function, the mapping Jacobian cancels the structure function (to order zero). We apply the cancellation explicitly, therefore both the Jacobian `f` and the zeroth-order value (see the `apply` method) are unity if mapping is turned on. If mapping is turned off, the Jacobian `f` includes the value of the (zeroth-order) structure function, and strongly peaked.

      real(default), intent(out) :: f
      real(default), dimension(:), intent(in) :: r
      real(default), dimension(:), intent(in) :: rb
      logical, intent(in) :: map
      real(default) :: eps
      eps = sf_int%data%eps
      if (map) then
         call map_power_1 (sf_int%xb, f, rb(1), eps)
      else
         sf_int%xb = rb(1)
         if (rb(1) > 0) then
            f = 1
         else
            f = 0
         end if
      end if
      sf_int%x = 1 - sf_int%xb
      x(1) = sf_int%x
      if (size (x) == 3)  x(2:3) = r(2:3)
      call sf_int%split_momentum (x, sf_int%xb)
      select case (sf_int%status)
      case (SF_FAILED_KINEMATICS)
         sf_int%x = 0
         sf_int%xb= 0
```

1182

```
          f = 0
     end select
   end subroutine isr_complete_kinematics
```

Overriding the default method: we compute the x array from the momentum configuration. In the specific case of ISR, we also set the internally stored x and $\bar{x}$ values, so they can be used in the following routine.

Note: the extraction of $\bar{x}$ is not numerically safe, but it can't be as long as the base `recover_x` isn't.

⟨*SF isr: isr: TBP*⟩+≡
```
   procedure :: recover_x => sf_isr_recover_x
```

⟨*SF isr: procedures*⟩+≡
```
   subroutine sf_isr_recover_x (sf_int, x, x_free)
     class(isr_t), intent(inout) :: sf_int
     real(default), dimension(:), intent(out) :: x
     real(default), intent(inout), optional :: x_free
     call sf_int%base_recover_x (x, x_free)
     sf_int%x  = x(1)
     sf_int%xb = 1 - x(1)
   end subroutine sf_isr_recover_x
```

Compute inverse kinematics. Here, we start with the x array and compute the "input" r values and the Jacobian f. After this, we can set momenta by the same formula as for normal kinematics.

For extracting x, we rely on the stored $\bar{x}$ value, since the x value in the argument is likely imprecise. This means that either `complete_kinematics` or `recover_x` must be called first, for the current sampling point (but maybe another channel).

10.4.6 ISR application

For ISR, we could in principle compute kinematics and function value in a single step. In order to be able to reweight matrix elements including structure functions we split kinematics and structure function calculation. The structure function works on a single beam, assuming that the input momentum has been set.

For the structure-function evaluation, we rely on the fact that the power mapping, which we apply in the kinematics method (if the `map` flag is set), has a Jacobian which is just the inverse lowest-order structure function. With mapping active, the two should cancel exactly.

After splitting momenta, we set the outgoing momenta on-shell. We choose to conserve momentum, so energy conservation may be violated.

10.5.1 Physics

The EPA structure function for a photon inside an (elementary) particle p with energy E, mass m and charge q_p (e.g., electron) is given by ($\bar{x} \equiv 1 - x$)

$$
f(x) = \frac{\alpha}{\pi} q_p^2 \frac{1}{x} \left[\left(\bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} \right.
$$

$$
\left. - \left(1 - \frac{x}{2} \right)^2 \ln \frac{x^2 + \frac{Q_{\max}^2}{E^2}}{x^2 + \frac{Q_{\min}^2}{E^2}} - x^2 \frac{m^2}{Q_{\min}^2} \left(1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (10.52)
$$

If no explicit Q bounds are provided, the kinematical bounds are

$$-Q_{\max}^2 = t_0 = -2\bar{x}(E^2 + p\bar{p}) + 2m^2 \approx -4\bar{x}E^2,$$
(10.53)

$$-Q_{\min}^2 = t_1 = -2\bar{x}(E^2 - p\bar{p}) + 2m^2 \approx -\frac{x^2}{\bar{x}}m^2.$$
(10.54)

The second and third terms in (10.52) are negative definite (and subleading). Noting that $\bar{x}+x^2/2$ is bounded between $1/2$ and 1, we derive that $f(x)$ is always smaller than

$$\bar{f}(x) = \frac{\alpha}{\pi}\, q_p^2\, \frac{L - 2\ln x}{x} \qquad \text{where} \qquad L = \ln\frac{\min(4E_{\max}^2, Q_{\max}^2)}{\max(m^2, Q_{\min}^2)},$$
(10.55)

where we allow for explicit Q bounds that narrow the kinematical range. Therefore, we generate this distribution:

$$\int_{x_0}^{x_1} dx\, \bar{f}(x) = C(x_0, x_1) \int_0^1 dx'$$
(10.56)

We set

$$\ln x = \frac{1}{2}\left\{L - \sqrt{L^2 - 4\left[x'\ln x_1(L - \ln x_1) + \bar{x}'\ln x_0(L - \ln x_0)\right]}\right\}$$
(10.57)

such that $x(0) = x_0$ and $x(1) = x_1$ and

$$\frac{dx}{dx'} = \left(\frac{\alpha}{\pi}q_p^2\right)^{-1} x\frac{C(x_0, x_1)}{L - 2\ln x}$$
(10.58)

with

$$C(x_0, x_1) = \frac{\alpha}{\pi}q_p^2\,\left[\ln x_1(L - \ln x_1) - \ln x_0(L - \ln x_0)\right]$$
(10.59)

such that (10.56) is satisfied. Finally, we have

$$\int_{x_0}^{x_1} dx\, f(x) = C(x_0, x_1) \int_0^1 dx'\, \frac{f(x(x'))}{\bar{f}(x(x'))}$$
(10.60)

where x' is calculated from x via (10.57).

The structure of the mapping is most obvious from:

$$x'(x) = \frac{\log x(L - \log x) - \log x_0(L - \log x_0)}{\log x_1(L - \log x_1) - \log x_0(L - \log x_0)}\ .$$
(10.61)

10.5.2 The EPA data block

The EPA parameters are: α, $E_{\max}$, m, $Q_{\min}$, and $x_{\min}$. Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charge.

Internally we store in addition $C_{0/1} = \frac{\alpha}{\pi}q_e^2 \ln x_{0/1}(L - \ln x_{0/1})$, the c.m. energy squared and the incoming particle mass.

10.5.3 The EPA object

The `epa_t` data type is a $1 \to 2$ interaction. We should be able to handle several flavors in parallel, since EPA is not necessarily applied immediately after beam collision: Photons may be radiated from quarks. In that case, the partons are massless and $q_{\min}$ applies instead, so we do not need to generate several kinematical configurations in parallel.

The squared charge values multiply the matrix elements, depending on the flavour. We scan the interaction after building it, so we have the correct assignments.

The particles are ordered as (incoming, radiated, photon), where the photon initiates the hard interaction.

We generate an unpolarized photon and transfer initial polarization to the radiated parton. Color is transferred in the same way.

⟨*SF epa: types*⟩+≡
```
type, extends (sf_int_t) :: epa_t
  type(epa_data_t), pointer :: data => null ()
  real(default) :: x  = 0
  real(default) :: xb = 0
  real(default) :: E  = 0
  real(default), dimension(:), allocatable :: charge2
 contains
 ⟨SF epa: epa: TBP⟩
end type epa_t
```

Type string: has to be here, but there is no string variable on which EPA depends. Hence, a dummy routine.

⟨*SF epa: epa: TBP*⟩≡
```
procedure :: type_string => epa_type_string
```

⟨*SF epa: procedures*⟩+≡
```
function epa_type_string (object) result (string)
  class(epa_t), intent(in) :: object
  type(string_t) :: string
  if (associated (object%data)) then
     string = "EPA: equivalent photon approx."
  else
     string = "EPA: [undefined]"
  end if
end function epa_type_string
```

Output. Call the interaction routine after displaying the configuration.

⟨*SF epa: epa: TBP*⟩+≡
```
procedure :: write => epa_write
```

⟨*SF epa: procedures*⟩+≡
```
subroutine epa_write (object, unit, testflag)

     sf_int%status = SF_INITIAL
  end subroutine epa_setup_constants
```

10.5.4 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

The EPA structure function allows for a straightforward mapping of the unit interval. The x value is transformed, and the mapped structure function becomes unity at its upper boundary.

The structure function implementation applies the above mapping to the input (random) number `r` to generate the momentum fraction `x` and the function value `f`. For numerical stability reasons, we also output `xb`, which is $\bar{x} = 1 - x$.

            case (SF_FAILED_KINEMATICS)
                sf_int%x = 0
                f = 0
            end select
        end if
    end subroutine epa_inverse_kinematics
```

Overriding the default method: we compute the x array from the momentum configuration. In the specific case of EPA, we also set the internally stored x and $\bar{x}$ values, so they can be used in the following routine.

Note: the extraction of $\bar{x}$ is not numerically safe, but it can't be as long as the base `recover_x` isn't.

⟨*SF epa: epa: TBP*⟩+≡
```
    procedure :: recover_x => sf_epa_recover_x
```

⟨*SF epa: procedures*⟩+≡
```
    subroutine sf_epa_recover_x (sf_int, x, x_free)
      class(epa_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), intent(inout), optional :: x_free
      call sf_int%base_recover_x (x, x_free)
      sf_int%x  = x(1)
      sf_int%xb = 1 - x(1)
    end subroutine sf_epa_recover_x
```

10.5.5   EPA application

For EPA, we can in principle compute kinematics and function value in a single step. In order to be able to reweight events, kinematics and structure function application are separated. This function works on a single beam, assuming that the input momentum has been set. We need three random numbers as input: one for x, and two for the polar and azimuthal angles. Alternatively, for the no-recoil case, we can skip p_T generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated x values are identical.

⟨*SF epa: epa: TBP*⟩+≡
```
    procedure :: apply => epa_apply
```

⟨*SF epa: procedures*⟩+≡
```
    subroutine epa_apply (sf_int, scale)

10.6.1   Physics

The EWA structure function for a Z or W inside a fermion (lepton or quark)
depends on the vector-boson polarization. We distinguish transversal ($\pm$) and

longitudinal (0) polarization.

$$F_+(x) = \frac{1}{16\pi^2} \frac{(v-a)^2 + (v+a)^2 \bar{x}^2}{x} \left[\ln\left(\frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right]$$

(10.62)

$$F_-(x) = \frac{1}{16\pi^2} \frac{(v+a)^2 + (v-a)^2 \bar{x}^2}{x} \left[\ln\left(\frac{p_{\perp,\max}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2} \right]$$

(10.63)

$$F_0(x) = \frac{v^2 + a^2}{8\pi^2} \frac{2\bar{x}}{x} \frac{p_{\perp,\max}^2}{p_{\perp,\max}^2 + \bar{x}M^2}$$

(10.64)

where $p_{\perp,\max}$ is the cutoff in transversal momentum, M is the vector-boson mass, v and a are the vector and axial-vector couplings, and $\bar{x} \equiv 1-x$. Note that the longitudinal structure function is finite for large cutoff, while the transversal structure function is logarithmically divergent.

The maximal transverse momentum is given by the kinematical limit, it is

$$p_{\perp,\max} = \bar{x}\sqrt{s}/2.$$

(10.65)

The vector and axial couplings for a fermion branching into a W are

$$v_W = \frac{g}{2\sqrt{2}}, \qquad\qquad a_W = \frac{g}{2\sqrt{2}}.$$

(10.66)

For Z emission, this is replaced by

$$v_Z = \frac{g}{2\cos\theta_w} \left(t_3 - 2q\sin^2\theta_w \right), \qquad a_Z = \frac{g}{2\cos\theta_w} t_3,$$

(10.67)

where $t_3 = \pm\frac{1}{2}$ is the fermion isospin, and q its charge.

For an initial antifermion, the signs of the axial couplings are inverted. Note that a common sign change of v and a is irrelevant.

The EWA depends on the parameters g, $\sin^2\theta_w$, M_W, and M_Z. These can all be taken from the SM input, and the prefactors are calculated from those and the incoming particle type.

Since these structure functions have a $1/x$ singularity (which is not really relevant in practice, however, since the vector boson mass is finite), we map this singularity allowing for nontrivial x bounds:

$$x = \exp(\bar{r}\ln x_0 + r\ln x_1)$$

(10.68)

such that

$$\int_{x_0}^{x_1} \frac{dx}{x} = (\ln x_1 - \ln x_0) \int_0^1 dr.$$

(10.69)

As a user parameter, we have the cutoff $p_{\perp,\max}$. The divergence $1/x$ also requires a x_0 cutoff; and for completeness we introduce a corresponding x_1. Physically, the minimal sensible value of x is M^2/s, although the approximation loses its value already at higher x values.

10.6.2 The EWA data block

The EWA parameters are: $p_{T,\max}$, c_V, c_A, and m. Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charges. In the initialization phase it is not yet determined whether a W or a Z is radiated, hence we set the vector and axial-vector couplings equal to the common prefactors $g/2 = e/2/\sin\theta_W$.

In principle, for EWA it would make sense to allow the user to also set the upper bound for x, $x_{\max}$, but we fix it to one here.

10.6.3   The EWA object

The `ewa_t` data type is a $1 \to 2$ interaction. We should be able to handle several flavors in parallel, since EWA is not necessarily applied immediately after beam collision: W/Z bosons may be radiated from quarks. In that case, the partons are massless and $q_{\min}$ applies instead, so we do not need to generate several kinematical configurations in parallel.

The particles are ordered as (incoming, radiated, W/Z), where the W/Z initiates the hard interaction.

In the case of EPA, we generated an unpolarized photon and transferred initial polarization to the radiated parton. Color is transferred in the same way. I do not know whether the same can/should be done for EWA, as the structure functions depend on the W/Z polarization. If we are having Z bosons, both up- and down-type fermions can participate. Otherwise, with a W^+ an up-type fermion is transferred to a down-type fermion, and the other way round.

⟨*SF ewa: types*⟩+≡
```
    type, extends (sf_int_t) :: ewa_t
      type(ewa_data_t), pointer :: data => null ()
      real(default) :: x  = 0
      real(default) :: xb = 0
      integer :: n_me = 0
      real(default), dimension(:), allocatable :: cv
      real(default), dimension(:), allocatable :: ca
    contains
    ⟨SF ewa: ewa: TBP⟩
    end type ewa_t
```

Type string: has to be here, but there is no string variable on which EWA depends. Hence, a dummy routine.

⟨*SF ewa: ewa: TBP*⟩≡

10.6.4 Kinematics

Set kinematics. The EWA structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value. If map is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If map is set, the exponential mapping for the $1/x$ singularity discussed above is applied.

10.6.5 EWA application

For EWA, we can compute kinematics and function value in a single step. This function works on a single beam, assuming that the input momentum has been set. We need four random numbers as input: one for x, one for Q^2, and two for the polar and azimuthal angles. Alternatively, we can skip p_T generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated x values are identical.

10.7.1 Physics

Beamstrahlung is applied before ISR. The CIRCE1 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously). Nevertheless it is factorized:

The functional form in the CIRCE1 parameterization is defined for electrons or photons

$$f(x) = \alpha \, x^{\beta} \, (1 - x)^{\gamma} \tag{10.70}$$

for $x < 1 - \epsilon$ (resp. $x > \epsilon$ in the photon case). In the remaining interval, the standard form is zero, with a delta singularity at $x = 1$ (resp. $x = 0$). Equivalently, the delta part may be distributed uniformly among this interval. This latter form is implemented in the `kirke` version of the `CIRCE1` subroutines, and is used here.

The parameter `circe1\_eps` sets the peak mapping of the `CIRCE1` structure function. Its default value is 10^{-5}. The other parameters are the parameterization version and revision number, the accelerator type, and the $\sqrt{s}$ value used by `CIRCE1`. The chattiness can also be set.

Since the energy is distributed in a narrow region around unity (for electrons) or zero (for photons), it is advantageous to map the interval first. The mapping is controlled by the parameter `circe1\_epsilon` which is taken from the `CIRCE1` internal data structure.

The $\sqrt{s}$ value, if not explicitly set, is taken from the process data. Note that interpolating $\sqrt{s}$ is not recommended; one should rather choose one of the distinct values known to `CIRCE1`.

10.7.2 The CIRCE1 data block

The CIRCE1 parameters are: The incoming flavors, the flags whether the photon or the lepton is the parton in the hard interaction, the flags for the generation mode (generator/mapping/no mapping), the mapping parameter ϵ, $\sqrt{s}$ and several steering parameters: `ver`, `rev`, `acc`, `chat`.

In generator mode, the x values are actually discarded and a random number generator is used instead.

```

Return true if this structure function is in generator mode. In that case, all parameters are free, otherwise bound. (We do not support mixed cases.) Default is: no generator.

⟨*SF circe1: circe1 data: TBP*⟩+≡
```
    procedure :: is_generator => circe1_data_is_generator
```

⟨*SF circe1: procedures*⟩+≡
```
    function circe1_data_is_generator (data) result (flag)
      class(circe1_data_t), intent(in) :: data
      logical :: flag
      flag = data%generate
    end function circe1_data_is_generator
```

The number of parameters is two, collinear splitting for the two beams.

⟨*SF circe1: circe1 data: TBP*⟩+≡
```
procedure :: get_n_par => circe1_data_get_n_par
```

⟨*SF circe1: procedures*⟩+≡
```
function circe1_data_get_n_par (data) result (n)
  class(circe1_data_t), intent(in) :: data
  integer :: n
  n = 2
end function circe1_data_get_n_par
```

Return the outgoing particles PDG codes. This is either the incoming particle (if a photon is radiated), or the photon if that is the particle of the hard interaction. The latter is determined via the `photon` flag. There are two entries for the two beams.

⟨*SF circe1: circe1 data: TBP*⟩+≡
```
procedure :: get_pdg_out => circe1_data_get_pdg_out
```

⟨*SF circe1: procedures*⟩+≡

  class(sf_int_t), intent(inout), allocatable :: sf_int
  allocate (circe1_t :: sf_int)
end subroutine circe1_data_allocate_sf_int
```

10.7.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

⟨SF circe1: types⟩+≡
```
type, extends (circe1_rng_t) :: rng_obj_t
  class(rng_t), allocatable :: rng
 contains
  procedure :: generate => rng_obj_generate
end type rng_obj_t
```

⟨SF circe1: procedures⟩+≡
```
subroutine rng_obj_generate (rng_obj, u)
  class(rng_obj_t), intent(inout) :: rng_obj
  real(double), intent(out) :: u
  real(default) :: x
  call rng_obj%rng%generate (x)
  u = x
end subroutine rng_obj_generate
```

10.7.4 The CIRCE1 object

This is a $2 \to 4$ interaction, where, depending on the parameters, any two of the four outgoing particles are connected to the hard interactions, the others are radiated. Knowing that all particles are colorless, we do not have to deal with color.

The flavors are sorted such that the first two particles are the incoming leptons, the next two are the radiated particles, and the last two are the partons initiating the hard interaction.

CIRCE1 does not support polarized beams explicitly. For simplicity, we nevertheless carry beam polarization through to the outgoing electrons and make the photons unpolarized.

⟨SF circe1: types⟩+≡
```
type, extends (sf_int_t) :: circe1_t
  type(circe1_data_t), pointer :: data => null ()
  real(default), dimension(2) :: x = 0
```

```
    real(default) :: f = 0
    logical, dimension(2) :: continuum = .true.
    logical, dimension(2) :: peak = .true.
    type(rng_obj_t) :: rng_obj
  contains
  ⟨SF circe1: circe1: TBP⟩
  end type circe1_t
```

Type string: has to be here, but there is no string variable on which CIRCE1 depends. Hence, a dummy routine.

⟨*SF circe1: circe1: TBP*⟩≡
```
    procedure :: type_string => circe1_type_string
```

⟨*SF circe1: procedures*⟩+≡
```
    function circe1_type_string (object) result (string)
      class(circe1_t), intent(in) :: object
      type(string_t) :: string
      if (associated (object%data)) then
         string = "CIRCE1: beamstrahlung"
      else
         string = "CIRCE1: [undefined]"
      end if
    end function circe1_type_string
```

Output. Call the interaction routine after displaying the configuration.

⟨*SF circe1: circe1: TBP*⟩+≡
```
    procedure :: write => circe1_write
```

⟨*SF circe1: procedures*⟩+≡

10.7.5 Kinematics

Refer to the `data` component.

⟨*SF circe1: circe1: TBP*⟩+≡
```
    procedure :: is_generator => circe1_is_generator
```

⟨*SF circe1: procedures*⟩+≡
```
    function circe1_is_generator (sf_int) result (flag)
      class(circe1_t), intent(in) :: sf_int
      logical :: flag
      flag = sf_int%data%is_generator ()
    end function circe1_is_generator
```

Generate free parameters, if generator mode is on. Otherwise, the parameters
will be discarded.

⟨*SF circe1: circe1: TBP*⟩+≡
```
    procedure :: generate_free => circe1_generate_free
```

⟨*SF circe1: procedures*⟩+≡
```
    subroutine circe1_generate_free (sf_int, r, rb,  x_free)
      class(circe1_t), intent(inout) :: sf_int
```

```
        real(default), dimension(:), intent(out) :: r, rb
        real(default), intent(inout) :: x_free

        if (sf_int%data%generate) then
           call circe_generate (r, sf_int%data%get_pdg_int (), sf_int%rng_obj)
           rb = 1 - r
           x_free = x_free * product (r)
        else
           r = 0
           rb= 1
        end if
     end subroutine circe1_generate_free
```

Generator mode: depending on the particle codes, call one of the available `girce`
generators. Illegal particle code combinations should have been caught during
data initialization.

⟨*SF circe1: procedures*⟩+≡
```
     subroutine circe_generate (x, pdg, rng_obj)
       real(default), dimension(2), intent(out) :: x
       integer, dimension(2), intent(in) :: pdg
       class(rng_obj_t), intent(inout) :: rng_obj
       real(double) :: xc1, xc2
       select case (abs (pdg(1)))
       case (ELECTRON)
          select case (abs (pdg(2)))
          case (ELECTRON)
             call gircee (xc1, xc2, rng_obj = rng_obj)
          case (PHOTON)
             call girceg (xc1, xc2, rng_obj = rng_obj)
          end select
       case (PHOTON)
          select case (abs (pdg(2)))
          case (ELECTRON)
             call girceg (xc2, xc1, rng_obj = rng_obj)
          case (PHOTON)
             call gircgg (xc1, xc2, rng_obj = rng_obj)
          end select
       end select
       x = [xc1, xc2]
     end subroutine circe_generate
```

Set kinematics. The r values (either from integration or from the generator call
above) are copied to x unchanged, and f is unity. We store the x values, so we
can use them for the evaluation later.

⟨*SF circe1: circe1: TBP*⟩+≡
```
     procedure :: complete_kinematics => circe1_complete_kinematics
```

⟨*SF circe1: procedures*⟩+≡
```
     subroutine circe1_complete_kinematics (sf_int, x, f, r, rb, map)
       class(circe1_t), intent(inout) :: sf_int
       real(default), dimension(:), intent(out) :: x
       real(default), intent(out) :: f
       real(default), dimension(:), intent(in) :: r
```

1258

```
    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
    real(default), dimension(2) :: xb1
    x = r
    sf_int%x = x
    f = 1
    xb1 = 1 - x
    call sf_int%split_momenta (x, xb1)
    select case (sf_int%status)
    case (SF_FAILED_KINEMATICS);  f = 0
    end select
  end subroutine circe1_complete_kinematics
```

Compute inverse kinematics. In generator mode, the r values are meaningless, but we copy them anyway.

⟨*SF circe1: circe1: TBP*⟩+≡
```
    procedure :: inverse_kinematics => circe1_inverse_kinematics
```

⟨*SF circe1: procedures*⟩+≡
```

end subroutine circe1_apply
```

This is a smeared delta peak at zero, as an endpoint singularity. We choose an exponentially decreasing function, starting at zero, with integral (from 0 to 1) $1 - e^{-1/\epsilon}$. For small ϵ, this reduces to one.

⟨*SF circe1: procedures*⟩+≡

```
function peak (x, eps) result (f)
  real(default), intent(in) :: x, eps
  real(default) :: f
  f = exp (-x / eps) / eps
end function peak
```

10.7.7 Unit tests

⟨*SF circe1: public*⟩+≡

```
      public :: sf_circe1_test
```

⟨*SF circe1: tests*⟩≡
```
    subroutine sf_circe1_test (u, results)

10.8.1 Physics

CIRCE2 describes photon spectra Beamstrahlung is applied before ISR. The CIRCE2 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously).

10.8.2 The CIRCE2 data block

The CIRCE2 parameters are: file and collider specification, incoming (= outgoing) particles. The luminosity is returned by `cir2lm`.

```

10.8.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

⟨*SF circe2: types*⟩+≡
```
type, extends (circe2_rng_t) :: rng_obj_t
  class(rng_t), allocatable :: rng
 contains
  procedure :: generate => rng_obj_generate
end type rng_obj_t
```

⟨*SF circe2: procedures*⟩+≡
```
subroutine rng_obj_generate (rng_obj, u)
  class(rng_obj_t), intent(inout) :: rng_obj
  real(double), intent(out) :: u
  real(default) :: x
  call rng_obj%rng%generate (x)
  u = x
end subroutine rng_obj_generate
```

10.8.4 The CIRCE2 object

For CIRCE2 spectra it does not make sense to describe the state matrix as a radiation interaction, even if photons originate from laser backscattering. Instead, it is a $2 \to 2$ interaction where the incoming particles are identical to the outgoing ones.

The current implementation of CIRCE2 does support polarization and classical correlations, but no entanglement, so the density matrix of the outgoing particles is diagonal. The incoming particles are unpolarized (user-defined polarization for beams is meaningless, since polarization is described by the data file). The outgoing particles are polarized or polarization-averaged, depending on user request.

When assigning matrix elements, we scan the previously initialized state matrix. For each entry, we extract helicity and call the structure function. In the unpolarized case, the helicity is undefined and replaced by value zero. In the polarized case, there are four entries. If the generator is used, only one entry is nonzero in each call. Which one, is determined by comparing with a previously (randomly, distributed by relative luminosity) selected pair of helicities.

⟨*SF circe2: types*⟩+≡
```
type, extends (sf_int_t) :: circe2_t
  type(circe2_data_t), pointer :: data => null ()
  type(rng_obj_t) :: rng_obj

10.9 Energy-scan spectrum

This spectrum is actually a trick that allows us to plot the c.m. energy dependence of a cross section without scanning the input energy. We start with the observation that a spectrum $f(x)$, applied to one of the incoming beams only, results in a cross section

$$\sigma = \int dx\, f(x)\, \hat{\sigma}(xs). \tag{10.71}$$

We want to compute the distribution of $E = \sqrt{\hat{s}} = \sqrt{xs}$, i.e.,

$$\frac{d\sigma}{dE} = \frac{2\sqrt{x}}{\sqrt{s}} \frac{d\sigma}{dx} = \frac{2\sqrt{x}}{\sqrt{s}}\, f(x)\, \hat{\sigma}(xs), \tag{10.72}$$

so if we set

$$f(x) = \frac{\sqrt{s}}{2\sqrt{x}}, \tag{10.73}$$

we get the distribution

$$\frac{d\sigma}{dE} = \hat{\sigma}(\hat{s} = E^2). \tag{10.74}$$

We implement this as a spectrum with a single parameter x. The parameters for the individual beams are computed as $x_i = \sqrt{x}$, so they are equal and the kinematics is always symmetric.

10.9.1   Data type

The `norm` is unity if the total cross section should be normalized to one, and $\sqrt{s}$ if it should be normalized to the total energy. In the latter case, the differential distribution $d\sigma/d\sqrt{\hat{s}}$ coincides with the partonic cross section $\hat{\sigma}$ as a function of $\sqrt{\hat{s}}$.

10.10 Using beam event data

Instead of an analytic beam description, beam data may be provided in form of
an event file. In its most simple form, the event file contains pairs of x values,
relative to nominal beam energies. More advanced formats may include polar-
ization, etc. The current implementation carries beam polarization through, if
specified.

The code is very similar to the energy scan described above.

        end if
    end associate
  end subroutine beam_events_generate_free
```

Set kinematics. Trivial transfer since this is a pure generator.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

⟨*SF beam events: beam events: TBP*⟩+≡
```
    procedure :: complete_kinematics => beam_events_complete_kinematics
```

⟨*SF beam events: procedures*⟩+≡
```
    subroutine beam_events_complete_kinematics (sf_int, x, f, r, rb, map)
      class(beam_events_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), intent(out) :: f
      real(default), dimension(:), intent(in) :: r
      real(default), dimension(:), intent(in) :: rb
      logical, intent(in) :: map
      if (map) then
          call msg_fatal ("Beam events: map flag not supported")
      else
          x = r
          f = 1
      end if
      call sf_int%reduce_momenta (x)
    end subroutine beam_events_complete_kinematics
```

Compute inverse kinematics. Trivial in this case.

⟨*SF beam events: beam events: TBP*⟩+≡
```
    procedure :: inverse_kinematics => beam_events_inverse_kinematics
```

⟨*SF beam events: procedures*⟩+≡
```
    subroutine beam_events_inverse_kinematics &
```

```
     (sf_int, x, f, r, rb, map, set_momenta)
   class(beam_events_t), intent(inout) :: sf_int
   real(default), dimension(:), intent(in) :: x
   real(default), intent(out) :: f
   real(default), dimension(:), intent(out) :: r
   real(default), dimension(:), intent(out) :: rb

10.11.2 LHAPDF library interface

Here we specify explicit interfaces for all LHAPDF routines that we use below.

⟨*SF lhapdf: interfaces*⟩≡
```
    interface
       subroutine InitPDFsetM (set, file)
         integer, intent(in) :: set
         character(*), intent(in) :: file
       end subroutine InitPDFsetM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       subroutine InitPDFM (set, mem)
         integer, intent(in) :: set, mem
       end subroutine InitPDFM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       subroutine numberPDFM (set, n_members)
         integer, intent(in) :: set
         integer, intent(out) :: n_members
       end subroutine numberPDFM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       subroutine evolvePDFM (set, x, q, ff)
         integer, intent(in) :: set
         double precision, intent(in) :: x, q
         double precision, dimension(-6:6), intent(out) :: ff
       end subroutine evolvePDFM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       subroutine evolvePDFphotonM (set, x, q, ff, fphot)
         integer, intent(in) :: set
         double precision, intent(in) :: x, q
         double precision, dimension(-6:6), intent(out) :: ff
         double precision, intent(out) :: fphot
       end subroutine evolvePDFphotonM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       subroutine evolvePDFpM (set, x, q, s, scheme, ff)
         integer, intent(in) :: set
         double precision, intent(in) :: x, q, s
         integer, intent(in) :: scheme
         double precision, dimension(-6:6), intent(out) :: ff
       end subroutine evolvePDFpM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       subroutine GetXminM (set, mem, xmin)
         integer, intent(in) :: set, mem
         double precision, intent(out) :: xmin
       end subroutine GetXminM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       subroutine GetXmaxM (set, mem, xmax)
         integer, intent(in) :: set, mem
         double precision, intent(out) :: xmax
       end subroutine GetXmaxM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       subroutine GetQ2minM (set, mem, q2min)
         integer, intent(in) :: set, mem
         double precision, intent(out) :: q2min
       end subroutine GetQ2minM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       subroutine GetQ2maxM (set, mem, q2max)
         integer, intent(in) :: set, mem
         double precision, intent(out) :: q2max
       end subroutine GetQ2maxM
    end interface
```

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       function has_photon () result(flag)
          logical :: flag
       end function has_photon
    end interface
```

10.11.3 The LHAPDF status

This type holds the initialization status of the LHAPDF system. Entry 1 is for proton PDFs, entry 2 for pion PDFs, entry 3 for photon PDFs.

⟨*SF lhapdf: public*⟩≡
```
public :: lhapdf_status_t
```

⟨*SF lhapdf: types*⟩≡
```
type :: lhapdf_status_t
   private
   logical, dimension(3) :: initialized = .false.
end type lhapdf_status_t
```

⟨*SF lhapdf: public*⟩+≡
```
public :: lhapdf_status_reset
```

⟨*SF lhapdf: procedures*⟩≡
```
subroutine lhapdf_status_reset (lhapdf_status)
  type(lhapdf_status_t), intent(inout) :: lhapdf_status
  lhapdf_status%initialized = .false.
end subroutine lhapdf_status_reset
```

⟨*SF lhapdf: procedures*⟩+≡
```
function lhapdf_status_is_initialized (lhapdf_status, set) result (flag)
  logical :: flag
  type(lhapdf_status_t), intent(in) :: lhapdf_status
  integer, intent(in), optional :: set
  if (present (set)) then
     select case (set)
     case (1:3);    flag = lhapdf_status%initialized(set)
     case default;  flag = .false.
     end select
  else
     flag = any (lhapdf_status%initialized)
  end if
end function lhapdf_status_is_initialized
```

⟨*SF lhapdf: procedures*⟩+≡
```
subroutine lhapdf_status_set_initialized (lhapdf_status, set)
  type(lhapdf_status_t), intent(inout) :: lhapdf_status
  integer, intent(in) :: set
  lhapdf_status%initialized(set) = .true.
end subroutine lhapdf_status_set_initialized
```

10.11.4 LHAPDF initialization

Before using LHAPDF, we have to initialize it with a particular data set and member. This applies not just if we use structure functions, but also if we just use an α_s formula. The integer `set` should be 1 for proton, 2 for pion, and 3 for photon, but this is just convention.

If the particular set has already been initialized, do nothing. This implies that whenever we want to change the setup for a particular set, we have to

reset the LHAPDF status. `lhapdf_initialize` has an obvious name clash
with `lhapdf_init`, the reason it works for `pdf_builtin` is that there things are
outsourced to a separate module (inc. `lhapdf_status` etc.).

⟨*SF lhapdf: public*⟩+≡
```
    public :: lhapdf_initialize
```

⟨*SF lhapdf: procedures*⟩+≡
```
    subroutine lhapdf_initialize (status, set, prefix, file, member, b_match)
      type(lhapdf_status_t), intent(inout) :: status
      integer, intent(in) :: set
      type(string_t), intent(inout) :: prefix
      type(string_t), intent(inout) :: file
      integer, intent(inout) :: member
      logical, intent(in), optional :: b_match
      if (lhapdf_status_is_initialized (status, set))  return
      if (prefix == "")  prefix = LHAPDF_PDFSETS_PATH
      if (file == "") then
         select case (set)
         case (1);  file = LHAPDF_DEFAULT_PROTON
         case (2);  file = LHAPDF_DEFAULT_PION
         case (3);  file = LHAPDF_DEFAULT_PHOTON
         end select
      end if
      if (data_file_exists (prefix // "/" // file)) then
         call InitPDFsetM (set, char (prefix // "/" // file))
      else
         call msg_fatal ("LHAPDF: Data file '" &
              // char (file) // "' not found in '" // char (prefix) // "'.")
         return
      end if
      if (.not. dataset_member_exists (set, member)) then
         call msg_error (" LHAPDF: Chosen member does not exist for set '" &
              // char (file) // "', using default.")
         member = 0
      end if
      call InitPDFM (set, member)
      if (present (b_match)) then
         if (b_match)  call hoppet_init ()
      end if
      call lhapdf_status_set_initialized (status, set)
    contains
      function data_file_exists (fq_name) result (exist)
        type(string_t), intent(in) :: fq_name
        logical :: exist
        inquire (file = char(fq_name), exist = exist)
      end function data_file_exists
      function dataset_member_exists (set, member) result (exist)
        integer, intent(in) :: set, member
        logical :: exist
        integer :: n_members
        call numberPDFM (set, n_members)
        exist = member >= 0 .and. member <= n_members
      end function dataset_member_exists
    end subroutine lhapdf_initialize
```

10.11.5 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

⟨*SF lhapdf: lhapdf: TBP*⟩≡
```
procedure :: complete_kinematics => lhapdf_complete_kinematics
```

⟨*SF lhapdf: procedures*⟩+≡
```
subroutine lhapdf_complete_kinematics (sf_int, x, f, r, rb, map)
  class(lhapdf_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(out) :: x
  real(default), intent(out) :: f
  real(default), dimension(:), intent(in) :: r
  real(default), dimension(:), intent(in) :: rb
  logical, intent(in) :: map
  real(default) :: xb1
  if (map) then
     call msg_fatal ("LHAPDF: map flag not supported")
  else
     x(1) = r(1)
     f = 1
  end if
  xb1 = 1 - x(1)
  call sf_int%split_momentum (x, xb1)
  select case (sf_int%status)
  case (SF_DONE_KINEMATICS)
     sf_int%x = x(1)
  case (SF_FAILED_KINEMATICS)
     sf_int%x = 0
     f = 0
  end select
end subroutine lhapdf_complete_kinematics
```

Compute inverse kinematics. Here, we start with the x array and compute the "input" r values and the Jacobian f. After this, we can set momenta by the same formula as for normal kinematics.

⟨*SF lhapdf: lhapdf: TBP*⟩+≡
```
procedure :: inverse_kinematics => lhapdf_inverse_kinematics
```

⟨*SF lhapdf: procedures*⟩+≡
```
subroutine lhapdf_inverse_kinematics (sf_int, x, f, r, rb, map, set_momenta)
  class(lhapdf_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(in) :: x
  real(default), intent(out) :: f
  real(default), dimension(:), intent(out) :: r
  real(default), dimension(:), intent(out) :: rb
  logical, intent(in) :: map
  logical, intent(in), optional :: set_momenta
  real(default) :: xb1
```

```
      logical :: set_mom
      set_mom = .false.;  if (present (set_momenta))  set_mom = set_momenta
      if (map) then
         call msg_fatal ("LHAPDF: map flag not supported")
      else
         r(1) = x(1)
         f = 1
      end if
      xb1 = 1 - x(1)
      rb = 1 - r
      if (set_mom) then
         call sf_int%split_momentum (x, xb1)
         select case (sf_int%status)
         case (SF_DONE_KINEMATICS)
            sf_int%x = x(1)
         case (SF_FAILED_KINEMATICS)
            sf_int%x = 0
            f = 0
         end select
      end if
    end subroutine lhapdf_inverse_kinematics
```

10.11.6   The LHAPDF data block

The data block holds the incoming flavor (which has to be proton, pion, or photon), the corresponding pointer to the global access data (1, 2, or 3), the flag `invert` which is set for an antiproton, the bounds as returned by LHAPDF for the specified set, and a mask that determines which partons will be actually in use.

⟨*SF lhapdf: public*⟩+≡

Generate PDF data. This is a provided as a function, but it has the side-effect of initializing the requested PDF set. A finalizer is not needed.

The library uses double precision, so since the default precision may be quadruple, we use auxiliary variables for type casting.

10.11.7 The LHAPDF object

The `lhapdf_t` data type is a $1 \to 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

This is the LHAPDF object which holds input data together with the interaction. We also store the x momentum fraction and the scale, since kinematics and function value are requested at different times.

The PDF application is a $1 \to 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

⟨*SF lhapdf: types*⟩+≡
```
type, extends (sf_int_t) :: lhapdf_t

10.11.9 Strong Coupling

Since the PDF codes provide a function for computing the running α_s value, we make this available as an implementation of the abstract `alpha_qcd_t` type, which is used for matrix element evaluation.

⟨*SF lhapdf: public*⟩+≡
```
    public :: alpha_qcd_lhapdf_t
```

⟨*SF lhapdf: types*⟩+≡
```
    type, extends (alpha_qcd_t) :: alpha_qcd_lhapdf_t
      type(string_t) :: pdfset_dir
      type(string_t) :: pdfset_file
      integer :: pdfset_member = -1
    contains
    ⟨SF lhapdf: alpha qcd: TBP⟩
    end type alpha_qcd_lhapdf_t
```

Output. As in earlier versions we leave the LHAPDF path out.

⟨*SF lhapdf: alpha qcd: TBP*⟩≡
```
    procedure :: write => alpha_qcd_lhapdf_write
```

⟨*SF lhapdf: procedures*⟩+≡
```
    subroutine alpha_qcd_lhapdf_write (object, unit)
      class(alpha_qcd_lhapdf_t), intent(in) :: object
      integer, intent(in), optional :: unit
```

```
    integer :: u
    u = output_unit (unit)
    write (u, "(3x,A)")  "QCD parameters (lhapdf):"
    write (u, "(5x,A,A)")  "PDF set    = ", char (object%pdfset_file)
    write (u, "(5x,A,I0)")  "PDF member = ", object%pdfset_member
  end subroutine alpha_qcd_lhapdf_write
```

Calculation: the numeric member ID selects the correct PDF set, which must be properly initialized.

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       double precision function alphasPDF (Q)
         double precision, intent(in) :: Q
       end function alphasPDF
    end interface
```

10.12.2 The PDF builtin data block

The data block holds the incoming flavor (which has to be proton, pion, or photon), the corresponding pointer to the global access data (1, 2, or 3), the flag `invert` which is set for an antiproton, the bounds as returned by LHAPDF for the specified set, and a mask that determines which partons will be actually in use.

⟨*SF pdf builtin: public*⟩≡
```
    public :: pdf_builtin_data_t
```

⟨*SF pdf builtin: types*⟩≡
```
    type, extends (sf_data_t) :: pdf_builtin_data_t
       private
       integer :: id = -1
```

```
        type (string_t) :: name
        type(model_t), pointer :: model => null ()
        type(flavor_t) :: flv_in
        logical :: invert
        logical :: has_photon
        logical :: photon
        logical, dimension(-6:6) :: mask
        logical :: mask_photon
   contains
   ⟨SF pdf builtin: pdf builtin data: TBP⟩
   end type pdf_builtin_data_t
```

Generate PDF data and initialize the requested set. Pion and photon PDFs are disabled at the moment until we ship appropiate structure functions. needed.

⟨*SF pdf builtin: pdf builtin data: TBP*⟩≡
```
   procedure :: init => pdf_builtin_data_init
```

⟨*SF pdf builtin: procedures*⟩≡
```
   subroutine pdf_builtin_data_init (data, pdf_status, model, pdg_in, name, path)

end function pdf_builtin_data_get_pdf_set
```

10.12.3 The PDF object

The PDF $1 \rightarrow 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton

is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

The PDF application is a $1 \to 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

⟨*SF pdf builtin: types*⟩+≡
```
type, extends (sf_int_t) :: pdf_builtin_t
   type(pdf_builtin_data_t), pointer :: data => null ()
   real(default) :: x = 0

     call object%base_write (u, testflag)
  else
```

```
          write (u, "(1x,A)")  "PDF builtin data: [undefined]"
        end if
      end subroutine pdf_builtin_write
```

Initialize. We know that `data` will be of concrete type `sf_test_data_t`, but we have to cast this explicitly.

For this implementation, we set the incoming and outgoing masses equal to the physical particle mass, but keep the radiated mass zero.

Optionally, we can provide minimum and maximum values for the momentum transfer.

```

10.12.4 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

⟨*SF pdf builtin: pdf builtin: TBP*⟩+≡
```
     procedure :: complete_kinematics => pdf_builtin_complete_kinematics
```

⟨*SF pdf builtin: procedures*⟩+≡
```
     subroutine pdf_builtin_complete_kinematics (sf_int, x, f, r, rb, map)
       class(pdf_builtin_t), intent(inout) :: sf_int
       real(default), dimension(:), intent(out) :: x
       real(default), intent(out) :: f
       real(default), dimension(:), intent(in) :: r
       real(default), dimension(:), intent(in) :: rb
       logical, intent(in) :: map
       real(default) :: xb1
       if (map) then
          call msg_fatal ("PDF builtin: map flag not supported")
       else
          x(1) = r(1)
          f = 1
       end if
       xb1 = 1 - x(1)
       call sf_int%split_momentum (x, xb1)
       select case (sf_int%status)
       case (SF_DONE_KINEMATICS)
          sf_int%x = x(1)
       case (SF_FAILED_KINEMATICS)
          sf_int%x = 0
          f = 0
       end select
     end subroutine pdf_builtin_complete_kinematics
```

Compute inverse kinematics. Here, we start with the x array and compute the "input" r values and the Jacobian f. After this, we can set momenta by the same formula as for normal kinematics.

⟨*SF pdf builtin: pdf builtin: TBP*⟩+≡
```
     procedure :: inverse_kinematics => pdf_builtin_inverse_kinematics
```

⟨*SF pdf builtin: procedures*⟩+≡

      sf_int%x = x(1)
   case (SF_FAILED_KINEMATICS)
      sf_int%x = 0
      f = 0
   end select
end if
end subroutine pdf_builtin_inverse_kinematics
```

10.12.5 Structure function

Once the scale is also known, we can actually call the PDF and set the values.
Contrary to LHAPDF, the wrapper already takes care of adjusting to the x and
Q bounds. Account for the Jacobian.

⟨*SF pdf builtin: pdf builtin: TBP*⟩+≡
```
procedure :: apply => pdf_builtin_apply
```

⟨*SF pdf builtin: procedures*⟩+≡
```
subroutine pdf_builtin_apply (sf_int, scale)
  class(pdf_builtin_t), intent(inout) :: sf_int
  real(default), intent(in) :: scale
  real(default), dimension(-6:6) :: ff
  real(default) :: x, fph
  complex(default), dimension(:), allocatable :: fc
  associate (data => sf_int%data)
    sf_int%q = scale
    x = sf_int%x
    if (data%invert) then
       if (data%has_photon) then
          call pdf_evolve (data%id, x, scale, ff(6:-6:-1), fph)
       else
          call pdf_evolve (data%id, x, scale, ff(6:-6:-1))
       end if
    else
```

```
      if (data%has_photon) then
         call pdf_evolve (data%id, x, scale, ff, fph)
      else
         call pdf_evolve (data%id, x, scale, ff)
      end if
   end if
   if (data%has_photon) then
      allocate (fc (count ([data%mask, data%mask_photon])))
      fc = max (pack ([ff, fph], &
         [data%mask, data%mask_photon]), 0._default)
   else
      allocate (fc (count (data%mask)))
      fc = max (pack (ff, data%mask), 0._default)
   end if
 end associate
 call interaction_set_matrix_element (sf_int%interaction_t, fc)
 sf_int%status = SF_EVALUATED
end subroutine pdf_builtin_apply
```

10.12.6 Strong Coupling

Since the PDF codes provide a function for computing the running α_s value, we make this available as an implementation of the abstract `alpha_qcd_t` type, which is used for matrix element evaluation.

⟨*SF pdf builtin: public*⟩+≡
```
    public :: alpha_qcd_pdf_builtin_t
```

⟨*SF pdf builtin: types*⟩+≡
```
    type, extends (alpha_qcd_t) :: alpha_qcd_pdf_builtin_t
      type(string_t) :: pdfset_name
      integer :: pdfset_id = -1
    contains
    ⟨SF pdf builtin: alpha qcd: TBP⟩
    end type alpha_qcd_pdf_builtin_t
```

Output.

⟨*SF pdf builtin: alpha qcd: TBP*⟩≡
```
    procedure :: write => alpha_qcd_pdf_builtin_write
```

⟨*SF pdf builtin: procedures*⟩+≡
```
    subroutine alpha_qcd_pdf_builtin_write (object, unit)
      class(alpha_qcd_pdf_builtin_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      write (u, "(3x,A)")  "QCD parameters (pdf_builtin):"
      write (u, "(5x,A,A)")  "PDF set = ", char (object%pdfset_name)
      write (u, "(5x,A,I0)") "PDF ID  = ", object%pdfset_id
    end subroutine alpha_qcd_pdf_builtin_write
```

Calculation: the numeric ID selects the correct PDF set, which must be properly initialized.

⟨SF pdf builtin: alpha qcd: TBP⟩+≡
```
    procedure :: get => alpha_qcd_pdf_builtin_get
```

⟨SF pdf builtin: procedures⟩+≡
```
    function alpha_qcd_pdf_builtin_get (alpha_qcd, scale) result (alpha)
      class(alpha_qcd_pdf_builtin_t), intent(in) :: alpha_qcd
      real(default), intent(in) :: scale
      real(default) :: alpha
      alpha = pdf_alphas (alpha_qcd%pdfset_id, scale)
    end function alpha_qcd_pdf_builtin_get
```

Initialization. We need to access the (quasi-global) initialization status.

⟨SF pdf builtin: alpha qcd: TBP⟩+≡
```
    procedure :: init => alpha_qcd_pdf_builtin_init
```

⟨SF pdf builtin: procedures⟩+≡
```
    subroutine alpha_qcd_pdf_builtin_init (alpha_qcd, status, name, path)
      class(alpha_qcd_pdf_builtin_t), intent(out) :: alpha_qcd
      type(pdf_builtin_status_t), intent(inout) :: status
      type(string_t), intent(in) :: name
      type(string_t), intent(in) :: path
      alpha_qcd%pdfset_name = name
      alpha_qcd%pdfset_id = pdf_get_id (name)
      if (alpha_qcd%pdfset_id < 0) &
           call msg_fatal ("QCD parameter initialization: PDF set " &
           // char (name) // " is unknown")
      call pdf_init (status, alpha_qcd%pdfset_id, path)
    end subroutine alpha_qcd_pdf_builtin_init
```

```

Assign procedure pointers from a dynamically loaded library, given the specified
`name`.

We have to distinguish three cases: (1) Both beams are affected, and the
user spectrum implements both beams. There is a single data object. (2) Both

beams are affected, and the user spectrum applies to single beams. Fill two different objects. (3) A single beam is affected.

10.13.3 The interaction

We fill the interaction by looking up the table of states using the interface
functions.

For particles which have a known flavor (as indicated by the mask), we
compute the mass squared, so we can use it for the invariant mass of the particle
objects.

10.13.4   The user structure function

For maximal flexibility, user structure functions separate kinematics from dynamics just as the PDF interface does. (JRR: Ok, I guess this now done for all structure functions, right?) We create `c_prt_t` particle objects from the incoming momenta (all other quantum numbers are irrelevant) and call the user-supplied kinematics function to compute the outgoing momenta, along with other variables that will be needed for matrix element evaluation. If known, we use the mass squared computed above. !!! JRR: WK please check (#529) I don't know actually whether this really fits into the setup done by WK.

⟨*SF user: types*⟩+≡
```

```

10.13.5 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

⟨*SF user: user: TBP*⟩+≡

```
procedure :: complete_kinematics => user_complete_kinematics
```

⟨*SF user: procedures*⟩+≡

```
subroutine user_complete_kinematics (sf_int, x, f, r, rb, map)
  !!! JRR: WK please check (#529)
  !!! This cannot be correct, as the CIRCE1 structure function has
  !!! twice the variables (2->4 instead of 1->2 splitting)
  class(user_t), intent(inout) :: sf_int

```

Chapter 11

Phase space and hard matrix elements

These modules contain the internal representation and evaluation of phase space and the interface to (hard-)process evaluation.

mappings Generate invariant masses and decay angles from given random numbers (or the inverse operation). Each mapping pertains to a particular node in a phase-space tree. Different mappings account for uniform distributions, resonances, zero-mass behavior, and so on.

phs_trees Phase space parameterizations for scattering processes are defined recursively as if there was an initial particle decaying. This module sets up a representation in terms of abstract trees, where each node gets a unique binary number. Each tree is stored as an array of branches, where integers indicate the connections. This emulates pointers in a transparent way. Real pointers would also be possible, but seem to be less efficient for this particular case.

phs_forests The type defined by this module collects the decay trees corresponding to a given process and the applicable mappings. To set this up, a file is read which is either written by the user or by the **cascades** module functions. The module also contains the routines that evaluate phase space, i.e., generate momenta from random numbers and back.

cascades This module is a Feynman diagram generator with the particular purpose of finding the phase space parameterizations best suited for a given process. It uses a model file to set up the possible vertices, generates all possible diagrams, identifies resonances and singularities, and simplifies the list by merging equivalent diagrams and dropping irrelevant ones. This process can be controlled at several points by user-defined parameters. Note that it depends on the particular values of particle masses, so it cannot be done before reading the input file.

11.1 Process data block

We define a simple transparent type that contains universal constant process data. We will reference objects of this type for the phase-space setup, for interfacing with process libraries, for implementing matrix-element generation, and in the master process-handling module.

⟨process_constants.f90⟩≡

  ⟨*PHS base: interfaces*⟩

  ⟨*PHS base: test types*⟩

  contains

  ⟨*PHS base: procedures*⟩

  ⟨*PHS base: tests*⟩

  end module phs_base

11.2.1 Phase-space channels

The kinematics configuration may generate multiple parameterizations of phase space. Some of those have specific properties, such as a resonance in the s channel.

Channel properties

This is the abstract type for the channel properties. We need them as a data transfer container, so everything is public and transparent.

⟨*PHS base: public*⟩≡
```
public :: channel_prop_t
```

⟨*PHS base: types*⟩≡
```
type, abstract :: channel_prop_t
 contains
   procedure (channel_prop_to_string), deferred :: to_string
   generic :: operator (==) => is_equal
   procedure (channel_eq), deferred :: is_equal
end type channel_prop_t
```

⟨*PHS base: interfaces*⟩≡
```
abstract interface
   function channel_prop_to_string (object) result (string)
     import
     class(channel_prop_t), intent(in) :: object
     type(string_t) :: string
   end function channel_prop_to_string
end interface
```

⟨*PHS base: interfaces*⟩+≡
```
abstract interface
   function channel_eq (prop1, prop2) result (flag)
     import
     class(channel_prop_t), intent(in) :: prop1, prop2
     logical :: flag
   end function channel_eq
end interface
```

Here is a resonance as a channel property. Mass and width are stored here in physical units.

⟨*PHS base: public*⟩+≡
```
public :: resonance_t
```

⟨*PHS base: types*⟩+≡
```
type, extends (channel_prop_t) :: resonance_t
   real(default) :: mass = 0
   real(default) :: width = 0
 contains
   procedure :: to_string => resonance_to_string
   procedure :: is_equal => resonance_is_equal
end type resonance_t
```

Print mass and width.

⟨*PHS base: procedures*⟩≡
```
function resonance_to_string (object) result (string)
   class(resonance_t), intent(in) :: object
   type(string_t) :: string
   character(32) :: buffer
```

```
       string = "resonant: m ="
       write (buffer, "(" // FMT_19 // ")")  object%mass
       string = string // trim (buffer) // " GeV, w ="
       write (buffer, "(" // FMT_19 // ")")  object%width
       string = string // trim (buffer) // " GeV"
    end function resonance_to_string
```

Equality.

⟨*PHS base: procedures*⟩+≡
```
    function resonance_is_equal (prop1, prop2) result (flag)
      class(resonance_t), intent(in) :: prop1
      class(channel_prop_t), intent(in) :: prop2
      logical :: flag
      select type (prop2)
      type is (resonance_t)
         flag = prop1%mass == prop2%mass .and. prop1%width == prop2%width
      class default
         flag = .false.
      end select
    end function resonance_is_equal
```

This is the limiting case of a resonance, namely an on-shell particle. We just store the mass in physical units.

⟨*PHS base: public*⟩+≡
```
    public :: on_shell_t
```

⟨*PHS base: types*⟩+≡
```
    type, extends (channel_prop_t) :: on_shell_t
      real(default) :: mass = 0
     contains
       procedure :: to_string => on_shell_to_string
       procedure :: is_equal => on_shell_is_equal
    end type on_shell_t
```

Print mass and width.

⟨*PHS base: procedures*⟩+≡
```
    function on_shell_to_string (object) result (string)
      class(on_shell_t), intent(in) :: object
      type(string_t) :: string
      character(32) :: buffer
      string = "on shell: m ="
      write (buffer, "(" // FMT_19 // ")")  object%mass
      string = string // trim (buffer) // " GeV"
    end function on_shell_to_string
```

Equality.

⟨*PHS base: procedures*⟩+≡
```
    function on_shell_is_equal (prop1, prop2) result (flag)
      class(on_shell_t), intent(in) :: prop1
      class(channel_prop_t), intent(in) :: prop2
      logical :: flag
      select type (prop2)
```

```
      type is (on_shell_t)
         flag = prop1%mass == prop2%mass
      class default
         flag = .false.
      end select
   end function on_shell_is_equal
```

Channel equivalences

This type describes an equivalence. The current channel is equivalent to channel
`c`. The equivalence involves a permutation `perm` of integration dimensions and,
within each integration dimension, a mapping `mode`.

⟨*PHS base: types*⟩+≡
```
   type :: phs_equivalence_t
      integer :: c = 0
      integer, dimension(:), allocatable :: perm
      integer, dimension(:), allocatable :: mode
    contains
    ⟨PHS base: phs equivalence: TBP⟩
   end type phs_equivalence_t
```

The mapping modes are

⟨*PHS base: types*⟩+≡
```
   integer, parameter, public :: &
        EQ_IDENTITY = 0, EQ_INVERT = 1, EQ_SYMMETRIC = 2, EQ_INVARIANT = 3
```

In particular, if a channel is equivalent to itself in the `EQ_SYMMETRIC` mode, the
integrand can be assumed to be symmetric w.r.t. a reflection $x \to 1 - x$ of the
correponding integration variable.

These are the associated tags, for output:

⟨*PHS base: types*⟩+≡
```
   character, dimension(0:3), parameter :: TAG = ["+", "-", ":", "x"]
```

Write an equivalence.

⟨*PHS base: phs equivalence: TBP*⟩≡
```
   procedure :: write => phs_equivalence_write
```

⟨*PHS base: procedures*⟩+≡
```
   subroutine phs_equivalence_write (object, unit)
     class(phs_equivalence_t), intent(in) :: object
     integer, intent(in), optional :: unit
     integer :: u, j
     u = output_unit (unit)
     write (u, "(5x,'=',1x,I0,1x)", advance = "no")  object%c
     if (allocated (object%perm)) then
        write (u, "(A)", advance = "no")  "("
        do j = 1, size (object%perm)
           if (j > 1)  write (u, "(1x)", advance = "no")
           write (u, "(I0,A1)", advance = "no") &
                object%perm(j), TAG(object%mode(j))
        end do
```

```
      write (u, "(A)")  ")"
   else
      write (u, "(A)")
   end if
end subroutine phs_equivalence_write
```

Initialize an equivalence. This allocates the `perm` and `mode` arrays with equal size.

⟨*PHS base: phs equivalence: TBP*⟩+≡
```
procedure :: init => phs_equivalence_init
```

⟨*PHS base: procedures*⟩+≡
```
subroutine phs_equivalence_init (eq, n_dim)
  class(phs_equivalence_t), intent(out) :: eq
  integer, intent(in) :: n_dim
  allocate (eq%perm (n_dim), source = 0)
  allocate (eq%mode (n_dim), source = EQ_IDENTITY)
end subroutine phs_equivalence_init
```

Channel objects

The channel entry holds (optionally) specific properties.

    `sf_channel` is the structure-function channel that corresponds to this phase-space channel. The structure-function channel may be set up with a specific mapping that depends on the phase-space channel properties. (The default setting is to leave the properties empty.)

⟨*PHS base: public*⟩+≡
```
public :: phs_channel_t
```

⟨*PHS base: types*⟩+≡
```
type :: phs_channel_t
  class(channel_prop_t), allocatable :: prop
  integer :: sf_channel = 1
  type(phs_equivalence_t), dimension(:), allocatable :: eq
 contains
 ⟨PHS base: phs channel: TBP⟩
end type phs_channel_t
```

Output.

⟨*PHS base: phs channel: TBP*⟩≡
```
procedure :: write => phs_channel_write
```

⟨*PHS base: procedures*⟩+≡
```
subroutine phs_channel_write (object, unit)
  class(phs_channel_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, j
  u = output_unit (unit)
  write (u, "(1x,I0)", advance="no") object%sf_channel
  if (allocated (object%prop)) then
     write (u, "(1x,A)")  char (object%prop%to_string ())
  else
```

```
      write (u, *)
   end if
   if (allocated (object%eq)) then
      do j = 1, size (object%eq)
         call object%eq(j)%write (u)
      end do
   end if
end subroutine phs_channel_write
```

Identify the channel with an s-channel resonance.

⟨PHS base: phs channel: TBP⟩+≡
```
procedure :: set_resonant => channel_set_resonant
```

⟨PHS base: procedures⟩+≡
```
subroutine channel_set_resonant (channel, mass, width)
  class(phs_channel_t), intent(inout) :: channel
  real(default), intent(in) :: mass, width
  allocate (resonance_t :: channel%prop)
  select type (prop => channel%prop)
  type is (resonance_t)
     prop%mass = mass
     prop%width = width
  end select
end subroutine channel_set_resonant
```

Identify the channel with an on-shell particle.

⟨PHS base: phs channel: TBP⟩+≡
```
procedure :: set_on_shell => channel_set_on_shell
```

⟨PHS base: procedures⟩+≡
```
subroutine channel_set_on_shell (channel, mass)
  class(phs_channel_t), intent(inout) :: channel
  real(default), intent(in) :: mass
  allocate (on_shell_t :: channel%prop)
  select type (prop => channel%prop)
  type is (on_shell_t)
     prop%mass = mass
  end select
end subroutine channel_set_on_shell
```

11.2.2 Property collection

We can set up a list of all distinct channel properties for a given set of channels.

⟨PHS base: public⟩+≡
```
public :: phs_channel_collection_t
```

⟨PHS base: types⟩+≡
```
type :: prop_entry_t
   integer :: i = 0
   class(channel_prop_t), allocatable :: prop
   type(prop_entry_t), pointer :: next => null ()
end type prop_entry_t
```

```
type :: phs_channel_collection_t
   integer :: n = 0
   type(prop_entry_t), pointer :: first => null ()
 contains
 ⟨PHS base: phs channel collection: TBP⟩
end type phs_channel_collection_t
```

Finalizer for the list.

⟨*PHS base: phs channel collection: TBP*⟩≡
```
procedure :: final => phs_channel_collection_final
```

⟨*PHS base: procedures*⟩+≡
```
subroutine phs_channel_collection_final (object)
  class(phs_channel_collection_t), intent(inout) :: object
  type(prop_entry_t), pointer :: entry
  do while (associated (object%first))
     entry => object%first
     object%first => entry%next
     deallocate (entry)
  end do
end subroutine phs_channel_collection_final
```

Output.

Note: eliminating the `string` auxiliary triggers an ICE in gfortran 4.7.2.

⟨*PHS base: phs channel collection: TBP*⟩+≡
```
procedure :: write => phs_channel_collection_write
```

⟨*PHS base: procedures*⟩+≡
```
subroutine phs_channel_collection_write (object, unit)
  class(phs_channel_collection_t), intent(in) :: object
  integer, intent(in), optional :: unit
  type(prop_entry_t), pointer :: entry
  type(string_t) :: string
  integer :: u
  u = output_unit (unit)
  entry => object%first
  do while (associated (entry))
     if (allocated (entry%prop)) then
        string = entry%prop%to_string ()
        write (u, "(1x,I0,1x,A)")  entry%i, char (string)
     else
        write (u, "(1x,I0)")  entry%i
     end if
     entry => entry%next
  end do
end subroutine phs_channel_collection_write
```

Push a new property to the stack if it is not yet included. Simultaneously, set the `sf_channel` entry in the phase-space channel object to the index of the matching entry, or the new entry if there was no match.

⟨*PHS base: phs channel collection: TBP*⟩+≡
```
procedure :: push => phs_channel_collection_push
```

⟨PHS base: procedures⟩+≡

```
subroutine phs_channel_collection_push (coll, channel)
  class(phs_channel_collection_t), intent(inout) :: coll
  type(phs_channel_t), intent(inout) :: channel
  type(prop_entry_t), pointer :: entry, new
  if (associated (coll%first)) then
     entry => coll%first
     do
        if (allocated (entry%prop)) then
           if (allocated (channel%prop)) then
              if (entry%prop == channel%prop) then
                 channel%sf_channel = entry%i
                 return
              end if
           end if
        else if (.not. allocated (channel%prop)) then
           channel%sf_channel = entry%i
           return
        end if
        if (associated (entry%next)) then
           entry => entry%next
        else
           exit
        end if
     end do
     allocate (new)
     entry%next => new
  else
     allocate (new)
     coll%first => new
  end if
  coll%n = coll%n + 1
  new%i = coll%n
  channel%sf_channel = new%i
  if (allocated (channel%prop)) then
     allocate (new%prop, source = channel%prop)
  end if
end subroutine phs_channel_collection_push
```

Return the number of collected distinct channels.

⟨PHS base: phs channel collection: TBP⟩+≡

```
procedure :: get_n => phs_channel_collection_get_n
```

⟨PHS base: procedures⟩+≡

```
function phs_channel_collection_get_n (coll) result (n)
  class(phs_channel_collection_t), intent(in) :: coll
  integer :: n
  n = coll%n
end function phs_channel_collection_get_n
```

Return a specific channel (property object).

⟨PHS base: phs channel collection: TBP⟩+≡

```
procedure :: get_entry => phs_channel_collection_get_entry
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine phs_channel_collection_get_entry (coll, i, prop)
      class(phs_channel_collection_t), intent(in) :: coll
      integer, intent(in) :: i
      class(channel_prop_t), intent(out), allocatable :: prop
      type(prop_entry_t), pointer :: entry
      integer :: k
      if (i > 0 .and. i <= coll%n) then
         entry => coll%first
         do k = 2, i
            entry => entry%next
         end do
         if (allocated (entry%prop)) then
            if (allocated (prop))  deallocate (prop)
            allocate (prop, source = entry%prop)
         end if
      else
         call msg_bug ("PHS channel collection: get entry: illegal index")
      end if
    end subroutine phs_channel_collection_get_entry
```

11.2.3   Kinematics configuration

Here, we store the universal information that is specifically relevant for phase-space generation. It is a subset of the process data, supplemented by basic information on phase-space parameterization channels.

A concrete implementation will contain more data, that describe the phase space in detail.

MD5 sums: the phase space setup depends on the process, it depends on the model parameters (the masses, that is), and on the configuration parameters. (It doesn't depend on the QCD setup.)

⟨*PHS base: public*⟩+≡
```
    public :: phs_config_t
```

⟨*PHS base: types*⟩+≡
```
    type, abstract :: phs_config_t
      ! private
      type(string_t) :: id
      integer :: n_in = 0
      integer :: n_out = 0
      integer :: n_tot = 0
      integer :: n_state = 0
      integer :: n_par = 0
      integer :: n_channel = 0
      real(default) :: sqrts = 0
      logical :: sqrts_fixed = .true.
      logical :: cm_frame = .true.
      logical :: azimuthal_dependence = .false.
      integer, dimension(:), allocatable :: dim_flat
      logical :: provides_equivalences = .false.
      logical :: provides_chains = .false.
      logical :: vis_channels = .false.
```

```
      integer, dimension(:), allocatable :: chain
      type(model_t), pointer :: model => null ()
      type(flavor_t), dimension(:,:), allocatable :: flv
      type(phs_channel_t), dimension(:), allocatable :: channel
      character(32) :: md5sum_process = ""
      character(32) :: md5sum_model_par = ""
      character(32) :: md5sum_phs_config = ""
    contains
    ⟨PHS base: phs config: TBP⟩
    end type phs_config_t
```

Finalizer, deferred.

⟨*PHS base: phs config: TBP*⟩≡
```
    procedure (phs_config_final), deferred :: final
```

⟨*PHS base: interfaces*⟩+≡
```
    abstract interface
      subroutine phs_config_final (object)
        import
        class(phs_config_t), intent(inout) :: object
      end subroutine phs_config_final
    end interface
```

Output. We provide an implementation for the output of the base-type contents and an interface for the actual write method.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure (phs_config_write), deferred :: write
    procedure :: base_write => phs_config_write
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine phs_config_write (object, unit)
      class(phs_config_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u, i, j
      u = output_unit (unit)
      write (u, "(3x,A,A,A)") "ID       = '", char (object%id), "'"
      write (u, "(3x,A,I0)")  "n_in     = ", object%n_in
      write (u, "(3x,A,I0)")  "n_out    = ", object%n_out
      write (u, "(3x,A,I0)")  "n_tot    = ", object%n_tot
      write (u, "(3x,A,I0)")  "n_state  = ", object%n_state
      write (u, "(3x,A,I0)")  "n_par    = ", object%n_par
      write (u, "(3x,A,I0)")  "n_channel = ", object%n_channel
      write (u, "(3x,A," // FMT_19 // ")")  "sqrts    = ", object%sqrts
      write (u, "(3x,A,L1)")  "s_fixed  = ", object%sqrts_fixed
      write (u, "(3x,A,L1)")  "cm_frame = ", object%cm_frame
      write (u, "(3x,A,L1)")  "azim.dep. = ", object%azimuthal_dependence
      if (allocated (object%dim_flat)) then
         write (u, "(3x,A,I0)")  "flat dim. = ", object%dim_flat
      end if
      write (u, "(1x,A)")  "Flavor combinations:"
      do i = 1, object%n_state
         write (u, "(3x,I0,':')", advance="no")  i
         do j = 1, object%n_tot
            write (u, "(1x,A)", advance="no") &
```

```
              char (flavor_get_name (object%flv(j,i)))
       end do
       write (u, *)
    end do
    if (allocated (object%channel)) then
       write (u, "(1x,A)")  "Phase-space / structure-function channels:"
       do i = 1, object%n_channel
          write (u, "(3x,I0,':')", advance="no") i
          call object%channel(i)%write (u)
       end do
    end if
    if (object%md5sum_process /= "") then
       write (u, "(3x,A,A,A)") "MD5 sum (process)   = '", &
            object%md5sum_process, "'"
    end if
    if (object%md5sum_model_par /= "") then
       write (u, "(3x,A,A,A)") "MD5 sum (model par)  = '", &
            object%md5sum_model_par, "'"
    end if
    if (object%md5sum_phs_config /= "") then
       write (u, "(3x,A,A,A)") "MD5 sum (phs config) = '", &
            object%md5sum_phs_config, "'"
    end if
  end subroutine phs_config_write
```

Similarly, a basic initializer and an interface. The model pointer is taken as an argument; we may verify that this has the expected model name.

The intent is `inout`. We want to be able to set parameters in advance.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: init => phs_config_init
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine phs_config_init (phs_config, data, model)
      class(phs_config_t), intent(inout) :: phs_config

      type(model_t), intent(in), target :: model
      integer :: i, j
      phs_config%id = data%id
      phs_config%n_in  = data%n_in
      phs_config%n_out = data%n_out
      phs_config%n_tot = data%n_in + data%n_out
      phs_config%n_state = data%n_flv
      if (data%model_name == model%get_name ()) then
         phs_config%model => model
      else
         call msg_bug ("phs_config_init: model name mismatch")
      end if
      allocate (phs_config%flv (phs_config%n_tot, phs_config%n_state))
      do i = 1, phs_config%n_state
         do j = 1, phs_config%n_tot
            call flavor_init (phs_config%flv(j,i), data%flv_state(j,i), &
                 phs_config%model)
         end do
      end do
```

1365

```
        phs_config%md5sum_process = data%md5sum
    end subroutine phs_config_init
```

This procedure should complete the phase-space configuration. We need the
sqrts value as overall scale, which is known only after the beams have been de-
fined. The procedure should determine the number of channels, their properties
(if any), and allocate and fill the channel array accordingly.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure (phs_config_configure), deferred :: configure
```

⟨*PHS base: interfaces*⟩+≡
```
    abstract interface
       subroutine phs_config_configure (phs_config, sqrts, &
            sqrts_fixed, cm_frame, azimuthal_dependence, rebuild, ignore_mismatch)
         import
         class(phs_config_t), intent(inout) :: phs_config
         real(default), intent(in) :: sqrts
         logical, intent(in), optional :: sqrts_fixed
         logical, intent(in), optional :: cm_frame
         logical, intent(in), optional :: azimuthal_dependence
         logical, intent(in), optional :: rebuild
         logical, intent(in), optional :: ignore_mismatch
       end subroutine phs_config_configure
    end interface
```

Manually assign structure-function channel indices to the phase-space channel
objects. (Used by a test routine.)

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: set_sf_channel => phs_config_set_sf_channel
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine phs_config_set_sf_channel (phs_config, sf_channel)
      class(phs_config_t), intent(inout) :: phs_config
      integer, dimension(:), intent(in) :: sf_channel
      phs_config%channel%sf_channel = sf_channel
    end subroutine phs_config_set_sf_channel
```

Collect new channels not yet in the collection from this phase-space configura-
tion object. At the same time, assign structure-function channels.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: collect_channels => phs_config_collect_channels
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine phs_config_collect_channels (phs_config, coll)
      class(phs_config_t), intent(inout) :: phs_config
      type(phs_channel_collection_t), intent(inout) :: coll
      integer :: c
      do c = 1, phs_config%n_channel
         call coll%push (phs_config%channel(c))
      end do
    end subroutine phs_config_collect_channels
```

Compute the MD5 sum. We abuse the `write` method. In type implementations, `write` should only display information that is relevant for the MD5 sum. The data include the process MD5 sum which is taken from the process constants, and the MD5 sum of the model parameters. This may change, so it is computed here.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: compute_md5sum => phs_config_compute_md5sum
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine phs_config_compute_md5sum (phs_config)
      class(phs_config_t), intent(inout) :: phs_config
      integer :: u
      phs_config%md5sum_model_par = model_get_parameters_md5sum (phs_config%model)
      phs_config%md5sum_phs_config = ""
      u = free_unit ()
      open (u, status = "scratch", action = "readwrite")
      call phs_config%write (u)
      rewind (u)
      phs_config%md5sum_phs_config = md5sum (u)
      close (u)
    end subroutine phs_config_compute_md5sum
```

Print an informative message after phase-space configuration.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure (phs_startup_message), deferred :: startup_message
    procedure :: base_startup_message => phs_startup_message
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine phs_startup_message (phs_config, unit)
      class(phs_config_t), intent(in) :: phs_config
      integer, intent(in), optional :: unit
      write (msg_buffer, "(A,3(1x,I0,1x,A))") &
           "Phase space:", &
           phs_config%n_channel, "channels,", &
           phs_config%n_par, "dimensions"
      call msg_message (unit = unit)
    end subroutine phs_startup_message
```

This procedure should be implemented such that the phase-space configuration object allocates a phase-space instance of matching type.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure (phs_config_allocate_instance), nopass, deferred :: &
         allocate_instance
```

⟨*PHS base: interfaces*⟩+≡
```
    abstract interface
      subroutine phs_config_allocate_instance (phs)
        import
        class(phs_t), intent(inout), pointer :: phs
      end subroutine phs_config_allocate_instance
    end interface
```

11.2.4 Extract data

Return the number of MC input parameters.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: get_n_par => phs_config_get_n_par
```

⟨*PHS base: procedures*⟩+≡
```
    function phs_config_get_n_par (phs_config) result (n)
      class(phs_config_t), intent(in) :: phs_config
      integer :: n
      n = phs_config%n_par
    end function phs_config_get_n_par
```

Return dimensions (parameter indices) for which the phase-space dimension is flat, so integration and event generation can be simplified.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: get_flat_dimensions => phs_config_get_flat_dimensions
```

⟨*PHS base: procedures*⟩+≡
```
    function phs_config_get_flat_dimensions (phs_config) result (dim_flat)
      class(phs_config_t), intent(in) :: phs_config
      integer, dimension(:), allocatable :: dim_flat
      if (allocated (phs_config%dim_flat)) then
         allocate (dim_flat (size (phs_config%dim_flat)))
         dim_flat = phs_config%dim_flat
      else
         allocate (dim_flat (0))
      end if
    end function phs_config_get_flat_dimensions
```

Return the number of phase-space channels.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: get_n_channel => phs_config_get_n_channel
```

⟨*PHS base: procedures*⟩+≡
```
    function phs_config_get_n_channel (phs_config) result (n)
      class(phs_config_t), intent(in) :: phs_config
      integer :: n
      n = phs_config%n_channel
    end function phs_config_get_n_channel
```

Return the structure-function channel that corresponds to the phase-space channel `c`. If the channel array is not allocated (which happens if there is no structure function), return zero.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: get_sf_channel => phs_config_get_sf_channel
```

⟨*PHS base: procedures*⟩+≡
```
    function phs_config_get_sf_channel (phs_config, c) result (c_sf)
      class(phs_config_t), intent(in) :: phs_config
      integer, intent(in) :: c
      integer :: c_sf
      if (allocated (phs_config%channel)) then
         c_sf = phs_config%channel(c)%sf_channel
```

```
    else
       c_sf = 0
    end if
end function phs_config_get_sf_channel
```

Return the mass(es) of the incoming particle(s). We take the first flavor combination in the array, assuming that masses must be degenerate among flavors.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: get_masses_in => phs_config_get_masses_in
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine phs_config_get_masses_in (phs_config, m)
      class(phs_config_t), intent(in) :: phs_config
      real(default), dimension(:), intent(out) :: m
      integer :: i
      do i = 1, phs_config%n_in
         m(i) = flavor_get_mass (phs_config%flv(i,1))
      end do
    end subroutine phs_config_get_masses_in
```

Return the MD5 sum of the configuration.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: get_md5sum => phs_config_get_md5sum
```

⟨*PHS base: procedures*⟩+≡
```
    function phs_config_get_md5sum (phs_config) result (md5sum)
      class(phs_config_t), intent(in) :: phs_config
      character(32) :: md5sum
      md5sum = phs_config%md5sum_phs_config
    end function phs_config_get_md5sum
```

11.2.5 Phase-space point instance

The `phs_t` object holds the workspace for phase-space generation. In the base object, we have the MC input parameters `r` and the Jacobian factor `f`, for each channel, and the incoming and outgoing momenta.

Note: The `active_channel` array is not used yet, all elements are initialized with `.true.`. It should be touched by the integrator if it decides to drop irrelevant channels.

⟨*PHS base: public*⟩+≡
```
    public :: phs_t
```

⟨*PHS base: types*⟩+≡
```
    type, abstract :: phs_t
      class(phs_config_t), pointer :: config => null ()
      logical :: r_defined = .false.
      integer :: selected_channel = 0
      logical, dimension(:), allocatable :: active_channel
      real(default), dimension(:,:), allocatable :: r
      real(default), dimension(:), allocatable :: f
      real(default), dimension(:), allocatable :: m_in
      real(default), dimension(:), allocatable :: m_out
```

```
    real(default) :: flux = 0
    real(default) :: volume = 0
    type(lorentz_transformation_t) :: lt_cm_to_lab
    logical :: p_defined = .false.
    real(default) :: sqrts_hat = 0
    type(vector4_t), dimension(:), allocatable :: p
    logical :: q_defined = .false.
    type(vector4_t), dimension(:), allocatable :: q
  contains
⟨PHS base: phs: TBP⟩
  end type phs_t
```

Output. Since phase space may get complicated, we include a `verbose` option for the abstract `write` procedure.

⟨*PHS base: phs: TBP*⟩≡
```
    procedure (phs_write), deferred :: write
```

⟨*PHS base: interfaces*⟩+≡
```
    abstract interface
      subroutine phs_write (object, unit, verbose)
        import
        class(phs_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose
      end subroutine phs_write
    end interface
```

This procedure can be called to print the contents of the base type.

⟨*PHS base: phs: TBP*⟩+≡
```
    procedure :: base_write => phs_base_write
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine phs_base_write (object, unit)
      class(phs_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u, c, i
      u = output_unit (unit)
      write (u, "(1x,A)", advance="no")  "Partonic phase space: parameters"

         write (u, *)
      else
         write (u, "(1x,A)")  "[undefined]"
      end if
      if (allocated (object%q)) then
         do i = 1, size (object%q)
            call vector4_write (object%q(i), u)
         end do
      end if
      if (object%p_defined .and. .not. object%config%cm_frame) then
         write (u, "(1x,A)")  "Transformation c.m -> lab frame"
         call lorentz_transformation_write (object%lt_cm_to_lab, u)
      end if
    end subroutine phs_base_write
```

Finalizer. The base type does not need it, but extensions may.

⟨*PHS base: phs: TBP*⟩+≡

```
    procedure (phs_final), deferred :: final
```

⟨*PHS base: interfaces*⟩+≡

```
    abstract interface
       subroutine phs_final (object)
         import
         class(phs_t), intent(inout) :: object
       end subroutine phs_final
    end interface
```

Initializer. Everything should be contained in the `process_data` configuration object, so we can require a universal interface.

⟨*PHS base: phs: TBP*⟩+≡
```
procedure (phs_init), deferred :: init
```

⟨*PHS base: interfaces*⟩+≡
```
abstract interface
   subroutine phs_init (phs, phs_config)
     import
     class(phs_t), intent(out) :: phs
     class(phs_config_t), intent(in), target :: phs_config
   end subroutine phs_init
end interface
```

The base version will just allocate the arrays. It should be called at the beginning of the implementation of `phs_init`.

⟨*PHS base: phs: TBP*⟩+≡
```
procedure :: base_init => phs_base_init
```

⟨*PHS base: procedures*⟩+≡
```
subroutine phs_base_init (phs, phs_config)
  class(phs_t), intent(out) :: phs
  class(phs_config_t), intent(in), target :: phs_config
  phs%config => phs_config
  allocate (phs%active_channel (phs%config%n_channel))
  phs%active_channel = .true.
  allocate (phs%r (phs%config%n_par, phs%config%n_channel));  phs%r = 0
  allocate (phs%f (phs%config%n_channel));                    phs%f = 0
  allocate (phs%p (phs%config%n_in))
  allocate (phs%q (phs%config%n_out))
  allocate (phs%m_in  (phs%config%n_in), &
       source = flavor_get_mass (phs_config%flv(:phs_config%n_in, 1)))
  allocate (phs%m_out (phs%config%n_out), &
       source = flavor_get_mass (phs_config%flv(phs_config%n_in+1:, 1)))
  call phs%compute_flux ()
end subroutine phs_base_init
```

Manually select a channel.

⟨*PHS base: phs: TBP*⟩+≡
```
procedure :: select_channel => phs_base_select_channel
```

⟨*PHS base: procedures*⟩+≡
```
subroutine phs_base_select_channel (phs, channel)
  class(phs_t), intent(inout) :: phs
  integer, intent(in), optional :: channel
  if (present (channel)) then
     phs%selected_channel = channel
  else
     phs%selected_channel = 0
  end if
end subroutine phs_base_select_channel
```

Set incoming momenta. Assume that array shapes match. If requested, compute the Lorentz transformation from the c.m. to the lab frame and apply that transformation to the incoming momenta.

In the c.m. frame, the sum of three-momenta is zero. In a scattering process, the z axis is the direction of the first beam, the second beam is along the negative z axis. The transformation from the c.m. to the lab frame is a rotation from the z axis to the boost axis followed by a boost, such that the c.m. momenta are transformed into the lab-frame momenta. In a decay process, we just boost along the flight direction, without rotation.

⟨*PHS base: phs: TBP*⟩+≡
```
   procedure :: set_incoming_momenta => phs_set_incoming_momenta
```

⟨*PHS base: procedures*⟩+≡
```
   subroutine phs_set_incoming_momenta (phs, p)
     class(phs_t), intent(inout) :: phs
     type(vector4_t), dimension(:), intent(in) :: p
     type(vector4_t) :: p0, p1
     type(lorentz_transformation_t) :: lt0
     phs%p = p
     if (phs%config%cm_frame) then
        phs%sqrts_hat = phs%config%sqrts
        phs%p = p
     else
        p0 = sum (p)
        if (phs%config%sqrts_fixed) then
           phs%sqrts_hat = phs%config%sqrts
        else
           phs%sqrts_hat = p0 ** 1
        end if
        lt0 = boost (p0, phs%sqrts_hat)
        select case (phs%config%n_in)
        case (1)
           phs%lt_cm_to_lab = lt0
        case (2)
           p1 = inverse (lt0) * p(1)
           phs%lt_cm_to_lab = lt0 * rotation_to_2nd (3, space_part (p1))
        end select
        phs%p = inverse (phs%lt_cm_to_lab) * p
     end if
     phs%p_defined = .true.
   end subroutine phs_set_incoming_momenta
```

Set outgoing momenta. Assume that array shapes match. The incoming momenta must be known, so can apply the Lorentz transformation from c.m. to lab (inverse) to the momenta.

⟨*PHS base: phs: TBP*⟩+≡
```
   procedure :: set_outgoing_momenta => phs_set_outgoing_momenta
```

⟨*PHS base: procedures*⟩+≡
```
   subroutine phs_set_outgoing_momenta (phs, q)
     class(phs_t), intent(inout) :: phs
     type(vector4_t), dimension(:), intent(in) :: q
     if (phs%p_defined) then
```

```
      if (phs%config%cm_frame) then
         phs%q = q
      else
         phs%q = inverse (phs%lt_cm_to_lab) * q
      end if
      phs%q_defined = .true.
   end if
end subroutine phs_set_outgoing_momenta
```

Return outgoing momenta. Apply the c.m. to lab transformation if necessary.

⟨*PHS base: phs: TBP*⟩+≡
```
   procedure :: get_outgoing_momenta => phs_get_outgoing_momenta
```

⟨*PHS base: procedures*⟩+≡
```
   subroutine phs_get_outgoing_momenta (phs, q)
     class(phs_t), intent(in) :: phs
     type(vector4_t), dimension(:), intent(out) :: q
     if (phs%p_defined .and. phs%q_defined) then
        if (phs%config%cm_frame) then
           q = phs%q
        else
           q = phs%lt_cm_to_lab * phs%q
        end if
     else
        q = vector4_null
     end if
   end subroutine phs_get_outgoing_momenta
```

Return the input parameter array for a channel.

⟨*PHS base: phs: TBP*⟩+≡
```
   procedure :: get_mcpar => phs_get_mcpar
```

⟨*PHS base: procedures*⟩+≡
```
   subroutine phs_get_mcpar (phs, c, r)
     class(phs_t), intent(in) :: phs
     integer, intent(in) :: c
     real(default), dimension(:), intent(out) :: r
     if (phs%r_defined) then
        r = phs%r(:,c)
     else
        r = 0
     end if
   end subroutine phs_get_mcpar
```

Return the Jacobian factor for a channel.

⟨*PHS base: phs: TBP*⟩+≡
```
   procedure :: get_f => phs_get_f
```

⟨*PHS base: procedures*⟩+≡
```
   function phs_get_f (phs, c) result (f)
     class(phs_t), intent(in) :: phs
     integer, intent(in) :: c
     real(default) :: f
     if (phs%r_defined) then
```

```
        f = phs%f(c)
      else
         f = 0
      end if
   end function phs_get_f
```

Return the overall factor, which is the product of the flux factor for the incoming partons and the phase-space volume for the outgoing partons.

⟨*PHS base: phs: TBP*⟩+≡
```
   procedure :: get_overall_factor => phs_get_overall_factor
```

⟨*PHS base: procedures*⟩+≡
```
   function phs_get_overall_factor (phs) result (f)
     class(phs_t), intent(in) :: phs
     real(default) :: f
     f = phs%flux * phs%volume
   end function phs_get_overall_factor
```

Compute flux factor. We do this during initialization (when the incoming momenta `p` are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

There are three different flux factors.

1. For a decaying massive particle, the factor is

$$f = (2\pi)^4/(2M) \tag{11.1}$$

2. For a $2 \to n$ scattering process with $n > 1$, the factor is

$$f = (2\pi)^4/(2\sqrt{\lambda}) \tag{11.2}$$

where for massless incoming particles, $\sqrt{\lambda} = s$.

3. For a $2 \to 1$ on-shell production process, the factor includes an extra $1/(2\pi)^3$ factor and a $1/m^2$ factor from the phase-space delta function $\delta(x_1 x_2 - m^2/s)$, which originate from the one-particle phase space that we integrate out.

$$f = 2\pi/(2sm^2) \tag{11.3}$$

The delta function is handled by the structure-function parameterization.

⟨*PHS base: phs: TBP*⟩+≡
```
   procedure :: compute_flux => phs_compute_flux
```

⟨*PHS base: procedures*⟩+≡
```
   subroutine phs_compute_flux (phs)

       end subroutine phs_inverse
    end interface
```

11.2.6   Auxiliary stuff

The `pacify` subroutine, which is provided by the Lorentz module, has the purpose of setting numbers to zero which are (by comparing with a `tolerance` parameter) considered equivalent with zero. This is useful for numerical checks.

⟨*PHS base: public*⟩+≡
```
    public :: pacify
```

⟨*PHS base: interfaces*⟩+≡
```
    interface pacify
       module procedure pacify_phs
    end interface pacify
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine pacify_phs (phs)
      class(phs_t), intent(inout) :: phs
      if (phs%p_defined) then
         call pacify (phs%p, 30 * epsilon (1._default) * phs%config%sqrts)
         call pacify (phs%lt_cm_to_lab, 30 * epsilon (1._default))
      end if
      if (phs%q_defined) then
         call pacify (phs%q, 30 * epsilon (1._default) * phs%config%sqrts)
      end if
    end subroutine pacify_phs
```

11.2.7   Unit tests

⟨*PHS base: public*⟩+≡
```
    public :: phs_base_test
```

⟨PHS base: tests⟩≡
```
subroutine phs_base_test (u, results)
  integer, intent(in) :: u
  type(test_results_t), intent(inout) :: results
⟨PHS base: execute tests⟩
end subroutine phs_base_test
```

Test process data

We provide a procedure that initializes a test case for the process constants. This set of process data contains just the minimal contents that we need for the phase space. The rest is left uninitialized.

⟨PHS base: public⟩+≡
```
public :: init_test_process_data
```

⟨PHS base: tests⟩+≡
```
subroutine init_test_process_data (id, data)
  type(process_constants_t), intent(out) :: data
  type(string_t), intent(in), optional :: id
  if (present (id)) then
     data%id = id
  else
     data%id = "testproc"
  end if
  data%model_name = "Test"
  data%n_in = 2
  data%n_out = 2
  data%n_flv = 1
  allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
  data%flv_state = 25
end subroutine init_test_process_data
```

This is the variant for a decay process.

⟨PHS base: public⟩+≡
```
public :: init_test_decay_data
```

⟨PHS base: tests⟩+≡
```
subroutine init_test_decay_data (id, data)
  type(process_constants_t), intent(out) :: data
  type(string_t), intent(in), optional :: id
  if (present (id)) then
     data%id = id
  else
     data%id = "testproc"
  end if
  data%model_name = "Test"
  data%n_in = 1
  data%n_out = 2
  data%n_flv = 1
  allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
  data%flv_state(:,1) = [25, 6, -6]
end subroutine init_test_decay_data
```

Test kinematics configuration

This is a trivial implementation of the `phs_config_t` configuration object.

⟨*PHS base: public*⟩+≡
```
    public :: phs_test_config_t
```

⟨*PHS base: test types*⟩≡
```
    type, extends (phs_config_t) :: phs_test_config_t
      logical :: create_equivalences = .false.
     contains
      procedure :: final => phs_test_config_final
      procedure :: write => phs_test_config_write
      procedure :: configure => phs_test_config_configure
      procedure :: startup_message => phs_test_config_startup_message
      procedure, nopass :: allocate_instance => phs_test_config_allocate_instance
    end type phs_test_config_t
```

The finalizer is empty.

⟨*PHS base: tests*⟩+≡
```
    subroutine phs_test_config_final (object)
      class(phs_test_config_t), intent(inout) :: object
    end subroutine phs_test_config_final
```

The `cm_frame` parameter is not tested here; we defer this to the `phs_single` implementation.

⟨*PHS base: tests*⟩+≡
```
    subroutine phs_test_config_write (object, unit)
      class(phs_test_config_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      write (u, "(1x,A)")  "Partonic phase-space configuration:"
      call object%base_write (unit)
    end subroutine phs_test_config_write

    subroutine phs_test_config_configure (phs_config, sqrts, &
        sqrts_fixed, cm_frame, azimuthal_dependence, rebuild, ignore_mismatch)
      class(phs_test_config_t), intent(inout) :: phs_config
      real(default), intent(in) :: sqrts
      logical, intent(in), optional :: sqrts_fixed
      logical, intent(in), optional :: cm_frame
      logical, intent(in), optional :: azimuthal_dependence
      logical, intent(in), optional :: rebuild
      logical, intent(in), optional :: ignore_mismatch
      phs_config%n_channel = 2
      phs_config%n_par = 2
      phs_config%sqrts = sqrts
      if (present (sqrts_fixed)) then
         phs_config%sqrts_fixed = sqrts_fixed
      end if
      if (present (cm_frame)) then
         phs_config%cm_frame = cm_frame
      end if
```

1379

```
      if (present (azimuthal_dependence)) then
         phs_config%azimuthal_dependence = azimuthal_dependence
      end if
      if (allocated (phs_config%channel))  deallocate (phs_config%channel)
      allocate (phs_config%channel (phs_config%n_channel))
      if (phs_config%create_equivalences) then
         call setup_test_equivalences (phs_config)
         call setup_test_channel_props (phs_config)
      end if
      call phs_config%compute_md5sum ()
    end subroutine phs_test_config_configure
```

If requested, we make up an arbitrary set of equivalences.

⟨*PHS base: tests*⟩+≡
```
    subroutine setup_test_equivalences (phs_config)
      class(phs_test_config_t), intent(inout) :: phs_config
      integer :: i
      associate (channel => phs_config%channel(1))
        allocate (channel%eq (2))
        do i = 1, size (channel%eq)
           call channel%eq(i)%init (phs_config%n_par)
        end do
        associate (eq => channel%eq(1))
          eq%c = 1;  eq%perm = [1, 2];  eq%mode = [EQ_IDENTITY, EQ_SYMMETRIC]
        end associate
        associate (eq => channel%eq(2))
          eq%c = 2;  eq%perm = [2, 1];  eq%mode = [EQ_INVARIANT, EQ_IDENTITY]
        end associate
      end associate
    end subroutine setup_test_equivalences
```

Ditto, for channel properties.

⟨*PHS base: tests*⟩+≡
```
    subroutine setup_test_channel_props (phs_config)
      class(phs_test_config_t), intent(inout) :: phs_config
      associate (channel => phs_config%channel(2))
        call channel%set_resonant (140._default, 3.1415_default)
      end associate
    end subroutine setup_test_channel_props
```

Startup message

⟨*PHS base: tests*⟩+≡
```
    subroutine phs_test_config_startup_message (phs_config, unit)
      class(phs_test_config_t), intent(in) :: phs_config
      integer, intent(in), optional :: unit
      call phs_config%base_startup_message (unit)
      write (msg_buffer, "(A)") "Phase space: Test"
      call msg_message (unit = unit)
    end subroutine phs_test_config_startup_message
```

The instance type that matches `phs_test_config_t` is `phs_test_t`.

⟨*PHS base: tests*⟩+≡

```
    subroutine phs_test_config_allocate_instance (phs)
      class(phs_t), intent(inout), pointer :: phs
      allocate (phs_test_t :: phs)
    end subroutine phs_test_config_allocate_instance
```

Test kinematics implementation

This implementation of kinematics generates a simple two-particle configuration from the incoming momenta. The incoming momenta must be in the c.m. system, all masses equal.

There are two channels: one generates $\cos\theta$ and ϕ uniformly, in the other channel we map the r_1 parameter which belongs to $\cos\theta$.

We should store the mass parameter that we need.

⟨*PHS base: public*⟩+≡
```
    public :: phs_test_t
```

⟨*PHS base: test types*⟩+≡
```
    type, extends (phs_t) :: phs_test_t
      real(default) :: m = 0
      real(default), dimension(:), allocatable :: x
     contains
```
    ⟨*PHS base: phs test: TBP*⟩
```
    end type phs_test_t
```

Output. The specific data are displayed only if `verbose` is set.

⟨*PHS base: phs test: TBP*⟩≡
```
    procedure :: write => phs_test_write
```

⟨*PHS base: tests*⟩+≡
```
    subroutine phs_test_write (object, unit, verbose)
      class(phs_test_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: u
      logical :: verb
      u = output_unit (unit)
      verb = .false.;  if (present (verbose))  verb = verbose
      if (verb) then
         write (u, "(1x,A)")  "Partonic phase space: data"
         write (u, "(3x,A," // FMT_19 // ")")  "m = ", object%m
      end if
      call object%base_write (u)
    end subroutine phs_test_write
```

The finalizer is empty.

⟨*PHS base: phs test: TBP*⟩+≡
```
    procedure :: final => phs_test_final
```

⟨*PHS base: tests*⟩+≡
```
    subroutine phs_test_final (object)
      class(phs_test_t), intent(inout) :: object
    end subroutine phs_test_final
```

Initialization: set the mass value.

⟨PHS base: phs test: TBP⟩+≡
```
    procedure :: init => phs_test_init
```

⟨PHS base: tests⟩+≡
```
    subroutine phs_test_init (phs, phs_config)
      class(phs_test_t), intent(out) :: phs
      class(phs_config_t), intent(in), target :: phs_config
      call phs%base_init (phs_config)
      phs%m = flavor_get_mass (phs%config%flv(1,1))
      allocate (phs%x (phs_config%n_par), source = 0._default)
    end subroutine phs_test_init
```

Evaluation. In channel 1, we uniformly generate $\cos\theta$ and ϕ, with Jacobian normalized to one. In channel 2, we prepend a mapping $r_1 \rightarrow r_1^{(}1/3)$ with Jacobian $f = 3r_1^2$.

The component x is allocated in the first subroutine, used and deallocated in the second one.

Uniform angular distribution

These procedures implement the uniform angular distribution, generated from two parameters x_1 and x_2:

$$\cos\theta = 1 - 2x_1, \qquad \phi = 2\pi x_2 \tag{11.4}$$

We generate a rotation (Lorentz transformation) which rotates the positive z axis into this point on the unit sphere. This rotation is applied to the **p** momenta, which are assumed to be back-to-back, on-shell, and with the correct mass.

We do not compute a Jacobian (constant). The uniform distribution is assumed to be normalized.

⟨*PHS base: public*⟩+≡
```
public :: compute_kinematics_solid_angle
```

⟨*PHS base: tests*⟩+≡
```
subroutine compute_kinematics_solid_angle (p, q, x)
  type(vector4_t), dimension(2), intent(in) :: p
  type(vector4_t), dimension(2), intent(out) :: q
  real(default), dimension(2), intent(in) :: x
  real(default) :: ct, st, phi
  type(lorentz_transformation_t) :: rot
  integer :: i
  ct = 1 - 2*x(1)
  st = sqrt (1 - ct**2)
  phi = twopi * x(2)
  rot = rotation (phi, 3) * rotation (ct, st, 2)
  do i = 1, 2
     q(i) = rot * p(i)
  end do
end subroutine compute_kinematics_solid_angle
```

This is the inverse transformation. We assume that the outgoing momenta are rotated versions of the incoming momenta, back-to-back. Thus, we determine the angles from $q(1)$ alone. **p** is unused.

⟨*PHS base: public*⟩+≡
```
public :: inverse_kinematics_solid_angle
```

⟨*PHS base: tests*⟩+≡
```
subroutine inverse_kinematics_solid_angle (p, q, x)
  type(vector4_t), dimension(:), intent(in) :: p
  type(vector4_t), dimension(2), intent(in) :: q

11.3 Single-particle phase space

This module implements the phase space for a single particle, i.e., the solid angle, in a straightforward parameterization with a single channel. The phase-space implementation may be used either for $1 \rightarrow 2$ decays or for $2 \rightarrow 2$ scattering processes, so the number of incoming particles is the only free parameter in the configuration. In the latter case, we should restrict its use to non-resonant s-channel processes, because there is no mapping of the scattering angle.

(We might extend this later to account for generic $2 \rightarrow 2$ situations, e.g., account for a Coulomb singularity or detect an s-channel resonance structure that requires matching structure-function mappings.)

This is derived from the `phs_test` implementation in the `phs_base` module above, even more simplified, but intended for actual use.

      allocate (phs_single_t :: phs)
    end subroutine phs_single_config_allocate_instance
```

11.3.2   Kinematics implementation

We generate $\cos\theta$ and ϕ uniformly, covering the solid angle.

Note: The incoming momenta must be in the c.m. system.

⟨*PHS single: public*⟩+≡
```
    public :: phs_single_t
```

⟨*PHS single: types*⟩+≡
```
    type, extends (phs_t) :: phs_single_t
     contains
     ⟨PHS single: phs single: TBP⟩
    end type phs_single_t
```

Output. The verbose setting is irrelevant, we just display the contents of the base object.

⟨*PHS single: phs single: TBP*⟩≡
```
    procedure :: write => phs_single_write
```

⟨*PHS single: procedures*⟩+≡
```
    subroutine phs_single_write (object, unit, verbose)
      class(phs_single_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: u
      u = output_unit (unit)
      call object%base_write (u)
    end subroutine phs_single_write
```

The finalizer is empty.

⟨*PHS single: phs single: TBP*⟩+≡
```
    procedure :: final => phs_single_final
```

⟨*PHS single: procedures*⟩+≡
```
    subroutine phs_single_final (object)
      class(phs_single_t), intent(inout) :: object
    end subroutine phs_single_final
```

Initialization. We allocate arrays (`base_init`) and adjust the phase-space volume. The massless two-particle phase space volume is

$$\Phi_2 = \frac{1}{4(2\pi)^5} = 2.55294034614 \times 10^{-5} \tag{11.5}$$

For a decay with nonvanishing masses (m_3, m_4), there is a correction factor

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}} \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \tag{11.6}$$

For a scattering process with nonvanishing masses, the correction factor is

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}^2} \lambda^{1/2}(\hat{s}, m_1^2, m_2^2)\, \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \tag{11.7}$$

If the energy is fixed, this is constant. Otherwise, we have to account for varying $\hat{s}$.

⟨*PHS single: phs single: TBP*⟩+≡
```
    procedure :: init => phs_single_init
```

⟨*PHS single: procedures*⟩+≡
```
    subroutine phs_single_init (phs, phs_config)
      class(phs_single_t), intent(out) :: phs
      class(phs_config_t), intent(in), target :: phs_config
      call phs%base_init (phs_config)
      phs%volume = 1 / (4 * twopi5)
      call phs%compute_factor ()
    end subroutine phs_single_init
```

Compute the correction factor for nonzero masses. We do this during initialization (when the incoming momenta `p` are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

⟨*PHS single: phs single: TBP*⟩+≡
```
    procedure :: compute_factor => phs_single_compute_factor
```

⟨*PHS single: procedures*⟩+≡

```
subroutine phs_single_compute_factor (phs)
  class(phs_single_t), intent(inout) :: phs
  real(default) :: s_hat
  select case (phs%config%n_in)
  case (1)
     if (.not. phs%p_defined) then
        if (sum (phs%m_out) < phs%m_in(1)) then
           s_hat = phs%m_in(1) ** 2
           phs%f(1) = 1 / s_hat &
                 * sqrt (lambda (s_hat, phs%m_out(1)**2, phs%m_out(2)**2))
        else
           print *, "m_in  = ", phs%m_in
           print *, "m_out = ", phs%m_out
           call msg_fatal ("Decay is kinematically forbidden")
        end if
     end if
  case (2)
     if (phs%config%sqrts_fixed) then
        if (phs%p_defined)  return
        s_hat = phs%config%sqrts ** 2
     else
        if (.not. phs%p_defined)  return
        s_hat = sum (phs%p) ** 2
     end if
     if (sum (phs%m_in)**2 < s_hat .and. sum (phs%m_out)**2 < s_hat) then
        phs%f(1) = 1 / s_hat * &
              ( lambda (s_hat, phs%m_in (1)**2, phs%m_in (2)**2)   &
              * lambda (s_hat, phs%m_out(1)**2, phs%m_out(2)**2) ) &
              ** 0.25_default
     else
        phs%f(1) = 0
     end if
  end select
end subroutine phs_single_compute_factor
```

Evaluation. We uniformly generate $\cos\theta$ and ϕ, with Jacobian normalized to one.

There is only a single channel, so the second subroutine does nothing.

Note: the current implementation works for elastic scattering only.

11.4 Mappings

Mappings are objects that encode the transformation of the interval $(0, 1)$ to a physical variable m^2 or $\cos\theta$ (and back), as it is used in the phase space parameterization. The mapping objects contain fixed parameters, the associated methods implement the mapping and inverse mapping operations, including the computation of the Jacobian (phase space factor).

    end function mapping_defaults_md5sum
```

11.4.2 The Mapping type

Each mapping has a type (e.g., s-channel, infrared), a binary code (redundant, but useful for debugging), and a reference particle. The flavor code of this particle is stored for bookkeeping reasons, what matters are the mass and width of this particle. Furthermore, depending on the type, various mapping parameters can be set and used.

The parameters `a1` to `a3` (for m^2 mappings) and `b1` to `b3` (for $\cos\theta$ mappings) are values that are stored once to speed up the calculation, if `variable_limits` is false. The exact meaning of these parameters depends on the mapping type. The limits are fixed if there is a fixed c.m. energy.

⟨*Mappings: public*⟩+≡
```
    public :: mapping_t
```

⟨*Mappings: types*⟩+≡
```
    type :: mapping_t

                  end select
               end if
            end if
         end if
      end subroutine mapping_write
```

11.4.4 Define a mapping

The initialization routine sets the mapping type and the particle (binary code and flavor code) for which the mapping applies (e.g., a Z resonance in branch #3). We only need the absolute value of the flavor code.

⟨*Mappings: public*⟩+≡
```
    public :: mapping_init
```

⟨*Mappings: procedures*⟩+≡
```
    subroutine mapping_init (mapping, bincode, type, f, model)
      type(mapping_t), intent(inout) :: mapping
```

```
    integer(TC), intent(in) :: bincode
    type(string_t), intent(in) :: type
    integer, intent(in), optional :: f
    type(model_t), intent(in), optional, target :: model
    mapping%bincode = bincode
    select case (char (type))
    case ("s_channel");  mapping%type = S_CHANNEL
    case ("collinear");  mapping%type = COLLINEAR
    case ("infrared");   mapping%type = INFRARED
    case ("radiation");  mapping%type = RADIATION
    case ("t_channel");  mapping%type = T_CHANNEL
    case ("u_channel");  mapping%type = U_CHANNEL
    case ("step_exp");   mapping%type = STEP_MAPPING_E
    case ("step_hyp");   mapping%type = STEP_MAPPING_H
    case ("on_shell");   mapping%type = ON_SHELL
    case default
       call msg_bug ("Mappings: encountered undefined mapping key '" &
             // char (type) // "'")
    end select
    if (present (f) .and. present (model)) &
         call flavor_init (mapping%flv, abs (f), model)
 end subroutine mapping_init
```

This sets the actual mass and width, using a parameter set. Since the auxiliary parameters will only be determined when the mapping is first called, they are marked as unknown.

⟨*Mappings: public*⟩+≡

```
    public :: mapping_set_parameters
```

⟨*Mappings: procedures*⟩+≡

```
    subroutine mapping_set_parameters (map, mapping_defaults, variable_limits)
      type(mapping_t), intent(inout) :: map
      type(mapping_defaults_t), intent(in) :: mapping_defaults
      logical, intent(in) :: variable_limits
      if (map%type /= NO_MAPPING) then
         map%mass  = flavor_get_mass (map%flv)
         map%width = flavor_get_width (map%flv)
         map%variable_limits = variable_limits
         map%a_unknown = .true.
         map%b_unknown = .true.
         select case (map%type)
         case (S_CHANNEL)
            if (map%mass <= 0) then
               call mapping_write (map)
               call msg_fatal &
                    & (" S-channel resonance must have positive mass")
            else if (map%width <= 0) then
               call mapping_write (map)
               call msg_fatal &
                    & (" S-channel resonance must have positive width")
            end if
         case (RADIATION)
            map%width = max (map%width, mapping_defaults%energy_scale)
         case (INFRARED, COLLINEAR)
```

```
          map%mass = max (map%mass, mapping_defaults%invariant_mass_scale)
       case (T_CHANNEL, U_CHANNEL)
          map%mass = max (map%mass, mapping_defaults%momentum_transfer_scale)
       end select
    end if
  end subroutine mapping_set_parameters
```

For a step mapping the mass and width are set directly, instead of being deter-
mined from the flavor parameter (which is meaningless here). They correspond
to the effective upper bound of phase space due to a resonance, as opposed to
the absolute upper bound.

⟨*Mappings: public*⟩+≡

```
  public :: mapping_set_step_mapping_parameters
```

⟨*Mappings: procedures*⟩+≡

```
  subroutine mapping_set_step_mapping_parameters (map, &
      mass, width, variable_limits)
    type(mapping_t), intent(inout) :: map
    real(default), intent(in) :: mass, width
    logical, intent(in) :: variable_limits
    select case (map%type)
    case (STEP_MAPPING_E, STEP_MAPPING_H)
       map%variable_limits = variable_limits
       map%a_unknown = .true.
       map%b_unknown = .true.
       map%mass = mass
       map%width = width
    end select
  end subroutine mapping_set_step_mapping_parameters
```

11.4.5   Retrieve contents

Return true if there is any / an s-channel mapping.

⟨*Mappings: public*⟩+≡

```
    interface operator(==)
       module procedure mapping_equal
    end interface
```

⟨*Mappings: procedures*⟩+≡
```
    function mapping_equal (m1, m2) result (equal)
      type(mapping_t), intent(in) :: m1, m2
      logical :: equal
      if (m1%type == m2%type) then
         select case (m1%type)
         case (NO_MAPPING)
            equal = .true.
         case (S_CHANNEL, RADIATION, STEP_MAPPING_E, STEP_MAPPING_H)
            equal = (m1%mass == m2%mass) .and. (m1%width == m2%width)
         case default
            equal = (m1%mass == m2%mass)
         end select
      else
         equal = .false.
      end if
    end function mapping_equal
```

11.4.7 Mappings of the invariant mass

Inserting an x value between 0 and 1, we want to compute the corresponding invariant mass $m^2(x)$ and the jacobian, aka phase space factor $f(x)$. We also need the reverse operation.

In general, the phase space factor f is defined by

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2\, g(m^2) = \int_0^1 dx\, \frac{1}{s}\frac{dm^2}{dx}\, g(m^2(x)) = \int_0^1 dx\, f(x)\, g(x), \qquad (11.8)$$

where thus

$$f(x) = \frac{1}{s}\frac{dm^2}{dx}. \qquad (11.9)$$

With this mapping, a function of the form

$$g(m^2) = c\frac{dx(m^2)}{dm^2} \qquad (11.10)$$

is mapped to a constant:

$$\frac{1}{s} \int_{m_{\min}^2}^{m_{\max}^2} dm^2\, g(m^2) = \int_0^1 dx\, f(x)\, g(m^2(x)) = \int_0^1 dx\, \frac{c}{s}. \qquad (11.11)$$

Here is the mapping routine. Input are the available energy squared `s`, the limits for m^2, and the x value. Output are the m^2 value and the phase space factor f.

⟨*Mappings: public*⟩+≡
```
    public :: mapping_compute_msq_from_x

      case default
         call msg_fatal ( " Attempt to apply undefined msq mapping")
      end select
    end subroutine mapping_compute_x_from_msq
```

Trivial mapping

We simply map the boundaries of the interval $(m_{\min}, m_{\max})$ to $(0, 1)$:

$$m^2 = (1-x)m_{\min}^2 + xm_{\max}^2; \qquad (11.12)$$

the inverse is

$$x = \frac{m^2 - m_{\min}^2}{m_{\max}^2 - m_{\min}^2}. \qquad (11.13)$$

Hence

$$f(x) = \frac{m_{\max}^2 - m_{\min}^2}{s}, \qquad (11.14)$$

and we have, as required,

$$f(x)\frac{dx}{dm^2} = \frac{1}{s}. \qquad (11.15)$$

We store the constant parameters the first time the mapping is called – or, if limits vary, recompute them each time.

⟨*Constants for trivial msq mapping*⟩≡
```
if (map%variable_limits .or. map%a_unknown) then
   map%a1 = 0
   map%a2 = msq_max - msq_min
   map%a3 = map%a2 / s
   map%a_unknown = .false.
end if
```

⟨*Apply trivial msq mapping*⟩≡
```
msq = (1-x) * msq_min + x * msq_max
f = map%a3
```

⟨*Apply inverse trivial msq mapping*⟩≡
```
if (map%a2 /= 0) then
   x = (msq - msq_min) / map%a2
else
   x = 0
end if
f = map%a3
```

Resonance or step mapping does not make much sense if the resonance mass is outside the kinematical bounds. If this is the case, revert to `NO_MAPPING`. This is possible even if the kinematical bounds vary from event to event.

⟨*Modify mapping type if necessary*⟩≡
```
select case (type)
case (S_CHANNEL, STEP_MAPPING_E, STEP_MAPPING_H)
   msq0 = map%mass**2
   if (msq0 < msq_min .or. msq0 > msq_max)  type = NO_MAPPING
end select
```

Breit-Wigner mapping

A Breit-Wigner resonance with mass M and width Γ is flattened by the following mapping:

This mapping does not make much sense if the resonance mass is too low. If this is the case, revert to `NO_MAPPING`. There is a tricky point with this if the

1415

mass is too high: `msq_max` is not a constant if structure functions are around. However, switching the type depending on the overall energy does not change the integral, it is just another branching point.

$$m^2 = M(M + t\Gamma), \qquad (11.16)$$

where

$$t = \tan\left[(1-x)\arctan\frac{m_{\min}^2 - M^2}{M\Gamma} + x\arctan\frac{m_{\max}^2 - M^2}{M\Gamma}\right]. \qquad (11.17)$$

The inverse:

$$x = \frac{\arctan\frac{m^2 - M^2}{M\Gamma} - \arctan\frac{m_{\min}^2 - M^2}{M\Gamma}}{\arctan\frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan\frac{m_{\min}^2 - M^2}{M\Gamma}} \qquad (11.18)$$

The phase-space factor of this transformation is

$$f(x) = \frac{M\Gamma}{s}\left(\arctan\frac{m_{\max}^2 - M^2}{M\Gamma} - \arctan\frac{m_{\min}^2 - M^2}{M\Gamma}\right)(1 + t^2). \qquad (11.19)$$

This maps any function proportional to

$$g(m^2) = \frac{M\Gamma}{(m^2 - M^2)^2 + M^2\Gamma^2} \qquad (11.20)$$

to a constant times $1/s$.

⟨*Constants for s-channel resonance mapping*⟩≡
```

x = (atan (tmp) - map%a1) / (map%a2 - map%a1)
f = map%a3 * (1 + tmp**2)
```

Mapping for massless splittings

This mapping accounts for approximately scale-invariant behavior where $\ln M^2$ is evenly distributed.

$$m^2 = m_{\min}^2 + M^2 \left(\exp(xL) - 1 \right) \tag{11.21}$$

where

$$L = \ln \left(\frac{m_{\max}^2 - m_{\min}^2}{M^2} + 1 \right). \tag{11.22}$$

The inverse:

$$x = \frac{1}{L} \ln \left(\frac{m^2 - m_{\min}^2}{M^2} + 1 \right) \tag{11.23}$$

The constant M is a characteristic scale. Above this scale $(m^2 - m_{\min}^2 \gg M^2)$, this mapping behaves like $x \propto \ln m^2$, while below the scale it reverts to a linear mapping.

The phase-space factor is

$$f(x) = \frac{M^2}{s} \exp(xL)\, L. \tag{11.24}$$

A function proportional to

$$g(m^2) = \frac{1}{(m^2 - m_{\min}^2) + M^2} \tag{11.25}$$

is mapped to a constant, i.e., a simple pole near $m_{\min}$ with a regulator mass M.

This type of mapping is useful for massless collinear and infrared singularities, where the scale is stored as the mass parameter. In the radiation case (IR radiation off massive particle), the heavy particle width is the characteristic scale.

⟨*Constants for s-channel pole mapping*⟩≡
```
if (map%variable_limits .or. map%a_unknown) then
   if (type == RADIATION) then
      msq0 = map%width**2
   else
      msq0 = map%mass**2
   end if
   map%a1 = msq0
   map%a2 = log ((msq_max - msq_min) / msq0 + 1)
   map%a3 = map%a2 / s
   map%a_unknown = .false.
end if
```

⟨*Apply s-channel pole mapping*⟩≡
```
msq1 = map%a1 * exp (x * map%a2)
msq = msq1 - map%a1 + msq_min
f = map%a3 * msq1
```

⟨*Apply inverse s-channel pole mapping*⟩≡
```
msq1 = msq - msq_min + map%a1
x = log (msq1 / map%a1) / map%a2
f = map%a3 * msq1
```

Mapping for t-channel poles

This is also approximately scale-invariant, and we use the same type of mapping as before. However, we map $1/x$ singularities at both ends of the interval; again, the mapping becomes linear when the distance is less than M^2:

$$m^2 = \begin{cases} m_{\min}^2 + M^2 \left(\exp(xL) - 1 \right) & \text{for } 0 < x < \frac{1}{2} \\ m_{\max}^2 - M^2 \left(\exp((1-x)L) - 1 \right) & \text{for } \frac{1}{2} \le x < 1 \end{cases} \tag{11.26}$$

where

$$L = 2 \ln \left(\frac{m_{\max}^2 - m_{\min}^2}{2M^2} + 1 \right). \tag{11.27}$$

The inverse:

$$x = \begin{cases} \frac{1}{L} \ln \left(\frac{m^2 - m_{\min}^2}{M^2} + 1 \right) & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1 - \frac{1}{L} \ln \left(\frac{m_{\max} - m^2}{M^2} + 1 \right) & \text{for } m^2 \ge (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \tag{11.28}$$

The phase-space factor is

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) \, L. & \text{for } 0 < x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) \, L. & \text{for } \frac{1}{2} \le x < 1 \end{cases} \tag{11.29}$$

A (continuous) function proportional to

$$g(m^2) = \begin{cases} 1/(m^2 - m_{\min}^2) + M^2) & \text{for } m^2 < (m_{\max}^2 - m_{\min}^2)/2 \\ 1/((m_{\max}^2 - m^2) + M^2) & \text{for } m^2 \le (m_{\max}^2 - m_{\min}^2)/2 \end{cases} \tag{11.30}$$

is mapped to a constant by this mapping, i.e., poles near both ends of the interval.

11.4.8   Step mapping

Step mapping is useful when the allowed range for a squared-mass variable is large, but only a fraction at the lower end is populated because the particle in question is an (off-shell) decay product of a narrow resonance. I.e., if the resonance was forced to be on-shell, the upper end of the range would be the resonance mass, minus the effective (real or resonance) mass of the particle(s) in the sibling branch of the decay.

The edge of this phase space section has a width which is determined by the width of the parent, plus the width of the sibling branch. (The widths might be added in quadrature, but this precision is probably not important.)

Fermi function

A possible mapping is derived from the Fermi function which has precisely this behavior. The Fermi function is given by

$$f(x) = \frac{1}{1 + \exp \frac{x - \mu}{\gamma}} \tag{11.31}$$

where x is taken as the invariant mass squared, μ is the invariant mass squared of the edge, and γ is the effective width which is given by the widths of the parent and the sibling branch. (Widths might be added in quadrature, but we do not require this level of precision.)

$$x = \frac{m^2 - m_{\text{min}}^2}{\Delta m^2} \tag{11.32}$$

$$\mu = \frac{m_{\text{max,eff}}^2 - m_{\text{min}}^2}{\Delta m^2} \tag{11.33}$$

$$\gamma = \frac{2m_{\text{max,eff}}\Gamma}{\Delta m^2} \tag{11.34}$$

with

$$\Delta m^2 = m_{\text{max}}^2 - m_{\text{min}}^2 \tag{11.35}$$

m^2 is thus given by

$$m^2(x) = xm_{\text{max}}^2 + (1 - x)m_{\text{min}}^2 \tag{11.36}$$

For the mapping, we compute the integral $g(x)$ of the Fermi function, normalized such that $g(0) = 0$ and $g(1) = 1$. We introduce the abbreviations

$$\alpha = 1 - \gamma \ln \frac{1 + \beta e^{1/\gamma}}{1 + \beta} \tag{11.37}$$

$$\beta = e^{-\mu/\gamma} \tag{11.38}$$

and obtain

$$g(x) = \frac{1}{\alpha} \left(x - \gamma \ln \frac{1 + \beta e^{x/\gamma}}{1 + \beta} \right) \tag{11.39}$$

The actual mapping is the inverse function $h(y) = g^{-1}(y)$,

$$h(y) = -\gamma \ln \left(e^{-\alpha y/\gamma} (1 + \beta) - \beta \right) \tag{11.40}$$

The Jacobian is

$$\frac{dh}{dy} = \alpha \left(1 - e^{\alpha y/\gamma} \frac{\beta}{1 + \beta} \right)^{-1} \tag{11.41}$$

which is equal to $1/(dg/dx)$, namely

$$\frac{dg}{dx} = \frac{1}{\alpha} \frac{1}{1 + \beta e^{x/\gamma}} \tag{11.42}$$

The final result is

$$\int_{m_{\min}^2}^{m_{\max}^2} dm^2 \, F(m^2) = \Delta m^2 \int_0^1 dx \, F(m^2(x)) \tag{11.43}$$

$$= \Delta m^2 \int_0^1 dy \, F(m^2(h(y))) \frac{dh}{dy} \tag{11.44}$$

Here is the implementation. We fill a1, a2, a3 with α, β, γ, respectively.

    z = - map%a3 * log (tmp - map%a2)
    msq  = z * msq_max + (1 - z) * msq_min
    f = map%a1 / (1 - map%a2 / tmp) * (msq_max - msq_min) / s
```

⟨*Apply inverse exponential step mapping*⟩≡
```
    z = (msq - msq_min) / (msq_max - msq_min)
    tmp = 1 + map%a2 * exp (z / map%a3)
    x = (z - map%a3 * log (tmp / (1 + map%a2))) &
        / map%a1
    f = map%a1 * tmp * (msq_max - msq_min) / s
```

Hyperbolic mapping

The Fermi function has the drawback that it decreases exponentially. It might be preferable to take a function with a power-law decrease, such that the high-mass region is not completely depopulated.

Here, we start with the actual mapping which we take as

$$h(y) = \frac{b}{a - y} - \frac{b}{a} + \mu y \tag{11.45}$$

with the abbreviation

$$a = \frac{1}{2}\left(1 + \sqrt{1 + \frac{4b}{1 - \mu}}\right) \tag{11.46}$$

This is a hyperbola in the xy plane. The derivative is

$$\frac{dh}{dy} = \frac{b}{(a-y)^2} + \mu \tag{11.47}$$

The constants correspond to

$$\mu = \frac{m^2_{\mathrm{max,eff}} - m^2_{\mathrm{min}}}{\Delta m^2} \tag{11.48}$$

$$b = \frac{1}{\mu}\left(\frac{2m_{\mathrm{max,eff}}\Gamma}{\Delta m^2}\right)^2 \tag{11.49}$$

The inverse function is the solution of a quadratic equation,

$$g(x) = \frac{1}{2}\left[\left(a + \frac{x}{\mu} + \frac{b}{a\mu}\right) - \sqrt{\left(a - \frac{x}{\mu}\right)^2 + 2\frac{b}{a\mu}\left(a + \frac{x}{\mu}\right) + \left(\frac{b}{a\mu}\right)^2}\right] \tag{11.50}$$

The constants $a_{1,2,3}$ are identified with a, b, μ.

            + tmp**2)) / 2
f = (map%a2 / (map%a1 - x)**2 + map%a3) * (msq_max - msq_min) / s
```

11.4.9   Mappings of the polar angle

The other type of singularity, a simple pole just outside the integration region, can occur in the integration over $\cos\theta$. This applies to exchange of massless (or light) particles.

Double poles (Coulomb scattering) are also possible, but only in certain cases. These are also handled by the single-pole mapping.

The mapping is analogous to the previous m^2 pole mapping, but with a different normalization and notation of variables:

$$\frac{1}{2} \int_{-1}^{1} d\cos\theta \, g(\theta) = \int_{0}^{1} dx \, \frac{d\cos\theta}{dx} \, g(\theta(x)) = \int_{0}^{1} dx \, f(x) \, g(x), \qquad (11.51)$$

where thus

$$f(x) = \frac{1}{2} \frac{d\cos\theta}{dx}. \qquad (11.52)$$

With this mapping, a function of the form

$$g(\theta) = c \frac{dx(\cos\theta)}{d\cos\theta} \qquad (11.53)$$

is mapped to a constant:

$$\int_{-1}^{1} d\cos\theta \, g(\theta) = \int_{0}^{1} dx \, f(x) \, g(\theta(x)) = \int_{0}^{1} dx \, c. \qquad (11.54)$$

Trivial mapping

This is just the mapping of the interval $(-1, 1)$ to $(0, 1)$:

$$\cos \theta = -1 + 2x \tag{11.55}$$

and

$$f(x) = 1 \tag{11.56}$$

with the inverse

$$x = \frac{1 + \cos \theta}{2} \tag{11.57}$$

⟨Apply trivial ct mapping⟩≡
```
tmp = 2 * (1-x)
ct = 1 - tmp
st = sqrt (tmp * (2-tmp))
f = 1
```

⟨Apply inverse trivial ct mapping⟩≡
```
x = (ct + 1) / 2
f = 1
```

Pole mapping

As above for m^2, we simultaneously map poles at both ends of the $\cos \theta$ interval. The formulae are completely analogous:

$$\cos \theta = \begin{cases} \frac{M^2}{s} \left[\exp(xL) - 1 \right] - 1 & \text{for } x < \frac{1}{2} \\ -\frac{M^2}{s} \left[\exp((1-x)L) - 1 \right] + 1 & \text{for } x \geq \frac{1}{2} \end{cases} \tag{11.58}$$

where

$$L = 2 \ln \frac{M^2 + s}{M^2}. \tag{11.59}$$

Inverse:

$$x = \begin{cases} \frac{1}{2L} \ln \frac{1 + \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta < 0 \\ 1 - \frac{1}{2L} \ln \frac{1 - \cos \theta + M^2/s}{M^2/s} & \text{for } \cos \theta \geq 0 \end{cases} \tag{11.60}$$

The phase-space factor:

$$f(x) = \begin{cases} \frac{M^2}{s} \exp(xL) L & \text{for } x < \frac{1}{2} \\ \frac{M^2}{s} \exp((1-x)L) L & \text{for } x \geq \frac{1}{2} \end{cases} \tag{11.61}$$

⟨Constants for ct pole mapping⟩≡

      x = 1 - log (ct1 / map%b1) / (2 * map%b2)
   end if
   f = ct1 * map%b2
```

11.5 Phase-space trees

The phase space evaluation is organized in terms of trees, where each branch corresponds to three integrations: m^2, $\cos\theta$, and ϕ. The complete tree thus makes up a specific parameterization of the multidimensional phase-space integral. For the multi-channel integration, the phase-space tree is a single channel.

The trees imply mappings of formal Feynman tree graphs into arrays of integer numbers: Each branch, corresponding to a particular line in the graph, is assigned an integer code c (with kind value $\mathtt{TC}$ = tree code).

In this integer, each bit determines whether a particular external momentum flows through the line. The external branches therefore have codes $1, 2, 4, 8, \ldots$. An internal branch has those bits ORed corresponding to the momenta flowing through it. For example, a branch with momentum $p_1 + p_4$ has code $2^0 + 2^3 = 1 + 8 = 9$.

There is a two-fold ambiguity: Momentum conservation implies that the branch with code

$$c_0 = \sum_{i=1}^{n(\text{ext})} 2^{i-1} \tag{11.62}$$

i.e. the branch with momentum $p_1 + p_2 + \ldots p_n$ has momentum zero, which is equivalent to tree code 0 by definition. Correspondingly,

$$c \quad \text{and} \quad c_0 - c = c \text{ XOR } c_0 \tag{11.63}$$

are equivalent. E.g., if there are five externals with codes $c = 1, 2, 4, 8, 16$, then $c = 9$ and $\bar{c} = 31 - 9 = 22$ are equivalent.

This ambiguity may be used to assign a direction to the line: If all momenta are understood as outgoing, $c = 9$ in the example above means $p_1 + p_4$, but $c = 22$ means $p_2 + p_3 + p_5 = -(p_1 + p_4)$.

Here we make use of the ambiguity in a slightly different way. First, the initial particles are singled out as those externals with the highest bits, the IN-bits. (Here: 8 and 16 for a $2 \to 3$ scattering process, 16 only for a $1 \to 4$ decay.) Then we invert those codes where all IN-bits are set. For a decay process this maps each tree of an equivalence class onto a unique representative (that one with the smallest integer codes). For a scattering process we proceed further:

The ambiguity remains in all branches where only one IN-bit is set, including the initial particles. If there are only externals with this property, we have an s-channel graph which we leave as it is. In all other cases, an internal with only one IN-bit is a t-channel line, which for phase space integration should be associated with one of the initial momenta as a reference axis. We take that one whose bit is set in the current tree code. (E.g., for branch $c = 9$ we use the initial particle $c = 8$ as reference axis, whereas for the same branch we would take $c = 16$ if it had been assigned $\bar{c} = 31 - 9 = 22$ as tree code.) Thus, different ways of coding the same t-channel graph imply different phase space parameterizations.

s-channel graphs have a unique parameterization. The same sets of parameterizations are used for t-channel graphs, except for the reference frames of their angular parts. We map each t-channel graph onto an s-channel graph as follows:

Working in ascending order, for each t-channel line (whose code has exactly one IN-bit set) the attached initial line is flipped upstream, while the outgoing

line is flipped downstream. (This works only if *t*-channel graphs are always parameterized beginning at their outer vertices, which we require as a restriction.) After all possible flips have been applied, we have an *s*-channel graph. We only have to remember the initial particle a vertex was originally attached to.

         write (u, "(1x,A,1x," // FMT_19 // ")") "T = ", prt%p2
      else
         write (u, "(3x,A)") "[undefined]"
      end if
    end subroutine phs_prt_write
```

11.5.2   The phase-space tree type

Definition

In the concrete implementation, each branch c may have two *daughters* c_1 and c_2 such that $c_1 + c_2 = c$, a *sibling* c_s and a *mother* c_m such that $c + c_s = c_m$, and a *friend* which is kept during flips, such that it can indicate a fixed reference frame. Absent entries are set $c = 0$.

First, declare the branch type. There is some need to have this public. Give initializations for all components, so no `init` routine is necessary. The branch has some information about the associated coordinates and about connections.

⟨*PHS trees: types*⟩+≡
```
    type :: phs_branch_t
      private
      logical :: set = .false.
      logical :: inverted_decay = .false.
      logical :: inverted_axis = .false.
      integer(TC) :: mother = 0
      integer(TC) :: sibling = 0
      integer(TC) :: friend = 0
      integer(TC) :: origin = 0
```

```
      integer(TC), dimension(2) :: daughter = 0
      integer :: firstborn = 0
      logical :: has_children = .false.
      logical :: has_friend = .false.
    end type phs_branch_t
```

The tree type: No initialization, this is done by `phs_tree_init`. In addition to the branch array which

The branches are collected in an array which holds all possible branches, of which only a few are set. After flips have been applied, the branch $c_M = \sum_{i=1}^{n(\text{fin})} 2^{i-1}$ must be there, indicating the mother of all decay products. In addition, we should check for consistency at the beginning.

`n_branches` is the number of those actually set. `n_externals` defines the number of significant bit, and `mask` is a code where all bits are set. Analogous: `n_in` and `mask_in` for the incoming particles.

The `mapping` array contains the mappings associated to the branches (corresponding indices). The array `mass_sum` contains the sum of the real masses of the external final-state particles associated to the branch. During phase-space evaluation, this determines the boundaries.

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_t
```

⟨*PHS trees: types*⟩+≡
```
    type :: phs_tree_t
      private
      integer :: n_branches, n_externals, n_in, n_msq, n_angles
      integer(TC) :: n_branches_tot, n_branches_out
      integer(TC) :: mask, mask_in, mask_out
      type(phs_branch_t), dimension(:), allocatable :: branch
      type(mapping_t), dimension(:), allocatable :: mapping
      real(default), dimension(:), allocatable :: mass_sum
      real(default), dimension(:), allocatable :: effective_mass
      real(default), dimension(:), allocatable :: effective_width
    end type phs_tree_t
```

The maximum number of external particles that can be represented is related to the bit size of the integer that stores binary codes. With the default integer of 32 bit on common machines, this is more than enough space. If `TC` is actually the default integer kind, there is no need to keep it separate, but doing so marks this as a special type of integer. So, just state that the maximum number is 32:

⟨*Limits: public parameters*⟩+≡
```
    integer, parameter, public :: MAX_EXTERNAL = 32
```

Constructor and destructor

Allocate memory for a phase-space tree with given number of externals and incoming. The number of allocated branches can easily become large, but appears manageable for realistic cases, e.g., for `n_in=2` and `n_out=8` we get $2^{10} - 1 = 1023$.

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_init
    public :: phs_tree_final
```

1429

Here we set the masks for incoming and for all externals.

⟨*PHS trees: procedures*⟩+≡
```
elemental subroutine phs_tree_init (tree, n_in, n_out, n_masses, n_angles)
  type(phs_tree_t), intent(inout) :: tree
  integer, intent(in) :: n_in, n_out, n_masses, n_angles
  integer(TC) :: i
  tree%n_externals = n_in + n_out
  tree%n_branches_tot = 2**(n_in+n_out) - 1
  tree%n_branches_out = 2**n_out - 1
  tree%mask = 0
  do i = 0, n_in + n_out - 1
     tree%mask = ibset (tree%mask, i)
  end do
  tree%n_in = n_in
  tree%mask_in = 0
  do i = n_out, n_in + n_out - 1
     tree%mask_in = ibset (tree%mask_in, i)
  end do
  tree%mask_out = ieor (tree%mask, tree%mask_in)
  tree%n_msq = n_masses
  tree%n_angles = n_angles
  allocate (tree%branch (tree%n_branches_tot))
  tree%n_branches  = 0
  allocate (tree%mapping (tree%n_branches_out))
  allocate (tree%mass_sum (tree%n_branches_out))
  allocate (tree%effective_mass (tree%n_branches_out))
  allocate (tree%effective_width (tree%n_branches_out))
end subroutine phs_tree_init

elemental subroutine phs_tree_final (tree)
  type(phs_tree_t), intent(inout) :: tree
  deallocate (tree%branch)
  deallocate (tree%mapping)
  deallocate (tree%mass_sum)
  deallocate (tree%effective_mass)
  deallocate (tree%effective_width)
end subroutine phs_tree_final
```

Screen output

Write only the branches that are set:

⟨*PHS trees: public*⟩+≡
```
public :: phs_tree_write

              end if
          end subroutine phs_branch_write
```

11.5.3 PHS tree setup

Transformation into an array of branch codes and back

Assume that the tree/array has been created before with the appropriate length
and is empty.

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_from_array
```

⟨*PHS trees: procedures*⟩+≡
```
    subroutine phs_tree_from_array (tree, a)
      type(phs_tree_t), intent(inout) :: tree
      integer(TC), dimension(:), intent(in) :: a
      integer :: i
      integer(TC) :: k
```
⟨*Set branches from array* a⟩
⟨*Set external branches if necessary*⟩
⟨*Check number of branches*⟩
⟨*Determine the connections*⟩
```
    contains
```
⟨*Subroutine: set relatives*⟩
```
    end subroutine phs_tree_from_array
```

First, set all branches specified by the user. If all IN-bits are set, we invert the
branch code.

⟨*Set branches from array* a⟩≡
```
    do i=1, size(a)
       k = a(i)
       if (iand(k, tree%mask_in) == tree%mask_in)  k = ieor(tree%mask, k)
       tree%branch(k)%set = .true.
       tree%n_branches = tree%n_branches+1
    end do
```

1432

The external branches are understood, so set them now if not yet done. In all cases ensure that the representative with one bit set is used, except for decays where the in-particle is represented by all OUT-bits set instead.

⟨*Set external branches if necessary*⟩≡
```
do i=0, tree%n_externals-1
   k = ibset(0,i)
   if (iand(k, tree%mask_in) == tree%mask_in)  k = ieor(tree%mask, k)
   if (tree%branch(ieor(tree%mask, k))%set) then
      tree%branch(ieor(tree%mask, k))%set = .false.
      tree%branch(k)%set = .true.
   else if (.not.tree%branch(k)%set) then
      tree%branch(k)%set = .true.
      tree%n_branches = tree%n_branches+1
   end if
end do
```

Now the number of branches set can be checked. Here we assume that the tree is binary. For three externals there are three branches in total, and for each additional external branch we get another internal one.

⟨*Check number of branches*⟩≡
```
if (tree%n_branches /= tree%n_externals*2-3) then
   call phs_tree_write (tree)
   call msg_bug &
        & (" Wrong number of branches set in phase space tree")
end if
```

For all branches that are set, except for the externals, we try to find the daughter branches:

⟨*Determine the connections*⟩≡
```
do k=1, size (tree%branch)
   if (tree%branch(k)%set .and. tc_decay_level (k) /= 1) then
      call branch_set_relatives(k)
   end if
end do
```

To this end, we scan all codes less than the current code, whether we can find two branches which are set and which together give the current code. After that, the tree may still not be connected, but at least we know if a branch does not have daughters: This indicates some inconsistency.

The algorithm ensures that, at this stage, the first daughter has a smaller code value than the second one.

⟨*Subroutine: set relatives*⟩≡
```
subroutine branch_set_relatives (k)
  integer(TC), intent(in) :: k
  integer(TC) :: m,n
  do m=1, k-1
     if(iand(k,m)==m) then
        n = ieor(k,m)
        if ( tree%branch(m)%set .and. tree%branch(n)%set ) then
           tree%branch(k)%daughter(1) = m;  tree%branch(k)%daughter(2) = n
           tree%branch(m)%mother      = k;  tree%branch(n)%mother      = k
           tree%branch(m)%sibling     = n;  tree%branch(n)%sibling     = m
           tree%branch(k)%has_children = .true.
           return
```

```
          end if
        end if
      end do
      call phs_tree_write (tree)
      call msg_bug &
          & (" Missing daughter branch(es) in phase space tree")
    end subroutine branch_set_relatives
```

The inverse: this is trivial, fortunately.

Flip *t*-channel into *s*-channel

Flipping the tree is done upwards, beginning from the decay products. First we select a *t*-channel branch k: one which is set, which does have an IN-bit, and which is not an external particle.

Next, we determine the adjacent in-particle (called the 'friend' f here, since it will provide the reference axis for the angular integration). In addition, we look for the 'mother' and 'sibling' of this particle. If the latter field is empty, we select the (unique) other out-particle which has no mother, calling the internal subroutine `find_orphan`.

The flip is done as follows: We assume that the first daughter d is an *s*-channel line, which is true if the daughters are sorted. This will stay the first daughter. The second one is a *t*-channel line; it is exchanged with the 'sibling' s. The new line which replaces the branch k is just the sum of s and d. In addition, we have to rearrange the relatives of s and d, as well of f.

Finally, we flip 'sibling' and 'friend' and set the new *s*-channel branch n which replaces the *t*-channel branch k. After this is complete, we are ready to execute another flip.

[Although the friend is not needed for the final flip, since it would be an initial particle anyway, we need to know whether we have *t*- or *u*-channel.]

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_flip_t_to_s_channel
```

⟨*PHS trees: procedures*⟩+≡
```
    subroutine phs_tree_flip_t_to_s_channel (tree)
      type(phs_tree_t), intent(inout) :: tree
      integer(TC) :: k, f, m, n, d, s
      if (tree%n_in == 2) then
         FLIP: do k=3, tree%mask-1
            if (.not. tree%branch(k)%set) cycle FLIP
            f = iand(k,tree%mask_in)
            if (f==0 .or. f==k) cycle FLIP
            m = tree%branch(k)%mother
            s = tree%branch(k)%sibling
            if (s==0) call find_orphan(s)
            d = tree%branch(k)%daughter(1)
            n = ior(d,s)
            tree%branch(k)%set = .false.
            tree%branch(n)%set = .true.
            tree%branch(n)%origin = k
            tree%branch(n)%daughter(1) = d; tree%branch(d)%mother  = n
            tree%branch(n)%daughter(2) = s; tree%branch(s)%mother  = n
```

```
                tree%branch(n)%has_children = .true.
                tree%branch(d)%sibling = s;   tree%branch(s)%sibling = d
                tree%branch(n)%sibling = f;   tree%branch(f)%sibling = n
                tree%branch(n)%mother      = m
                tree%branch(f)%mother      = m
                if (m/=0) then
                    tree%branch(m)%daughter(1) = n
                    tree%branch(m)%daughter(2) = f
                end if
                tree%branch(n)%friend = f
                tree%branch(n)%has_friend = .true.
                tree%branch(n)%firstborn = 2
            end do FLIP
        end if
    contains
        subroutine find_orphan(s)
            integer(TC) :: s
            do s=1, tree%mask_out
                if (tree%branch(s)%set .and. tree%branch(s)%mother==0) return
            end do
            call phs_tree_write (tree)
            call msg_bug (" Can't flip phase space tree to channel")
        end subroutine find_orphan
    end subroutine phs_tree_flip_t_to_s_channel
```

After the tree has been flipped, one may need to determine what has become
of a particular *t*-channel branch. This function gives the bincode of the flipped
tree. If the original bincode does not contain IN-bits, we leave it as it is.

⟨*PHS trees: procedures*⟩+≡
```
    function tc_flipped (tree, kt) result (ks)
      type(phs_tree_t), intent(in) :: tree
      integer(TC), intent(in) :: kt
      integer(TC) :: ks
      if (iand (kt, tree%mask_in) == 0) then
          ks = kt
      else
          ks = tree%branch(iand (kt, tree%mask_out))%mother
      end if
    end function tc_flipped
```

Scan a tree and make sure that the first daughter has always a smaller code
than the second one. Furthermore, delete any `friend` entry in the root branch
– this branching has the incoming particle direction as axis anyway. Keep track
of reordering by updating `inverted_axis`, `inverted_decay` and `firstborn`.

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_canonicalize
```

⟨*PHS trees: procedures*⟩+≡
```
    subroutine phs_tree_canonicalize (tree)
      type(phs_tree_t), intent(inout) :: tree
      integer :: n_out
      integer(TC) :: k_out
      call branch_canonicalize (tree%branch(tree%mask_out))
```

```
      n_out = tree%n_externals - tree%n_in
      k_out = tree%mask_out
      if (tree%branch(k_out)%has_friend &
            & .and. tree%branch(k_out)%friend == ibset (0, n_out)) then
         tree%branch(k_out)%inverted_axis = .not.tree%branch(k_out)%inverted_axis
      end if
      tree%branch(k_out)%has_friend = .false.
      tree%branch(k_out)%friend = 0
    contains
      recursive subroutine branch_canonicalize (b)
        type(phs_branch_t), intent(inout) :: b
        integer(TC) :: d1, d2
        if (b%has_children) then
            d1 = b%daughter(1)
            d2 = b%daughter(2)
            if (d1 > d2) then
               b%daughter(1) = d2
               b%daughter(2) = d1
               b%inverted_decay = .not.b%inverted_decay
               if (b%firstborn /= 0)  b%firstborn = 3 - b%firstborn
            end if
            call branch_canonicalize (tree%branch(b%daughter(1)))
            call branch_canonicalize (tree%branch(b%daughter(2)))
        end if
      end subroutine branch_canonicalize
    end subroutine phs_tree_canonicalize
```

Mappings

Initialize a mapping for the current tree. This is done while reading from file, so the mapping parameters are read, but applied to the flipped tree. Thus, the size of the array of mappings is given by the number of outgoing particles only.

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_init_mapping
```

⟨*PHS trees: procedures*⟩+≡
```
    subroutine phs_tree_init_mapping (tree, k, type, pdg, model)
      type(phs_tree_t), intent(inout) :: tree
      integer(TC), intent(in) :: k
      type(string_t), intent(in) :: type
      integer, intent(in) :: pdg
      type(model_t), intent(in), target :: model
      integer(TC) :: kk
      kk = tc_flipped (tree, k)
      call mapping_init (tree%mapping(kk), kk, type, pdg, model)
    end subroutine phs_tree_init_mapping
```

Set the physical parameters for the mapping, using a specific parameter set. Also set the mass sum array.

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_set_mapping_parameters
```

⟨PHS trees: procedures⟩+≡

```
subroutine phs_tree_set_mapping_parameters &
     (tree, mapping_defaults, variable_limits)
  type(phs_tree_t), intent(inout) :: tree
  type(mapping_defaults_t), intent(in) :: mapping_defaults
  logical, intent(in) :: variable_limits
  integer(TC) :: k
  do k = 1, tree%n_branches_out
     call mapping_set_parameters &
          (tree%mapping(k), mapping_defaults, variable_limits)
  end do
end subroutine phs_tree_set_mapping_parameters
```

Return the mapping for the sum of all outgoing particles. This should either be no mapping or a global s-channel mapping.

⟨PHS trees: public⟩+≡

```
public :: phs_tree_assign_s_mapping
```

⟨PHS trees: procedures⟩+≡

```
subroutine phs_tree_assign_s_mapping (tree, mapping)
  type(phs_tree_t), intent(in) :: tree
  type(mapping_t), intent(out) :: mapping
  mapping = tree%mapping(tree%mask_out)
end subroutine phs_tree_assign_s_mapping
```

Kinematics

Fill the mass sum array, starting from the external particles and working down to the tree root. For each bincode `k` we scan the bits in `k`; if only one is set, we take the physical mass of the corresponding external particle; if more then one is set, we sum up the two masses (which we know have already been set).

⟨PHS trees: public⟩+≡

```

1437

```
         end do
      end do
    end subroutine phs_tree_set_mass_sum
```

Set the effective masses and widths. For each non-resonant branch in a tree, the effective mass is equal to the sum of the effective masses of the children (and analogous for the width). External particles have their real mass and width zero. For resonant branches, we insert mass and width from the corresponding mapping.

This routine has `phs_tree_set_mass_sum` and `phs_tree_set_mapping_parameters` as prerequisites.

    end subroutine phs_tree_set_effective_masses
```

Define step mappings, recursively, for the decay products of all intermediate resonances. Step mappings account for the fact that a branch may originate from a resonance, which almost replaces the upper limit on the possible invariant mass. The step mapping implements a smooth cutoff that interpolates between the resonance and the real kinematic limit. The mapping width determines the sharpness of the cutoff.

Step mappings are inserted only for branches that are not mapped otherwise.

At each branch, we record the mass that is effectively available for phase

space, by taking the previous limit and subtracting the effective mass of the sibling branch. Widths are added, not subtracted.

If we encounter a resonance decay, we discard the previous limit and replace it by the mass and width of the resonance, also subtracting the sibling branch.

Initially, the limit is zero, so it becomes negative at any branch. Only if there is a resonance, the limit becomes positive. Whenever the limit is positive, and the current branch decays, we activate a step mapping for the current branch.

As a result, step mappings are implemented for all internal lines that originate from an intermediate resonance decay.

The flag `variable_limits` applies to the ultimate limit from the available energy, not to the intermediate resonances whose masses are always fixed.

This routine requires `phs_tree_set_effective_masses`

Structural comparison

This function allows to check whether one tree is the permutation of another one. The permutation is applied to the second tree in the argument list. We do not make up a temporary permuted tree, but compare the two trees directly. The branches are scanned recursively, where for each daughter we check the friend and the mapping as well. Once a discrepancy is found, the recursion is exited immediately.

11.5.4 Phase-space evaluation

Phase-space volume

We compute the phase-space volume recursively, following the same path as for computing other kinematical variables. However, the volume depends just on $\sqrt{\hat{s}}$, not on the momentum configuration.

   Note: counting branches, we may replace this by a simple formula.

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_compute_volume
```

⟨*PHS trees: procedures*⟩+≡
```
    subroutine phs_tree_compute_volume (tree, sqrts, volume)
      type(phs_tree_t), intent(in) :: tree
      real(default), intent(in) :: sqrts
      real(default), intent(out) :: volume
      integer(TC) :: k
      k  = tree%mask_out
      if (tree%branch(k)%has_children) then
         call compute_volume_x (tree%branch(k), k, volume, .true.)
      else
         volume = 1
      end if
    contains
      recursive subroutine compute_volume_x (b, k, volume, initial)
        type(phs_branch_t), intent(in) :: b
        integer(TC), intent(in) :: k
        real(default), intent(out) :: volume
        logical, intent(in) :: initial
        integer(TC) :: k1, k2
        real(default) :: v1, v2
        k1 = b%daughter(1);  k2 = b%daughter(2)
        if (tree%branch(k1)%has_children) then
           call compute_volume_x (tree%branch(k1), k1, v1, .false.)
        else
           v1 = 1
        end if
        if (tree%branch(k2)%has_children) then
```

```
          call compute_volume_x (tree%branch(k2), k2, v2, .false.)
      else
         v2 = 1
      end if
      if (initial) then
         volume = v1 * v2 / (4 * twopi5)
      else
         volume = v1 * v2 * sqrts**2 / (4 * twopi2)
      end if
    end subroutine compute_volume_x
  end subroutine phs_tree_compute_volume
```

Determine momenta

This is done in two steps: First the masses are determined. This step may
fail, in which case `ok` is set to false. If successful, we generate angles and
the actual momenta. The array `decay_p` serves for transferring the individual
three-momenta of the daughter particles in their mother rest frame from the
mass generation to the momentum generation step.

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_compute_momenta_from_x
```

⟨*PHS trees: procedures*⟩+≡
```
    subroutine phs_tree_compute_momenta_from_x &
        (tree, prt, factor, volume, sqrts, x, ok)
      type(phs_tree_t), intent(inout) :: tree

      real(default), dimension(tree%mask_out) :: decay_p
      integer :: n1, n2
      n1 = tree%n_msq
      n2 = n1 + tree%n_angles
      call phs_tree_set_msq &
          (tree, prt, factor, volume, decay_p, sqrts, x(1:n1), ok)
      if (ok) call phs_tree_set_angles &
          (tree, prt, factor, decay_p, sqrts, x(n1+1:n2))
    end subroutine phs_tree_compute_momenta_from_x
```

Mass generation is done recursively. The `ok` flag causes the filled tree to be
discarded if set to `.false.`. This happens if a three-momentum turns out to be
imaginary, indicating impossible kinematics. The index `ix` tells us how far we
have used up the input array `x`.

⟨*PHS trees: procedures*⟩+≡
```
    subroutine phs_tree_set_msq &
        (tree, prt, factor, volume, decay_p, sqrts, x, ok)

The heart of phase space generation: Now we have the invariant masses, let us generate angles. At each branch, we take a Lorentz transformation and augment it by a boost to the current particle rest frame, and by rotations ϕ and θ around the z and y axis, respectively. This transformation is passed down to the daughter particles, if present.

Recover random numbers

For the other channels we want to compute the random numbers that would
have generated the momenta that we already know.

⟨*PHS trees: public*⟩+≡
```
    public :: phs_tree_compute_x_from_momenta
```

⟨*PHS trees: procedures*⟩+≡
```
    subroutine phs_tree_compute_x_from_momenta (tree, prt, factor, sqrts, x)
      type(phs_tree_t), intent(inout) :: tree
      type(phs_prt_t), dimension(:), intent(in) :: prt
      real(default), intent(out) :: factor
      real(default), intent(in) :: sqrts
```

```
      real(default), dimension(:), intent(inout) :: x
      real(default), dimension(tree%mask_out) :: decay_p
      integer :: n1, n2
      n1 = tree%n_msq
      n2 = n1 + tree%n_angles
      call phs_tree_get_msq &
           (tree, prt, factor, decay_p, sqrts, x(1:n1))
      call phs_tree_get_angles &
           (tree, prt, factor, decay_p, sqrts, x(n1+1:n2))
    end subroutine phs_tree_compute_x_from_momenta
```

The inverse operation follows exactly the same steps. The tree is `inout` because it contains mappings whose parameters can be reset when the mapping is applied.

  end subroutine phs_tree_get_msq
```

This subroutine is the most time-critical part of the whole program. Therefore, we do not exactly parallel the angle generation routine above but make sure that things get evaluated only if they are really needed, at the expense of readability. Particularly important is to have as few multiplications of Lorentz transformations as possible.

11.6 The phase-space forest

Simply stated, a phase-space forest is a collection of phase-space trees. More precisely, a `phs_forest` object contains all parameterizations of phase space that WHIZARD will use for a single hard process, prepared in the form of `phs_tree` objects. This is suitable for evaluation by the VAMP integration package: each parameterization (tree) is a valid channel in the multi-channel adaptive integration, and each variable in a tree corresponds to an integration dimension, defined by an appropriate mapping of the $(0, 1)$ interval to the allowed range of the integration variable.

The trees are grouped in groves. The trees (integration channels) within a grove share a common weight, assuming that they are related by some approximate symmetry.

Trees/channels that are related by an exact symmetry are connected by an array of equivalences; each equivalence object holds the data that relate one channel to another.

The phase-space setup, i.e., the detailed structure of trees and forest, are read from a file. Therefore, this module also contains the syntax definition and the parser needed for interpreting this file.

11.6.1   Phase-space setup parameters

This transparent container holds the parameters that the algorithm needs for phase-space setup, with reasonable defaults.

The threshold mass (for considering a particle as effectively massless) is specified separately for s- and t-channel. The default is to treat W and Z bosons as massive in the s-channel, but as massless in the t-channel. The b-quark is treated always massless, the t-quark always massive.

⟨*PHS forests: public*⟩≡

    end function phs_parameters_ne
```

11.6.2 Equivalences

This type holds information about equivalences between phase-space trees. We make a linked list, where each node contains the two trees which are equivalent and the corresponding permutation of external particles. Two more arrays are

to be filled: The permutation of mass variables and the permutation of angular variables, where the signature indicates a necessary exchange of daughter branches.

⟨*PHS forests: types*⟩+≡

```
type :: equivalence_t
  private
  integer :: left, right
  type(permutation_t) :: perm
  type(permutation_t) :: msq_perm, angle_perm
  logical, dimension(:), allocatable :: angle_sig
  type(equivalence_t), pointer :: next => null ()
end type equivalence_t
```

⟨*PHS forests: types*⟩+≡

```
type :: equivalence_list_t
  private
  integer :: length = 0
  type(equivalence_t), pointer :: first => null ()
  type(equivalence_t), pointer :: last => null ()
end type equivalence_list_t
```

Append an equivalence to the list

⟨*PHS forests: procedures*⟩+≡

```
subroutine equivalence_list_add (eql, left, right, perm)
  type(equivalence_list_t), intent(inout) :: eql
  integer, intent(in) :: left, right
  type(permutation_t), intent(in) :: perm
  type(equivalence_t), pointer :: eq
  allocate (eq)
  eq%left = left
  eq%right = right
  eq%perm = perm
  if (associated (eql%last)) then
     eql%last%next => eq
  else
     eql%first => eq
  end if
  eql%last => eq
  eql%length = eql%length + 1
end subroutine equivalence_list_add
```

Delete the list contents. Has to be pure because it is called from an elemental subroutine.

⟨*PHS forests: procedures*⟩+≡

```
pure subroutine equivalence_list_final (eql)
  type(equivalence_list_t), intent(inout) :: eql
  type(equivalence_t), pointer :: eq
  do while (associated (eql%first))
     eq => eql%first
     eql%first => eql%first%next
     deallocate (eq)
  end do
```

```
      eql%last => null ()
      eql%length = 0
   end subroutine equivalence_list_final
```

Make a deep copy of the equivalence list. This allows for deep copies of groves and forests.

⟨*PHS forests: interfaces*⟩+≡
```
   interface assignment(=)
      module procedure equivalence_list_assign
   end interface
```

⟨*PHS forests: procedures*⟩+≡
```
   subroutine equivalence_list_assign (eql_out, eql_in)
     type(equivalence_list_t), intent(out) :: eql_out
     type(equivalence_list_t), intent(in) :: eql_in
     type(equivalence_t), pointer :: eq, eq_copy
     eq => eql_in%first
     do while (associated (eq))
        allocate (eq_copy)
        eq_copy = eq
        eq_copy%next => null ()
        if (associated (eql_out%first)) then
           eql_out%last%next => eq_copy
        else
           eql_out%first => eq_copy
        end if
        eql_out%last => eq_copy
        eq => eq%next
     end do
   end subroutine equivalence_list_assign
```

The number of list entries

⟨*PHS forests: procedures*⟩+≡
```
   elemental function equivalence_list_length (eql) result (length)
     integer :: length
     type(equivalence_list_t), intent(in) :: eql
     length = eql%length
   end function equivalence_list_length
```

Recursively write the equivalences list

⟨*PHS forests: procedures*⟩+≡
```
   subroutine equivalence_list_write (eql, unit)
     type(equivalence_list_t), intent(in) :: eql
     integer, intent(in), optional :: unit
     integer :: u
     u = output_unit (unit);  if (u < 0)  return
     if (associated (eql%first)) then
        call equivalence_write_rec (eql%first, u)
     else
        write (u, *) " [empty]"
     end if
   contains
```

```
      recursive subroutine equivalence_write_rec (eq, u)
        type(equivalence_t), intent(in) :: eq
        integer, intent(in) :: u
        integer :: i
        write (u, "(3x,A,1x,I0,1x,I0,2x,A)", advance="no") &
             "Equivalence:", eq%left, eq%right, "Final state permutation:"
        call permutation_write (eq%perm, u)
        write (u, "(1x,12x,1x,A,1x)", advance="no") &
             "      msq permutation:  "
        call permutation_write (eq%msq_perm, u)
        write (u, "(1x,12x,1x,A,1x)", advance="no") &
             "      angle permutation:"
        call permutation_write (eq%angle_perm, u)
        write (u, "(1x,12x,1x,26x)", advance="no")
        do i = 1, size (eq%angle_sig)
           if (eq%angle_sig(i)) then
              write (u, "(1x,A)", advance="no") "+"
           else
              write (u, "(1x,A)", advance="no") "-"
           end if
        end do
        write (u, *)
        if (associated (eq%next))  call equivalence_write_rec (eq%next, u)
      end subroutine equivalence_write_rec
    end subroutine equivalence_list_write
```

11.6.3 Groves

A grove is a group of trees (phase-space channels) that share a common weight
in the integration. Within a grove, channels can be declared equivalent, so they
also share their integration grids (up to symmetries). The grove contains a list
of equivalences. The `tree_count_offset` is the total number of trees of the
preceding groves; when the trees are counted per forest (integration channels),
the offset has to be added to all tree indices.

⟨*PHS forests: types*⟩+≡
```
    type :: phs_grove_t
       private
       integer :: tree_count_offset
       type(phs_tree_t), dimension(:), allocatable :: tree
       type(equivalence_list_t) :: equivalence_list
    end type phs_grove_t
```

Call `phs_tree_init` which is also elemental:

⟨*PHS forests: procedures*⟩+≡
```
    elemental subroutine phs_grove_init &
         (grove, n_trees, n_in, n_out, n_masses, n_angles)
      type(phs_grove_t), intent(inout) :: grove
      integer, intent(in) :: n_trees, n_in, n_out, n_masses, n_angles
      grove%tree_count_offset = 0
      allocate (grove%tree (n_trees))
      call phs_tree_init (grove%tree, n_in, n_out, n_masses, n_angles)
```

```
    end subroutine phs_grove_init
```

The trees do not have pointer components, thus no call to `phs_tree_final`:

⟨*PHS forests: procedures*⟩+≡
```
    elemental subroutine phs_grove_final (grove)
      type(phs_grove_t), intent(inout) :: grove
      deallocate (grove%tree)
      call equivalence_list_final (grove%equivalence_list)
    end subroutine phs_grove_final
```

Deep copy.

⟨*PHS forests: interfaces*⟩+≡
```
    interface assignment(=)
       module procedure phs_grove_assign0
       module procedure phs_grove_assign1
    end interface
```

⟨*PHS forests: procedures*⟩+≡
```
    subroutine phs_grove_assign0 (grove_out, grove_in)
      type(phs_grove_t), intent(out) :: grove_out
      type(phs_grove_t), intent(in) :: grove_in
      grove_out%tree_count_offset = grove_in%tree_count_offset
      if (allocated (grove_in%tree)) then
         allocate (grove_out%tree (size (grove_in%tree)))
         grove_out%tree = grove_in%tree
      end if
      grove_out%equivalence_list = grove_in%equivalence_list
    end subroutine phs_grove_assign0

    subroutine phs_grove_assign1 (grove_out, grove_in)
      type(phs_grove_t), dimension(:), intent(out) :: grove_out
      type(phs_grove_t), dimension(:), intent(in) :: grove_in
      integer :: i
      do i = 1, size (grove_in)
         call phs_grove_assign0 (grove_out(i), grove_in(i))
      end do
    end subroutine phs_grove_assign1
```

Get the global (s-channel) mappings. Implemented as a subroutine which returns an array (slice).

⟨*PHS forests: procedures*⟩+≡
```
    subroutine phs_grove_assign_s_mappings (grove, mapping)
      type(phs_grove_t), intent(in) :: grove
      type(mapping_t), dimension(:), intent(out) :: mapping
      integer :: i
      if (size (mapping) == size (grove%tree)) then
         do i = 1, size (mapping)
            call phs_tree_assign_s_mapping (grove%tree(i), mapping(i))
         end do
      else
         call msg_bug ("phs_grove_assign_s_mappings: array size mismatch")
      end if
```

1459

```
      end subroutine phs_grove_assign_s_mappings
```

11.6.4 The forest type

This is a collection of trees and associated particles. In a given tree, each branch code corresponds to a particle in the `prt` array. Furthermore, we have an array of mass sums which is independent of the decay tree and of the particular event. The mappings directly correspond to the decay trees, and the decay groves collect the trees in classes. The permutation list consists of all permutations of outgoing particles that map the decay forest onto itself.

The particle codes `flv` (one for each external particle) are needed for determining masses and such. The trees and associated information are collected in the `grove` array, together with a lookup table that associates tree indices to groves. Finally, the `prt` array serves as workspace for phase-space evaluation.

The `prt_combination` is a list of index pairs, namely the particle momenta pairs that need to be combined in order to provide all momentum combinations that the phase-space trees need to know.

⟨*PHS forests: public*⟩+≡
```
    public :: phs_forest_t
```

⟨*PHS forests: types*⟩+≡
```
    type :: phs_forest_t
      private
      integer :: n_in, n_out, n_tot
      integer :: n_masses, n_angles, n_dimensions
      integer :: n_trees, n_equivalences
      type(flavor_t), dimension(:), allocatable :: flv
      type(phs_grove_t), dimension(:), allocatable :: grove
      integer, dimension(:), allocatable :: grove_lookup
      type(phs_prt_t), dimension(:), allocatable :: prt_in
      type(phs_prt_t), dimension(:), allocatable :: prt_out
      type(phs_prt_t), dimension(:), allocatable :: prt
      integer(TC), dimension(:,:), allocatable :: prt_combination
      type(mapping_t), dimension(:), allocatable :: s_mapping
    contains
    ⟨PHS forests: phs forest: TBP⟩
    end type phs_forest_t
```

The initialization merely allocates memory. We have to know how many trees there are in each grove, so we can initialize everything. The number of groves is the size of the `n_tree` array.

In the `grove_lookup` table we store the grove index that belongs to each absolute tree index. The difference between the absolute index and the relative (to the grove) index is stored, for each grove, as `tree_count_offset`.

The particle array is allocated according to the total number of branches each tree has, but not filled.

⟨*PHS forests: public*⟩+≡
```
    public :: phs_forest_init
```

⟨PHS forests: procedures⟩+≡

```
subroutine phs_forest_init (forest, n_tree, n_in, n_out)
  type(phs_forest_t), intent(inout) :: forest
  integer, dimension(:), intent(in) :: n_tree
  integer, intent(in) :: n_in, n_out
  integer :: g, count, k_root
  forest%n_in = n_in
  forest%n_out = n_out
  forest%n_tot = n_in + n_out
  forest%n_masses = max (n_out - 2, 0)
  forest%n_angles = max (2*n_out - 2, 0)
  forest%n_dimensions = forest%n_masses + forest%n_angles
  forest%n_trees = sum (n_tree)
  forest%n_equivalences = 0
  allocate (forest%grove (size (n_tree)))
  call phs_grove_init &
       (forest%grove, n_tree, n_in, n_out, forest%n_masses, forest%n_angles)
  allocate (forest%grove_lookup (forest%n_trees))
  count = 0
  do g = 1, size (forest%grove)
     forest%grove(g)%tree_count_offset = count
     forest%grove_lookup (count+1:count+n_tree(g)) = g
     count = count + n_tree(g)
  end do
  allocate (forest%prt_in  (n_in))
  allocate (forest%prt_out (n_out))
  k_root = 2**forest%n_tot - 1
  allocate (forest%prt (k_root))
  allocate (forest%prt_combination (2, k_root))
  allocate (forest%s_mapping (forest%n_trees))
end subroutine phs_forest_init
```

Assign the global (s-channel) mappings.

⟨PHS forests: public⟩+≡

```
public :: phs_forest_set_s_mappings
```

⟨PHS forests: procedures⟩+≡

```
subroutine phs_forest_set_s_mappings (forest)
  type(phs_forest_t), intent(inout) :: forest
  integer :: g, i0, i1, n
  do g = 1, size (forest%grove)
     call phs_forest_get_grove_bounds (forest, g, i0, i1, n)
     call phs_grove_assign_s_mappings &
          (forest%grove(g), forest%s_mapping(i0:i1))
  end do
end subroutine phs_forest_set_s_mappings
```

The grove finalizer is called because it contains the equivalence list:

⟨PHS forests: public⟩+≡

```
public :: phs_forest_final
```

⟨PHS forests: procedures⟩+≡

```
subroutine phs_forest_final (forest)
  type(phs_forest_t), intent(inout) :: forest
```

```
      if (allocated (forest%grove)) then
         call phs_grove_final (forest%grove)
         deallocate (forest%grove)
      end if
      if (allocated (forest%grove_lookup))  deallocate (forest%grove_lookup)
      if (allocated (forest%prt))  deallocate (forest%prt)
      if (allocated (forest%s_mapping))  deallocate (forest%s_mapping)
   end subroutine phs_forest_final
```

11.6.5 Screen output

Write the particles that are non-null, then the trees which point to them:

⟨*PHS forests: public*⟩+≡
```
   public :: phs_forest_write
```

⟨*PHS forests: phs forest: TBP*⟩≡
```
   procedure :: write => phs_forest_write
```

⟨*PHS forests: procedures*⟩+≡
```
   subroutine phs_forest_write (forest, unit)
     class(phs_forest_t), intent(in) :: forest
     integer, intent(in), optional :: unit
     integer :: u
     integer :: i, g, k
     u = output_unit (unit);  if (u < 0)  return
     write (u, "(1x,A)") "Phase space forest:"

11.6.7 Read the phase space setup from file

The phase space setup is stored in a file. The file may be generated by the
cascades module below, or by other means. This file has to be read and parsed
to create the PHS forest as the internal phase-space representation.

Create lexer and syntax:

⟨PHS forests: procedures⟩+≡

```
subroutine define_phs_forest_syntax (ifile)
  type(ifile_t) :: ifile
  call ifile_append (ifile, "SEQ phase_space_list = process_phase_space*")
  call ifile_append (ifile, "SEQ process_phase_space = " &
       // "process_def process_header phase_space")
  call ifile_append (ifile, "SEQ process_def = process process_list")
  call ifile_append (ifile, "KEY process")
  call ifile_append (ifile, "LIS process_list = process_tag*")
  call ifile_append (ifile, "IDE process_tag")
  call ifile_append (ifile, "SEQ process_header = " &
       // "md5sum_process = md5sum " &
       // "md5sum_model_par = md5sum " &
       // "md5sum_phs_config = md5sum " &
       // "sqrts = real " &
       // "m_threshold_s = real " &
       // "m_threshold_t = real " &
```

```
          // "off_shell = integer " &
          // "t_channel = integer " &
          // "keep_nonresonant = logical")
    call ifile_append (ifile, "KEY '='")
    call ifile_append (ifile, "KEY md5sum_process")
    call ifile_append (ifile, "KEY md5sum_model_par")
    call ifile_append (ifile, "KEY md5sum_phs_config")
    call ifile_append (ifile, "KEY sqrts")
    call ifile_append (ifile, "KEY m_threshold_s")
    call ifile_append (ifile, "KEY m_threshold_t")
    call ifile_append (ifile, "KEY off_shell")
    call ifile_append (ifile, "KEY t_channel")
    call ifile_append (ifile, "KEY keep_nonresonant")
    call ifile_append (ifile, "QUO md5sum = '""' ... '""'")
    call ifile_append (ifile, "REA real")
    call ifile_append (ifile, "INT integer")
    call ifile_append (ifile, "IDE logical")
    call ifile_append (ifile, "SEQ phase_space = grove_def+")
    call ifile_append (ifile, "SEQ grove_def = grove tree_def+")
    call ifile_append (ifile, "KEY grove")
    call ifile_append (ifile, "SEQ tree_def = tree bincodes mapping*")
    call ifile_append (ifile, "KEY tree")
    call ifile_append (ifile, "SEQ bincodes = bincode*")
    call ifile_append (ifile, "INT bincode")
    call ifile_append (ifile, "SEQ mapping = map bincode channel pdg")
    call ifile_append (ifile, "KEY map")
    call ifile_append (ifile, "ALT channel = &
          &s_channel | t_channel | u_channel | &
          &collinear | infrared | radiation | on_shell")
    call ifile_append (ifile, "KEY s_channel")
    ! call ifile_append (ifile, "KEY t_channel")    !!! Key already exists
    call ifile_append (ifile, "KEY u_channel")
    call ifile_append (ifile, "KEY collinear")
    call ifile_append (ifile, "KEY infrared")
    call ifile_append (ifile, "KEY radiation")
    call ifile_append (ifile, "KEY on_shell")
    call ifile_append (ifile, "INT pdg")
  end subroutine define_phs_forest_syntax
```

The model-file syntax and lexer are fixed, therefore stored as module variables:

⟨*PHS forests: variables*⟩≡
```
    type(syntax_t), target, save :: syntax_phs_forest
```

⟨*PHS forests: public*⟩+≡
```
    public :: syntax_phs_forest_init
```

⟨*PHS forests: procedures*⟩+≡
```
    subroutine syntax_phs_forest_init ()
      type(ifile_t) :: ifile
      call define_phs_forest_syntax (ifile)
      call syntax_init (syntax_phs_forest, ifile)
      call ifile_final (ifile)
    end subroutine syntax_phs_forest_init
```

⟨*PHS forests: procedures*⟩+≡
```
    subroutine lexer_init_phs_forest (lexer)
      type(lexer_t), intent(out) :: lexer
      call lexer_init (lexer, &
           comment_chars = "#!", &
           quote_chars = '"', &
           quote_match = '"', &
           single_chars = "", &
           special_class = ["="] , &
           keyword_list = syntax_get_keyword_list_ptr (syntax_phs_forest))
    end subroutine lexer_init_phs_forest
```

⟨*PHS forests: public*⟩+≡
```
    public :: syntax_phs_forest_final
```
⟨*PHS forests: procedures*⟩+≡
```
    subroutine syntax_phs_forest_final ()
      call syntax_final (syntax_phs_forest)
    end subroutine syntax_phs_forest_final
```

⟨*PHS forests: public*⟩+≡
```
    public :: syntax_phs_forest_write
```
⟨*PHS forests: procedures*⟩+≡
```
    subroutine syntax_phs_forest_write (unit)
      integer, intent(in), optional :: unit
      call syntax_write (syntax_phs_forest, unit)
    end subroutine syntax_phs_forest_write
```

The concrete parser and interpreter. Generate an input stream for the external `unit`, read the parse tree (with given `syntax` and `lexer`) from this stream, and transfer the contents of the parse tree to the PHS `forest`.

We look for the matching `process` tag, count groves and trees for initializing the `forest`, and fill the trees.

If the optional parameters are set, compare the parameters stored in the file to those. Set `match` true if everything agrees.

⟨*PHS forests: public*⟩+≡
```
    public :: phs_forest_read
```
⟨*PHS forests: interfaces*⟩+≡
```
    interface phs_forest_read
       module procedure phs_forest_read_file
       module procedure phs_forest_read_unit
       module procedure phs_forest_read_parse_tree
    end interface
```

⟨*PHS forests: procedures*⟩+≡

Initialize a specific tree in the forest, using the contents of the 'tree' node. First, count the bincodes, allocate an array and read them in, and make the tree. Each t-channel tree is flipped to s-channel. Then, find mappings and initialize them.

⟨*PHS forests: procedures*⟩+≡

      end do
    end subroutine phs_tree_set
```

11.6.8 Preparation

The trees that we read from file do not carry flavor information. This is set
separately:

   The flavor list must be unique for a unique set of masses; if a given particle
can have different flavor, the mass must be degenerate, so we can choose one of
the possible flavor combinations.

⟨*PHS forests: public*⟩+≡

```
    public :: phs_forest_set_flavors
```

⟨*PHS forests: procedures*⟩+≡
```
  subroutine phs_forest_set_flavors (forest, flv)
    type(phs_forest_t), intent(inout) :: forest
    type(flavor_t), dimension(:), intent(in) :: flv
    allocate (forest%flv (size (flv)))
    forest%flv = flv
  end subroutine phs_forest_set_flavors
```

Once the parameter set is fixed, the masses and the widths of the particles
are known and the `mass_sum` arrays as well as the mapping parameters can be
computed. Note that order is important: we first compute the mass sums, then
the ordinary mappings. The resonances obtained here determine the effective
masses, which in turn are used to implement step mappings for resonance decay
products that are not mapped otherwise.

⟨*PHS forests: public*⟩+≡
```
  public :: phs_forest_set_parameters
```

⟨*PHS forests: procedures*⟩+≡
```
  subroutine phs_forest_set_parameters &
      (forest, mapping_defaults, variable_limits)
    type(phs_forest_t), intent(inout) :: forest
    type(mapping_defaults_t), intent(in) :: mapping_defaults
    logical, intent(in) :: variable_limits

    do g = 1, size (forest%grove)
       do t = 1, size (forest%grove(g)%tree)
          call phs_tree_set_mass_sum &
              (forest%grove(g)%tree(t), forest%flv(forest%n_in+1:))
          call phs_tree_set_mapping_parameters (forest%grove(g)%tree(t), &
              mapping_defaults, variable_limits)
          call phs_tree_set_effective_masses (forest%grove(g)%tree(t))
          if (mapping_defaults%step_mapping) then
             call phs_tree_set_step_mappings (forest%grove(g)%tree(t), &
                 mapping_defaults%step_mapping_exp, variable_limits)
          end if
       end do
    end do
  end subroutine phs_forest_set_parameters
```

Generate the particle combination table. Scan all trees and merge their individ-
ual combination tables. At the end, valid entries are non-zero, and they indicate
the indices of a pair of particles to be combined to a new particle. If a particle
is accessible by more than one tree (this is usual), only keep the first possibility.

    end function phs_forest_get_momenta_out
```

11.6.10 Find equivalences among phase-space trees

Scan phase space for equivalences. We generate the complete set of unique permutations for the given list of outgoing particles, and use this for scanning equivalences within each grove. We scan all pairs of trees, using all permutations. This implies that trivial equivalences are included, and equivalences between different trees are recorded twice. This is intentional.

⟨*PHS forests: procedures*⟩+≡
```
    subroutine phs_grove_set_equivalences (grove, perm_array)
```

```
      type(phs_grove_t), intent(inout) :: grove

11.7 Finding phase space parameterizations

If the phase space configuration is not found in the appropriate file, we should
generate one.

The idea is to construct all Feynman diagrams subject to certain constraints
which eliminate everything that is probably irrelevant for the integration. These
Feynman diagrams (cascades) are grouped in groves by finding equivalence
classes related by symmetry and ordered with respect to their importance (resonances). Finally, the result (or part of it) is written to file and used for the
integration.

This module may eventually disappear and be replaced by CAML code. In
particular, we need here a set of Feynman rules (vertices with particle codes,
but not the factors). Thus, the module works for the Standard Model only.

Note that this module is stand-alone, it communicates to the main program
only via the generated ASCII phase-space configuration file.

11.7.1 The mapping modes

The valid mapping modes, to be used below. We will make use of the convention that mappings of internal particles have a positive value. Only for positive values, the flavor code is propagated when combining cascades.

⟨*Mapping modes*⟩≡
```
    integer, parameter :: &
        & EXTERNAL_PRT = -1, &
        & NO_MAPPING = 0, S_CHANNEL = 1, T_CHANNEL =  2, U_CHANNEL = 3, &
        & RADIATION = 4, COLLINEAR = 5, INFRARED = 6, &
        & STEP_MAPPING_E = 11, STEP_MAPPING_H = 12, &
        & ON_SHELL = 99
```

⟨*Cascades: parameters*⟩≡
  ⟨*Mapping modes*⟩

11.7.2 The cascade type

A cascade is essentially the same as a decay tree (both definitions may be merged in a later version). It contains a linked tree of nodes, each of which representing an internal particle. In contrast to decay trees, each node has a definite particle code. These nodes need not be modified, therefore we can use pointers and do not have to copy them. Thus, physically each cascades has only a single node, the mother particle. However, to be able to compare trees quickly, we store in addition an array of binary codes which is always sorted in ascending order. This is accompanied by a corresponding list of particle codes. The index is the location of the corresponding cascade in the cascade set, this may be used to access the daughters directly.

The real mass is the particle mass belonging to the particle code. The minimal mass is the sum of the real masses of all its daughters; this is the kinematical cutoff. The effective mass may be zero if the particle mass is below a certain threshold; it may be the real mass if the particle is resonant; or it may be some other value.

The logical `t_channel` is set if this a t-channel line, while `initial` is true only for an initial particle. Note that both initial particles are also `t_channel` by definition, and that they are distinguished by the direction of the tree: One of them decays and is the root of the tree, while the other one is one of the leaves.

The cascade is a list of nodes (particles) which are linked via the `daughter` entries. The node is the mother particle of the decay cascade. Much of the information in the nodes is repeated in arrays, to be accessible more easily. The arrays will be kept sorted by binary codes.

The counter `n_off_shell` is increased for each internal line that is neither resonant nor log-enhanced. It is set to zero if the current line is resonant, since this implies on-shell particle production and subsequent decay.

The counter `n_t_channel` is non-negative once an initial particle is included in the tree: then, it counts the number of t-channel lines.

The `multiplicity` is the number of branchings to follow until all daughters are on-shell. A resonant or non-decaying particle has multiplicity one. Merging nodes, the multiplicities add unless the mother is a resonance. An initial or final node has multiplicity zero.

The arrays correspond to the subnode tree `tree` of the current cascade. PDG codes are stored only for those positions which are resonant, with the exception of the last entry, i.e., the current node. Other positions, in particular external legs, are assigned undefined PDG code.

A cascade is uniquely identified by its tree, the tree of PDG codes, and the tree of mappings. The tree of resonances is kept only to mask the PDG tree as described above.

      cascade%index = index
      cascade%depth = depth
      cascade%active = .true.
      allocate (cascade%tree (depth))
      allocate (cascade%tree_pdg (depth))
      allocate (cascade%tree_mapping (depth))
      allocate (cascade%tree_resonant (depth))
    end subroutine cascade_init
```

Keep and increment a global index

⟨*Cascades: procedures*⟩+≡

```
      function cascade_index (seed) result (index)
        integer :: index
        integer, intent(in), optional :: seed
        integer, save :: i = 0
        if (present (seed))  i = seed
        i = i + 1
        index = i
      end function cascade_index
```

We need three versions of writing cascades. This goes to the phase-space file:

⟨*Cascades: procedures*⟩+≡

```
      subroutine cascade_write_file_format (cascade, model, unit)
        type(cascade_t), intent(in) :: cascade
        type(model_t), intent(in), target :: model
        integer, intent(in), optional :: unit
        type(flavor_t) :: flv
        integer :: u, i
1       format(3x,A,1x,40(1x,I4))
2       format(3x,A,1x,I3,1x,A,1x,I7,1x,'!',1x,A)
        u = output_unit (unit);  if (u < 0)  return
        call write_reduced (cascade%tree, u)
        write (u, "(A)")
        do i = 1, cascade%depth
           call flavor_init (flv, cascade%tree_pdg(i), model)
           select case (cascade%tree_mapping(i))
           case (NO_MAPPING, EXTERNAL_PRT)
           case (S_CHANNEL)

       end subroutine cascade_write
```

11.7.3 Creating new cascades

This initializes a single-particle cascade (external, final state). The PDG entry
in the tree is set undefined because the cascade is not resonant. However, the
flavor entry is set, so the cascade flavor is identified nevertheless.

⟨*Cascades: procedures*⟩+≡
```
       subroutine cascade_init_outgoing (cascade, flv, pos, m_thr)
         type(cascade_t), intent(out) :: cascade
         type(flavor_t), intent(in) :: flv
         integer, intent(in) :: pos
         real(default), intent(in) :: m_thr
         call cascade_init (cascade, 1)
         cascade%bincode = ibset (0_TC, pos-1)
         cascade%flv = flv
         cascade%pdg = abs (flavor_get_pdg (cascade%flv))
         cascade%is_vector = flavor_get_spin_type (flv) == VECTOR
         cascade%m_min = flavor_get_mass (flv)
         cascade%m_rea = cascade%m_min
         if (cascade%m_rea >= m_thr) then
            cascade%m_eff = cascade%m_rea
         end if
         cascade%on_shell = .true.
         cascade%multiplicity = 1
         cascade%tree(1) = cascade%bincode
         cascade%tree_pdg(1) = cascade%pdg
         cascade%tree_mapping(1) = EXTERNAL_PRT
         cascade%tree_resonant(1) = .false.
       end subroutine cascade_init_outgoing
```

The same for an incoming line:

⟨*Cascades: procedures*⟩+≡
```
       subroutine cascade_init_incoming (cascade, flv, pos, m_thr)
         type(cascade_t), intent(out) :: cascade
         type(flavor_t), intent(in) :: flv
         integer, intent(in) :: pos
         real(default), intent(in) :: m_thr
         call cascade_init (cascade, 1)
         cascade%incoming = .true.
         cascade%bincode = ibset (0_TC, pos-1)
         cascade%flv = flavor_anti (flv)
         cascade%pdg = abs (flavor_get_pdg (flv))
         cascade%is_vector = flavor_get_spin_type (flv) == VECTOR
         cascade%m_min = flavor_get_mass (flv)
         cascade%m_rea = cascade%m_min
         if (cascade%m_rea >= m_thr) then
            cascade%m_eff = cascade%m_rea
         end if
```

```
      cascade%on_shell = .true.
      cascade%n_t_channel = 0
      cascade%n_off_shell = 0
      cascade%tree(1) = cascade%bincode
      cascade%tree_pdg(1) = cascade%pdg
      cascade%tree_mapping(1) = EXTERNAL_PRT
      cascade%tree_resonant(1) = .false.
    end subroutine cascade_init_incoming
```

11.7.4 Tools

This function returns true if the two cascades share no common external particle. This is a requirement for joining them.

⟨*Cascades: interfaces*⟩≡
```
    interface operator(.disjunct.)
       module procedure cascade_disjunct
    end interface
```

⟨*Cascades: procedures*⟩+≡
```
    function cascade_disjunct (cascade1, cascade2) result (flag)
      logical :: flag
      type(cascade_t), intent(in) :: cascade1, cascade2
      flag = iand (cascade1%bincode, cascade2%bincode) == 0
    end function cascade_disjunct
```

Compute a hash code for the resonance pattern of a cascade. We count the number of times each particle appears as a resonance.

We pack the PDG codes of the resonances in two arrays (s-channel and t-channel), sort them both, concatenate the results, transfer to `i8` integers, and compute the hash code from this byte stream.

⟨*Cascades: procedures*⟩+≡
```
    subroutine cascade_assign_resonance_hash (cascade)
      type(cascade_t), intent(inout) :: cascade
      integer(i8), dimension(1) :: mold
      cascade%res_hash = hash (transfer &
          (concat (sort (pack (cascade%tree_pdg, &
                               cascade%tree_resonant)), &
                   sort (pack (cascade%tree_pdg, &
                               cascade%tree_mapping == T_CHANNEL .or. &
                               cascade%tree_mapping == U_CHANNEL))), &
          mold))
    end subroutine cascade_assign_resonance_hash
```

11.7.5 Hash entries for cascades

We will set up a hash array which contains keys of and pointers to cascades. We hold a list of cascade (pointers) within each bucket. This is not for collision resolution, but for keeping similar, but unequal cascades together.

⟨*Cascades: types*⟩+≡

```
    type :: cascade_p
       type(cascade_t), pointer :: cascade => null ()
       type(cascade_p), pointer :: next => null ()
    end type cascade_p
```

Here is the bucket or hash entry type:

⟨*Cascades: types*⟩+≡

```
    type :: hash_entry_t
       integer(i32) :: hashval = 0
       integer(i8), dimension(:), allocatable :: key
       type(cascade_p), pointer :: first => null ()
       type(cascade_p), pointer :: last => null ()
    end type hash_entry_t
```

Finalize: just deallocate the list; the contents are just pointers.

⟨*Cascades: procedures*⟩+≡

```
    subroutine hash_entry_final (hash_entry)
      type(hash_entry_t), intent(inout) :: hash_entry
      type(cascade_p), pointer :: current
      do while (associated (hash_entry%first))
         current => hash_entry%first
         hash_entry%first => current%next
         deallocate (current)
      end do
    end subroutine hash_entry_final
```

Output: concise format for debugging, just list cascade indices.

⟨*Cascades: procedures*⟩+≡

```
    subroutine hash_entry_write (hash_entry, unit)
      type(hash_entry_t), intent(in) :: hash_entry
      integer, intent(in), optional :: unit
      type(cascade_p), pointer :: current
      integer :: u, i
      u = output_unit (unit);  if (u < 0)  return
      write (u, "(1x,A)", advance="no")  "Entry:"
      do i = 1, size (hash_entry%key)
         write (u, "(1x,I0)", advance="no")  hash_entry%key(i)
      end do
      write (u, "(1x,A)", advance="no")  "->"
      current => hash_entry%first
      do while (associated (current))
         write (u, "(1x,I7)", advance="no") current%cascade%index
         current => current%next
      end do
      write (u, *)
    end subroutine hash_entry_write
```

This function adds a cascade pointer to the bucket. If `ok` is present, check first if it is already there and return failure if yes. If `cascade_ptr` is also present, set it to the current cascade if successful. If not, set it to the cascade that is already there.

⟨*Cascades: procedures*⟩+≡

```
subroutine hash_entry_add_cascade_ptr (hash_entry, cascade, ok, cascade_ptr)
  type(hash_entry_t), intent(inout) :: hash_entry
  type(cascade_t), intent(in), target :: cascade
  logical, intent(out), optional :: ok
  type(cascade_t), optional, pointer :: cascade_ptr
  type(cascade_p), pointer :: current
  if (present (ok)) then
     call hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
     if (.not. ok)  return
  end if
  allocate (current)
  current%cascade => cascade
  if (associated (hash_entry%last)) then
     hash_entry%last%next => current
  else
     hash_entry%first => current
  end if
  hash_entry%last => current
end subroutine hash_entry_add_cascade_ptr
```

This function checks whether a cascade is already in the bucket. For incomplete cascades, we look for an exact match. It should suffice to verify the tree, the PDG codes, and the mapping modes. This is the information that is written to the phase space file.

For complete cascades, we ignore the PDG code at positions with mappings infrared, collinear, or t/u-channel. Thus a cascade which is distinguised only by PDG code at such places, is flagged existent. If the convention is followed that light particles come before heavier ones (in the model definition), this ensures that the lightest particle is kept in the appropriate place, corresponding to the strongest peak.

For external cascades (incoming/outgoing) we take the PDG code into account even though it is zeroed in the PDG-code tree.

⟨Cascades: procedures⟩+≡
```
subroutine hash_entry_check_cascade (hash_entry, cascade, ok, cascade_ptr)
  type(hash_entry_t), intent(in), target :: hash_entry
  type(cascade_t), intent(in), target :: cascade
  logical, intent(out) :: ok
  type(cascade_t), optional, pointer :: cascade_ptr
  type(cascade_p), pointer :: current
  integer, dimension(:), allocatable :: tree_pdg
  ok = .true.
  allocate (tree_pdg (size (cascade%tree_pdg)))
  if (cascade%complete) then
     where (cascade%tree_mapping == INFRARED .or. &
            cascade%tree_mapping == COLLINEAR .or. &
            cascade%tree_mapping == T_CHANNEL .or. &
            cascade%tree_mapping == U_CHANNEL)
       tree_pdg = 0
     elsewhere
       tree_pdg = cascade%tree_pdg
     end where
  else
     tree_pdg = cascade%tree_pdg
```

```
         end if
         current => hash_entry%first
         do while (associated (current))
            if (current%cascade%depth == cascade%depth) then
               if (all (current%cascade%tree == cascade%tree)) then
                  if (all (current%cascade%tree_mapping == cascade%tree_mapping)) &
                       then
                     if (all (current%cascade%tree_pdg .match. tree_pdg)) then

11.7.6   The cascade set

The cascade set will later be transformed into the decay forest. It is set up as a
linked list. In addition to the usual `first` and `last` pointers, there is a `first_t`
pointer which points to the first t-channel cascade (after all s-channel cascades),
and a `first_k` pointer which points to the first final cascade (with a keystone).

As an auxiliary device, the object contains a hash array with associated
parameters where an additional pointer is stored for each cascade. The keys are

made from the relevant cascade data. This hash is used for fast detection (and thus avoidance) of double entries in the cascade list.

⟨*Cascades: public*⟩≡
```
    public :: cascade_set_t
```

⟨*Cascades: types*⟩+≡
```
    type :: cascade_set_t
      private

```

11.7.7   Adding cascades

Add a deep copy of a cascade to the set. The copy has all content of the original,
but the pointers are nullified. We do not care whether insertion was successful
or not. The pointer argument, if present, is assigned to the input cascade, or to
the hash entry if it is already present.

The procedure is recursive: any daughter or mother entries are also deep-
copied and added to the cascade set before the current copy is added.

⟨*Cascades: procedures*⟩+≡
```
   recursive subroutine cascade_set_add_copy &
        (cascade_set, cascade_in, cascade_ptr)
     type(cascade_set_t), intent(inout), target :: cascade_set
     type(cascade_t), intent(in) :: cascade_in
     type(cascade_t), optional, pointer :: cascade_ptr
     type(cascade_t), pointer :: cascade
     logical :: ok
     allocate (cascade)
     cascade = cascade_in
     if (associated (cascade_in%daughter1))  call cascade_set_add_copy &
          (cascade_set, cascade_in%daughter1, cascade%daughter1)
     if (associated (cascade_in%daughter2))  call cascade_set_add_copy &
          (cascade_set, cascade_in%daughter2, cascade%daughter2)
     if (associated (cascade_in%mother))  call cascade_set_add_copy &
          (cascade_set, cascade_in%mother, cascade%mother)
     cascade%next => null ()
     call cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
     if (.not. ok)  deallocate (cascade)
   end subroutine cascade_set_add_copy
```

Add a cascade to the set. This does not deep-copy. We first try to insert it in the hash array. If successful, add it to the list. Failure indicates that it is already present, and we drop it.

The hash key is built solely from the tree array, so neither particle codes nor resonances count, just topology.

Technically, hash and list receive only pointers, so the cascade can be considered as being in either of both. We treat it as part of the list.

⟨*Cascades: procedures*⟩+≡
```
subroutine cascade_set_add (cascade_set, cascade, ok, cascade_ptr)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), intent(in), target :: cascade
  logical, intent(out) :: ok
  type(cascade_t), optional, pointer :: cascade_ptr
  integer(i8), dimension(1) :: mold
  call cascade_set_hash_insert &
      (cascade_set, transfer (cascade%tree, mold), cascade, ok, cascade_ptr)
  if (ok)  call cascade_set_list_add (cascade_set, cascade)
end subroutine cascade_set_add
```

Add a new cascade to the list:

⟨*Cascades: procedures*⟩+≡
```
subroutine cascade_set_list_add (cascade_set, cascade)
  type(cascade_set_t), intent(inout) :: cascade_set
  type(cascade_t), intent(in), target :: cascade
  if (associated (cascade_set%last)) then
     cascade_set%last%next => cascade
  else
     cascade_set%first => cascade
  end if
  cascade_set%last => cascade
end subroutine cascade_set_list_add
```

Add a cascade entry to the hash array:

⟨*Cascades: procedures*⟩+≡
```
subroutine cascade_set_hash_insert &
      (cascade_set, key, cascade, ok, cascade_ptr)
  type(cascade_set_t), intent(inout), target :: cascade_set
  integer(i8), dimension(:), intent(in) :: key
  type(cascade_t), intent(in), target :: cascade
  logical, intent(out) :: ok
  type(cascade_t), optional, pointer :: cascade_ptr
  integer(i32) :: h
  if (cascade_set%n_entries >= cascade_set%n_entries_max) &
      call cascade_set_hash_expand (cascade_set)
  h = hash (key)
  call cascade_set_hash_insert_rec &
      (cascade_set, h, h, key, cascade, ok, cascade_ptr)
end subroutine cascade_set_hash_insert
```

Double the hashtable size when necesssary:

⟨*Cascades: procedures*⟩+≡
```
subroutine cascade_set_hash_expand (cascade_set)
```

```
      type(cascade_set_t), intent(inout), target :: cascade_set
      type(hash_entry_t), dimension(:), allocatable, target :: table_tmp
      type(cascade_p), pointer :: current
      integer :: i, s
      allocate (table_tmp (0:cascade_set%mask))
      table_tmp = cascade_set%entry
      deallocate (cascade_set%entry)
      s = 2 * size (table_tmp)
      cascade_set%n_entries = 0
      cascade_set%n_entries_max = s * cascade_set%fill_ratio
      cascade_set%mask = s - 1
      allocate (cascade_set%entry (0:cascade_set%mask))
      do i = 0, ubound (table_tmp, 1)
         current => table_tmp(i)%first
         do while (associated (current))
            call cascade_set_hash_insert_rec &
                 (cascade_set, table_tmp(i)%hashval, table_tmp(i)%hashval, &
                  table_tmp(i)%key, current%cascade)
            current => current%next
         end do
      end do
   end subroutine cascade_set_hash_expand
```

Insert the cascade at the bucket determined by the hash value. If the bucket is filled, check first for a collision (unequal keys). In that case, choose the following bucket and repeat. Otherwise, add the cascade to the bucket.

If the bucket is empty, record the hash value, allocate and store the key, and then add the cascade to the bucket.

If ok is present, before insertion we check whether the cascade is already stored, and return failure if yes.

⟨Cascades: procedures⟩+≡

```
   recursive subroutine cascade_set_hash_insert_rec &
        (cascade_set, h, hashval, key, cascade, ok, cascade_ptr)
     type(cascade_set_t), intent(inout) :: cascade_set
     integer(i32), intent(in) :: h, hashval
     integer(i8), dimension(:), intent(in) :: key
     type(cascade_t), intent(in), target :: cascade
     logical, intent(out), optional :: ok
     type(cascade_t), optional, pointer :: cascade_ptr
     integer(i32) :: i
     i = iand (h, cascade_set%mask)
     if (allocated (cascade_set%entry(i)%key)) then
        if (size (cascade_set%entry(i)%key) /= size (key)) then
           call cascade_set_hash_insert_rec &
                (cascade_set, h + 1, hashval, key, cascade, ok, cascade_ptr)
        else if (any (cascade_set%entry(i)%key /= key)) then
           call cascade_set_hash_insert_rec &
                (cascade_set, h + 1, hashval, key, cascade, ok, cascade_ptr)
        else
           call hash_entry_add_cascade_ptr &
                (cascade_set%entry(i), cascade, ok, cascade_ptr)
        end if
     else
```

```
            cascade_set%entry(i)%hashval = hashval
            allocate (cascade_set%entry(i)%key (size (key)))
            cascade_set%entry(i)%key = key
            call hash_entry_add_cascade_ptr &
                 (cascade_set%entry(i), cascade, ok, cascade_ptr)
            cascade_set%n_entries = cascade_set%n_entries + 1
         end if
      end subroutine cascade_set_hash_insert_rec
```

11.7.8   External particles

We want to initialize the cascade set with the outgoing particles. In case of
multiple processes, initial cascades are prepared for all of them. The hash array
check ensures that no particle appears more than once at the same place.

⟨*Cascades: interfaces*⟩+≡
```
      interface cascade_set_add_outgoing
         module procedure cascade_set_add_outgoing1
         module procedure cascade_set_add_outgoing2
      end interface
```

⟨*Cascades: procedures*⟩+≡
```
      subroutine cascade_set_add_outgoing2 (cascade_set, flv)
        type(cascade_set_t), intent(inout), target :: cascade_set
        type(flavor_t), dimension(:,:), intent(in) :: flv
        integer :: pos, prc, n_out, n_prc
        type(cascade_t), pointer :: cascade
        logical :: ok
        n_out = size (flv, dim=1)
        n_prc = size (flv, dim=2)
        do prc = 1, n_prc
           do pos = 1, n_out
              allocate (cascade)
              call cascade_init_outgoing &
                   (cascade, flv(pos,prc), pos, cascade_set%m_threshold_s)
              call cascade_set_add (cascade_set, cascade, ok)
              if (.not. ok) then
                 deallocate (cascade)
              end if
           end do
        end do
      end subroutine cascade_set_add_outgoing2

      subroutine cascade_set_add_outgoing1 (cascade_set, flv)
        type(cascade_set_t), intent(inout), target :: cascade_set
        type(flavor_t), dimension(:), intent(in) :: flv
        integer :: pos, n_out
        type(cascade_t), pointer :: cascade
        logical :: ok
        n_out = size (flv, dim=1)
        do pos = 1, n_out
           allocate (cascade)
           call cascade_init_outgoing &
```

```
                  (cascade, flv(pos), pos, cascade_set%m_threshold_s)
          call cascade_set_add (cascade_set, cascade, ok)
          if (.not. ok) then
              deallocate (cascade)
          end if
      end do
    end subroutine cascade_set_add_outgoing1
```

The incoming particles are added one at a time. Nevertheless, we may have
several processes which are looped over. At the first opportunity, we set the
pointer `first_t` in the cascade set which should point to the first t-channel
cascade.

Return the indices of the first and last cascade generated.

⟨*Cascades: interfaces*⟩+≡
```
    interface cascade_set_add_incoming
        module procedure cascade_set_add_incoming0
        module procedure cascade_set_add_incoming1
    end interface
```

⟨*Cascades: procedures*⟩+≡
```
    subroutine cascade_set_add_incoming1 (cascade_set, n1, n2, pos, flv)
      type(cascade_set_t), intent(inout), target :: cascade_set
      integer, intent(out) :: n1, n2
      integer, intent(in) :: pos
      type(flavor_t), dimension(:), intent(in) :: flv
      integer :: prc, n_prc
      type(cascade_t), pointer :: cascade
      logical :: ok
      n1 = 0
      n2 = 0
      n_prc = size (flv)
      do prc = 1, n_prc
          allocate (cascade)
          call cascade_init_incoming &
              (cascade, flv(prc), pos, cascade_set%m_threshold_t)
          call cascade_set_add (cascade_set, cascade, ok)
          if (ok) then
              if (n1 == 0)  n1 = cascade%index
              n2 = cascade%index
              if (.not. associated (cascade_set%first_t)) then
                  cascade_set%first_t => cascade
              end if
          else
              deallocate (cascade)
          end if
      end do
    end subroutine cascade_set_add_incoming1

    subroutine cascade_set_add_incoming0 (cascade_set, n1, n2, pos, flv)
      type(cascade_set_t), intent(inout), target :: cascade_set
      integer, intent(out) :: n1, n2
      integer, intent(in) :: pos
      type(flavor_t), intent(in) :: flv
```

```
type(cascade_t), pointer :: cascade
logical :: ok
n1 = 0
n2 = 0
allocate (cascade)
call cascade_init_incoming &
     (cascade, flv, pos, cascade_set%m_threshold_t)
call cascade_set_add (cascade_set, cascade, ok)
if (ok) then
   if (n1 == 0)  n1 = cascade%index
   n2 = cascade%index
   if (.not. associated (cascade_set%first_t)) then
      cascade_set%first_t => cascade
   end if
else
   deallocate (cascade)
end if
end subroutine cascade_set_add_incoming0
```

11.7.9   Cascade combination I: flavor assignment

We have two disjunct cascades, now use the vertex table to determine the possible flavors of the combination cascade. For each possibility, try to generate a new cascade. The total cascade depth has to be one less than the limit, because this is reached by setting the keystone.

⟨*Cascades: procedures*⟩+≡

```
subroutine cascade_match_pair (cascade_set, cascade1, cascade2, s_channel)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), intent(in), target :: cascade1, cascade2
  logical, intent(in) :: s_channel
  integer, dimension(:), allocatable :: pdg3
  integer :: i, depth_max
  type(flavor_t) :: flv
  if (s_channel) then
     depth_max = cascade_set%depth_out
  else
     depth_max = cascade_set%depth_tot
  end if
  if (cascade1%depth + cascade2%depth < depth_max) then
     call model_match_vertex (cascade_set%model, &
          flavor_get_pdg (cascade1%flv), &
          flavor_get_pdg (cascade2%flv), &
          pdg3)
     do i = 1, size (pdg3)
        call flavor_init (flv, pdg3(i), cascade_set%model)
        if (s_channel) then
           call cascade_combine_s (cascade_set, cascade1, cascade2, flv)
        else
           call cascade_combine_t (cascade_set, cascade1, cascade2, flv)
        end if
     end do
     deallocate (pdg3)
```

```
            end if
        end subroutine cascade_match_pair
```

The triplet version takes a third cascade, and we check whether this triplet has a matching vertex in the database. If yes, we make a keystone cascade.

⟨*Cascades: procedures*⟩+≡
```
        subroutine cascade_match_triplet &
             (cascade_set, cascade1, cascade2, cascade3, s_channel)
          type(cascade_set_t), intent(inout), target :: cascade_set
          type(cascade_t), intent(in), target :: cascade1, cascade2, cascade3
          logical, intent(in) :: s_channel
          integer :: depth_max
          depth_max = cascade_set%depth_tot
          if (cascade1%depth + cascade2%depth + cascade3%depth == depth_max) then
             if (model_check_vertex (cascade_set%model, &
                   flavor_get_pdg (cascade1%flv), &
                   flavor_get_pdg (cascade2%flv), &
                   flavor_get_pdg (cascade3%flv))) then
                call cascade_combine_keystone &
                     (cascade_set, cascade1, cascade2, cascade3, s_channel)
             end if
          end if
        end subroutine cascade_match_triplet
```

11.7.10 Cascade combination II: kinematics setup and check

Having three matching flavors, we start constructing the combination cascade. We look at the mass hierarchies and determine whether the cascade is to be kept. In passing we set mapping modes, resonance properties and such.

If successful, the cascade is finalized. For a resonant cascade, we prepare in addition a copy without the resonance.

⟨*Cascades: procedures*⟩+≡
```
        subroutine cascade_combine_s (cascade_set, cascade1, cascade2, flv)
          type(cascade_set_t), intent(inout), target :: cascade_set
          type(cascade_t), intent(in), target :: cascade1, cascade2
          type(flavor_t), intent(in) :: flv
          type(cascade_t), pointer :: cascade3, cascade4
          logical :: keep
          keep = .false.
          allocate (cascade3)
          call cascade_init (cascade3, cascade1%depth + cascade2%depth + 1)
          cascade3%bincode = ior (cascade1%bincode, cascade2%bincode)
          cascade3%flv = flavor_anti (flv)
          cascade3%pdg = abs (flavor_get_pdg (cascade3%flv))
          cascade3%is_vector = flavor_get_spin_type (flv) == VECTOR
          cascade3%m_min = cascade1%m_min + cascade2%m_min
          cascade3%m_rea = flavor_get_mass (flv)
          if (cascade3%m_rea > cascade_set%m_threshold_s) then

Here we complete a decay cascade. The third input is the single-particle cascade for the initial particle. There is no resonance or mapping assignment. The only condition for keeping the cascade is the mass sum of the final state, which must be less than the available energy.

Two modifications are necessary for scattering cascades: a pure s-channel diagram (cascade1 is the incoming particle) do not have a logarithmic mapping at top-level. And in a t-channel diagram, the last line exchanged is mapped t-channel, not u-channel. Finally, we can encounter the case of a $2 \rightarrow 1$ process, where cascade1 is incoming, and cascade2 is the outgoing particle. In all three cases we register a new cascade with the modified mapping.

11.7.11 Cascade combination III: node connections and tree fusion

Here we assign global tree properties. If the allowed number of off-shell lines is exceeded, discard the new cascade. Otherwise, assign the trees, sort them, and assign connections. Finally, append the cascade to the list. This may fail (because in the hash array there is already an equivalent cascade). On failure, discard the cascade.

⟨*Cascades: procedures*⟩+≡
```

         cascade4%mother => cascade3
         call cascade_set_add (cascade_set, cascade4, ok)
         if (ok) then
            if (.not. associated (cascade_set%first_k)) then
               cascade_set%first_k => cascade4
            end if
         else
            deallocate (cascade4)
         end if
      end if
  end subroutine cascade_keystone
```

Sort a tree (array of binary codes) and particle code array simultaneously, by ascending binary codes. A convenient method is to use the `maxloc` function iteratively, to find and remove the largest entry in the tree array one by one.

⟨*Cascades: procedures*⟩+≡

```
subroutine tree_sort (tree, pdg, mapping, resonant)
  integer(TC), dimension(:), intent(inout) :: tree
  integer, dimension(:), intent(inout) :: pdg, mapping
  logical, dimension(:), intent(inout) :: resonant
  integer(TC), dimension(size(tree)) :: tree_tmp
  integer, dimension(size(pdg)) :: pdg_tmp, mapping_tmp
  logical, dimension(size(resonant)) :: resonant_tmp
  integer, dimension(1) :: pos
  integer :: i
  tree_tmp = tree
  pdg_tmp = pdg
  mapping_tmp = mapping
  resonant_tmp = resonant
  do i = size(tree),1,-1
     pos = maxloc (tree_tmp)
     tree(i) = tree_tmp (pos(1))
     pdg(i) = pdg_tmp (pos(1))
     mapping(i) = mapping_tmp (pos(1))
     resonant(i) = resonant_tmp (pos(1))
     tree_tmp(pos(1)) = 0
  end do
end subroutine tree_sort
```

11.7.12 Cascade set generation

These procedures loop over cascades and build up the cascade set. After each iteration of the innermost loop, we set a breakpoint.

s-channel: We use a nested scan to combine all cascades with all other cascades.

⟨*Cascades: procedures*⟩+≡

```
subroutine cascade_set_generate_s (cascade_set)
  type(cascade_set_t), intent(inout), target :: cascade_set
  type(cascade_t), pointer :: cascade1, cascade2
  cascade1 => cascade_set%first
  LOOP1: do while (associated (cascade1))
     cascade2 => cascade_set%first
     LOOP2: do while (associated (cascade2))
        if (cascade2%index >= cascade1%index)  exit LOOP2
        if (cascade1 .disjunct. cascade2) then
           call cascade_match_pair (cascade_set, cascade1, cascade2, .true.)
        end if
        call terminate_now_if_signal ()
        cascade2 => cascade2%next
     end do LOOP2
     cascade1 => cascade1%next
  end do LOOP1
end subroutine cascade_set_generate_s
```

The t-channel cascades are directed and have a seed (one of the incoming particles) and a target (the other one). We loop over all possible seeds and targets. Inside this, we loop over all t-channel cascades (cascade1) and s-channel cascades (cascade2) and try to combine them.

⟨*Cascades: procedures*⟩+≡

```
subroutine cascade_set_generate_t (cascade_set, pos_seed, pos_target)
  type(cascade_set_t), intent(inout), target :: cascade_set
  integer, intent(in) :: pos_seed, pos_target
  type(cascade_t), pointer :: cascade_seed, cascade_target
  type(cascade_t), pointer :: cascade1, cascade2
  integer(TC) :: bc_seed, bc_target
  bc_seed = ibset (0_TC, pos_seed-1)
  bc_target = ibset (0_TC, pos_target-1)
  cascade_seed => cascade_set%first_t
  LOOP_SEED: do while (associated (cascade_seed))
     if (cascade_seed%bincode == bc_seed) then
        cascade_target => cascade_set%first_t
        LOOP_TARGET: do while (associated (cascade_target))
           if (cascade_target%bincode == bc_target) then
              cascade1 => cascade_set%first_t
              LOOP_T: do while (associated (cascade1))
                 if ((cascade1 .disjunct. cascade_target) &
                      .and. .not. (cascade1 .disjunct. cascade_seed)) then
                    cascade2 => cascade_set%first
                    LOOP_S: do while (associated (cascade2))
                       if ((cascade2 .disjunct. cascade_target) &
                            .and. (cascade2 .disjunct. cascade1)) then
                          call cascade_match_pair &
                               (cascade_set, cascade1, cascade2, .false.)
                       end if
                       call terminate_now_if_signal ()
                       cascade2 => cascade2%next
                    end do LOOP_S
                 end if
                 call terminate_now_if_signal ()
                 cascade1 => cascade1%next
              end do LOOP_T
           end if
           call terminate_now_if_signal ()
           cascade_target => cascade_target%next
        end do LOOP_TARGET
     end if
     call terminate_now_if_signal ()
     cascade_seed => cascade_seed%next
  end do LOOP_SEED
end subroutine cascade_set_generate_t
```

This part completes the phase space for decay processes. It is similar to s-channel cascade generation, but combines two cascade with the particular cascade of the incoming particle. This particular cascade is expected to be pointed at by `first_t`.

⟨*Cascades: procedures*⟩+≡

```
subroutine cascade_set_generate_decay (cascade_set)
```

```
      type(cascade_set_t), intent(inout), target :: cascade_set
      type(cascade_t), pointer :: cascade1, cascade2
      type(cascade_t), pointer :: cascade_in
      cascade_in => cascade_set%first_t
      cascade1 => cascade_set%first
      do while (associated (cascade1))
         if (cascade1 .disjunct. cascade_in) then
            cascade2 => cascade1%next
            do while (associated (cascade2))
               if ((cascade2 .disjunct. cascade1) &
                    .and. (cascade2 .disjunct. cascade_in)) then
                  call cascade_match_triplet (cascade_set, &
                       cascade1, cascade2, cascade_in, .true.)
               end if
               call terminate_now_if_signal ()
               cascade2 => cascade2%next
            end do
         end if
         call terminate_now_if_signal ()
         cascade1 => cascade1%next
      end do
    end subroutine cascade_set_generate_decay
```

This part completes the phase space for scattering processes. We combine a t-channel cascade (containing the seed) with a s-channel cascade and the target.

⟨*Cascades: procedures*⟩+≡

```
    subroutine cascade_set_generate_scattering &
        (cascade_set, ns1, ns2, nt1, nt2, pos_seed, pos_target)
      type(cascade_set_t), intent(inout), target :: cascade_set
      integer, intent(in) :: pos_seed, pos_target
      integer, intent(in) :: ns1, ns2, nt1, nt2
      type(cascade_t), pointer :: cascade_seed, cascade_target
      type(cascade_t), pointer :: cascade1, cascade2
      integer(TC) :: bc_seed, bc_target
      bc_seed = ibset (0_TC, pos_seed-1)
      bc_target = ibset (0_TC, pos_target-1)
      cascade_seed => cascade_set%first_t
      LOOP_SEED: do while (associated (cascade_seed))
         if (cascade_seed%index < ns1) then
            cascade_seed => cascade_seed%next
            cycle LOOP_SEED
         else if (cascade_seed%index > ns2) then
            exit LOOP_SEED
         else if (cascade_seed%bincode == bc_seed) then
            cascade_target => cascade_set%first_t
            LOOP_TARGET: do while (associated (cascade_target))
               if (cascade_target%index < nt1) then
                  cascade_target => cascade_target%next
                  cycle LOOP_TARGET
               else if (cascade_target%index > nt2) then
                  exit LOOP_TARGET
               else if (cascade_target%bincode == bc_target) then
                  cascade1 => cascade_set%first_t
```

```
                        LOOP_T: do while (associated (cascade1))
                           if ((cascade1 .disjunct. cascade_target) &
                                .and. .not. (cascade1 .disjunct. cascade_seed)) then
                              cascade2 => cascade_set%first
                              LOOP_S: do while (associated (cascade2))
                                 if ((cascade2 .disjunct. cascade_target) &
                                      .and. (cascade2 .disjunct. cascade1)) then
                                    call cascade_match_triplet (cascade_set, &
                                         cascade1, cascade2, cascade_target, .false.)
                                 end if
                                 call terminate_now_if_signal ()
                                 cascade2 => cascade2%next
                              end do LOOP_S
                           end if
                           call terminate_now_if_signal ()
                           cascade1 => cascade1%next
                        end do LOOP_T
                     end if
                     call terminate_now_if_signal ()
                     cascade_target => cascade_target%next
                  end do LOOP_TARGET
               end if
               call terminate_now_if_signal ()
               cascade_seed => cascade_seed%next
            end do LOOP_SEED
       end subroutine cascade_set_generate_scattering
```

11.7.13 Groves

Before assigning groves, assign hashcodes to the resonance patterns, so they can
easily be compared.

⟨*Cascades: procedures*⟩+≡
```
    subroutine cascade_set_assign_resonance_hash (cascade_set)
      type(cascade_set_t), intent(inout) :: cascade_set
      type(cascade_t), pointer :: cascade
      cascade => cascade_set%first_k
      do while (associated (cascade))
         call cascade_assign_resonance_hash (cascade)
         cascade => cascade%next
      end do
    end subroutine cascade_set_assign_resonance_hash
```

After all cascades are recorded, we group the complete cascades in groves. A
grove consists of cascades with identical multiplicity, number of resonances, log-
enhanced, t-channel lines, and resonance flavors.

⟨*Cascades: procedures*⟩+≡
```
    subroutine cascade_set_assign_groves (cascade_set)
      type(cascade_set_t), intent(inout), target :: cascade_set
      type(cascade_t), pointer :: cascade1, cascade2
      integer :: multiplicity
      integer :: n_resonances, n_log_enhanced, n_t_channel, n_off_shell
      integer :: res_hash
```

```
      integer :: grove
      grove = 0
      cascade1 => cascade_set%first_k
      do while (associated (cascade1))
         if (cascade1%active .and. cascade1%complete &
              .and. cascade1%grove == 0) then
            grove = grove + 1
            cascade1%grove = grove
            multiplicity = cascade1%multiplicity
            n_resonances = cascade1%n_resonances
            n_log_enhanced = cascade1%n_log_enhanced
            n_off_shell = cascade1%n_off_shell
            n_t_channel = cascade1%n_t_channel
            res_hash = cascade1%res_hash
            cascade2 => cascade1%next
            do while (associated (cascade2))
               if (cascade2%grove == 0) then
                  if (cascade2%multiplicity == multiplicity &
                       .and. cascade2%n_resonances == n_resonances &
                       .and. cascade2%n_log_enhanced == n_log_enhanced &
                       .and. cascade2%n_off_shell == n_off_shell &
                       .and. cascade2%n_t_channel == n_t_channel &
                       .and. cascade2%res_hash == res_hash) then
                     cascade2%grove = grove
                  end if
               end if
               call terminate_now_if_signal ()
               cascade2 => cascade2%next
            end do
         end if
         call terminate_now_if_signal ()
         cascade1 => cascade1%next
      end do
      cascade_set%n_groves = grove
    end subroutine cascade_set_assign_groves
```

11.7.14 Generate the phase space file

Generate a complete phase space configuration.

For each flavor assignment: First, all s-channel graphs that can be built up from the outgoing particles. Then we distinguish (1) decay, where we complete the s-channel graphs by connecting to the input line, and (2) scattering, where we now generate t-channel graphs by introducing an incoming particle, and complete this by connecting to the other incoming particle.

After all cascade sets have been generated, merge them into a common set. This eliminates redunancies between flavor assignments.

⟨*Cascades: public*⟩+≡
```
    public :: cascade_set_generate
```

⟨*Cascades: procedures*⟩+≡
```
    subroutine cascade_set_generate &
        (cascade_set, model, n_in, n_out, flv, phs_par, fatal_beam_decay)
```

```
type(cascade_set_t), intent(out) :: cascade_set
type(model_t), intent(in), target :: model
integer, intent(in) :: n_in, n_out
type(flavor_t), dimension(:,:), intent(in) :: flv
type(phs_parameters_t), intent(in) :: phs_par
logical, intent(in) :: fatal_beam_decay
type(cascade_set_t), dimension(:), allocatable :: cset
type(cascade_t), pointer :: cascade
integer :: i
if (phase_space_vanishes (phs_par%sqrts, n_in, flv))  return
call cascade_set_init (cascade_set, model, n_in, n_out, phs_par, &
   fatal_beam_decay, flv)
allocate (cset (size (flv, 2)))
do i = 1, size (cset)
   call cascade_set_generate_single (cset(i), &
        model, n_in, n_out, flv(:,i), phs_par, fatal_beam_decay)
   cascade => cset(i)%first_k
   do while (associated (cascade))
      if (cascade%active .and. cascade%complete) then
         call cascade_set_add_copy (cascade_set, cascade)
      end if
      cascade => cascade%next
   end do
   call cascade_set_final (cset(i))
end do
cascade_set%first_k => cascade_set%first
call cascade_set_assign_resonance_hash (cascade_set)
call cascade_set_assign_groves (cascade_set)
end subroutine cascade_set_generate
```

This generates phase space for a single channel, without assigning groves.

⟨*Cascades: procedures*⟩+≡

```
subroutine cascade_set_generate_single (cascade_set, &
   model, n_in, n_out, flv, phs_par, fatal_beam_decay)
  type(cascade_set_t), intent(out) :: cascade_set
  type(model_t), intent(in), target :: model
  integer, intent(in) :: n_in, n_out
  type(flavor_t), dimension(:), intent(in) :: flv
  type(phs_parameters_t), intent(in) :: phs_par
  logical, intent(in) :: fatal_beam_decay
  integer :: n11, n12, n21, n22
  call cascade_set_init (cascade_set, model, n_in, n_out, phs_par, &
     fatal_beam_decay)
  call cascade_set_add_outgoing (cascade_set, flv(n_in+1:))
  call cascade_set_generate_s (cascade_set)
  select case (n_in)

11.8 WOOD phase space

This is the module that interfaces the `phs_forests` phase-space treatment and
the `cascades` module for generating phase-space channels. As an extension of
the `phs_base` abstract type, the phase-space configuration and instance imple-
ment the standard API.

(Currently, this is the only generic phase-space implementation of WHIZARD.
For trivial two-particle phase space, there is `phs_wood` as an alternative.)

    end subroutine phs_wood_config_set_input
```

11.8.2 Phase-space generation

This subroutine generates a phase space configuration using the `cascades` module. Note that this may take time, and the `cascade_set` subobject may consume a large amount of memory.

⟨*PHS wood: phs wood config: TBP*⟩+≡
```
    procedure :: generate_phase_space => phs_wood_config_generate_phase_space
```

⟨*PHS wood: procedures*⟩+≡
```
    subroutine phs_wood_config_generate_phase_space (phs_config)
      class(phs_wood_config_t), intent(inout) :: phs_config
      integer :: off_shell, extra_off_shell
      call msg_message ("Phase space: generating configuration ...")
      off_shell = phs_config%par%off_shell
      allocate (phs_config%cascade_set)
      do extra_off_shell = 0, max (phs_config%n_tot - 3, 0)
         phs_config%par%off_shell = off_shell + extra_off_shell
         call cascade_set_generate (phs_config%cascade_set, &
             phs_config%model, phs_config%n_in, phs_config%n_out, &
             phs_config%flv, &
             phs_config%par, phs_config%fatal_beam_decay)
         if (cascade_set_is_valid (phs_config%cascade_set)) then
            exit
         else
            call msg_message ("Phase space: ... failed.  &
                &Increasing phs_off_shell ...")
         end if
      end do
```

```
        if (cascade_set_is_valid (phs_config%cascade_set)) then
           call msg_message ("Phase space: ... success.")
        else
           call msg_fatal ("Phase-space: generation failed")
        end if
     end subroutine phs_wood_config_generate_phase_space
```

Using the generated phase-space configuration, write an appropriate phase-space
file to the stored (or explicitly specified) I/O unit.

⟨*PHS wood: phs wood config: TBP*⟩+≡
```
     procedure :: write_phase_space => phs_wood_config_write_phase_space
```

⟨*PHS wood: procedures*⟩+≡
```

```

11.8.3 Phase-space configuration

We read the phase-space configuration from the stored I/O unit. If this is not set, we assume that we have to generate a phase space configuration. When done, we open a scratch file and write the configuration.

If `rebuild` is set, we should trash any existing phase space file and build a new one. Otherwise, we try to use an old one, which we check for existence and integrity. If `ignore_mismatch` is set, we reuse an existing file even if it does not match the current setup.

⟨*PHS wood: phs wood config: TBP*⟩+≡

         end if
      end do
    end subroutine phs_wood_config_record_on_shell
```

The MD5 sum of the forest is computed in addition to the MD5 sum of the configuration. The reason is that the forest may depend on a user-provided external file. On the other hand, this MD5 sum encodes all information that is relevant for further processing. Therefore, the `get_md5sum` method returns this result, once it is available.

⟨*PHS wood: phs wood config: TBP*⟩+≡
```
    procedure :: compute_md5sum_forest => phs_wood_config_compute_md5sum_forest
```

⟨*PHS wood: procedures*⟩+≡
```
    subroutine phs_wood_config_compute_md5sum_forest (phs_config)
      class(phs_wood_config_t), intent(inout) :: phs_config
      integer :: u
      u = free_unit ()
      open (u, status = "scratch", action = "readwrite")
      call phs_config%write_forest (u)
      rewind (u)
      phs_config%md5sum_forest = md5sum (u)
      close (u)
    end subroutine phs_wood_config_compute_md5sum_forest
```

Return the most relevant MD5 sum. This overrides the method of the base type.

⟨*PHS wood: phs wood config: TBP*⟩+≡
```
    procedure :: get_md5sum => phs_wood_config_get_md5sum
```

⟨*PHS wood: procedures*⟩+≡
```
   function phs_wood_config_get_md5sum (phs_config) result (md5sum)

     else
        md5sum = phs_config%md5sum_phs_config
     end if
   end function phs_wood_config_get_md5sum
```

Check whether a phase-space configuration for the current process exists. We
look for the phase-space file that should correspond to the current process. If
we find it, we check the MD5 sums stored in the file against the MD5 sums in
the current configuration (if required).

   If successful, read the PHS file.

⟨*PHS wood: phs wood config: TBP*⟩+≡

      allocate (phs_wood_t :: phs)
    end subroutine phs_wood_config_allocate_instance
```

11.8.4 Kinematics implementation

We generate $\cos\theta$ and ϕ uniformly, covering the solid angle.

⟨*PHS wood: public*⟩+≡
```
public :: phs_wood_t
```

⟨*PHS wood: types*⟩+≡
```
type, extends (phs_t) :: phs_wood_t
  real(default) :: sqrts = 0
  type(phs_forest_t) :: forest
 contains
 ⟨PHS wood: phs wood: TBP⟩
end type phs_wood_t
```

Output. The `verbose` setting is irrelevant, we just display the contents of the base object.

⟨*PHS wood: phs wood: TBP*⟩≡
```
procedure :: write => phs_wood_write
```

⟨*PHS wood: procedures*⟩+≡
```
subroutine phs_wood_write (object, unit, verbose)
  class(phs_wood_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose
  integer :: u
  u = output_unit (unit)
  call object%base_write (u)
end subroutine phs_wood_write
```

Write the forest separately.

⟨*PHS wood: phs wood: TBP*⟩+≡
```
procedure :: write_forest => phs_wood_write_forest
```

⟨*PHS wood: procedures*⟩+≡
```
subroutine phs_wood_write_forest (object, unit)
  class(phs_wood_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
  call phs_forest_write (object%forest, u)
end subroutine phs_wood_write_forest
```

Finalizer.

⟨*PHS wood: phs wood: TBP*⟩+≡
```
procedure :: final => phs_wood_final
```

⟨*PHS wood: procedures*⟩+≡
```
subroutine phs_wood_final (object)
  class(phs_wood_t), intent(inout) :: object
  call phs_forest_final (object%forest)
end subroutine phs_wood_final
```

Initialization. We allocate arrays (`base_init`) and adjust the phase-space volume. The two-particle phase space volume is

$$\Phi_2 = \frac{1}{4(2\pi)^5} = 2.55294034614 \times 10^{-5} \tag{11.64}$$

independent of the particle masses.

⟨*PHS wood: phs wood: TBP*⟩+≡
```
procedure :: init => phs_wood_init
```

⟨*PHS wood: procedures*⟩+≡
```
subroutine phs_wood_init (phs, phs_config)
  class(phs_wood_t), intent(out) :: phs
  class(phs_config_t), intent(in), target :: phs_config
  call phs%base_init (phs_config)
  select type (phs_config)
  type is (phs_wood_config_t)
     phs%forest = phs_config%forest
  end select
end subroutine phs_wood_init
```

11.8.5 Evaluation

We compute the outgoing momenta from the incoming momenta and the input parameter set `r_in` in channel `r_in`. We also compute the `r` parameters and Jacobians `f` for all other channels.

We do *not* need to a apply a transformation from/to the c.m. frame, because in `phs_base` the momenta are already boosted to the c.m. frame before assigning them in the `phs` object, and inversely boosted when extracting them.

⟨*PHS wood: phs wood: TBP*⟩+≡
```
procedure :: evaluate_selected_channel => phs_wood_evaluate_selected_channel
procedure :: evaluate_other_channels => phs_wood_evaluate_other_channels
```

⟨*PHS wood: procedures*⟩+≡
```

Chapter 12

Random Number Generation

The integration and event generation modules need a random-number generator. Here, we provide an abstract interface for a random-number generator and a concrete implementation.

Module `rng_base`: Abstract type for interfacing or implementing a r.n.g.

Module `rng_tao`: Implementation as an interface to the TAO random number generator which the VAMP package provides.

Module `selectors`: Select from a range of integers based on a set of weights and a random-number generator.

12.1 Generic Random-Number Generator

For all generator implementations, we define a `rng` type which represents the state of a random-number generator with the associated methods that produce a random number. Furthermore, we define a `rng_factory` type. An object of this type is capable of allocating a sequence of `rng` objects. These generator states should be, if possible, statistically independent, so they can be used in parallel in different places of the event-generation chain.

⟨`rng_base.f90`⟩≡
  ⟨*File header*⟩

  module rng_base

    use kinds !NODEP!
  ⟨*Use file utils*⟩
    use unit_tests

  ⟨*Standard module head*⟩

  ⟨*RNG base: public*⟩

  ⟨*RNG base: types*⟩

⟨*RNG base: interfaces*⟩

⟨*RNG base: test types*⟩

```
contains
```

⟨*RNG base: tests*⟩

```
end module rng_base
```

12.1.1 Generator type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

⟨*RNG base: public*⟩≡
```
    public :: rng_t
```

⟨*RNG base: types*⟩≡
```
    type, abstract :: rng_t
     contains
    ⟨RNG base: rng: TBP⟩
    end type rng_t
```

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The behavior without seed is not defined, however.

⟨*RNG base: rng: TBP*⟩≡
```
    procedure (rng_init), deferred :: init
```

⟨*RNG base: interfaces*⟩≡
```
    abstract interface
       subroutine rng_init (rng, seed)
         import
         class(rng_t), intent(out) :: rng
         integer, intent(in), optional :: seed
       end subroutine rng_init
    end interface
```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

⟨*RNG base: rng: TBP*⟩+≡
```
    procedure (rng_final), deferred :: final
```

⟨*RNG base: interfaces*⟩+≡
```
    abstract interface
       subroutine rng_final (rng)
         import
         class(rng_t), intent(inout) :: rng
       end subroutine rng_final
    end interface
```

Output. We should, at least, identify the generator.

⟨*RNG base: rng: TBP*⟩+≡
```
procedure (rng_write), deferred :: write
```

⟨*RNG base: interfaces*⟩+≡
```
abstract interface
   subroutine rng_write (rng, unit, indent)
     import
     class(rng_t), intent(in) :: rng
     integer, intent(in), optional :: unit, indent
   end subroutine rng_write
end interface
```

These routines generate a single and an array of default-precision random numbers, respectively.

⟨*RNG base: rng: TBP*⟩+≡
```
generic :: generate => generate_single, generate_array
procedure (rng_generate_single), deferred :: generate_single
procedure (rng_generate_array), deferred :: generate_array
```

⟨*RNG base: interfaces*⟩+≡
```
abstract interface
   subroutine rng_generate_single (rng, x)
     import
     class(rng_t), intent(inout) :: rng
     real(default), intent(out) :: x
   end subroutine rng_generate_single
end interface

abstract interface
   subroutine rng_generate_array (rng, x)
     import
     class(rng_t), intent(inout) :: rng
     real(default), dimension(:), intent(out) :: x
   end subroutine rng_generate_array
end interface
```

12.1.2 RNG Factory

A factory object has a `make` method that allocates and initializes a new generator of appropriate type. It uses a 16-bit integer for initialization. For a real-life implementation, the factory should return a sequence of statistically independent generators, and for different seeds, the sequences should also be independent.

⟨*RNG base: public*⟩+≡
```
public :: rng_factory_t
```

⟨*RNG base: types*⟩+≡
```
type, abstract :: rng_factory_t
 contains
 ⟨RNG base: rng factory: TBP⟩
end type rng_factory_t
```

Output. Should be short, just report the seed and current state of the factory.

⟨RNG base: rng factory: TBP⟩≡
```
    procedure (rng_factory_write), deferred :: write
```

⟨RNG base: interfaces⟩+≡
```
    abstract interface
       subroutine rng_factory_write (object, unit)
         import
         class(rng_factory_t), intent(in) :: object
         integer, intent(in), optional :: unit
       end subroutine rng_factory_write
    end interface
```

Initialize. It should be possible to do this repeatedly, resetting the state. The default seed should be 0.

⟨RNG base: rng factory: TBP⟩+≡
```
    procedure (rng_factory_init), deferred :: init
```

⟨RNG base: interfaces⟩+≡
```
    abstract interface
       subroutine rng_factory_init (factory, seed)
         import
         class(rng_factory_t), intent(out) :: factory
         integer(i16), intent(in), optional :: seed
       end subroutine rng_factory_init
    end interface
```

Spawn a new generator.

⟨RNG base: rng factory: TBP⟩+≡
```
    procedure (rng_factory_make), deferred :: make
```

⟨RNG base: interfaces⟩+≡
```
    abstract interface
       subroutine rng_factory_make (factory, rng)
         import
         class(rng_factory_t), intent(inout) :: factory
         class(rng_t), intent(out), allocatable :: rng
       end subroutine rng_factory_make
    end interface
```

12.1.3   Unit tests

⟨RNG base: public⟩+≡
```
    public :: rng_base_test
```

⟨RNG base: tests⟩≡
```
    subroutine rng_base_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
⟨RNG base: execute tests⟩
```
    end subroutine rng_base_test
```

1565

Test generator

The test 'mock' random generator generates a repeating series with the numbers
$0.1, 0.3, 0.5, 0.7, 0.9$. It has an integer stored as state. The integer must be one
of $1, 3, 5, 7, 9$.

⟨*RNG base: public*⟩+≡

```
    public :: rng_test_t
```

⟨*RNG base: test types*⟩≡

```
    type, extends (rng_t) :: rng_test_t
      integer :: state = 1
    contains
      procedure :: write => rng_test_write
      procedure :: init => rng_test_init
      procedure :: final => rng_test_final
      procedure :: generate_single => rng_test_generate_single
      procedure :: generate_array => rng_test_generate_array
    end type rng_test_t
```

Output. The state is a single number, so print it.

⟨*RNG base: tests*⟩+≡

```
    subroutine rng_test_write (rng, unit, indent)
      class(rng_test_t), intent(in) :: rng
      integer, intent(in), optional :: unit, indent
      integer :: u, ind
      u = output_unit (unit)
      ind = 0;  if (present (indent))  ind = indent
      call write_indent (u, ind)
      write (u, "(A,I0,A)")  "Random-number generator: &
           &test (state = ", rng%state, ")"
    end subroutine rng_test_write
```

The default seed is 1.

⟨*RNG base: tests*⟩+≡

```
    subroutine rng_test_init (rng, seed)
      class(rng_test_t), intent(out) :: rng
      integer, intent(in), optional :: seed
      if (present (seed))  rng%state = seed
    end subroutine rng_test_init
```

Nothing to finalize:

⟨*RNG base: tests*⟩+≡

```
    subroutine rng_test_final (rng)
      class(rng_test_t), intent(inout) :: rng
    end subroutine rng_test_final
```

Generate a single number and advance the state.

⟨*RNG base: tests*⟩+≡

```
    subroutine rng_test_generate_single (rng, x)
      class(rng_test_t), intent(inout) :: rng
      real(default), intent(out) :: x
      x = rng%state / 10._default
```

1566

```
      rng%state = mod (rng%state + 2, 10)
    end subroutine rng_test_generate_single
```

The array generator calls the single-item generator multiple times.

⟨*RNG base: tests*⟩+≡
```
    subroutine rng_test_generate_array (rng, x)
      class(rng_test_t), intent(inout) :: rng
      real(default), dimension(:), intent(out) :: x
      integer :: i
      do i = 1, size (x)
         call rng%generate (x(i))
      end do
    end subroutine rng_test_generate_array
```

Test Factory

This factory makes `rng_test_t` generators, initialized with integers 1, 3, 5, 7, 9 if given the input 0, 1, 2, 3, 4. The generators within one sequence are all identical, however.

⟨*RNG base: public*⟩+≡
```
    public :: rng_test_factory_t
```

⟨*RNG base: test types*⟩+≡
```
    type, extends (rng_factory_t) :: rng_test_factory_t
       integer :: seed = 1
     contains
     ⟨RNG base: rng test factory: TBP⟩
    end type rng_test_factory_t
```

Output.

⟨*RNG base: rng test factory: TBP*⟩≡
```
    procedure :: write => rng_test_factory_write
```

⟨*RNG base: tests*⟩+≡
```
    subroutine rng_test_factory_write (object, unit)
      class(rng_test_factory_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      write (u, "(1x,A,I0,A)")  "RNG factory: test (", object%seed, ")"
    end subroutine rng_test_factory_write
```

Initialize, translating the given seed.

⟨*RNG base: rng test factory: TBP*⟩+≡
```
    procedure :: init => rng_test_factory_init
```

⟨*RNG base: tests*⟩+≡
```
    subroutine rng_test_factory_init (factory, seed)
      class(rng_test_factory_t), intent(out) :: factory
      integer(i16), intent(in), optional :: seed
      if (present (seed))  factory%seed = mod (seed * 2 + 1, 10)
    end subroutine rng_test_factory_init
```

⟨*RNG base: rng test factory: TBP*⟩+≡

```
    procedure :: make => rng_test_factory_make
```

⟨*RNG base: tests*⟩+≡

```
    subroutine rng_test_factory_make (factory, rng)
      class(rng_test_factory_t), intent(inout) :: factory
      class(rng_t), intent(out), allocatable :: rng
      allocate (rng_test_t :: rng)
      select type (rng)
      type is (rng_test_t)
         call rng%init (int (factory%seed))
      end select
    end subroutine rng_test_factory_make
```

Generator check

Initialize the generator and draw random numbers.

⟨*RNG base: execute tests*⟩≡

     call rng_factory%write (u)

     write (u, "(A)")
     write (u, "(A)")  "* Make a generator"
     write (u, "(A)")

     call rng_factory%make (rng)
     call rng%write (u)

     write (u, "(A)")
     write (u, "(A)")  "* Cleanup"

     call rng%final ()

     write (u, "(A)")
     write (u, "(A)")  "* Test output end: rng_base_2"

   end subroutine rng_base_2
```

12.2 TAO Random-Number Generator

This module provides an implementation for the generic random-number generator. Actually, we interface the TAO random-number generator which is available via the VAMP package.

⟨rng_tao.f90⟩≡
  ⟨File header⟩

  module rng_tao

    use kinds !NODEP!
  ⟨Use file utils⟩
    use unit_tests
    use tao_random_numbers !NODEP!

    use rng_base

  ⟨Standard module head⟩

  ⟨RNG tao: public⟩

  ⟨RNG tao: types⟩

  contains

  ⟨RNG tao: procedures⟩

  ⟨RNG tao: tests⟩

  end module rng_tao

12.2.1 Generator type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

We keep the seed, in case we want to recover it later, and count the number of calls since seeding.

⟨RNG tao: public⟩≡
    public :: rng_tao_t

⟨RNG tao: types⟩≡
    type, extends (rng_t) :: rng_tao_t
       integer :: seed = 0
       integer :: n_calls = 0
       type(tao_random_state) :: state
     contains
     ⟨RNG tao: rng tao: TBP⟩
    end type rng_tao_t

1570

Output: Display seed and number of calls.

⟨RNG tao: rng tao: TBP⟩≡
```
procedure :: write => rng_tao_write
```

⟨RNG tao: procedures⟩≡
```
subroutine rng_tao_write (rng, unit, indent)
  class(rng_tao_t), intent(in) :: rng
  integer, intent(in), optional :: unit, indent
  integer :: u, ind
  u = output_unit (unit)
  ind = 0;  if (present (indent))  ind = indent
  call write_indent (u, ind)
  write (u, "(A)")  "TAO random-number generator:"
  call write_indent (u, ind)
  write (u, "(2x,A,I0)")  "seed  = ", rng%seed
  call write_indent (u, ind)
  write (u, "(2x,A,I0)")  "calls = ", rng%n_calls
end subroutine rng_tao_write
```

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The default seed is 0.

⟨RNG tao: rng tao: TBP⟩+≡
```
procedure :: init => rng_tao_init
```

⟨RNG tao: procedures⟩+≡
```
subroutine rng_tao_init (rng, seed)
  class(rng_tao_t), intent(out) :: rng
  integer, intent(in), optional :: seed
  if (present (seed))  rng%seed = seed
  call tao_random_create (rng%state, rng%seed)
end subroutine rng_tao_init
```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

⟨RNG tao: rng tao: TBP⟩+≡
```
procedure :: final => rng_tao_final
```

⟨RNG tao: procedures⟩+≡
```
subroutine rng_tao_final (rng)
  class(rng_tao_t), intent(inout) :: rng
  call tao_random_destroy (rng%state)
end subroutine rng_tao_final
```

These routines generate a single and an array of default-precision random numbers, respectively.

We have to convert from explicit double to abstract default precision. Under normal conditions, both are equivalent, however. Unless, someone decides to do single precision, there is always an interface for `tao_random_numbers`.

⟨RNG tao: rng tao: TBP⟩+≡
```
procedure :: generate_single => rng_tao_generate_single
procedure :: generate_array => rng_tao_generate_array
```

⟨*RNG tao: procedures*⟩+≡
```
    subroutine rng_tao_generate_single (rng, x)
      class(rng_tao_t), intent(inout) :: rng
      real(default), intent(out) :: x
      real(default) :: r
      call tao_random_number (rng%state, r)
      x = r

```

Factory

This factory makes `rng_tao_t` generators, initialized with the seeds

$$s_i = s_0 * 2^{16} + i \tag{12.1}$$

where s_0 is the seed (a 16-bit integer) given to the factory object, and i is the index in the generated sequence of generators, starting with zero.

⟨*RNG tao: public*⟩+≡

  end module selectors
```

12.3.1   Selector type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

⟨Selectors: public⟩≡
```
    public :: selector_t
```

⟨Selectors: types⟩≡
```
    type :: selector_t
       integer, dimension(:), allocatable :: map
       real(default), dimension(:), allocatable :: weight
       real(default), dimension(:), allocatable :: acc
     contains
     ⟨Selectors: selector: TBP⟩
  end type selector_t
```

Display contents.

⟨Selectors: selector: TBP⟩≡
```
    procedure :: write => selector_write
```

⟨Selectors: procedures⟩≡
```
    subroutine selector_write (object, unit)
      class(selector_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u, i
      u = output_unit (unit)
      write (u, "(1x,A)")  "Selector: i, weight, acc. weight"
      if (allocated (object%weight)) then
         do i = 1, size (object%weight)
            write (u, "(3x,I0,1x,ES19.12,1x,ES19.12)") &
                 object%map(i), object%weight(i), object%acc(i)
         end do
      else
         write (u, "(3x,A)")  "[undefined]"
      end if
    end subroutine selector_write
```

We pack the input weight array such that zero-weight entries are removed. We also normalize it. This makes a `map` array for mapping the selected weight to the actual entry necessary.

⟨Selectors: selector: TBP⟩+≡
```
    procedure :: init => selector_init
```

⟨Selectors: procedures⟩+≡
```
    subroutine selector_init (selector, weight)
      class(selector_t), intent(out) :: selector
      real(default), dimension(:), intent(in) :: weight
      real(default) :: s
      integer :: n, i
      logical, dimension(:), allocatable :: mask
      if (size (weight) == 0) &
           call msg_bug ("Selector init: zero-size weight array")
      if (any (weight < 0)) &
           call msg_bug ("Selector init: negative weight")
      s = sum (weight)
      if (s == 0) &
           call msg_bug ("Selector init: all weights are zero")
      allocate (mask (size (weight)), &
```

```
         source = weight /= 0)
    n = count (mask)
    allocate (selector%map (n), &
         source = pack ([(i, i = 1, size (weight))], mask))
    allocate (selector%weight (n), &
         source = pack (weight / s, mask))
    allocate (selector%acc (n))
    selector%acc(1) = selector%weight(1)
    do i = 2, n - 1
        selector%acc(i) = selector%acc(i-1) + selector%weight(i)
    end do
    selector%acc(n) = 1
end subroutine selector_init
```

Select an entry based upon the number x, which should be a uniformly distributed random number between 0 and 1.

⟨*Selectors: selector: TBP*⟩+≡
```
    procedure :: select => selector_select
```

⟨*Selectors: procedures*⟩+≡
```
    function selector_select (selector, x) result (n)
      class(selector_t), intent(in) :: selector
      real(default), intent(in) :: x
      integer :: n
      integer :: i
      if (x < 0 .or. x > 1) &
          call msg_bug ("Selector: random number out of range")
      do i = 1, size (selector%acc)
         if (x <= selector%acc(i))  exit
      end do
      n = selector%map(i)
    end function selector_select
```

Use the provided random-number generator to select an entry. (Unless there is only one entry.)

⟨*Selectors: selector: TBP*⟩+≡
```
    procedure :: generate => selector_generate
```

⟨*Selectors: procedures*⟩+≡
```
    subroutine selector_generate (selector, rng, n)
      class(selector_t), intent(in) :: selector
      class(rng_t), intent(inout) :: rng
      integer, intent(out) :: n
      real(default) :: x
      select case (size (selector%acc))
      case (1);  n = 1
      case default
         call rng%generate (x)
         n = selector%select (x)
      end select
    end subroutine selector_generate
```

Determine the normalized weight for a selected entry. We use a linear search for the inverse lookup, assuming that efficiency is not an issue for this function.

⟨*Selectors: selector: TBP*⟩+≡
```
    procedure :: get_weight => selector_get_weight
```

⟨*Selectors: procedures*⟩+≡
```
    function selector_get_weight (selector, n) result (weight)
      class(selector_t), intent(in) :: selector
      integer, intent(in) :: n
      real(default) :: weight
      integer :: i
      do i = 1, size (selector%weight)
         if (selector%map(i) == n) then
            weight = selector%weight(i)
            return
         end if
      end do
      weight = 0
    end function selector_get_weight
```

Chapter 13

Multi-Channel Integration

In this chapter we provide a generic module for handling multi-channel phase space and concrete implementations.

Module `mci_base`**:** The abstract types and their methods. It provides a test integrator that is referenced in later unit tests.

Module `mci_midpoint`**:** A simple integrator that uses the midpoint rule to sample the integrand uniformly over the unit hypercube. There is only one integration channel, so this can be matched only to single-channel phase space.

Module `mci_vamp`**:** Interface for the VAMP package.

13.1   Generic Integrator

This module provides a multi-channel integrator (MCI) base type, a corresponding configuration type, and methods for integration and event generation.

⟨`mci_base.f90`⟩≡

⟨*MCI base: tests*⟩

```
end module mci_base
```

13.1.1 MCI: integrator

The MCI object contains the methods for integration and event generation. For the actual work and data storage, it spawns an MCI instance object.

The base object contains the number of integration dimensions and the number of channels as configuration data. Further configuration data are stored in the concrete extensions.

The MCI sum contains all relevant information about the integrand. It can be used for comparing the current configuration against a previous one. If they match, we can skip an actual integration. (Implemented only for the VAMP version.)

There is a random-number generator (its state with associated methods) available as `rng`. It may or may not be used for integration. It will be used for event generation.

⟨*MCI base: public*⟩≡

               "Integrator:", mci%n_chain, "chains,", &
               mci%n_channel, "channels,", &
               mci%n_dim, "dimensions"
      else
         write (msg_buffer, "(A,3(1x,I0,1x,A))") &
               "Integrator:", &
               mci%n_channel, "channels,", &
               mci%n_dim, "dimensions"
      end if
      call msg_message (unit = unit)
    end subroutine mci_startup_message
```

Record the index of the MCI object within a process. For multi-component processes with more than one integrator, the integrator should know about its own index, so file names can be unique, etc. The default implementation does nothing, however.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: record_index => mci_record_index
```

⟨*MCI base: procedures*⟩+≡
```
    subroutine mci_record_index (mci, i_mci)
      class(mci_t), intent(inout) :: mci
      integer, intent(in) :: i_mci
    end subroutine mci_record_index
```

There is no Initializer for the abstract type, but a generic setter for the number of channels and dimensions. We make two aliases available, to be able to override it.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: set_dimensions => mci_set_dimensions
    procedure :: base_set_dimensions => mci_set_dimensions
```

⟨*MCI base: procedures*⟩+≡
```
    subroutine mci_set_dimensions (mci, n_dim, n_channel)
      class(mci_t), intent(inout) :: mci
```

1584

```
      integer, intent(in) :: n_dim
      integer, intent(in) :: n_channel
      mci%n_dim = n_dim
      mci%n_channel = n_channel
    end subroutine mci_set_dimensions
```

Declare particular dimensions as flat. This information can be used to simplify integration. When generating events, the flat dimensions should be sampled with uniform and uncorrelated distribution. It depends on the integrator what to do with that information.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure (mci_declare_flat_dimensions), deferred :: declare_flat_dimensions
```

⟨*MCI base: interfaces*⟩≡
```
    abstract interface
      subroutine mci_declare_flat_dimensions (mci, dim_flat)
        import
        class(mci_t), intent(inout) :: mci
        integer, dimension(:), intent(in) :: dim_flat
      end subroutine mci_declare_flat_dimensions
    end interface
```

Declare particular channels as equivalent, possibly allowing for permutations or reflections of dimensions. We use the information stored in the `phs_channel_t` object array that the phase-space module provides.

(We do not test this here, deferring the unit test to the `mci_vamp` implementation where we actually use this feature.)

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure (mci_declare_equivalences), deferred :: declare_equivalences
```

⟨*MCI base: interfaces*⟩+≡
```
    abstract interface
      subroutine mci_declare_equivalences (mci, channel, dim_offset)
        import
        class(mci_t), intent(inout) :: mci
        type(phs_channel_t), dimension(:), intent(in) :: channel
        integer, intent(in) :: dim_offset
      end subroutine mci_declare_equivalences
    end interface
```

Declare particular channels as chained together. The implementation may use this array for keeping their weights equal to each other, etc.

The chain array is an array sized by the number of channels. For each channel, there is an integer entry that indicates the corresponding chains. The total number of chains is the maximum value of this entry.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: declare_chains => mci_declare_chains
```

⟨*MCI base: procedures*⟩+≡
```
    subroutine mci_declare_chains (mci, chain)
      class(mci_t), intent(inout) :: mci
      integer, dimension(:), intent(in) :: chain
      allocate (mci%chain (size (chain)))
```

```
      mci%n_chain = maxval (chain)
      allocate (mci%chain_weights (mci%n_chain), source = 0._default)
      mci%chain = chain
    end subroutine mci_declare_chains
```

Collect channel weights according to chains and store them in the `chain_weights`
for output. We sum up the weights for all channels that share the same `chain`
index and store the results in the `chain_weights` array.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: collect_chain_weights => mci_collect_chain_weights
```

⟨*MCI base: procedures*⟩+≡
```
    subroutine mci_collect_chain_weights (mci, weight)
      class(mci_t), intent(inout) :: mci
      real(default), dimension(:), intent(in) :: weight
      integer :: i, c
      if (allocated (mci%chain)) then
         mci%chain_weights = 0
         do i = 1, size (mci%chain)
            c = mci%chain(i)
            mci%chain_weights(c) = mci%chain_weights(c) + weight(i)
         end do
      end if
    end subroutine mci_collect_chain_weights
```

Check if there are chains.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: has_chains => mci_has_chains
```

⟨*MCI base: procedures*⟩+≡
```
    function mci_has_chains (mci) result (flag)
      class(mci_t), intent(in) :: mci
      logical :: flag
      flag = allocated (mci%chain)
    end function mci_has_chains
```

Output of the chain weights, kept separate from the main `write` method.
[The formatting will work as long as the number of chains is less than 10^{10}. . .]

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: write_chain_weights => mci_write_chain_weights
```

⟨*MCI base: procedures*⟩+≡
```
    subroutine mci_write_chain_weights (mci, unit)
      class(mci_t), intent(in) :: mci
      integer, intent(in), optional :: unit
      integer :: u, i, n, n_digits
      character(4) :: ifmt
      u = output_unit (unit)
      if (allocated (mci%chain_weights)) then
         write (u, "(1x,A)")  "Weights of channel chains (groves):"
         n_digits = 0
         n = size (mci%chain_weights)
         do while (n > 0)
```

1586

```
        n = n / 10
        n_digits = n_digits + 1
      end do
      write (ifmt, "(A1,I1)") "I", n_digits
      do i = 1, size (mci%chain_weights)
         write (u, "(3x," // ifmt // ",F13.10)")  i, mci%chain_weights(i)
      end do
    end if
  end subroutine mci_write_chain_weights
```

Set the MD5 sum, independent of initialization.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: set_md5sum => mci_set_md5sum
```

⟨*MCI base: procedures*⟩+≡
```
    subroutine mci_set_md5sum (mci, md5sum)
      class(mci_t), intent(inout) :: mci
      character(32), intent(in) :: md5sum
      mci%md5sum = md5sum
    end subroutine mci_set_md5sum
```

Initialize a new integration pass. This is not necessarily meaningful, so we provide an empty base method. The `mci_vamp` implementation overrides this.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: add_pass => mci_add_pass
```

⟨*MCI base: procedures*⟩+≡
```
    subroutine mci_add_pass (mci, adapt_grids, adapt_weights, final)
      class(mci_t), intent(inout) :: mci
      logical, intent(in), optional :: adapt_grids
      logical, intent(in), optional :: adapt_weights
      logical, intent(in), optional :: final
    end subroutine mci_add_pass
```

Allocate an instance with matching type. This must be deferred.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure (mci_allocate_instance), deferred :: allocate_instance
```

⟨*MCI base: interfaces*⟩+≡
```
    abstract interface
       subroutine mci_allocate_instance (mci, mci_instance)
         import
         class(mci_t), intent(in) :: mci
         class(mci_instance_t), intent(out), pointer :: mci_instance
       end subroutine mci_allocate_instance
    end interface
```

Import a random-number generator. We transfer the allocation of an existing generator state into the object. The generator state may already be initialized, or we can reset it by its `init` method.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: import_rng => mci_import_rng
```

⟨*MCI base: procedures*⟩+≡
```
subroutine mci_import_rng (mci, rng)
  class(mci_t), intent(inout) :: mci
  class(rng_t), intent(inout), allocatable :: rng
  call move_alloc (rng, mci%rng)
end subroutine mci_import_rng
```

Activate or deactivate the timer.
⟨*MCI base: mci: TBP*⟩+≡
```
procedure :: set_timer => mci_set_timer
```

⟨*MCI base: procedures*⟩+≡
```
subroutine mci_set_timer (mci, active)
  class(mci_t), intent(inout) :: mci
  logical, intent(in) :: active
  mci%use_timer = active
end subroutine mci_set_timer
```

Start and stop signal for the timer, if active. The elapsed time can then be retrieved from the MCI record.
⟨*MCI base: mci: TBP*⟩+≡
```
procedure :: start_timer => mci_start_timer
procedure :: stop_timer => mci_stop_timer
```

⟨*MCI base: procedures*⟩+≡
```
subroutine mci_start_timer (mci)
  class(mci_t), intent(inout) :: mci
  if (mci%use_timer)  call mci%timer%start ()
end subroutine mci_start_timer

subroutine mci_stop_timer (mci)
  class(mci_t), intent(inout) :: mci
  if (mci%use_timer)  call mci%timer%stop ()
end subroutine mci_stop_timer
```

Sampler test. Evaluate the sampler a given number of times. Results are discarded, so we don't need the MCI instance which would record them.

The evaluation channel is iterated, and the x parameters are randomly chosen.
⟨*MCI base: mci: TBP*⟩+≡
```
procedure :: sampler_test => mci_sampler_test
```

⟨*MCI base: procedures*⟩+≡
```
subroutine mci_sampler_test (mci, sampler, n_calls)
  class(mci_t), intent(inout) :: mci
  class(mci_sampler_t), intent(inout), target :: sampler
  integer, intent(in) :: n_calls
  real(default), dimension(:), allocatable :: x_in, f
  real(default), dimension(:,:), allocatable :: x_out
  real(default) :: val
  integer :: i, c
  allocate (x_in (mci%n_dim))
  allocate (f (mci%n_channel))
```

1588

```
      allocate (x_out (mci%n_dim, mci%n_channel))
      do i = 1, n_calls
         c = mod (i, mci%n_channel) + 1
         call mci%rng%generate_array (x_in)
         call sampler%evaluate (c, x_in, val, x_out, f)
      end do
   end subroutine mci_sampler_test
```

Integrate: this depends on the implementation. We foresee a pacify flag to take care of small numerical noise on different platforms.

⟨*MCI base: mci: TBP*⟩+≡
```
   procedure (mci_integrate), deferred :: integrate
```

⟨*MCI base: interfaces*⟩+≡
```
   abstract interface
      subroutine mci_integrate (mci, instance, sampler, &
           n_it, n_calls, results, pacify)
        import
        class(mci_t), intent(inout) :: mci
        class(mci_instance_t), intent(inout) :: instance
        class(mci_sampler_t), intent(inout) :: sampler
        integer, intent(in) :: n_it
        integer, intent(in) :: n_calls
        logical, intent(in), optional :: pacify
        class(mci_results_t), intent(inout), optional :: results
      end subroutine mci_integrate
   end interface
```

Event generation. Depending on the implementation, event generation may or may not require a previous integration pass.

Instead of a black-box `simulate` method, we require an initializer, a finalizer, and procedures for generating a single event. This allows us to interface simulation event by event from the outside, and it facilitates the further processing of an event after successful generation. For integration, this is not necessary.

The initializer has `intent(inout)` for the `mci` passed object. The reason is that the initializer can read integration results and grids from file, where the results can modify the `mci` record.

⟨*MCI base: mci: TBP*⟩+≡
```
   procedure (mci_prepare_simulation), deferred :: prepare_simulation
```

⟨*MCI base: interfaces*⟩+≡
```
   abstract interface
      subroutine mci_prepare_simulation (mci)
        import
        class(mci_t), intent(inout) :: mci
      end subroutine mci_prepare_simulation
   end interface
```

The generated event will reside in in the `instance` object (overall results and weight) and in the `sampler` object (detailed data). In the real application, we can subsequently call methods of the `sampler` in order to further process the generated event.

The `target` attributes are required by the VAMP implementation, which uses pointers to refer to the instance and sampler objects from within the integration function.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure (mci_generate), deferred :: generate_weighted_event
    procedure (mci_generate), deferred :: generate_unweighted_event
```

⟨*MCI base: interfaces*⟩+≡
```
    abstract interface
       subroutine mci_generate (mci, instance, sampler)
         import
         class(mci_t), intent(inout) :: mci
         class(mci_instance_t), intent(inout), target :: instance
         class(mci_sampler_t), intent(inout), target :: sampler
       end subroutine mci_generate
    end interface
```

This is analogous, but we rebuild the event from the information stored in `state` instead of generating it.

Note: currently unused outside of tests, might be deleted later.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure (mci_rebuild), deferred :: rebuild_event
```

⟨*MCI base: interfaces*⟩+≡
```
    abstract interface
       subroutine mci_rebuild (mci, instance, sampler, state)
         import
         class(mci_t), intent(inout) :: mci
         class(mci_instance_t), intent(inout) :: instance
         class(mci_sampler_t), intent(inout) :: sampler
         class(mci_state_t), intent(in) :: state
       end subroutine mci_rebuild
    end interface
```

Return the value of the integral, error, efficiency, and time per call.

⟨*MCI base: mci: TBP*⟩+≡
```
    procedure :: get_integral => mci_get_integral
    procedure :: get_error => mci_get_error
    procedure :: get_efficiency => mci_get_efficiency
    procedure :: get_time => mci_get_time
```

⟨*MCI base: procedures*⟩+≡
```
    function mci_get_integral (mci) result (integral)
      class(mci_t), intent(in) :: mci
      real(default) :: integral
      if (mci%integral_known) then
         integral = mci%integral
      else
         call msg_bug ("The integral is unknown. This is presumably a" // &
              "WHIZARD bug.")
      end if
    end function mci_get_integral

    function mci_get_error (mci) result (error)
```

```
      class(mci_t), intent(in) :: mci
      real(default) :: error
      if (mci%error_known) then
         error = mci%error
      else
         error = 0
      end if
   end function mci_get_error

   function mci_get_efficiency (mci) result (efficiency)
      class(mci_t), intent(in) :: mci
      real(default) :: efficiency
      if (mci%efficiency_known) then
         efficiency = mci%efficiency
      else
         efficiency = 0
      end if
   end function mci_get_efficiency

   function mci_get_time (mci) result (time)
      class(mci_t), intent(in) :: mci
      real(default) :: time
      if (mci%use_timer) then
         time = mci%timer
      else
         time = 0
      end if
   end function mci_get_time
```

Return the MD5 sum of the configuration. This may be overridden in an extension, to return a different MD5 sum.

⟨*MCI base: mci: TBP*⟩+≡
```
   procedure :: get_md5sum => mci_get_md5sum
```

⟨*MCI base: procedures*⟩+≡
```
   function mci_get_md5sum (mci) result (md5sum)
      class(mci_t), intent(in) :: mci
      character(32) :: md5sum
      md5sum = mci%md5sum
   end function mci_get_md5sum
```

13.1.2   MCI instance

The base type contains an array of channel weights. The value `mci_weight` is the combined MCI weight that corresponds to a particular sampling point.

For convenience, we also store the `x` and Jacobian values for this sampling point.

⟨*MCI base: public*⟩+≡
```
   public :: mci_instance_t
```

⟨*MCI base: types*⟩+≡
```
type, abstract :: mci_instance_t
  logical :: valid = .false.
  real(default), dimension(:), allocatable :: w
  real(default), dimension(:), allocatable :: f
  real(default), dimension(:,:), allocatable :: x
  integer :: selected_channel = 0
  real(default) :: mci_weight = 0
  real(default) :: integrand  = 0
 contains
 ⟨MCI base: mci instance: TBP⟩
 end type mci_instance_t
```

Output: deferred

⟨*MCI base: mci instance: TBP*⟩≡
```
procedure (mci_instance_write), deferred :: write
```

⟨*MCI base: interfaces*⟩+≡
```
abstract interface
  subroutine mci_instance_write (object, unit, pacify)
    import
    class(mci_instance_t), intent(in) :: object
    integer, intent(in), optional :: unit
    logical, intent(in), optional :: pacify
  end subroutine mci_instance_write
end interface
```

A finalizer, just in case.

⟨*MCI base: mci instance: TBP*⟩+≡
```
procedure (mci_instance_final), deferred :: final
```

⟨*MCI base: interfaces*⟩+≡
```
abstract interface
  subroutine mci_instance_final (object)
    import
    class(mci_instance_t), intent(inout) :: object
  end subroutine mci_instance_final
end interface
```

Init: basic initializer for the arrays, otherwise deferred. Assigning the `mci` object is also deferred, because it depends on the concrete type.

The weights are initialized with an uniform normalized value.

⟨*MCI base: mci instance: TBP*⟩+≡
```
procedure (mci_instance_base_init), deferred :: init
procedure :: base_init => mci_instance_base_init
```

⟨*MCI base: procedures*⟩+≡
```
subroutine mci_instance_base_init (mci_instance, mci)
  class(mci_instance_t), intent(out) :: mci_instance
  class(mci_t), intent(in), target :: mci
  allocate (mci_instance%w (mci%n_channel))
  allocate (mci_instance%f (mci%n_channel))
  allocate (mci_instance%x (mci%n_dim, mci%n_channel))
```

```
      if (size (mci_instance%w) /= 0) then
         mci_instance%w = 1._default / size (mci_instance%w)
      end if
      mci_instance%f = 0
      mci_instance%x = 0
   end subroutine mci_instance_base_init
```

Compute the overall weight factor for a configuration of x values and Jacobians f. The x values come in `n_channel` rows with `n_dim` entries each. The f factors constitute an array with `n_channel` entries.

We assume that the x and f arrays are already stored inside the MC instance. The result is also stored there.

⟨*MCI base: mci instance: TBP*⟩+≡
```
   procedure (mci_instance_compute_weight), deferred :: compute_weight
```

⟨*MCI base: interfaces*⟩+≡
```
   abstract interface
      subroutine mci_instance_compute_weight (mci, c)
        import
        class(mci_instance_t), intent(inout) :: mci
        integer, intent(in) :: c
      end subroutine mci_instance_compute_weight
   end interface
```

Record the integrand as returned by the sampler. Depending on the implementation, this may merely copy the value, or do more complicated things.

We may need the MCI weight for the actual computations, so this should be called after the previous routine.

⟨*MCI base: mci instance: TBP*⟩+≡
```
   procedure (mci_instance_record_integrand), deferred :: record_integrand
```

⟨*MCI base: interfaces*⟩+≡
```
   abstract interface
      subroutine mci_instance_record_integrand (mci, integrand)
        import
        class(mci_instance_t), intent(inout) :: mci
        real(default), intent(in) :: integrand
      end subroutine mci_instance_record_integrand
   end interface
```

Sample a point directly: evaluate the sampler, then compute the weight and the weighted integrand. Finally, record the integrand within the MCI instance.

If a signal (interrupt) was raised recently, we abort the calculation before entering the sampler. Thus, a previous calculation will have completed and any data are already recorded, but any new point can be discarded. If the `abort` flag is present, we may delay the interrupt, so we can do some cleanup.

⟨*MCI base: mci instance: TBP*⟩+≡
```
   procedure :: evaluate => mci_instance_evaluate
```

⟨*MCI base: procedures*⟩+≡
```
   subroutine mci_instance_evaluate (mci, sampler, c, x)
     class(mci_instance_t), intent(inout) :: mci
```

```
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x
      real(default) :: val
      call sampler%evaluate (c, x, val, mci%x, mci%f)
      mci%valid = sampler%is_valid ()
      if (mci%valid) then
         call mci%compute_weight (c)
         call mci%record_integrand (val)
      end if
   end subroutine mci_instance_evaluate
```

Initiate and terminate simulation. In contrast to integration, we implement these as methods of the process instance, since the `mci` configuration object is unchanged.

The safety factor reduces the acceptance probability for unweighted events. The implementation of this feature depends on the concrete type.

⟨*MCI base: mci instance: TBP*⟩+≡
```
    procedure (mci_instance_init_simulation), deferred :: init_simulation
    procedure (mci_instance_final_simulation), deferred :: final_simulation
```

⟨*MCI base: interfaces*⟩+≡
```
    abstract interface
       subroutine mci_instance_init_simulation (instance, safety_factor)
         import
         class(mci_instance_t), intent(inout) :: instance
         real(default), intent(in), optional :: safety_factor
       end subroutine mci_instance_init_simulation
    end interface

    abstract interface
       subroutine mci_instance_final_simulation (instance)
         import
         class(mci_instance_t), intent(inout) :: instance
       end subroutine mci_instance_final_simulation
    end interface
```

Assuming that the sampler is in a completely defined state, just extract the data that `evaluate` would compute. Also record the integrand.

⟨*MCI base: mci instance: TBP*⟩+≡
```
    procedure :: fetch => mci_instance_fetch
```

⟨*MCI base: procedures*⟩+≡
```
    subroutine mci_instance_fetch (mci, sampler, c)
      class(mci_instance_t), intent(inout) :: mci
      class(mci_sampler_t), intent(in) :: sampler
      integer, intent(in) :: c
      real(default) :: val
      mci%valid = sampler%is_valid ()
      if (mci%valid) then
         call sampler%fetch (val, mci%x, mci%f)
         call mci%compute_weight (c)
         call mci%record_integrand (val)
```

```
      end if
   end subroutine mci_instance_fetch
```

The value, i.e., the weighted integrand, is the integrand (which should be taken as-is from the sampler) multiplied by the MCI weight.

⟨*MCI base: mci instance: TBP*⟩+≡
```
   procedure :: get_value => mci_instance_get_value
```

⟨*MCI base: procedures*⟩+≡
```
   function mci_instance_get_value (mci) result (value)
     class(mci_instance_t), intent(in) :: mci
     real(default) :: value
     if (mci%valid) then
        value = mci%integrand * mci%mci_weight
     else
        value = 0
     end if
   end function mci_instance_get_value
```

This is an extra routine. By default, the event weight is equal to the value returned by the previous routine. However, if we select a channel for event generation not just based on the channel weights, the event weight has to account for this bias, so the event weight that applies to event generation is different. In that case, we should override the default routine.

⟨*MCI base: mci instance: TBP*⟩+≡
```
   procedure :: get_event_weight => mci_instance_get_value
```

Excess weight can occur during unweighted event generation, if the assumed maximum value of the integrand is too small. This excess should be normalized in the same way as the event weight above (which for unweighted events becomes unity).

⟨*MCI base: mci instance: TBP*⟩+≡
```
   procedure (mci_instance_get_event_excess), deferred :: get_event_excess
```

⟨*MCI base: interfaces*⟩+≡
```
   abstract interface
     function mci_instance_get_event_excess (mci) result (excess)
       import
       class(mci_instance_t), intent(in) :: mci
       real(default) :: excess
     end function mci_instance_get_event_excess
   end interface
```

13.1.3 MCI state

This object can hold the relevant information that allows us to reconstruct the MCI instance without re-evaluating the sampler completely.

We store the `x_in` MC input parameter set, which coincides with the section of the complete `x` array that belongs to a particular channel. We also store the MC function value. When we want to reconstruct the state, we can use the input array to recover the complete `x` and `f` arrays (i.e., the kinematics), but do not need to recompute the MC function value (the dynamics).

The `mci_state_t` may be extended, to allow storing/recalling more information. In that case, we would override the type-bound procedures. However, the base type is also a concrete type and self-contained.

⟨*MCI base: public*⟩+≡
```
public :: mci_state_t
```

⟨*MCI base: types*⟩+≡
```
type :: mci_state_t
   integer :: selected_channel = 0
   real(default), dimension(:), allocatable :: x_in
   real(default) :: val
 contains
 ⟨MCI base: mci state: TBP⟩
 end type mci_state_t
```

Output:

⟨*MCI base: mci state: TBP*⟩≡
```
procedure :: write => mci_state_write
```

⟨*MCI base: procedures*⟩+≡
```
subroutine mci_state_write (object, unit)
  class(mci_state_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
  write (u, "(1x,A)")  "MCI state:"
  write (u, "(3x,A,I0)")  "Channel   = ", object%selected_channel
  write (u, "(3x,A,999(1x,F12.10))")  "x (in)    =", object%x_in
  write (u, "(3x,A,ES19.12)")  "Integrand = ", object%val
end subroutine mci_state_write
```

To store the object, we take the relevant section of the `x` array. The channel used for storing data is taken from the `instance` object, but it could be arbitrary in principle.

⟨*MCI base: mci instance: TBP*⟩+≡
```
procedure :: store => mci_instance_store
```

⟨*MCI base: procedures*⟩+≡
```
subroutine mci_instance_store (mci, state)
  class(mci_instance_t), intent(in) :: mci
  class(mci_state_t), intent(out) :: state
  state%selected_channel = mci%selected_channel
  allocate (state%x_in (size (mci%x, 1)))
  state%x_in = mci%x(:,mci%selected_channel)
  state%val = mci%integrand
end subroutine mci_instance_store
```

Recalling the state, we must consult the sampler in order to fully reconstruct the `x` and `f` arrays. The integrand value is known, and we also give it to the sampler, bypassing evaluation.

The final steps are equivalent to the `evaluate` method above.

⟨*MCI base: mci instance: TBP*⟩+≡
```
procedure :: recall => mci_instance_recall
```

1596

⟨*MCI base: procedures*⟩+≡
```
    subroutine mci_instance_recall (mci, sampler, state)
      class(mci_instance_t), intent(inout) :: mci
      class(mci_sampler_t), intent(inout) :: sampler
      class(mci_state_t), intent(in) :: state
      if (size (state%x_in) == size (mci%x, 1) &
           .and. state%selected_channel <= size (mci%x, 2)) then
         call sampler%rebuild (state%selected_channel, &
              state%x_in, state%val, mci%x, mci%f)
         call mci%compute_weight (state%selected_channel)
         call mci%record_integrand (state%val)
      else
         call msg_fatal ("Recalling event: mismatch in channel or dimension")
      end if
    end subroutine mci_instance_recall
```

13.1.4 MCI sampler

A sampler is an object that implements a multi-channel parameterization of the unit hypercube. Specifically, it is able to compute, given a channel and a set of x MC parameter values, a the complete set of x values and associated Jacobian factors f for all channels.

Furthermore, the sampler should return a single real value, the integrand, for the given point in the hypercube.

It must implement a method `evaluate` for performing the above computations.

⟨*MCI base: public*⟩+≡
```
    public :: mci_sampler_t
```

⟨*MCI base: types*⟩+≡
```
    type, abstract :: mci_sampler_t
     contains
     ⟨MCI base: mci sampler: TBP⟩
    end type mci_sampler_t
```

Output, deferred to the implementation.

⟨*MCI base: mci sampler: TBP*⟩≡
```
    procedure (mci_sampler_write), deferred :: write
```

⟨*MCI base: interfaces*⟩+≡
```
    abstract interface
      subroutine mci_sampler_write (object, unit, testflag)
        import
        class(mci_sampler_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: testflag
      end subroutine mci_sampler_write
    end interface
```

The evaluation routine. Input is the channel index `c` and the one-dimensional parameter array `x_in`. Output are the integrand value `val`, the two-dimensional parameter array `x` and the Jacobian array `f`.

⟨*MCI base: mci sampler: TBP*⟩+≡
```
procedure (mci_sampler_evaluate), deferred :: evaluate
```

⟨*MCI base: interfaces*⟩+≡
```
abstract interface
   subroutine mci_sampler_evaluate (sampler, c, x_in, val, x, f)
     import
     class(mci_sampler_t), intent(inout) :: sampler
     integer, intent(in) :: c
     real(default), dimension(:), intent(in) :: x_in
     real(default), intent(out) :: val
     real(default), dimension(:,:), intent(out) :: x
     real(default), dimension(:), intent(out) :: f
   end subroutine mci_sampler_evaluate
end interface
```

Query the validity of the sampling point. Can be called after `evaluate`.

⟨*MCI base: mci sampler: TBP*⟩+≡
```
procedure (mci_sampler_is_valid), deferred :: is_valid
```

⟨*MCI base: interfaces*⟩+≡
```
abstract interface
   function mci_sampler_is_valid (sampler) result (valid)
     import
     class(mci_sampler_t), intent(in) :: sampler
     logical :: valid
   end function mci_sampler_is_valid
end interface
```

The shortcut. Again, the channel index `c` and the parameter array `x_in` are input. However, we also provide the integrand value `val`, and we just require that the complete parameter array `x` and Jacobian array `f` are recovered.

⟨*MCI base: mci sampler: TBP*⟩+≡
```
procedure (mci_sampler_rebuild), deferred :: rebuild
```

⟨*MCI base: interfaces*⟩+≡
```
abstract interface
   subroutine mci_sampler_rebuild (sampler, c, x_in, val, x, f)
     import
     class(mci_sampler_t), intent(inout) :: sampler
     integer, intent(in) :: c
     real(default), dimension(:), intent(in) :: x_in
     real(default), intent(in) :: val
     real(default), dimension(:,:), intent(out) :: x
     real(default), dimension(:), intent(out) :: f
   end subroutine mci_sampler_rebuild
end interface
```

This routine should extract the important data from a sampler that has been filled by other means. We fetch the integrand value `val`, the two-dimensional parameter array `x` and the Jacobian array `f`.

⟨*MCI base: mci sampler: TBP*⟩+≡
```
    procedure (mci_sampler_fetch), deferred :: fetch
```

⟨*MCI base: interfaces*⟩+≡
```
    abstract interface
      subroutine mci_sampler_fetch (sampler, val, x, f)
        import
        class(mci_sampler_t), intent(in) :: sampler
        real(default), intent(out) :: val
        real(default), dimension(:,:), intent(out) :: x
        real(default), dimension(:), intent(out) :: f
      end subroutine mci_sampler_fetch
    end interface
```

13.1.5 Results record

This is an abstract type which allows us to implement callback: each integration results can optionally be recorded to an instance of this object. The actual object may store a new result, average results, etc. It may also display a result on-line or otherwise, whenever the `record` method is called.

⟨*MCI base: public*⟩+≡
```
    public :: mci_results_t
```

⟨*MCI base: types*⟩+≡
```
    type, abstract :: mci_results_t
     contains
     ⟨MCI base: mci results: TBP⟩
    end type mci_results_t
```

The output routine is deferred. We provide an extra `verbose` flag, which could serve any purpose.

⟨*MCI base: mci results: TBP*⟩≡
```
    procedure (mci_results_write), deferred :: write
```

⟨*MCI base: interfaces*⟩+≡
```
    abstract interface
      subroutine mci_results_write (object, unit, verbose, suppress)
        import
        class(mci_results_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: verbose, suppress
      end subroutine mci_results_write
    end interface
```

This is the `record` method, which can be called directly from the integrator.

⟨*MCI base: mci results: TBP*⟩+≡
```
    procedure (mci_results_record), deferred :: record
```

⟨*MCI base: interfaces*⟩+≡
```
    abstract interface
        subroutine mci_results_record (object, n_it, &
             n_calls, integral, error, efficiency, chain_weights, suppress)
          import
          class(mci_results_t), intent(inout) :: object
          integer, intent(in) :: n_it
          integer, intent(in) :: n_calls
          real(default), intent(in) :: integral
          real(default), intent(in) :: error
          real(default), intent(in) :: efficiency
          real(default), dimension(:), intent(in), optional :: chain_weights
          logical, intent(in), optional :: suppress
        end subroutine mci_results_record
    end interface
```

13.1.6   Unit tests

⟨*MCI base: public*⟩+≡
```
    public :: mci_base_test
```

⟨*MCI base: tests*⟩≡
```
    subroutine mci_base_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
⟨*MCI base: execute tests*⟩
```
    end subroutine mci_base_test
```

Test implementation of the configuration type

The concrete type contains the number of requested calls and the integral result, to be determined.

The `max_factor` entry is set for the actual test integration, where the integrand is not unity but some other constant value. This value should be set here, such that the actual maximum of the integrand is known when vetoing unweighted events.

⟨*MCI base: public*⟩+≡
```
    public :: mci_test_t
```

⟨*MCI base: test types*⟩≡
```
    type, extends (mci_t) :: mci_test_t
       integer :: divisions = 0
       integer :: tries = 0
       real(default) :: max_factor = 1
     contains
       procedure :: final => mci_test_final
       procedure :: write => mci_test_write
       procedure :: startup_message => mci_test_startup_message
       procedure :: declare_flat_dimensions => mci_test_ignore_flat_dimensions
       procedure :: declare_equivalences => mci_test_ignore_equivalences
       procedure :: set_divisions => mci_test_set_divisions
       procedure :: set_max_factor => mci_test_set_max_factor
```

```
      procedure :: allocate_instance => mci_test_allocate_instance
      procedure :: integrate => mci_test_integrate
      procedure :: prepare_simulation => mci_test_ignore_prepare_simulation
      procedure :: generate_weighted_event => mci_test_generate_weighted_event
      procedure :: generate_unweighted_event => &
           mci_test_generate_unweighted_event
      procedure :: rebuild_event => mci_test_rebuild_event
    end type mci_test_t
```

Finalizer: base version is sufficient

⟨*MCI base: tests*⟩+≡
```
    subroutine mci_test_final (object)
      class(mci_test_t), intent(inout) :: object
      call object%base_final ()
    end subroutine mci_test_final
```

Output: trivial

⟨*MCI base: tests*⟩+≡
```
    subroutine mci_test_write (object, unit, pacify, md5sum_version)
      class(mci_test_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: pacify
      logical, intent(in), optional :: md5sum_version
      integer :: u
      u = output_unit (unit)
      write (u, "(1x,A)")  "Test integrator:"
      call object%base_write (u, pacify, md5sum_version)
      if (object%divisions /= 0) then
         write (u, "(3x,A,I0)")  "Number of divisions  = ", object%divisions
      end if
      if (allocated (object%rng))  call object%rng%write (u)
    end subroutine mci_test_write
```

Short version.

⟨*MCI base: tests*⟩+≡
```
    subroutine mci_test_startup_message (mci, unit, n_calls)
      class(mci_test_t), intent(in) :: mci
      integer, intent(in), optional :: unit, n_calls
      call mci%base_startup_message (unit = unit, n_calls = n_calls)
      write (msg_buffer, "(A,1x,I0,1x,A)") &
           "Integrator: Test:", mci%divisions, "divisions"
      call msg_message (unit = unit)
    end subroutine mci_test_startup_message
```

This is a no-op for the test integrator.

⟨*MCI base: tests*⟩+≡
```
    subroutine mci_test_ignore_flat_dimensions (mci, dim_flat)
      class(mci_test_t), intent(inout) :: mci
      integer, dimension(:), intent(in) :: dim_flat
    end subroutine mci_test_ignore_flat_dimensions
```

Ditto.

⟨MCI base: tests⟩+≡

```
    subroutine mci_test_ignore_equivalences (mci, channel, dim_offset)
      class(mci_test_t), intent(inout) :: mci
      type(phs_channel_t), dimension(:), intent(in) :: channel
      integer, intent(in) :: dim_offset
    end subroutine mci_test_ignore_equivalences
```

Set the number of divisions to a nonzero value.

⟨MCI base: tests⟩+≡

```
    subroutine mci_test_set_divisions (object, divisions)
      class(mci_test_t), intent(inout) :: object
      integer, intent(in) :: divisions
      object%divisions = divisions
    end subroutine mci_test_set_divisions
```

Set the maximum factor (default is 1).

⟨MCI base: tests⟩+≡

```
    subroutine mci_test_set_max_factor (object, max_factor)
      class(mci_test_t), intent(inout) :: object
      real(default), intent(in) :: max_factor
      object%max_factor = max_factor
    end subroutine mci_test_set_max_factor
```

Allocate instance with matching type.

⟨MCI base: tests⟩+≡

```
    subroutine mci_test_allocate_instance (mci, mci_instance)
      class(mci_test_t), intent(in) :: mci
      class(mci_instance_t), intent(out), pointer :: mci_instance
      allocate (mci_test_instance_t :: mci_instance)
    end subroutine mci_test_allocate_instance
```

Integrate: sample at the midpoints of uniform bits and add the results. We implement this for one and for two dimensions. In the latter case, we scan over two channels and multiply with the channel weights.

The arguments `n_it` and `n_calls` are ignored in this implementations.

The test integrator does not set error or efficiency, so those will remain undefined.

⟨MCI base: tests⟩+≡

```
    subroutine mci_test_integrate (mci, instance, sampler, &
         n_it, n_calls, results, pacify)
      class(mci_test_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout) :: instance
      class(mci_sampler_t), intent(inout) :: sampler
      integer, intent(in) :: n_it
      integer, intent(in) :: n_calls
      logical, intent(in), optional :: pacify
      class(mci_results_t), intent(inout), optional :: results
      real(default), dimension(:), allocatable :: integral
      real(default), dimension(:), allocatable :: x
      integer :: i, j, c
```

1602

```
      select type (instance)
      type is (mci_test_instance_t)
         allocate (integral (mci%n_channel))
         integral = 0
         allocate (x (mci%n_dim))
         select case (mci%n_dim)
         case (1)

         end select
         if (present (results)) then
            call results%record (n_it, n_calls, &
                 mci%integral, mci%error, &
                 efficiency = 0._default)
         end if
      end select
    end subroutine mci_test_integrate
```

Simulation initializer and finalizer: nothing to do here.

⟨*MCI base: tests*⟩+≡
```
    subroutine mci_test_ignore_prepare_simulation (mci)
      class(mci_test_t), intent(inout) :: mci
    end subroutine mci_test_ignore_prepare_simulation
```

Event generator. We use mock random numbers for first selecting the channel and then setting the x values. The results reside in the state of `instance` and `sampler`.

⟨*MCI base: tests*⟩+≡
```
    subroutine mci_test_generate_weighted_event (mci, instance, sampler)
      class(mci_test_t), intent(inout) :: mci
      class(mci_instance_t), intent(inout), target :: instance
```

1603

```
            class(mci_sampler_t), intent(inout), target :: sampler
            real(default) :: r
            real(default), dimension(:), allocatable :: x
            integer :: c
            select type (instance)
            type is (mci_test_instance_t)
               allocate (x (mci%n_dim))
               select case (mci%n_channel)
               case (1)
                  c = 1
                  call mci%rng%generate (x(1))
               case (2)
                  call mci%rng%generate (r)
                  if (r < instance%w(1)) then
                     c = 1
                  else
                     c = 2
                  end if
                  call mci%rng%generate (x)
               end select
               call instance%evaluate (sampler, c, x)
            end select
         end subroutine mci_test_generate_weighted_event
```

For unweighted events, we generate weighted events and apply a simple rejection step to the relative event weight, until an event passes.

(This might result in an endless loop if we happen to be in sync with the mock random generator cycle. Therefore, limit the number of tries.)

⟨*MCI base: tests*⟩+≡
```
         subroutine mci_test_generate_unweighted_event (mci, instance, sampler)
            class(mci_test_t), intent(inout) :: mci
            class(mci_instance_t), intent(inout), target :: instance
            class(mci_sampler_t), intent(inout), target :: sampler
            real(default) :: r
            integer :: i

      type is (mci_test_instance_t)
         call instance%recall (sampler, state)
      end select
    end subroutine mci_test_rebuild_event
```

Instance of the test MCI type

This instance type simulates the VAMP approach. We implement the VAMP multi-channel formula, but keep the channel-specific probability functions g_i smooth and fixed. We also keep the weights fixed.

The setup is as follows: we have n mappings of the unit hypercube

$$x = x(x^{(k)}) \qquad \text{where } x = (x_1, \ldots). \tag{13.1}$$

The Jacobian factors are the determinants

$$f^{(k)}(x^{(k)}) = \left| \frac{\partial x}{\partial x^{(k)}} \right| \tag{13.2}$$

We introduce arbitrary probability functions

$$g^{(k)}(x^{(k)}) \qquad \text{with} \quad \int dx^{(k)} g^{(k)}(x^{(k)}) = 1 \tag{13.3}$$

and weights

$$w_k \qquad \text{with} \quad \sum_k w_k = 1 \tag{13.4}$$

and construct the joint probability function

$$g(x) = \sum_k w_k \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \tag{13.5}$$

which also satisfies

$$\int g(x)\, dx = 1. \tag{13.6}$$

The algorithm implements a resolution of unity as follows

$$
\begin{aligned}
1 = \int dx &= \int \frac{g(x)}{g(x)} dx \\
&= \sum w_k \int \frac{g^{(k)}(x^{(k)}(x))}{f^{(k)}(x^{(k)}(x))} \frac{dx}{g(x)} \\
&= \sum w_k \int g^{(k)}(x^{(k)}) \frac{dx^{(k)}}{g(x(x^{(k)}))}
\end{aligned}
\tag{13.7}
$$

where each of the integrals in the sum is evaluated using the channel-specific variables $x^{(k)}$.

We provide two examples: (1) trivial with one channel, one dimension, and all functions unity and (2) two channels and two dimensions with

$$x(x^{(1)}) = (x_1^{(1)}, x_2^{(1)})$$
$$x(x^{(2)}) = (x_1^{(2)2}, x_2^{(2)}) \tag{13.8}$$

hence

$$f^{(1)} \equiv 1, \qquad\qquad f^{(2)}(x^{(2)}) = 2x_1^{(2)} \tag{13.9}$$

The probability functions are

$$g^{(1)} \equiv 1, \qquad\qquad g^{(2)}(x^{(2)}) = 2x_2^{(2)} \tag{13.10}$$

In the concrete implementation of the integrator instance we store values for the channel probabilities g_i and the accumulated probability g.

We also store the result (product of integrand and MCI weight), the expected maximum for the result in each channel.

⟨*MCI base: public*⟩+≡

```

Return always zero.

⟨*MCI base: tests*⟩+≡
```
    function mci_test_instance_get_event_excess (mci) result (excess)
      class(mci_test_instance_t), intent(in) :: mci
      real(default) :: excess
      excess = 0
    end function mci_test_instance_get_event_excess
```

Test sampler

The test sampler implements a fixed configuration, either trivial (one-channel, one-dimension), or slightly nontrivial (two-channel, two-dimension). In the second channel, the first parameter is mapped according to $x_1 = x_1^{(2)2}$, so we have $f^{(2)}(x^{(2)}) = 2x_1^{(2)}$.

For display purposes, we store the return values inside the object. This is not strictly necessary.

⟨*MCI base: test types*⟩+≡

        write (u, "(A)")
        write (u, "(A)")  "* Test output end: mci_base_2"

    end subroutine mci_base_2
```

Nontrivial integral

Use the MCI approach to compute a simple two-dimensional integral with two channels.

⟨*MCI base: execute tests*⟩+≡
```
    call test (mci_base_3, "mci_base_3", &
         "integration (two channels)", &
         u, results)
```

⟨*MCI base: tests*⟩+≡
```
    subroutine mci_base_3 (u)
      integer, intent(in) :: u
      class(mci_t), allocatable, target :: mci
      class(mci_instance_t), pointer :: mci_instance => null ()
      class(mci_sampler_t), allocatable :: sampler

      write (u, "(A)")  "* Test output: mci_base_3"
      write (u, "(A)")  "*   Purpose: perform a nontrivial test integral"
      write (u, "(A)")

      write (u, "(A)")  "* Initialize integrator"
      write (u, "(A)")

      allocate (mci_test_t :: mci)
      call mci%set_dimensions (2, 2)
      select type (mci)
      type is (mci_test_t)
         call mci%set_divisions (10)
      end select

      write (u, "(A)")  "* Initialize instance"
      write (u, "(A)")

      call mci%allocate_instance (mci_instance)
      call mci_instance%init (mci)

      write (u, "(A)")  "* Initialize test sampler"
```

1615

```
      write (u, "(A)")

      allocate (test_sampler_t :: sampler)

```

```
        write (u, "(A)")  "* Test output end: mci_base_4"

    end subroutine mci_base_4
```

Store and recall data

We generate an event and store the relevant data, i.e., the input parameters and
the result value for a particular channel. Then we use those data to recover the
event, as far as the MCI record is concerned.

⟨*MCI base: execute tests*⟩+≡
```
    call test (mci_base_5, "mci_base_5", &
         "store and recall", &
         u, results)
```

⟨*MCI base: tests*⟩+≡

   write (u, "(A)")
   write (u, "(A)")  "* Cleanup"

   call mci%final ()

   write (u, "(A)")
   write (u, "(A)")  "* Test output end: mci_base_8"

 end subroutine mci_base_8
```

13.2 Simple midpoint integration

This is a most simple implementation of an integrator. The algorithm is the straightforward multi-dimensional midpoint rule, i.e., the integration hypercube is binned uniformly, the integrand is evaluated at the midpoints of each bin, and the result is the average. The binning is equivalent for all integration dimensions.

This rule is accurate to the order h^2, where h is the bin width. Given that $h = N^{-1/d}$, where d is the integration dimension and N is the total number of sampling points, we get a relative error of order $N^{-2/d}$. This is superior to MC integration if $d < 4$, and equivalent if $d = 4$. It is not worse than higher-order formulas (such as Gauss integration) if the integrand is not smooth, e.g., if it contains cuts.

The integrator is specifically single-channel. However, we do not limit the dimension.

13.2.1 Integrator

The object contains the methods for integration and event generation. For the actual work and data storage, it spawns an instance object.

After an integration pass, we update the `max` parameter to indicate the maximum absolute value of the integrand that the integrator encountered. This

is required for event generation.

```

Integrate. The number of dimensions is arbitrary. We make sure that the number of calls is evenly distributed among the dimensions. The actual number of calls will typically be smaller than the requested number, but never smaller than 1.

The sampling over a variable number of dimensions implies a variable number of nested loops. We implement this by a recursive subroutine, one loop in each recursion level.

The number of iterations `n_it` is ignored. Also, the error is set to zero in the current implementation.

With this integrator, we allow the calculation to abort immediately when forced by a signal. There is no state that we can save, hence we do not catch an interrupt.

```

For unweighted events, we generate weighted events and apply a simple rejection
step to the relative event weight, until an event passes.

   Note that we use the `max_abs` value stored in the configuration record, not
the one stored in the instance. The latter may change during event generation.
After an event generation pass is over, we may update the value for a subsequent
pass.

      type(test_results_t), intent(inout) :: results
    ⟨MCI midpoint: execute tests⟩
    end subroutine mci_midpoint_test
```

Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

This is the function $f(x) = 3x^2$ with integral $\int_0^1 f(x)\,dx = 1$ and maximum $f(1) = 3$. If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

Mimicking the behavior of a process object, we store the argument and result inside the sampler, so we can `fetch` results.

⟨*MCI midpoint: test types*⟩≡
```
    type, extends (mci_sampler_t) :: test_sampler_1_t
       real(default), dimension(:), allocatable :: x
       real(default) :: val
     contains
     ⟨MCI midpoint: test sampler 1: TBP⟩
    end type test_sampler_1_t
```

Output: There is nothing stored inside, so just print an informative line.

⟨*MCI midpoint: test sampler 1: TBP*⟩≡
```
    procedure :: write => test_sampler_1_write
```

⟨*MCI midpoint: procedures*⟩+≡
```
    subroutine test_sampler_1_write (object, unit, testflag)
      class(test_sampler_1_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
      integer :: u
      u = output_unit (unit)
      write (u, "(1x,A)") "Test sampler: f(x) = 3 x^2"
    end subroutine test_sampler_1_write
```

Evaluation: compute the function value. The output x parameter (only one channel) is identical to the input x, and the Jacobian is 1.

⟨*MCI midpoint: test sampler 1: TBP*⟩+≡
```
    procedure :: evaluate => test_sampler_1_evaluate
```

13.3 VAMP interface

The standard method for integration is VAMP: the multi-channel version of the VEGAS algorithm. Each parameterization (channel) of the hypercube is binned in each dimension. The binning is equally equidistant, but an iteration of the integration procedure, the binning is updated for each dimension, according to the variance distribution of the integrand, summed over all other dimension. In the next iteration, the binning approximates (hopefully) follows the integrand more closely, and the accuracy of the result is increased. Furthermore, the relative weight of the individual channels is also updated after an iteration.

The bin distribution is denoted as the grid for a channel, which we can write to file and reuse later.

In our implementation we specify the generic VAMP algorithm more tightly: the number of bins is equal for all dimensions, the initial weights are all equal. The user controls whether to update bins and/or weights after each iteration. The integration is organized in passes, each one consisting of several iterations with a common number of calls to the integrand. The first passes are intended as warmup, so the results are displayed but otherwise discarded. In the final pass, the integration estimates for the individual iterations are averaged for the final result.

      else
         write (u, "(1x,A)")  "Channel histories: [undefined]"
      end if
    end subroutine pass_write_history
```

Given a number of calls and iterations, compute remaining data.

⟨*MCI vamp: pass: TBP*⟩+≡
```
    procedure :: configure => pass_configure
```

⟨*MCI vamp: procedures*⟩+≡
```
    subroutine pass_configure (pass, n_it, n_calls, min_calls, &
         min_bins, max_bins, min_channel_calls)
      class(pass_t), intent(inout) :: pass
      integer, intent(in) :: n_it, n_calls, min_channel_calls
      integer, intent(in) :: min_calls, min_bins, max_bins
      pass%n_it = n_it
      if (min_calls /= 0) then
         pass%n_bins =  max (min_bins, &
```

```
                  min (n_calls / min_calls, max_bins))
          else
             pass%n_bins = max_bins
          end if
          pass%n_calls = max (n_calls, max (min_calls, min_channel_calls))
          if (pass%n_calls /= n_calls) then
             write (msg_buffer, "(A,I0)")  "VAMP: too few calls, resetting " &
                   // "n_calls to ", pass%n_calls
             call msg_warning ()
          end if
          allocate (pass%calls (n_it), source = 0)
          allocate (pass%integral (n_it), source = 0._default)
          allocate (pass%error (n_it), source = 0._default)
          allocate (pass%efficiency (n_it), source = 0._default)
        end subroutine pass_configure
```

Allocate the VAMP history and give options. We assume that the `configure`
routine above has been executed, so the number of iterations is known.

⟨*MCI vamp: pass: TBP*⟩+≡
```
        procedure :: configure_history => pass_configure_history
```

⟨*MCI vamp: procedures*⟩+≡
```
        subroutine pass_configure_history (pass, n_channels, par)
          class(pass_t), intent(inout) :: pass
          integer, intent(in) :: n_channels
          type(history_parameters_t), intent(in) :: par
          if (par%global) then
             allocate (pass%v_history (pass%n_it))
             call vamp_create_history (pass%v_history, &
                   verbose = par%global_verbose)
          end if
          if (par%channel) then
             allocate (pass%v_histories (pass%n_it, n_channels))
             call vamp_create_history (pass%v_histories, &
                   verbose = par%channel_verbose)
          end if
        end subroutine pass_configure_history
```

Given two pass objects, compare them. All parameters must match. Where
integrations are done in both (number of calls nonzero), the results must be
equal (up to numerical noise).

   The allocated array sizes might be different, but should match up to the
common `n_it` value.

```

Update a pass object, given a reference. The parameters must match, except
for the `n_it` entry. The number of complete iterations must be less or equal to
the reference, and the number of complete iterations in the reference must be no
larger than `n_it`. Where results are present in both passes, they must match.
Where results are present in the reference only, the pass is updated accordingly.

    end subroutine mci_vamp_allocate_instance
```

Allocate a new integration pass. We can preset everything that does not depend on the number of iterations and calls. This is postponed to the `integrate` method.

In the final pass, we do not check accuracy goal etc., since we can assume that the user wants to perform and average all iterations in this pass.

Update the MCI record (i.e., the integration passes) by reading from input stream. The stream should contain a `write` output from a previous run. We first check the MD5 sum of the configuration parameters. If that matches, we proceed directly to the stored integration passes. If successful, we may continue to read the file; the position will be after a blank line that must follow the MCI record.

Integrate. Perform a new integration pass (possibly reusing previous results), which may consist of several iterations.

Note: we record the integral once per iteration. The integral stored in the `mci` record itself is the last integral of the current iteration, no averaging done. The `results` record may average results.

Note: recording the efficiency is not supported yet.

Prepare an event generation pass. Should be called before a sequence of events is generated, then we should call the corresponding finalizer.

The pass-specific data of the previous integration pass are retained, but we reset the number of iterations and calls to zero. The latter now counts the number of events (calls to the sampling function, actually).

Generate weighted event. Note that the event weight (`vamp_weight`) is not just the MCI weight. `vamp_next_event` selects a channel based on the channel weights multiplied by the (previously recorded) maximum integrand value of the channel. The MCI weight is renormalized accordingly, to cancel this effect on the result.

13.3.5   Sampler as Workspace

In the full setup, the sampling function requires the process instance object as
workspace. We implement this by (i) implementing the process instance as a
type extension of the abstract `sampler_t` object used by the MCI implemen-
tation and (ii) providing such an object as an extra argument to the sampling
function that VAMP can call. To minimize cross-package dependencies, we use
an abstract type `vamp_workspace` that VAMP declares and extend this by in-
cluding a pointer to the `sampler` and `instance` objects. In the body of the
sampling function, we dereference this pointer and can then work with the con-
tents.

⟨*MCI vamp: types*⟩+≡

```
type, extends (vamp_data_t) :: mci_workspace_t
   class(mci_sampler_t), pointer :: sampler => null ()
   class(mci_vamp_instance_t), pointer :: instance => null ()
end type mci_workspace_t
```

13.3.6   Integrator instance

The history entries should point to the corresponding history entry in the `pass_t` object. If there is none, we may allocate a local history, which is then just transient.

Prepare a new integration pass: write the pass-specific settings to the `instance` object. This should be called initially, together with the `create_grids` procedure, and whenever we start a new integration pass.

Set `reshape` if the number of calls is different than previously (unless it was zero, indicating the first pass).

We link VAMP histories to the allocated histories in the current pass object, so the recorded results are persistent. However, if there are no histories present there, we allocate them locally. In that case, the histories will disappear together with the MCI instance object.

        end if
      end associate
    end subroutine mci_vamp_instance_create_grids
```

Reset a grid set, so we can start a fresh integration pass. In effect, we delete results of previous integrations, but keep the grid shapes, weights, and variance arrays, so adaptation is still possible. The grids are prepared for a specific number of calls (per iteration) and sampling mode (stratified/importance).

The `vamp_discard_integrals` implementation will reshape the grids only if the argument `num_calls` is present.

         end if
      end if
    end subroutine mci_vamp_instance_adapt_grids
```

Adapt weights. Use the variance array returned by `VAMP` for recalculating the weight array. The parameter `channel_weights_power` dampens fluctuations.

If the number of calls in a given channel falls below a user-defined threshold, the weight is not lowered further but kept at this threshold. The other channel weights are reduced accordingly.

Integration: sample the VAMP grids. The number of calls etc. are already stored inside the grids. We provide the random-number generator, the sampling function, and a link to the workspace object, which happens to contain a pointer to the sampler object. The sampler object thus becomes the workspace of the sampling function.

Note: in the current implementation, the random-number generator must be the TAO generator. This explicit dependence should be removed from the VAMP implementation.

    end subroutine mci_vamp_instance_final_simulation
```

13.3.7 Sampling function

The VAMP sampling function has a well-defined interface which we have to implement. The `data` argument allows us to pass pointers to the `sampler` and `instance` objects, so we can access configuration data and fill point-dependent contents within these objects.

The `weights` and `channel` argument must be present in the call.

Note: we would normally declare the `instance` pointer with the concrete type, or just use the `data` component directly. Unfortunately, gfortran 4.6 forgets the inherited base-type methods in that case.

Note: this is the place where we must look for external signals, i.e., interrupt from the OS. We would like to raise a VAMP exception which is then caught by `vamp_sample_grids` as the caller, so it dumps its current state and returns (with the signal still pending). WHIZARD will then terminate gracefully. Of course, VAMP should be able to resume from the dump.

In the current implementation, we handle the exception in place and terminate immediately. The incomplete current integration pass is lost.

⟨*MCI vamp: procedures*⟩+≡

```
    function vamp_sampling_function &
        (xi, data, weights, channel, grids) result (f)
      real(default) :: f
      real(default), dimension(:), intent(in) :: xi
      class(vamp_data_t), intent(in) :: data
      real(default), dimension(:), intent(in), optional :: weights
      integer, intent(in), optional :: channel
      type(vamp_grid), dimension(:), intent(in), optional :: grids
      type(exception) :: exc
      class(mci_instance_t), pointer :: instance
      logical :: verbose
      character(*), parameter :: FN = "WHIZARD sampling function"
      select type (data)
      type is (mci_workspace_t)
         instance => data%instance
         select type (instance)
         class is (mci_vamp_instance_t)
            instance%calls = instance%calls + 1
            verbose = instance%mci%verbose
         end select
         call instance%evaluate (data%sampler, channel, xi)
         if (signal_is_pending ()) then
            call raise_exception (exc, EXC_FATAL, FN, "signal received")
            call handle_vamp_exception (exc, verbose)
            call terminate_now_if_signal ()
         end if
         f = instance%get_value ()
      end select
    end function vamp_sampling_function
```

This is supposed to be the mapping between integration channels. The VAMP event generating procedures technically require it, but it is meaningless in our setup where all transformations happen inside the sampler object. So, this implementation is trivial:

⟨*MCI vamp: procedures*⟩+≡
```
pure function phi_trivial (xi, channel_dummy) result (x)
  real(default), dimension(:), intent(in) :: xi
  integer, intent(in) :: channel_dummy
  real(default), dimension(size(xi)) :: x
  x = xi
end function phi_trivial
```

13.3.8   Integrator instance: evaluation

Here, we compute the multi-channel reweighting factor for the current channel, that accounts for the Jacobians of the transformations from/to all other channels.

The computation of the VAMP probabilities may consume considerable time, therefore we enable parallel evaluation. (Collecting the contributions to `mci%g` is a reduction, which we should also implement via OpenMP.)

⟨*MCI vamp: mci vamp instance: TBP*⟩+≡
```
procedure :: compute_weight => mci_vamp_instance_compute_weight
```

⟨*MCI vamp: procedures*⟩+≡
```
subroutine mci_vamp_instance_compute_weight (mci, c)
  class(mci_vamp_instance_t), intent(inout) :: mci
  integer, intent(in) :: c
  integer :: i
  mci%selected_channel = c
  !$OMP PARALLEL PRIVATE(i) SHARED(mci)
  !$OMP DO
  do i = 1, mci%mci%n_channel
     if (mci%w(i) /= 0) then
        mci%gi(i) = vamp_probability (mci%grids%grids(i), mci%x(:,i))
     else
        mci%gi(i) = 0
     end if
  end do
  !$OMP END DO
  !$OMP END PARALLEL
  mci%g = 0
  if (mci%gi(c) /= 0) then
     do i = 1, mci%mci%n_channel
        if (mci%w(i) /= 0 .and. mci%f(i) /= 0) then
           mci%g = mci%g + mci%w(i) * mci%gi(i) / mci%f(i)
        end if
     end do
  end if
  if (mci%g /= 0) then
     mci%mci_weight = mci%gi(c) / mci%g
  else
     mci%mci_weight = 0
  end if
end subroutine mci_vamp_instance_compute_weight
```

1690

Record the integrand.

⟨*MCI vamp: mci vamp instance: TBP*⟩+≡
```
    procedure :: record_integrand => mci_vamp_instance_record_integrand
```

⟨*MCI vamp: procedures*⟩+≡
```
    subroutine mci_vamp_instance_record_integrand (mci, integrand)
      class(mci_vamp_instance_t), intent(inout) :: mci
      real(default), intent(in) :: integrand
      mci%integrand = integrand
    end subroutine mci_vamp_instance_record_integrand
```

Get the event weight. The default routine returns the same value that we would use for integration. This is correct if we select the integration channel according to the channel weight. `vamp_next_event` does differently, so we should rather rely on the weight that VAMP returns. This is the value stored in `vamp_weight`. We override the default TBP accordingly.

⟨*MCI vamp: mci vamp instance: TBP*⟩+≡
```
    procedure :: get_event_weight => mci_vamp_instance_get_event_weight
    procedure :: get_event_excess => mci_vamp_instance_get_event_excess
```

⟨*MCI vamp: procedures*⟩+≡
```
    function mci_vamp_instance_get_event_weight (mci) result (value)
      class(mci_vamp_instance_t), intent(in) :: mci
      real(default) :: value
      if (mci%vamp_weight_set) then
         value = mci%vamp_weight
      else
         call msg_bug ("VAMP: attempt to read undefined event weight")
      end if
    end function mci_vamp_instance_get_event_weight

    function mci_vamp_instance_get_event_excess (mci) result (value)
      class(mci_vamp_instance_t), intent(in) :: mci
      real(default) :: value
      if (mci%vamp_weight_set) then
         value = mci%vamp_excess
      else
         call msg_bug ("VAMP: attempt to read undefined event excess weight")
      end if
    end function mci_vamp_instance_get_event_excess
```

13.3.9   VAMP exceptions

A VAMP routine may have raised an exception. Turn this into a WHIZARD error message.

An external signal could raise a fatal exception, but this should be delayed and handled by the correct termination routine.

⟨*MCI vamp: procedures*⟩+≡
```
    subroutine handle_vamp_exception (exc, verbose)
      type(exception), intent(in) :: exc
      logical, intent(in) :: verbose
      integer :: exc_level
```

```
            if (verbose) then
               exc_level = EXC_INFO
            else
               exc_level = EXC_ERROR
            end if
            if (exc%level >= exc_level) then
               write (msg_buffer, "(A,':',1x,A)")  trim (exc%origin), trim (exc%message)
               select case (exc%level)
               case (EXC_INFO);  call msg_message ()
               case (EXC_WARN);  call msg_warning ()
               case (EXC_ERROR); call msg_error ()
               case (EXC_FATAL)
                  if (signal_is_pending ()) then
                     call msg_message ()
                  else
                     call msg_fatal ()
                  end if
               end select
            end if
         end subroutine handle_vamp_exception
```

13.3.10 Unit tests

⟨*MCI vamp: public*⟩+≡
```
    public :: mci_vamp_test
```

⟨*MCI vamp: tests*⟩+≡
```
    subroutine mci_vamp_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
⟨*MCI vamp: execute tests*⟩
```
    end subroutine mci_vamp_test
```

Test sampler

A test sampler object should implement a function with known integral that we can use to check the integrator.

In mode 1, the function is $f(x) = 3x^2$ with integral $\int_0^1 f(x)\,dx = 1$ and maximum $f(1) = 3$. If the integration dimension is greater than one, the function is extended as a constant in the other dimension(s).

In mode 2, the function is $11x^{10}$, also with integral 1.

⟨*MCI vamp: test types*⟩≡
```
    type, extends (mci_sampler_t) :: test_sampler_1_t
       real(default), dimension(:), allocatable :: x
       real(default) :: val
       integer :: mode = 1
     contains
```
⟨*MCI vamp: test sampler 1: TBP*⟩
```
    end type test_sampler_1_t
```

Output: There is nothing stored inside, so just print an informative line.

⟨*MCI vamp: test sampler 1: TBP*⟩≡
```
procedure :: write => test_sampler_1_write
```

⟨*MCI vamp: tests*⟩+≡
```
subroutine test_sampler_1_write (object, unit, testflag)
  class(test_sampler_1_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: testflag
  integer :: u
  u = output_unit (unit)
  select case (object%mode)
  case (1)
     write (u, "(1x,A)") "Test sampler: f(x) = 3 x^2"
  case (2)
     write (u, "(1x,A)") "Test sampler: f(x) = 11 x^10"
  case (3)
     write (u, "(1x,A)") "Test sampler: f(x) = 11 x^10 * 2 * cos^2 (2 pi y)"
  end select
end subroutine test_sampler_1_write
```

Evaluation: compute the function value. The output x parameter (only one channel) is identical to the input x, and the Jacobian is 1.

⟨*MCI vamp: test sampler 1: TBP*⟩+≡
```
procedure :: evaluate => test_sampler_1_evaluate
```

⟨*MCI vamp: tests*⟩+≡
```
subroutine test_sampler_1_evaluate (sampler, c, x_in, val, x, f)
  class(test_sampler_1_t), intent(inout) :: sampler
  integer, intent(in) :: c
  real(default), dimension(:), intent(in) :: x_in
  real(default), intent(out) :: val
  real(default), dimension(:,:), intent(out) :: x
  real(default), dimension(:), intent(out) :: f
  if (allocated (sampler%x))  deallocate (sampler%x)
  allocate (sampler%x (size (x_in)))
  sampler%x = x_in
  select case (sampler%mode)
  case (1)
     sampler%val = 3 * x_in(1) ** 2
  case (2)
     sampler%val = 11 * x_in(1) ** 10
  case (3)
     sampler%val = 11 * x_in(1) ** 10 * 2 * cos (twopi * x_in(2)) ** 2
  end select
  call sampler%fetch (val, x, f)
end subroutine test_sampler_1_evaluate
```

The point is always valid.

⟨*MCI vamp: test sampler 1: TBP*⟩+≡
```
procedure :: is_valid => test_sampler_1_is_valid
```

⟨*MCI vamp: tests*⟩+≡

      real(default), dimension(:,:), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
      val = sampler%val
      x(:,1) = sampler%x
      f = 1
    end subroutine test_sampler_1_fetch
```

Two-channel, two dimension test sampler

This sampler implements the function

$$f(x, y) = 4 \sin^2(\pi x) \sin^2(\pi y) + 2 \sin^2(\pi v) \qquad (13.11)$$

where

$$x = u^v \qquad\qquad u = xy \qquad\qquad (13.12)$$

$$y = u^{(1-v)} \qquad\qquad v = \frac{1}{2} \left(1 + \frac{\log(x/y)}{\log xy} \right) \qquad (13.13)$$

1694

Each term contributes 1 to the integral. The first term in the function is peaked along a cross aligned to the coordinates x and y, while the second term is peaked along the diagonal $x = y$.

The Jacobian is

$$\frac{\partial(x, y)}{\partial(u, v)} = |\log u| \tag{13.14}$$

Two-channel, one dimension test sampler

This sampler implements the function

$$f(x, y) = a * 5x^4 + b * 5(1 - x)^4 \qquad (13.15)$$

Each term contributes 1 to the integral, multiplied by a or b, respectively. The first term is peaked at $x = 1$, the second one at $x = 0$..

We implement the two mappings

$$x = u^{1/5} \quad \text{and} \quad x = 1 - v^{1/5}, \qquad (13.16)$$

with Jacobians

$$\frac{\partial(x)}{\partial(u)} = u^{-4/5}/5 \quad \text{and} \quad v^{-4/5}/5, \qquad (13.17)$$

respectively. The first mapping concentrates points near $x = 1$, the second one near $x = 0$.

      val = sampler%val
      x = sampler%x
      f = sampler%f
    end subroutine test_sampler_3_fetch
```

One-dimensional integration

Construct an integrator and use it for a one-dimensional sampler.

Note: We would like to check the precise contents of the grid allocated during integration, but the output format for reals is very long (for good reasons), so the last digits in the grid content display are numerical noise. So, we just check the integration results.

⟨*MCI vamp: execute tests*⟩≡
```
call test (mci_vamp_1, "mci_vamp_1", &
    "one-dimensional integral", &
    u, results)
```

Chapter 14

Process Libraries

This chapter consists of two modules which organize and interface the interaction matrix elements for a variety of elementary processes.

prclib_interfaces This module deals with matrix-element code which is accessible via external libraries (Fortran libraries or generic C-compatible libraries) and must either be generated by the program or provided by the user explicitly.

The module defines and uses an abstract type `prc_writer_t` and two abstract extensions, one for a Fortran module and one for a C-compatible library. The implementation provides the specific methods for writing the appropriate parts in external matrix element code.

prc_core_def This module defines the abstract types `prc_core_def_t` and `prc_driver_t`. The implementation of the former provides the configuration for processes of a certain class, while the latter accesses the corresponding matrix element, in particular those generated by the appropriate `prc_writer_t` object.

process_libraries This module combines the functionality of the previous module with the means for holding processes definitions (the internal counterpart of appropriate declarations in the user interface), for handling matrix elements which do not need external code, and for accessing the matrix elements by the procedures for matrix-element evaluation, integration and event generation.

test_me This module provides a test implementation for the abstract types in the `prc_core_def` module. The implementation is intended for self-tests of several later modules. The implementation is internal, i.e., no external code has is generated.

All data structures which are specific for a particular way of generating code or evaluating matrix element are kept abstract and thus generic. Later modules such as `prc_omega` provide implementations, in the form of type extensions for the various abstract types.

14.1 Process library interface

The module `prclib_interfaces` handles external matrix-element code.

14.1.1 Overview

The top-level data structure is the `prclib_driver_t` data type. The associated type-bound procedures deal with the generation of external code, compilation and linking, and accessing the active external library.

An object of type `prclib_driver_t` consists of the following parts:

1. Metadata that identify name and status of the library driver, etc.

2. An array of process records (`prclib_driver_record_t`), one for each external matrix element.

3. A record of type `dlaccess_t` which handles the operating-system part of linking a dynamically loadable library.

4. A collection of procedure pointers which have a counterpart in the external library interface. Given the unique identifier of a matrix element, the procedures retrieve generic matrix-element information such as the particle content and helicity combination tables. There is also a procedure which returns pointers to the more specific procedures that a matrix element provides, called *features*.

The process records of type `prclib_driver_record_t` handle the individual matrix elements. Each record identifies a process by name (`id`), names the physics model to be loaded for this process, lists the features that the associated matrix-element code provides, and holds a `writer` object which handles all operations that depend on the process type. The numbering of process records is identical to the numbering of matrix-element codes in the external library.

The writer object is of abstract type `prc_writer_t`. The module defines two basic, also abstract, extensions: `prc_writer_f_module_t` and `prc_writer_c_lib_t`. The first version is for matrix-element code that is available in form of Fortran modules. The writer contains type-bound procedures which create appropriate `use` directives and C-compatible wrapper functions for the given set of Fortran modules and their features. The second version is for matrix-element code that is available in form of a C-compatible library (this includes Fortran libraries with proper C bindings). The writer needs not write wrapper function, but explicit interface blocks for the matrix-element features.

Each matrix-element variant is encoded in an appropriate extension of `prc_writer_t`. For instance, O'MEGA matrix elements provide an implementation `omega_writer_t` which extends `prc_writer_f_module_t`.

14.1.2 Workflow

We expect that the functionality provided by this module is called in the following order:

1. The caller initializes the `prclib_driver_t` object and fills the array of `prclib_record_t` entries with the appropriate process data and process-specific writer objects.

2. It calls the `generate_makefile` method to set up an appropriate makefile in the current directory. The makefile will handle source generation, compilation and linking both for the individual matrix elements (unless this has to be done manually) and for the common external driver code which interfaces those matrix element.

3. The `generate_driver_code` writes the common driver as source code to file.

4. The methods `make_source`, `make_compile`, and `make_link` individually perform the corresponding steps in building the library. Wherever possible, they simply use the generated makefile. By calling `make`, we make sure that we can avoid unnecessary recompilation. For the compilation and linking steps, the makefile will employ `libtool`.

5. The `load` method loads the library procedures into the corresponding procedure pointers, using the `dlopen` mechanism via the `dlaccess` subobject.

14.1.3   The module

⟨`prclib_interfaces.f90`⟩≡
  ⟨*File header*⟩

  ⟨*Use file utils*⟩
    use diagnostics !NODEP!
    use limits, only: TAB !NODEP!
    use unit_tests
    use os_interface

  ⟨*Standard module head*⟩

  ⟨*Prclib interfaces: public*⟩

  ⟨*Prclib interfaces: types*⟩

  ⟨*Prclib interfaces: interfaces*⟩

  ⟨*Prclib interfaces: test types*⟩

  contains

  ⟨*Prclib interfaces: procedures*⟩

  ⟨*Prclib interfaces: tests*⟩

  end module prclib_interfaces

14.1.4 Writers

External matrix element code provides externally visible procedures, which we denote as *features*. The features consist of informational subroutines and functions which are mandatory (universal features) and matrix-element specific subroutines and functions (specific features). The driver interfaces the generic features directly, while it returns the specific features in form of bind(C) procedure pointers to the caller. For instance, function `n_in` is generic, while the matrix matrix-element value itself is specific.

To implement these tasks, the driver needs `use` directives for Fortran module procedures, interface blocks for other external stuff, wrapper code, and Makefile snippets.

Generic writer

In the `prc_writer_t` data type, we collect the procedures which implement the writing tasks. The type is abstract. The concrete implementations are defined by an extension which is specific for the process type.

The MD5 sum stored here should be the MD5 checksum of the current process component, which can be calculated once the process is configured completely. It can be used by implementations which work with external files, such as `O'MEGA`.

⟨*Prclib interfaces: public*⟩≡
```
    public :: prc_writer_t
```

⟨*Prclib interfaces: types*⟩≡
```
    type, abstract :: prc_writer_t
      character(32) :: md5sum = ""
     contains
     ⟨Prclib interfaces: prc writer: TBP⟩
    end type prc_writer_t
```

In any case, it is useful to have a string representation of the writer type. This must be implemented by all extensions.

⟨*Prclib interfaces: prc writer: TBP*⟩≡
```
    procedure(get_const_string), nopass, deferred :: type_name
```

⟨*Prclib interfaces: interfaces*⟩≡
```
    abstract interface
      function get_const_string () result (string)
        import
        type(string_t) :: string
      end function get_const_string
    end interface
```

Return the name of a procedure that implements a given feature, as it is provided by the external matrix-element code. For a reasonable default, we take the feature name unchanged.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure, nopass :: get_procname => prc_writer_get_procname
```

⟨*Prclib interfaces: procedures*⟩≡
```
function prc_writer_get_procname (feature) result (name)
  type(string_t) :: name
  type(string_t), intent(in) :: feature
  name = feature
end function prc_writer_get_procname
```

Return the name of a procedure that implements a given feature with the bind(C) property, so it can be accessed via a C procedure pointer and handled by dlopen. We need this for all special features of a matrix element, since the interface has to return a C function pointer for it. For a default implementation, we prefix the external procedure name by the process ID.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
procedure :: get_c_procname => prc_writer_get_c_procname
```

⟨*Prclib interfaces: procedures*⟩+≡
```
function prc_writer_get_c_procname (writer, id, feature) result (name)
  class(prc_writer_t), intent(in) :: writer
  type(string_t), intent(in) :: id, feature
  type(string_t) :: name
  name = id // "_" // feature
end function prc_writer_get_c_procname
```

Common signature of code-writing procedures. The procedure may use the process ID, and the feature name. (Not necessarily all of them.)

⟨*Prclib interfaces: interfaces*⟩+≡
```
abstract interface
  subroutine write_code_file (writer, id)
    import
    class(prc_writer_t), intent(in) :: writer
    type(string_t), intent(in) :: id
  end subroutine write_code_file
end interface

abstract interface
  subroutine write_code (writer, unit, id)
    import
    class(prc_writer_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
  end subroutine write_code
end interface

abstract interface
  subroutine write_code_os (writer, unit, id, os_data, testflag)
    import
    class(prc_writer_t), intent(in) :: writer
    integer, intent(in) :: unit
    type(string_t), intent(in) :: id
    type(os_data_t), intent(in) :: os_data
    logical, intent(in), optional :: testflag
  end subroutine write_code_os
end interface
```

1734

```
abstract interface
   subroutine write_feature_code (writer, unit, id, feature)
      import
      class(prc_writer_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id, feature
   end subroutine write_feature_code
end interface
```

There must be a procedure which writes an interface block for a given feature. If the external matrix element is implemented as a Fortran module, this is required only for the specific features which are returned as procedure pointers.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
procedure(write_feature_code), deferred :: write_interface
```

There must also be a procedure which writes Makefile code which is specific for the current process, but not the feature.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
procedure(write_code_os), deferred :: write_makefile_code
```

This procedure writes code process-specific source-code file (which need not be Fortran). It may be a no-op, if the source code is generated by Make instead.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
procedure(write_code_file), deferred :: write_source_code
```

Writer for Fortran-module matrix elements

If the matrix element is available as a Fortran module, we have specific requirements: (i) the features are imported via `use` directives, (ii) the specific features require bind(C) wrappers.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

⟨*Prclib interfaces: public*⟩+≡
```
public :: prc_writer_f_module_t
```

⟨*Prclib interfaces: types*⟩+≡
```
type, extends (prc_writer_t), abstract :: prc_writer_f_module_t
 contains
   ⟨Prclib interfaces: prc writer f module: TBP⟩
end type prc_writer_f_module_t
```

Return the name of the Fortran module. As a default implementation, we take the process ID unchanged.

⟨*Prclib interfaces: prc writer f module: TBP*⟩≡
```
procedure, nopass :: get_module_name => prc_writer_get_module_name
```

⟨*Prclib interfaces: procedures*⟩+≡
```
function prc_writer_get_module_name (id) result (name)
   type(string_t) :: name
   type(string_t), intent(in) :: id
   name = id
end function prc_writer_get_module_name
```

Write a `use` directive that associates the driver reference with the procedure in the matrix element code. By default, we use the C name for this.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
procedure :: write_use_line => prc_writer_write_use_line
```

⟨*Prclib interfaces: procedures*⟩+≡
```
subroutine prc_writer_write_use_line (writer, unit, id, feature)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t) :: id, feature
  write (unit, "(2x,9A)")  "use ", char (writer%get_module_name (id)), &
       ", only: ", char (writer%get_c_procname (id, feature)), &
       " => ", char (writer%get_procname (feature))
end subroutine prc_writer_write_use_line
```

Write a wrapper routine for a feature. This also associates a C name the module procedure. The details depend on the writer variant.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
procedure(prc_write_wrapper), deferred :: write_wrapper
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
abstract interface
   subroutine prc_write_wrapper (writer, unit, id, feature)
     import
     class(prc_writer_f_module_t), intent(in) :: writer
     integer, intent(in) :: unit
     type(string_t), intent(in) :: id, feature
   end subroutine prc_write_wrapper
end interface
```

This is used for testing only: initialize the writer with a specific MD5 sum string.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
procedure :: init_test => prc_writer_init_test
```

⟨*Prclib interfaces: procedures*⟩+≡
```
subroutine prc_writer_init_test (writer)
  class(prc_writer_t), intent(out) :: writer
  writer%md5sum = "1234567890abcdef1234567890abcdef"
end subroutine prc_writer_init_test
```

Writer for C-library matrix elements

This applies if the matrix element is available as a C library or a Fortran library with bind(C) compatible interface. We can use the basic version.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

⟨*Prclib interfaces: types*⟩+≡
```
type, extends (prc_writer_t), abstract :: prc_writer_c_lib_t
 contains
 ⟨Prclib interfaces: prc writer c lib: TBP⟩
end type prc_writer_c_lib_t
```

14.1.5 Process records in the library driver

A process record holds the process (component) `ID`, the physics `model_name`, and the array of `feature`s that are implemented by the corresponding matrix element code.

The `writer` component holds procedures. The procedures write source code for the current record, either for the driver or for the Makefile.

⟨*Prclib interfaces: types*⟩+≡
```
type :: prclib_driver_record_t
  type(string_t) :: id
  type(string_t) :: model_name
  type(string_t), dimension(:), allocatable :: feature
  class(prc_writer_t), pointer :: writer => null ()
 contains
 ⟨Prclib interfaces: prclib driver record: TBP⟩
 end type prclib_driver_record_t
```

Output routine. We indent the output, so it smoothly integrates into the output routine for the whole driver.

Note: the pointer `writer` is introduced as a workaround for a NAG compiler bug.

⟨*Prclib interfaces: prclib driver record: TBP*⟩≡
```
procedure :: write => prclib_driver_record_write
```

⟨*Prclib interfaces: procedures*⟩+≡
```
subroutine prclib_driver_record_write (object, unit)
  class(prclib_driver_record_t), intent(in) :: object
  integer, intent(in) :: unit
  integer :: j
  class(prc_writer_t), pointer :: writer
  write (unit, "(3x,A,2x,'[',A,']')")  &
      char (object%id), char (object%model_name)
  if (allocated (object%feature)) then
     writer => object%writer
     write (unit, "(5x,A,A)", advance="no") &
         char (writer%type_name ()), ":"
     do j = 1, size (object%feature)
        write (unit, "(1x,A)", advance="no") &
            char (object%feature(j))
     end do
     write (unit, *)
  end if
end subroutine prclib_driver_record_write
```

Get the C procedure name for a feature.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
procedure :: get_c_procname => prclib_driver_record_get_c_procname
```

⟨*Prclib interfaces: procedures*⟩+≡
```
function prclib_driver_record_get_c_procname (record, feature) result (name)
  type(string_t) :: name
  class(prclib_driver_record_t), intent(in) :: record
  type(string_t), intent(in) :: feature
```

```
      name = record%writer%get_c_procname (record%id, feature)
    end function prclib_driver_record_get_c_procname
```

Write a USE directive for a given feature. Applies only if the record corresponds to a Fortran module.

⟨Prclib interfaces: prclib driver record: TBP⟩+≡
```
    procedure :: write_use_line => prclib_driver_record_write_use_line
```

⟨Prclib interfaces: procedures⟩+≡
```
    subroutine prclib_driver_record_write_use_line (record, unit, feature)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      type(string_t), intent(in) :: feature
      select type (writer => record%writer)
      class is (prc_writer_f_module_t)
         call writer%write_use_line (unit, record%id, feature)
      end select
    end subroutine prclib_driver_record_write_use_line
```

The alternative: write an interface block for a given feature, unless the record corresponds to a Fortran module.

⟨Prclib interfaces: prclib driver record: TBP⟩+≡
```
    procedure :: write_interface => prclib_driver_record_write_interface
```

⟨Prclib interfaces: procedures⟩+≡
```
    subroutine prclib_driver_record_write_interface (record, unit, feature)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      type(string_t), intent(in) :: feature
      select type (writer => record%writer)
      class is (prc_writer_f_module_t)
      class default
         call writer%write_interface (unit, record%id, feature)
      end select
    end subroutine prclib_driver_record_write_interface
```

Write all special feature interfaces for the current record. Do this for all process variants.

⟨Prclib interfaces: prclib driver record: TBP⟩+≡
```
    procedure :: write_interfaces => prclib_driver_record_write_interfaces
```

⟨Prclib interfaces: procedures⟩+≡
```
    subroutine prclib_driver_record_write_interfaces (record, unit)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      integer :: i
      do i = 1, size (record%feature)
         call record%writer%write_interface (unit, record%id, record%feature(i))
      end do
    end subroutine prclib_driver_record_write_interfaces
```

Write the wrapper routines for this record, if it corresponds to a Fortran module.

⟨Prclib interfaces: prclib driver record: TBP⟩+≡
```
    procedure :: write_wrappers => prclib_driver_record_write_wrappers
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_wrappers (record, unit)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      integer :: i
      select type (writer => record%writer)
      class is (prc_writer_f_module_t)
         do i = 1, size (record%feature)
            call writer%write_wrapper (unit, record%id, record%feature(i))
         end do
      end select
    end subroutine prclib_driver_record_write_wrappers
```

Write the Makefile code for this record.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_makefile_code => prclib_driver_record_write_makefile_code
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_makefile_code &
         (record, unit, os_data, testflag)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      type(os_data_t), intent(in) :: os_data
      logical, intent(in), optional :: testflag
      call record%writer%write_makefile_code (unit, record%id, os_data, testflag)
    end subroutine prclib_driver_record_write_makefile_code
```

Write source-code files for this record. (Does nothing if the source code is handled by Makefile rules.)

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_source_code => prclib_driver_record_write_source_code
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_source_code (record)
      class(prclib_driver_record_t), intent(in) :: record
      call record%writer%write_source_code (record%id)
    end subroutine prclib_driver_record_write_source_code
```

14.1.6 The process library driver object

A `prclib_driver_t` object provides the interface to external matrix element code. The code is provided by an external library which is either statically or dynamically linked.

The dynamic and static versions of the library are two different implementations of the abstract base type.

The `basename` identifies the library, both by file names and by Fortran variable names.

The `loaded` flag becomes true once all procedure pointers to the matrix element have been assigned.

For a dynamical external library, the communication proceeds via a `dlaccess` object.

`n_processes` is the number of external process code components that are referenced by this library. The code is addressed by index (`i_lib` in the process library entry above). This number should be equal to the number returned by `get_n_prc`.

For each external process, there is a separate `record` which holds the data that are needed for the driver parts which are specific for a given process component. The actual pointers for the loaded library will be assigned elsewhere.

The remainder is a collection of procedure pointers, which can be assigned once all external code has been compiled and linked. The procedure pointers all take a process component code index as an argument. Most return information about the process component that should match the process definition. The `get_fptr` procedures return a function pointer, which is the actual means to compute matrix elements or retrieve associated data.

Finally, the `unload_hook` and `reload_hook` pointers allow for the insertion of additional code when a library is loaded.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prclib_driver_t
```

⟨*Prclib interfaces: types*⟩+≡
```
    type, abstract :: prclib_driver_t
      type(string_t) :: basename
      character(32) :: md5sum = ""
      logical :: loaded = .false.
      type(string_t) :: libname
      type(string_t) :: modellibs_ldflags
      integer :: n_processes = 0
      type(prclib_driver_record_t), dimension(:), allocatable :: record
      procedure(prc_get_n_processes), nopass, pointer :: &
           get_n_processes => null ()
      procedure(prc_get_stringptr), nopass, pointer :: &
           get_process_id_ptr => null ()
      procedure(prc_get_stringptr), nopass, pointer :: &
           get_model_name_ptr => null ()
      procedure(prc_get_stringptr), nopass, pointer :: &
           get_md5sum_ptr => null ()
      procedure(prc_get_log), nopass, pointer :: &
           get_openmp_status => null ()
      procedure(prc_get_int), nopass, pointer :: get_n_in  => null ()
      procedure(prc_get_int), nopass, pointer :: get_n_out => null ()
      procedure(prc_get_int), nopass, pointer :: get_n_flv => null ()
      procedure(prc_get_int), nopass, pointer :: get_n_hel => null ()
      procedure(prc_get_int), nopass, pointer :: get_n_col => null ()
      procedure(prc_get_int), nopass, pointer :: get_n_cin => null ()
      procedure(prc_get_int), nopass, pointer :: get_n_cf  => null ()
      procedure(prc_set_int_tab1), nopass, pointer :: &
           set_flv_state_ptr => null ()

           set_color_factors_ptr => null ()
      procedure(prc_get_fptr), nopass, pointer :: get_fptr => null ()
```

```
  contains
  ⟨Prclib interfaces: prclib driver: TBP⟩
end type prclib_driver_t
```

This is the dynamic version. It contains a `dlaccess` object for communicating with the OS.

⟨*Prclib interfaces: types*⟩+≡
```
    type, extends (prclib_driver_t) :: prclib_driver_dynamic_t
      type(dlaccess_t) :: dlaccess
    contains
    ⟨Prclib interfaces: prclib driver dynamic: TBP⟩
    end type prclib_driver_dynamic_t
```

Print just the metadata. Procedure pointers cannot be printed.

⟨*Prclib interfaces: prclib driver: TBP*⟩≡
```
    procedure :: write => prclib_driver_write
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_write (object, unit, libpath)
      class(prclib_driver_t), intent(in) :: object
      integer, intent(in) :: unit
      logical, intent(in), optional :: libpath
      logical :: write_lib
      integer :: i
      write_lib = .true.
      if (present (libpath))  write_lib = libpath
      write (unit, "(1x,A,A)")  &
           "External matrix-element code library: ", char (object%basename)
      select type (object)
      type is (prclib_driver_dynamic_t)
        write (unit, "(3x,A,L1)")  "static   = F"
      class default
        write (unit, "(3x,A,L1)")  "static   = T"
      end select
      write (unit, "(3x,A,L1)")  "loaded   = ", object%loaded
      write (unit, "(3x,A,A,A)") "MD5 sum  = '", object%md5sum, "'"
      if (write_lib) then
        write (unit, "(3x,A,A,A)") "Mdl flags = '", &
             char (object%modellibs_ldflags), "'"
      end if
      select type (object)
      type is (prclib_driver_dynamic_t)
        write (unit, *)
        call object%dlaccess%write (unit)
      end select
      write (unit, *)
      if (allocated (object%record)) then
        write (unit, "(1x,A)")  "Matrix-element code entries:"
        do i = 1, object%n_processes
           call object%record(i)%write (unit)
        end do
      else
        write (unit, "(1x,A)")  "Matrix-element code entries: [undefined]"
```

```
        end if
      end subroutine prclib_driver_write
```

Allocate a library as either static or dynamic. For static libraries, the procedure defers control to an external procedure which knows about the available static libraries. By default, this procedure is empty, but when we build a stand-alone executable, we replace the dummy by an actual dispatcher for the available static libraries. If the static dispatcher was not successful, we allocate a dynamic library.

The default version of `dispatch_prclib_static` resides in the `prebuilt` section of the `WHIZARD` tree, in a separate library. It does nothing, but can be replaced by a different procedure that allocates a static library driver if requested by name.

Note: `intent(out)` for the `driver` argument segfaults with gfortran 4.7.

⟨*Prclib interfaces: public*⟩+≡
```
      public :: dispatch_prclib_driver
```

⟨*Prclib interfaces: procedures*⟩+≡
```
      subroutine dispatch_prclib_driver &
          (driver, basename, modellibs_ldflags)
        class(prclib_driver_t), intent(inout), allocatable :: driver
        type(string_t), intent(in) :: basename
        type(string_t), intent(in), optional :: modellibs_ldflags
        procedure(dispatch_prclib_driver) :: dispatch_prclib_static
        if (allocated (driver))  deallocate (driver)
        call dispatch_prclib_static (driver, basename)
        if (.not. allocated (driver)) then
           allocate (prclib_driver_dynamic_t :: driver)
        end if
        driver%basename = basename
        driver%modellibs_ldflags = modellibs_ldflags
      end subroutine dispatch_prclib_driver
```

Initialize the ID array and set `n_processes` accordingly.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
      procedure :: init => prclib_driver_init
```

⟨*Prclib interfaces: procedures*⟩+≡
```
      subroutine prclib_driver_init (driver, n_processes)
        class(prclib_driver_t), intent(inout) :: driver
        integer, intent(in) :: n_processes
        driver%n_processes = n_processes
        allocate (driver%record (n_processes))
      end subroutine prclib_driver_init
```

Set the MD5 sum. This is separate because the MD5 sum may be known only after initialization.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
      procedure :: set_md5sum => prclib_driver_set_md5sum
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_set_md5sum (driver, md5sum)
      class(prclib_driver_t), intent(inout) :: driver
      character(32), intent(in) :: md5sum
      driver%md5sum = md5sum
    end subroutine prclib_driver_set_md5sum
```

Set the process record for a specific library entry. If the index is zero, we do nothing.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: set_record => prclib_driver_set_record
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_set_record (driver, i, &
        id, model_name, features, writer)
      class(prclib_driver_t), intent(inout) :: driver
      integer, intent(in) :: i
      type(string_t), intent(in) :: id
      type(string_t), intent(in) :: model_name
      type(string_t), dimension(:), intent(in) :: features
      class(prc_writer_t), intent(in), pointer :: writer
      if (i > 0) then
         associate (record => driver%record(i))
           record%id = id
           record%model_name = model_name
           allocate (record%feature (size (features)))
           record%feature = features
           record%writer => writer
         end associate
      end if
    end subroutine prclib_driver_set_record
```

Write all USE directives for a given feature, scanning the array of processes. Only Fortran-module processes count. Then, write interface blocks for the remaining processes.

The `implicit none` statement must go in-between.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_interfaces => prclib_driver_write_interfaces
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_write_interfaces (driver, unit, feature)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: feature
      integer :: i
      do i = 1, driver%n_processes
         call driver%record(i)%write_use_line (unit, feature)
      end do
      write (unit, "(2x,9A)")  "implicit none"
      do i = 1, driver%n_processes
         call driver%record(i)%write_interface (unit, feature)
      end do
    end subroutine prclib_driver_write_interfaces
```

14.1.7 Write makefile

The makefile contains constant parts, parts that depend on the library name,
and parts that depend on the specific processes and their types.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: generate_makefile => prclib_driver_generate_makefile
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_generate_makefile (driver, unit, os_data, testflag)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(os_data_t), intent(in) :: os_data
      logical, intent(in), optional :: testflag
      integer :: i
      write (unit, "(A)")  "# WHIZARD: Makefile for process library '" &
            // char (driver%basename) // "'"
      write (unit, "(A)")  "# Automatically generated file, do not edit"
      write (unit, "(A)")  ""
      write (unit, "(A)")  "# Integrity check (don't modify the following line!)"
      write (unit, "(A)")  "MD5SUM = '" // driver%md5sum // "'"
      write (unit, "(A)")  ""
      write (unit, "(A)")  "# Library name"
      write (unit, "(A)")  "BASE = " // char (driver%basename)

14.1.8   Write driver file

This procedure writes the process library driver source code to the specified
output unit. The individual routines for writing source-code procedures are
given below.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: generate_driver_code => prclib_driver_generate_code
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_generate_code (driver, unit)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t) :: prefix
      integer :: i

      prefix = driver%basename // "_"

      write (unit, "(A)")  "! WHIZARD matrix-element code interface"
      write (unit, "(A)")  "!"
      write (unit, "(A)")  "! Automatically generated file, do not edit"
      call driver%write_module (unit, prefix)
      call driver%write_lib_md5sum_fun (unit, prefix)
      call driver%write_get_n_processes_fun (unit, prefix)
      call driver%write_get_process_id_fun (unit, prefix)
      call driver%write_get_model_name_fun (unit, prefix)
      call driver%write_get_md5sum_fun (unit, prefix)
      call driver%write_string_to_array_fun (unit, prefix)
      call driver%write_get_openmp_status_fun (unit, prefix)
      call driver%write_get_int_fun (unit, prefix, var_str ("n_in"))
      call driver%write_get_int_fun (unit, prefix, var_str ("n_out"))
      call driver%write_get_int_fun (unit, prefix, var_str ("n_flv"))
      call driver%write_get_int_fun (unit, prefix, var_str ("n_hel"))
      call driver%write_get_int_fun (unit, prefix, var_str ("n_col"))
      call driver%write_get_int_fun (unit, prefix, var_str ("n_cin"))
      call driver%write_get_int_fun (unit, prefix, var_str ("n_cf"))
      call driver%write_set_int_sub (unit, prefix, var_str ("flv_state"))
      call driver%write_set_int_sub (unit, prefix, var_str ("hel_state"))
      call driver%write_set_col_state_sub (unit, prefix)
      call driver%write_set_color_factors_sub (unit, prefix)
      call driver%write_get_fptr_sub (unit, prefix)
      do i = 1, driver%n_processes
         call driver%record(i)%write_wrappers (unit)
      end do
    end subroutine prclib_driver_generate_code
```

The driver module is used and required *only* if we intend to link the library
statically. Then, it provides the (static) driver type as a concrete implementa-
tion of the abstract library driver. This type contains the internal dispatcher
for assigning the library procedures to their appropriate procedure pointers. In

the dynamical case, the assignment is done via the base-type dispatcher which invokes the DL mechanism.

However, compiling this together with the rest in any case should not do any harm.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
procedure, nopass :: write_module => prclib_driver_write_module
```

⟨*Prclib interfaces: procedures*⟩+≡

      write (unit, "(A)")  "end function " // char (prefix) // "md5sum"
    end subroutine prclib_driver_write_lib_md5sum_fun
```

14.1.9   Interface bodies for informational functions

These interfaces implement the communication between WHIZARD (the main
program) and the process-library driver. The procedures are all BIND(C), so
they can safely be exposed by the library and handled by the `dlopen` mechanism,
which apparently understands only C calling conventions.

In the sections below, for each procedure, we provide both the interface itself
and a procedure that writes the correponding procedure as source code to the
process library driver.

Process count

Return the number of processes contained in the library.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_get_n_processes
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
      function prc_get_n_processes () result (n) bind(C)
        import
        integer(c_int) :: n
      end function prc_get_n_processes
    end interface
```

Here is the code.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_n_processes_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_n_processes_fun (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
```

1749

```
      write (unit, "(A)")  ""
      write (unit, "(A)")  "! Return the number of processes in this library"
      write (unit, "(A)")  "function " // char (prefix) &
           // "get_n_processes () result (n) bind(C)"
      write (unit, "(A)")  "  use iso_c_binding"
      write (unit, "(A)")  "  implicit none"
      write (unit, "(A)")  "  integer(c_int) :: n"
      write (unit, "(A,I0)")  "  n = ", driver%n_processes
      write (unit, "(A)")  "end function " // char (prefix) &
           // "get_n_processes"
    end subroutine write_get_n_processes_fun
```

Informational string functions

These functions return constant information about the matrix-element code.

The following procedures have to return strings. With the BIND(C) constraint, we choose to return the C pointer to a string, and its length, so the procedures implement this interface. They are actually subroutines.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_get_stringptr
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
      subroutine prc_get_stringptr (i, cptr, len) bind(C)
        import
        integer(c_int), intent(in) :: i
        type(c_ptr), intent(out) :: cptr
        integer(c_int), intent(out) :: len
      end subroutine prc_get_stringptr
    end interface
```

To hide this complication, we introduce a subroutine that converts the returned C pointer to a `string_t` object. As a side effect, we deallocate the original after conversion – otherwise, we might have a memory leak.

For the conversion, we first pointer-convert the C pointer to a Fortran character array pointer, length 1 and size `len`. Using argument association and an internal subroutine, we convert this to a character array with length `len` and size 1. Using ordinary assignment, we finally convert this to `string_t`.

The function takes the pointer-returning function as an argument. The index `i` identifies the process in the library.

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine get_string_via_cptr (string, i, get_stringptr)
      type(string_t), intent(out) :: string
      integer, intent(in) :: i
      procedure(prc_get_stringptr) :: get_stringptr
      type(c_ptr) :: cptr
      integer(c_int) :: pid, len
      character(kind=c_char), dimension(:), pointer :: c_array
      pid = i
      call get_stringptr (pid, cptr, len)
      if (c_associated (cptr)) then
         call c_f_pointer (cptr, c_array, shape = [len])
```

1750

```
        call set_string (c_array)
        call get_stringptr (0_c_int, cptr, len)
     else
        string = ""
     end if
  contains
    subroutine set_string (buffer)
      character(len, kind=c_char), dimension(1), intent(in) :: buffer
      string = buffer(1)
    end subroutine set_string
  end subroutine get_string_via_cptr
```

Since the module procedures return Fortran strings, we have to convert them.
This is the necessary auxiliary routine. The routine is not BIND(C), it is not
accessed from outside.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure, nopass :: write_string_to_array_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_string_to_array_fun (unit, prefix)
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      write (unit, "(A)")  ""
      write (unit, "(A)")  "! Auxiliary: convert character string &
          &to array pointer"
      write (unit, "(A)")  "subroutine " // char (prefix) &
          // "string_to_array (string, a)"
      write (unit, "(A)")  "  use iso_c_binding"
      write (unit, "(A)")  "  implicit none"
      write (unit, "(A)")  "  character(*), intent(in) :: string"
      write (unit, "(A)")  "  character(kind=c_char), dimension(:), &
          &allocatable, intent(out) :: a"
      write (unit, "(A)")  "  integer :: i"
      write (unit, "(A)")  "  allocate (a (len (string)))"
      write (unit, "(A)")  "  do i = 1, size (a)"
      write (unit, "(A)")  "     a(i) = string(i:i)"
      write (unit, "(A)")  "  end do"
      write (unit, "(A)")  "end subroutine " // char (prefix) &
          // "string_to_array"
    end subroutine write_string_to_array_fun
```

The above routine is called by other functions. It is not in a module, so they
need its interface explicitly.

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_string_to_array_interface (unit, prefix)
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      write (unit, "(2x,A)")  "interface"
      write (unit, "(2x,A)")  "   subroutine " // char (prefix) &
          // "string_to_array (string, a)"
      write (unit, "(2x,A)")  "     use iso_c_binding"
      write (unit, "(2x,A)")  "     implicit none"
      write (unit, "(2x,A)")  "     character(*), intent(in) :: string"
```

```
        write (unit, "(2x,A)")  "    character(kind=c_char), dimension(:), &
            &allocatable, intent(out) :: a"
        write (unit, "(2x,A)")  "   end subroutine " // char (prefix) &
            // "string_to_array"
        write (unit, "(2x,A)")  "end interface"
    end subroutine write_string_to_array_interface
```

Here are the info functions which return strings, implementing the interface
`prc_get_stringptr`.

Return the process ID for each process.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_process_id_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_process_id_fun (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i
      write (unit, "(A)")  ""
      write (unit, "(A)")  "! Return the process ID of process #i &
          &(as a C pointer to a character array)"
      write (unit, "(A)")  "subroutine " // char (prefix) &
          // "get_process_id_ptr (i, cptr, len) bind(C)"
      write (unit, "(A)")  "  use iso_c_binding"
      write (unit, "(A)")  "  implicit none"
      write (unit, "(A)")  "  integer(c_int), intent(in) :: i"
      write (unit, "(A)")  "  type(c_ptr), intent(out) :: cptr"
      write (unit, "(A)")  "  integer(c_int), intent(out) :: len"
      write (unit, "(A)")  "  character(kind=c_char), dimension(:), &
          &allocatable, target, save :: a"
      call write_string_to_array_interface (unit, prefix)
      write (unit, "(A)")  "  select case (i)"
      write (unit, "(A)")  "  case (0);  if (allocated (a))  deallocate (a)"
      do i = 1, driver%n_processes
         write (unit, "(A,I0,9A)")  "  case (", i, ");  ", &
             "call ", char (prefix), "string_to_array ('", &
             char (driver%record(i)%id), "', a)"
      end do
      write (unit, "(A)")  "  end select"
      write (unit, "(A)")  "  if (allocated (a)) then"
      write (unit, "(A)")  "     cptr = c_loc (a)"
      write (unit, "(A)")  "     len = size (a)"
      write (unit, "(A)")  "  else"
      write (unit, "(A)")  "     cptr = c_null_ptr"
      write (unit, "(A)")  "     len = 0"
      write (unit, "(A)")  "  end if"
      write (unit, "(A)")  "end subroutine " // char (prefix) &
          // "get_process_id_ptr"
    end subroutine write_get_process_id_fun
```

Return the model name, given explicitly.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_model_name_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_model_name_fun (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i
      write (unit, "(A)")   ""
      write (unit, "(A)")   "! Return the model name for process #i &
          &(as a C pointer to a character array)"
      write (unit, "(A)")   "subroutine " // char (prefix) &
          // "get_model_name_ptr (i, cptr, len) bind(C)"
      write (unit, "(A)")   "  use iso_c_binding"
      write (unit, "(A)")   "  implicit none"
      write (unit, "(A)")   "  integer(c_int), intent(in) :: i"
      write (unit, "(A)")   "  type(c_ptr), intent(out) :: cptr"
      write (unit, "(A)")   "  integer(c_int), intent(out) :: len"
      write (unit, "(A)")   "  character(kind=c_char), dimension(:), &
          &allocatable, target, save :: a"
      call write_string_to_array_interface (unit, prefix)
      write (unit, "(A)")   "  select case (i)"
      write (unit, "(A)")   "  case (0);  if (allocated (a))  deallocate (a)"
      do i = 1, driver%n_processes
         write (unit, "(A,I0,9A)")  "  case (", i, ");  ", &
              "call ", char (prefix), "string_to_array ('" , &
              char (driver%record(i)%model_name), &
              "', a)"
      end do
      write (unit, "(A)")   "  end select"
      write (unit, "(A)")   "  if (allocated (a)) then"
      write (unit, "(A)")   "     cptr = c_loc (a)"
      write (unit, "(A)")   "     len = size (a)"
      write (unit, "(A)")   "  else"
      write (unit, "(A)")   "     cptr = c_null_ptr"
      write (unit, "(A)")   "     len = 0"
      write (unit, "(A)")   "  end if"
      write (unit, "(A)")   "end subroutine " // char (prefix) &
          // "get_model_name_ptr"
    end subroutine write_get_model_name_fun
```

Call the MD5 sum function for the process. The function calls the corresponding
function of the matrix-element code, and it returns the C address of a character
array with length 32.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_md5sum_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_md5sum_fun (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i
      write (unit, "(A)")   ""
      write (unit, "(A)")   "! Return the MD5 sum for the process configuration &
          &(as a C pointer to a character array)"
```

```
      write (unit, "(A)")  "subroutine " // char (prefix) &
           // "get_md5sum_ptr (i, cptr, len) bind(C)"
      write (unit, "(A)")  "  use iso_c_binding"
      call driver%write_interfaces (unit, var_str ("md5sum"))
      write (unit, "(A)")  "  interface"
      write (unit, "(A)")  "     function " // char (prefix) &
           // "md5sum () result (md5sum)"
      write (unit, "(A)")  "       character(32) :: md5sum"
      write (unit, "(A)")  "     end function " // char (prefix) // "md5sum"
      write (unit, "(A)")  "  end interface"
      write (unit, "(A)")  "  integer(c_int), intent(in) :: i"
      write (unit, "(A)")  "  type(c_ptr), intent(out) :: cptr"
      write (unit, "(A)")  "  integer(c_int), intent(out) :: len"
      write (unit, "(A)")  "  character(kind=c_char), dimension(32), &
           &target, save :: md5sum"
      write (unit, "(A)")  "  select case (i)"
      write (unit, "(A)")  "  case (0)"
      write (unit, "(A)")  "     call copy (" // char (prefix) // "md5sum ())"
      write (unit, "(A)")  "     cptr = c_loc (md5sum)"
      do i = 1, driver%n_processes
         write (unit, "(A,I0,A)")  "  case (", i, ")"
         call driver%record(i)%write_md5sum_call (unit)
      end do
      write (unit, "(A)")  "  case default"
      write (unit, "(A)")  "     cptr = c_null_ptr"
      write (unit, "(A)")  "  end select"
      write (unit, "(A)")  "  len = 32"
      write (unit, "(A)")  "contains"
      write (unit, "(A)")  "  subroutine copy (md5sum_tmp)"
      write (unit, "(A)")  "    character, dimension(32), intent(in) :: &
           &md5sum_tmp"
      write (unit, "(A)")  "    md5sum = md5sum_tmp"
      write (unit, "(A)")  "  end subroutine copy"
      write (unit, "(A)")  "end subroutine " // char (prefix) &
             // "get_md5sum_ptr"
    end subroutine write_get_md5sum_fun
```

The actual call depends on the type of matrix element.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_md5sum_call => prclib_driver_record_write_md5sum_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_md5sum_call (record, unit)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      call record%writer%write_md5sum_call (unit, record%id)
    end subroutine prclib_driver_record_write_md5sum_call
```

The interface goes into the writer base type:

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_code), deferred :: write_md5sum_call
```

In the Fortran module case, we take a detour. The string returned by the
Fortran function is copied into a fixed-size array. The copy routine is an internal

1754

subroutine of `get_md5sum_ptr`. We return the C address of the target array.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
procedure :: write_md5sum_call => prc_writer_f_module_write_md5sum_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
subroutine prc_writer_f_module_write_md5sum_call (writer, unit, id)
  class(prc_writer_f_module_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  write (unit, "(5x,9A)")  "call copy (", &
       char (writer%get_c_procname (id, var_str ("md5sum"))), " ())"
  write (unit, "(5x,9A)")  "cptr = c_loc (md5sum)"
end subroutine prc_writer_f_module_write_md5sum_call
```

In the C library case, the library function returns a C pointer, which we can just copy.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩≡
```
procedure :: write_md5sum_call => prc_writer_c_lib_write_md5sum_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
subroutine prc_writer_c_lib_write_md5sum_call (writer, unit, id)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  write (unit, "(5x,9A)") &
       "cptr =  ", &
       char (writer%get_c_procname (id, var_str ("get_md5sum"))), " ()"
end subroutine prc_writer_c_lib_write_md5sum_call
```

Actual references to the info functions

The string-valued info functions return C character arrays. For the API of the library driver, we provide convenience functions which (re)convert those arrays into `string_t` objects.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
procedure :: get_process_id => prclib_driver_get_process_id
procedure :: get_model_name => prclib_driver_get_model_name
procedure :: get_md5sum => prclib_driver_get_md5sum
```

⟨*Prclib interfaces: procedures*⟩+≡
```
function prclib_driver_get_process_id (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptr (string, i, driver%get_process_id_ptr)
end function prclib_driver_get_process_id

function prclib_driver_get_model_name (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptr (string, i, driver%get_model_name_ptr)
end function prclib_driver_get_model_name
```

1755

```
function prclib_driver_get_md5sum (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptr (string, i, driver%get_md5sum_ptr)
end function prclib_driver_get_md5sum
```

Informational logical functions

When returning a logical value, we use the C boolean type, which may differ
from Fortran.

⟨*Prclib interfaces: public*⟩+≡
```
public :: prc_get_log
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
abstract interface
   function prc_get_log (pid) result (l) bind(C)
     import
     integer(c_int), intent(in) :: pid
     logical(c_bool) :: l
   end function prc_get_log
end interface
```

Return a logical flag which tells whether OpenMP is supported for a specific
process code.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
procedure :: write_get_openmp_status_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
subroutine write_get_openmp_status_fun (driver, unit, prefix)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  integer :: i
  write (unit, "(A)")  ""
  write (unit, "(A)")  "! Return the OpenMP support status"
  write (unit, "(A)")  "function " // char (prefix) &
       // "get_openmp_status (i) result (openmp_status) bind(C)"
  write (unit, "(A)")  "  use iso_c_binding"
  call driver%write_interfaces (unit, var_str ("openmp_supported"))
  write (unit, "(A)")  "  integer(c_int), intent(in) :: i"
  write (unit, "(A)")  "  logical(c_bool) :: openmp_status"
  write (unit, "(A)")  "  select case (i)"
  do i = 1, driver%n_processes
     write (unit, "(A,I0,9A)")  "  case (", i, ");  ", &
            "openmp_status = ", &
            char (driver%record(i)%get_c_procname &
            (var_str ("openmp_supported"))), " ()"
  end do
  write (unit, "(A)")  "  end select"
  write (unit, "(A)")  "end function " // char (prefix) &
       // "get_openmp_status"
end subroutine write_get_openmp_status_fun
```

Informational integer functions

Various process metadata are integer values. We can use a single interface for all of them.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_get_int
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
       function prc_get_int (pid) result (n) bind(C)
         import
         integer(c_int), intent(in) :: pid
         integer(c_int) :: n
       end function prc_get_int
    end interface
```

This function returns any data of type integer, for each process.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_int_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_int_fun (driver, unit, prefix, feature)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      type(string_t), intent(in) :: feature
      integer :: i
      write (unit, "(A)")  ""
      write (unit, "(9A)")  "! Return the value of ", char (feature)
      write (unit, "(9A)")  "function ", char (prefix), &
           "get_", char (feature), " (pid)", &
           " result (", char (feature), ") bind(C)"
      write (unit, "(9A)")  "  use iso_c_binding"
      call driver%write_interfaces (unit, feature)
      write (unit, "(9A)")  "  integer(c_int), intent(in) :: pid"
      write (unit, "(9A)")  "  integer(c_int) :: ", char (feature)
      write (unit, "(9A)")  "  select case (pid)"
      do i = 1, driver%n_processes
         write (unit, "(2x,A,I0,9A)")  "case (", i, ");  ", &
              char (feature), " = ", &
              char (driver%record(i)%get_c_procname (feature)), &
              " ()"
      end do
      write (unit, "(9A)")  "  end select"
      write (unit, "(9A)")  "end function ", char (prefix), &
           "get_", char (feature)
    end subroutine write_get_int_fun
```

Write a `case` line that assigns the value of the external function to the current return value.

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_case_int_fun (record, unit, i, feature)
```

```
          class(prclib_driver_record_t), intent(in) :: record
          integer, intent(in) :: unit
          integer, intent(in) :: i
          type(string_t), intent(in) :: feature
          write (unit, "(5x,A,I0,9A)")  "case (", i, ");  ", &
               char (feature), " = ", char (record%get_c_procname (feature))
        end subroutine write_case_int_fun
```

Flavor and helicity tables

Transferring tables is more complicated. First, a two-dimensional array.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_set_int_tab1
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_set_int_tab1 (pid, tab, shape) bind(C)
         import
         integer(c_int), intent(in) :: pid
         integer(c_int), dimension(*), intent(out) :: tab
         integer(c_int), dimension(2), intent(in) :: shape
       end subroutine prc_set_int_tab1
    end interface
```

This subroutine returns a table of integers.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_set_int_sub
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_set_int_sub (driver, unit, prefix, feature)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      type(string_t), intent(in) :: feature
      integer :: i
      write (unit, "(A)")  ""
      write (unit, "(9A)")  "! Set table: ", char (feature)
      write (unit, "(9A)")  "subroutine ", char (prefix), &
           "set_", char (feature), "_ptr (pid, ", char (feature), &
           ", shape) bind(C)"
      write (unit, "(9A)")  "  use iso_c_binding"
      call driver%write_interfaces (unit, feature)
      write (unit, "(9A)")  "  integer(c_int), intent(in) :: pid"
      write (unit, "(9A)")  "  integer(c_int), dimension(*), intent(out) :: ", &
           char (feature)
      write (unit, "(9A)")  "  integer(c_int), dimension(2), intent(in) :: shape"
      write (unit, "(9A)")  "  integer, dimension(:,:), allocatable :: ", &
           char (feature), "_tmp"
      write (unit, "(9A)")  "  integer :: i, j"
      write (unit, "(9A)")  "  select case (pid)"
      do i = 1, driver%n_processes
         write (unit, "(2x,A,I0,A)")  "case (", i, ")"
         call driver%record(i)%write_int_sub_call (unit, feature)
      end do
```

1758

```
      write (unit, "(9A)")  "  end select"
      write (unit, "(9A)")  "end subroutine ", char (prefix), &
           "set_", char (feature), "_ptr"
    end subroutine write_set_int_sub
```

The actual call depends on the type of matrix element.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_int_sub_call => prclib_driver_record_write_int_sub_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_int_sub_call (record, unit, feature)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      type(string_t), intent(in) :: feature
      call record%writer%write_int_sub_call (unit, record%id, feature)
    end subroutine prclib_driver_record_write_int_sub_call
```

The interface goes into the writer base type:

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_feature_code), deferred :: write_int_sub_call
```

In the Fortran module case, we need an extra copy in the (academical) situation
where default integer and `c_int` differ. Otherwise, we just associate a Fortran
array with the C pointer and let the matrix-element subroutine fill the array.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
    procedure :: write_int_sub_call => prc_writer_f_module_write_int_sub_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_f_module_write_int_sub_call (writer, unit, id, feature)
      class(prc_writer_f_module_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id, feature
      write (unit, "(5x,9A)")  "allocate (",  char (feature), "_tmp ", &
           "(shape(1), shape(2)))"
      write (unit, "(5x,9A)")  "call ", &
           char (writer%get_c_procname (id, feature)), &
           " (", char (feature), "_tmp)"
      write (unit, "(5x,9A)")  "forall (i=1:shape(1), j=1:shape(2)) "
      write (unit, "(8x,9A)")  char (feature), "(i + shape(1)*(j-1)) = ", &
           char (feature), "_tmp", "(i,j)"
      write (unit, "(5x,9A)")  "end forall"
    end subroutine prc_writer_f_module_write_int_sub_call
```

In the C library case, we just transfer the C pointer to the library function.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩+≡
```
    procedure :: write_int_sub_call => prc_writer_c_lib_write_int_sub_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_c_lib_write_int_sub_call (writer, unit, id, feature)
      class(prc_writer_c_lib_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id, feature
      write (unit, "(5x,9A)")  "call ", &
           char (writer%get_c_procname (id, feature)), " (", char (feature), ")"
```

```
      end subroutine prc_writer_c_lib_write_int_sub_call
```

Color state table

The color-state specification needs a table of integers (one array per color flow)
and a corresponding array of color-ghost flags.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_set_col_state
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_set_col_state (pid, col_state, ghost_flag, shape) bind(C)
         import
         integer(c_int), intent(in) :: pid
         integer(c_int), dimension(*), intent(out) :: col_state
         logical(c_bool), dimension(*), intent(out) :: ghost_flag
         integer(c_int), dimension(3), intent(in) :: shape
       end subroutine prc_set_col_state
    end interface
```

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_set_col_state_sub
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_set_col_state_sub (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i
      type(string_t) :: feature
      feature = "col_state"
      write (unit, "(A)")  ""
      write (unit, "(9A)")  "! Set tables: col_state, ghost_flag"
      write (unit, "(9A)")  "subroutine ", char (prefix), &
           "set_col_state_ptr (pid, col_state, ghost_flag, shape) bind(C)"
      write (unit, "(9A)")  "  use iso_c_binding"
      call driver%write_interfaces (unit, feature)
      write (unit, "(9A)")  "  integer(c_int), intent(in) :: pid"
      write (unit, "(9A)") &
           "  integer(c_int), dimension(*), intent(out) :: col_state"
      write (unit, "(9A)") &
           "  logical(c_bool), dimension(*), intent(out) :: ghost_flag"
      write (unit, "(9A)") &
           "  integer(c_int), dimension(3), intent(in) :: shape"
      write (unit, "(9A)") &
           "  integer, dimension(:,:,:), allocatable :: col_state_tmp"
      write (unit, "(9A)") &
           "  logical, dimension(:,:), allocatable :: ghost_flag_tmp"
      write (unit, "(9A)") "  integer :: i, j, k"
      write (unit, "(A)")  "  select case (pid)"
      do i = 1, driver%n_processes
         write (unit, "(A,I0,A)")  "  case (", i, ")"
         call driver%record(i)%write_col_state_call (unit)
      end do
```

```
          write (unit, "(A)")  "  end select"
          write (unit, "(9A)")  "end subroutine ", char (prefix), &
               "set_col_state_ptr"
        end subroutine write_set_col_state_sub
```

The actual call depends on the type of matrix element.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
        procedure :: write_col_state_call => prclib_driver_record_write_col_state_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
        subroutine prclib_driver_record_write_col_state_call (record, unit)
          class(prclib_driver_record_t), intent(in) :: record
          integer, intent(in) :: unit
          call record%writer%write_col_state_call (unit, record%id)
        end subroutine prclib_driver_record_write_col_state_call
```

The interface goes into the writer base type:

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
        procedure(write_code), deferred :: write_col_state_call
```

In the Fortran module case, we need an extra copy in the (academical) situation
where default integer and `c_int` differ. Otherwise, we just associate a Fortran
array with the C pointer and let the matrix-element subroutine fill the array.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
        procedure :: write_col_state_call => prc_writer_f_module_write_col_state_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
        subroutine prc_writer_f_module_write_col_state_call (writer, unit, id)
          class(prc_writer_f_module_t), intent(in) :: writer
          integer, intent(in) :: unit
          type(string_t), intent(in) :: id
          write (unit, "(9A)")  "  allocate (col_state_tmp ", &
                  "(shape(1), shape(2), shape(3)))"
          write (unit, "(5x,9A)")  "allocate (ghost_flag_tmp ", &
                    "(shape(2), shape(3)))"
          write (unit, "(5x,9A)")  "call ", &
              char (writer%get_c_procname (id, var_str ("col_state"))), &
              " (col_state_tmp, ghost_flag_tmp)"
          write (unit, "(5x,9A)")  "forall (i = 1:shape(2), j = 1:shape(3))"
          write (unit, "(8x,9A)")  "forall (k = 1:shape(1))"
          write (unit, "(11x,9A)")  &
              "col_state(k + shape(1) * (i + shape(2)*(j-1) - 1)) ", &
              "= col_state_tmp(k,i,j)"
          write (unit, "(8x,9A)")  "end forall"
          write (unit, "(8x,9A)")  &
              "ghost_flag(i + shape(2)*(j-1)) = ghost_flag_tmp(i,j)"
          write (unit, "(5x,9A)")  "end forall"
        end subroutine prc_writer_f_module_write_col_state_call
```

In the C library case, we just transfer the C pointer to the library function.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩+≡
```
        procedure :: write_col_state_call => prc_writer_c_lib_write_col_state_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_c_lib_write_col_state_call (writer, unit, id)
      class(prc_writer_c_lib_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      write (unit, "(5x,9A)")  "call ", &
           char (writer%get_c_procname (id, var_str ("col_state"))), &
           " (col_state, ghost_flag)"
    end subroutine prc_writer_c_lib_write_col_state_call
```

Color factors

For the color-factor information, we return two integer arrays and a complex
array.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_set_color_factors
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_set_color_factors &
            (pid, cf_index1, cf_index2, color_factors, shape) bind(C)
         import
         integer(c_int), intent(in) :: pid
         integer(c_int), dimension(*), intent(out) :: cf_index1, cf_index2
         complex(c_default_complex), dimension(*), intent(out) :: color_factors
         integer(c_int), dimension(1), intent(in) :: shape
       end subroutine prc_set_color_factors
    end interface
```

This subroutine returns the color-flavor factor table.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_set_color_factors_sub
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_set_color_factors_sub (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i
      type(string_t) :: feature
      feature = "color_factors"
      write (unit, "(A)")  ""
      write (unit, "(A)")  "! Set tables: color factors"
      write (unit, "(9A)")  "subroutine ", char (prefix), &
           "set_color_factors_ptr (pid, cf_index1, cf_index2, color_factors, ", &
           "shape) bind(C)"
      write (unit, "(A)")  "  use iso_c_binding"
      write (unit, "(A)")  "  use kinds"
      write (unit, "(A)")  "  use omega_color"
      call driver%write_interfaces (unit, feature)
      write (unit, "(A)")  "  integer(c_int), intent(in) :: pid"
      write (unit, "(A)")  "  integer(c_int), dimension(1), intent(in) :: shape"
      write (unit, "(A)")  "  integer(c_int), dimension(*), intent(out) :: &
```

```
              &cf_index1, cf_index2"
      write (unit, "(A)")  "  complex(c_default_complex), dimension(*), &
              &intent(out) :: color_factors"
      write (unit, "(A)")  "  type(omega_color_factor), dimension(:), &
              &allocatable :: cf"
      write (unit, "(A)")  "  select case (pid)"
      do i = 1, driver%n_processes
          write (unit, "(2x,A,I0,A)")  "case (", i, ")"
          call driver%record(i)%write_color_factors_call (unit)
      end do
      write (unit, "(A)")  "  end select"
      write (unit, "(A)")  "end subroutine " // char (prefix) &
              // "set_color_factors_ptr"
  end subroutine write_set_color_factors_sub
```

The actual call depends on the type of matrix element.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_color_factors_call => prclib_driver_record_write_color_factors_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_color_factors_call (record, unit)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      call record%writer%write_color_factors_call (unit, record%id)
    end subroutine prclib_driver_record_write_color_factors_call
```

The interface goes into the writer base type:

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_code), deferred :: write_color_factors_call
```

In the Fortran module case, the matrix-element procedure fills an array of
`omega_color_factor` elements. We distribute this array among two integer
arrays and one complex-valued array, for which we have the C pointers.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
    procedure :: write_color_factors_call => prc_writer_f_module_write_color_factors_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_f_module_write_color_factors_call (writer, unit, id)
      class(prc_writer_f_module_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      write (unit, "(5x,A)")  "allocate (cf (shape(1)))"
      write (unit, "(5x,9A)")  "call ", &
          char (writer%get_c_procname (id, var_str ("color_factors"))), " (cf)"
      write (unit, "(5x,9A)")  "cf_index1(1:shape(1)) = cf%i1"
      write (unit, "(5x,9A)")  "cf_index2(1:shape(1)) = cf%i2"
      write (unit, "(5x,9A)")  "color_factors(1:shape(1)) = cf%factor"
    end subroutine prc_writer_f_module_write_color_factors_call
```

In the C library case, we just transfer the C pointers to the library function.
There are three arrays.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩+≡
```
    procedure :: write_color_factors_call => &
        prc_writer_c_lib_write_color_factors_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_c_lib_write_color_factors_call (writer, unit, id)
      class(prc_writer_c_lib_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      write (unit, "(5x,9A)")  "call ", &
            char (writer%get_c_procname (id, var_str ("color_factors"))), &
            " (cf_index1, cf_index2, color_factors)"
    end subroutine prc_writer_c_lib_write_color_factors_call
```

14.1.10   Interfaces for C-library matrix element

If the matrix element code is not provided as a Fortran module but as a C or
bind(C) Fortran library, we need explicit interfaces for the library functions.
They are not identical to the Fortran module versions. They transfer pointers
directly.

The implementation is part of the `prc_writer_c_lib` type, which serves as
base type for all C-library writers. It writes specific interfaces depending on the
feature.

We bind this as the method `write_standard_interface` instead of `write_interface`,
because we have to override the latter. Otherwise we could not call the method
because the writer type is abstract.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩+≡
```
    procedure :: write_standard_interface => prc_writer_c_lib_write_interface
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_c_lib_write_interface (writer, unit, id, feature)
      class(prc_writer_c_lib_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id, feature
      select case (char (feature))
      case ("md5sum")
         write (unit, "(2x,9A)")  "interface"
         write (unit, "(5x,9A)")  "function ", &
               char (writer%get_c_procname (id, var_str ("get_md5sum"))), &
               " () result (cptr) bind(C)"
         write (unit, "(7x,9A)")  "import"
         write (unit, "(7x,9A)")  "implicit none"
         write (unit, "(7x,9A)")  "type(c_ptr) :: cptr"
         write (unit, "(5x,9A)")  "end function ", &
               char (writer%get_c_procname (id, var_str ("get_md5sum")))
         write (unit, "(2x,9A)")  "end interface"
      case ("openmp_supported")
         write (unit, "(2x,9A)")  "interface"
         write (unit, "(5x,9A)")  "function ", &
               char (writer%get_c_procname (id, feature)), &
               " () result (status) bind(C)"
         write (unit, "(7x,9A)")  "import"
         write (unit, "(7x,9A)")  "implicit none"
         write (unit, "(7x,9A)")  "logical(c_bool) :: status"
         write (unit, "(5x,9A)")  "end function ", &
               char (writer%get_c_procname (id, feature))
```

```
                  write (unit, "(2x,9A)")  "end interface"
          case ("n_in", "n_out", "n_flv", "n_hel", "n_col", "n_cin", "n_cf")
                  write (unit, "(2x,9A)")  "interface"
                  write (unit, "(5x,9A)")  "function ", &
                       char (writer%get_c_procname (id, feature)), &
                       " () result (n) bind(C)"
                  write (unit, "(7x,9A)")  "import"
                  write (unit, "(7x,9A)")  "implicit none"
                  write (unit, "(7x,9A)")  "integer(c_int) :: n"
                  write (unit, "(5x,9A)")  "end function ", &
                       char (writer%get_c_procname (id, feature))
                  write (unit, "(2x,9A)")  "end interface"
          case ("flv_state", "hel_state")
                  write (unit, "(2x,9A)")  "interface"
                  write (unit, "(5x,9A)")  "subroutine ", &
                       char (writer%get_c_procname (id, feature)), &
                       " (", char (feature), ") bind(C)"
                  write (unit, "(7x,9A)")  "import"
                  write (unit, "(7x,9A)")  "implicit none"
                  write (unit, "(7x,9A)")  "integer(c_int), dimension(*), intent(out) ", &
                       ":: ", char (feature)
                  write (unit, "(5x,9A)")  "end subroutine ", &
                       char (writer%get_c_procname (id, feature))
                  write (unit, "(2x,9A)")  "end interface"
          case ("col_state")
                  write (unit, "(2x,9A)")  "interface"
                  write (unit, "(5x,9A)")  "subroutine ", &
                       char (writer%get_c_procname (id, feature)), &
                       " (col_state, ghost_flag) bind(C)"
                  write (unit, "(7x,9A)")  "import"
                  write (unit, "(7x,9A)")  "implicit none"
                  write (unit, "(7x,9A)")  "integer(c_int), dimension(*), intent(out) ", &
                       ":: col_state"
                  write (unit, "(7x,9A)")  "logical(c_bool), dimension(*), intent(out) ", &
                       ":: ghost_flag"
                  write (unit, "(5x,9A)")  "end subroutine ", &
                       char (writer%get_c_procname (id, feature))
                  write (unit, "(2x,9A)")  "end interface"
          case ("color_factors")
                  write (unit, "(2x,9A)")  "interface"
                  write (unit, "(5x,9A)")  "subroutine ", &
                       char (writer%get_c_procname (id, feature)), &
                       " (cf_index1, cf_index2, color_factors) bind(C)"
                  write (unit, "(7x,9A)")  "import"
                  write (unit, "(7x,9A)")  "implicit none"
                  write (unit, "(7x,9A)")  "integer(c_int), dimension(*), &
                       &intent(out) :: cf_index1"
                  write (unit, "(7x,9A)")  "integer(c_int), dimension(*), &
                       &intent(out) :: cf_index2"
                  write (unit, "(7x,9A)")  "complex(c_default_complex), dimension(*), &
                       &intent(out) :: color_factors"
                  write (unit, "(5x,9A)")  "end subroutine ", &
                       char (writer%get_c_procname (id, feature))
                  write (unit, "(2x,9A)")  "end interface"
```

```
      end select
    end subroutine prc_writer_c_lib_write_interface
```

14.1.11 Retrieving the tables

In the previous section we had the writer routines for procedures that return
tables, actually C pointers to tables. Here, we write convenience routines that
unpack them and move the contents to suitable Fortran arrays.

The flavor and helicity tables are two-dimensional integer arrays. We use
intermediate storage for correctly transforming C to Fortran data types.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: set_flv_state => prclib_driver_set_flv_state
    procedure :: set_hel_state => prclib_driver_set_hel_state
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_set_flv_state (driver, i, flv_state)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: i
      integer, dimension(:,:), allocatable, intent(out) :: flv_state
      integer :: n_tot, n_flv
      integer(c_int) :: pid
      integer(c_int), dimension(:,:), allocatable :: c_flv_state
      pid = i
      n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
      n_flv = driver%get_n_flv (pid)
      allocate (flv_state (n_tot, n_flv))
      allocate (c_flv_state (n_tot, n_flv))
      call driver%set_flv_state_ptr &
           (pid, c_flv_state, int ([n_tot, n_flv], kind=c_int))
      flv_state = c_flv_state
    end subroutine prclib_driver_set_flv_state

    subroutine prclib_driver_set_hel_state (driver, i, hel_state)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: i
      integer, dimension(:,:), allocatable, intent(out) :: hel_state
      integer :: n_tot, n_hel
      integer(c_int) :: pid
      integer(c_int), dimension(:,:), allocatable, target :: c_hel_state
      pid = i
      n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
      n_hel = driver%get_n_hel (pid)
      allocate (hel_state (n_tot, n_hel))
      allocate (c_hel_state (n_tot, n_hel))
      call driver%set_hel_state_ptr &
           (pid, c_hel_state, int ([n_tot, n_hel], kind=c_int))
      hel_state = c_hel_state
    end subroutine prclib_driver_set_hel_state
```

The color-flow table is three-dimensional, otherwise similar. We simultaneously
set the ghost-flag table, which consists of logical entries.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡

```
      procedure :: set_col_state => prclib_driver_set_col_state
⟨Prclib interfaces: procedures⟩+≡
    subroutine prclib_driver_set_col_state (driver, i, col_state, ghost_flag)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: i
      integer, dimension(:,:,:), allocatable, intent(out) :: col_state
      logical, dimension(:,:), allocatable, intent(out) :: ghost_flag
      integer :: n_cin, n_tot, n_col
      integer(c_int) :: pid
      integer(c_int), dimension(:,:,:), allocatable :: c_col_state
      logical(c_bool), dimension(:,:), allocatable :: c_ghost_flag
      pid = i
      n_cin = driver%get_n_cin (pid)
      n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
      n_col = driver%get_n_col (pid)
      allocate (col_state (n_cin, n_tot, n_col))
      allocate (c_col_state (n_cin, n_tot, n_col))
      allocate (ghost_flag (n_tot, n_col))
      allocate (c_ghost_flag (n_tot, n_col))
      call driver%set_col_state_ptr (pid, &
           c_col_state, c_ghost_flag, int ([n_cin, n_tot, n_col], kind=c_int))
      col_state = c_col_state
      ghost_flag = c_ghost_flag
    end subroutine prclib_driver_set_col_state
```

The color-factor table is a sparse matrix: a two-column array of indices and one
array which contains the corresponding factors.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: set_color_factors => prclib_driver_set_color_factors
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_set_color_factors (driver, i, color_factors, cf_index)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: i
      complex(default), dimension(:), allocatable, intent(out) :: color_factors
      integer, dimension(:,:), allocatable, intent(out) :: cf_index
      integer :: n_cf
      integer(c_int) :: pid
      complex(c_default_complex), dimension(:), allocatable, target :: c_color_factors
      integer(c_int), dimension(:), allocatable, target :: c_cf_index1
      integer(c_int), dimension(:), allocatable, target :: c_cf_index2
      pid = i
      n_cf = driver%get_n_cf (pid)
      allocate (color_factors (n_cf))
      allocate (c_color_factors (n_cf))
      allocate (c_cf_index1 (n_cf))
      allocate (c_cf_index2 (n_cf))
      call driver%set_color_factors_ptr (pid, &
           c_cf_index1, c_cf_index2, &
           c_color_factors, int ([n_cf], kind=c_int))
      color_factors = c_color_factors
      allocate (cf_index (2, n_cf))
      cf_index(1,:) = c_cf_index1
      cf_index(2,:) = c_cf_index2
```

```
            end subroutine prclib_driver_set_color_factors
```

14.1.12 Returning a procedure pointer

The functions that directly access the matrix element, event by event, are assigned to a process-specific driver object as procedure pointers. For the `dlopen` interface, we use C function pointers. This subroutine returns such a pointer:

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_get_fptr
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_get_fptr (pid, fid, fptr) bind(C)
         import
         integer(c_int), intent(in) :: pid
         integer(c_int), intent(in) :: fid
         type(c_funptr), intent(out) :: fptr
       end subroutine prc_get_fptr
    end interface
```

This procedure writes the source code for the procedure pointer returning subroutine.

All C functions that are provided by the matrix element code of a specific process are handled here. The selection consists of a double layered `select case` construct.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_fptr_sub
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_fptr_sub (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i, j
      write (unit, "(A)")  ""
      write (unit, "(A)")  "! Return C pointer to a procedure:"
      write (unit, "(A)")  "! pid = process index;  fid = function index"
      write (unit, "(4A)")  "subroutine ", char (prefix), "get_fptr ", &
           "(pid, fid, fptr) bind(C)"
      write (unit, "(A)")  "  use iso_c_binding"
      write (unit, "(A)")  "  use kinds"
      write (unit, "(A)")  "  implicit none"
      write (unit, "(A)")  "  integer(c_int), intent(in) :: pid"
      write (unit, "(A)")  "  integer(c_int), intent(in) :: fid"
      write (unit, "(A)")  "  type(c_funptr), intent(out) :: fptr"
      do i = 1, driver%n_processes
         call driver%record(i)%write_interfaces (unit)
      end do
      write (unit, "(A)")  "  select case (pid)"
      do i = 1, driver%n_processes
         write (unit, "(2x,A,I0,A)")  "case (", i, ")"
         write (unit, "(5x,A)")  "select case (fid)"
```

```
         associate (record => driver%record(i))
           do j = 1, size (record%feature)
             write (unit, "(5x,A,I0,9A)")  "case (", j, ");  ", &
                   "fptr = c_funloc (", &
                   char (record%get_c_procname (record%feature(j))), &
                   ")"
           end do
         end associate
         write (unit, "(5x,A)")  "end select"
       end do
       write (unit, "(A)")  "  end select"
       write (unit, "(3A)")  "end subroutine ", char (prefix), "get_fptr"
     end subroutine write_get_fptr_sub
```

The procedures for which we want to return a pointer (the 'features' of the
matrix element code) are actually Fortran module procedures. If we want to
have a C signature, we must write wrapper functions for all of them. The
procedures, their signatures, and the appropriate writer routines are specific for
the process type.

To keep this generic, we do not provide the writer routines here, but just
the interface for a writer routine. The actual routines are stored in the process
record.

The prefix indicates the library, the id indicates the process, and procname
is the bare name of the procedure to be written.

⟨*Prclib interfaces: public*⟩+≡
```
     public :: write_driver_code
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
     abstract interface
       subroutine write_driver_code (unit, prefix, id, procname)
         import
         integer, intent(in) :: unit
         type(string_t), intent(in) :: prefix
         type(string_t), intent(in) :: id
         type(string_t), intent(in) :: procname
       end subroutine write_driver_code
     end interface
```

14.1.13   Hooks

Interface for additional library unload / reload hooks (currently unused!)

⟨*Prclib interfaces: public*⟩+≡
```
     public :: prclib_unload_hook
     public :: prclib_reload_hook
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
     abstract interface
       subroutine prclib_unload_hook (libname)
         import
         type(string_t), intent(in) :: libname
       end subroutine prclib_unload_hook
```

```
      subroutine prclib_reload_hook (libname)
        import
        type(string_t), intent(in) :: libname
      end subroutine prclib_reload_hook
    end interface
```

14.1.14 Make source, compile, link

Since we should have written a Makefile, these tasks amount to simple `make`
calls. Note that the Makefile targets depend on each other, so calling `link`
executes also the `source` and `compile` steps, when necessary.

The first routine writes source-code files for the individual processes. First
it calls the writer routines directly for each process, then it calls `make source`.
The make command may either post-process the files, or it may do the complete
work, e.g., calling an external program the generates the files.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: make_source => prclib_driver_make_source
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_make_source (driver, os_data)
      class(prclib_driver_t), intent(in) :: driver
      type(os_data_t), intent(in) :: os_data
      integer :: i
      do i = 1, driver%n_processes
        call driver%record(i)%write_source_code ()
      end do
      call os_system_call ("make source " // os_data%makeflags &
          // " -f " // driver%basename // ".makefile")
    end subroutine prclib_driver_make_source
```

Compile matrix element source code and the driver source code.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: make_compile => prclib_driver_make_compile
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_make_compile (driver, os_data)
      class(prclib_driver_t), intent(in) :: driver
      type(os_data_t), intent(in) :: os_data
      call os_system_call ("make compile " // os_data%makeflags &
          // " -f " // driver%basename // ".makefile")
    end subroutine prclib_driver_make_compile
```

Combine all matrix-element code together with the driver in a process library
on disk.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: make_link => prclib_driver_make_link
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_make_link (driver, os_data)
      class(prclib_driver_t), intent(in) :: driver
      type(os_data_t), intent(in) :: os_data
      call os_system_call ("make link " // os_data%makeflags &
          // " -f " // driver%basename // ".makefile")
```

```
      end subroutine prclib_driver_make_link
```

14.1.15   Clean up generated files

The task of cleaning any generated files should also be deferred to Makefile
targets. Apart from removing everything, removing specific files may be useful
for partial rebuilds. (Note that removing the makefile itself can only be done
once, for obvious reasons.)

If there is no makefile, do nothing.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
      procedure :: clean_library => prclib_driver_clean_library
      procedure :: clean_objects => prclib_driver_clean_objects
      procedure :: clean_source => prclib_driver_clean_source
      procedure :: clean_driver => prclib_driver_clean_driver
      procedure :: clean_makefile => prclib_driver_clean_makefile
      procedure :: clean => prclib_driver_clean
      procedure :: distclean => prclib_driver_distclean
```

⟨*Prclib interfaces: procedures*⟩+≡
```
      subroutine prclib_driver_clean_library (driver, os_data)
        class(prclib_driver_t), intent(in) :: driver
        type(os_data_t), intent(in) :: os_data
        if (driver%makefile_exists ()) then
           call os_system_call ("make clean-library " // os_data%makeflags &
                // " -f " // driver%basename // ".makefile")
        end if
      end subroutine prclib_driver_clean_library

      subroutine prclib_driver_clean_objects (driver, os_data)
        class(prclib_driver_t), intent(in) :: driver
        type(os_data_t), intent(in) :: os_data
        if (driver%makefile_exists ()) then
           call os_system_call ("make clean-objects " // os_data%makeflags &
                // " -f " // driver%basename // ".makefile")
        end if
      end subroutine prclib_driver_clean_objects

      subroutine prclib_driver_clean_source (driver, os_data)
        class(prclib_driver_t), intent(in) :: driver
        type(os_data_t), intent(in) :: os_data
        if (driver%makefile_exists ()) then
           call os_system_call ("make clean-source " // os_data%makeflags &
                // " -f " // driver%basename // ".makefile")
        end if
      end subroutine prclib_driver_clean_source

      subroutine prclib_driver_clean_driver (driver, os_data)
        class(prclib_driver_t), intent(in) :: driver
        type(os_data_t), intent(in) :: os_data
        if (driver%makefile_exists ()) then
           call os_system_call ("make clean-driver " // os_data%makeflags &
                // " -f " // driver%basename // ".makefile")
```

```
      end if
   end subroutine prclib_driver_clean_driver

   subroutine prclib_driver_clean_makefile (driver, os_data)
     class(prclib_driver_t), intent(in) :: driver
     type(os_data_t), intent(in) :: os_data
     if (driver%makefile_exists ()) then
        call os_system_call ("make clean-makefile " // os_data%makeflags &
             // " -f " // driver%basename // ".makefile")
     end if
   end subroutine prclib_driver_clean_makefile

   subroutine prclib_driver_clean (driver, os_data)
     class(prclib_driver_t), intent(in) :: driver
     type(os_data_t), intent(in) :: os_data
     if (driver%makefile_exists ()) then
        call os_system_call ("make clean " // os_data%makeflags &
             // " -f " // driver%basename // ".makefile")
     end if
   end subroutine prclib_driver_clean

   subroutine prclib_driver_distclean (driver, os_data)
     class(prclib_driver_t), intent(in) :: driver
     type(os_data_t), intent(in) :: os_data
     if (driver%makefile_exists ()) then
        call os_system_call ("make distclean " // os_data%makeflags &
             // " -f " // driver%basename // ".makefile")
     end if
   end subroutine prclib_driver_distclean
```

This Make target should remove all files that apply to a specific process. We execute this when we want to force remaking source code. Note that source targets need not have prerequisites, so just calling `make_source` would not do anything if the files exist.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
   procedure :: clean_proc => prclib_driver_clean_proc
```

⟨*Prclib interfaces: procedures*⟩+≡
```
   subroutine prclib_driver_clean_proc (driver, i, os_data)
     class(prclib_driver_t), intent(in) :: driver
     integer, intent(in) :: i
     type(os_data_t), intent(in) :: os_data
     type(string_t) :: id
     if (driver%makefile_exists ()) then
        id = driver%record(i)%id
       call os_system_call ("make clean-" // driver%record(i)%id // " " &
             // os_data%makeflags &
             // " -f " // driver%basename // ".makefile")
     end if
   end subroutine prclib_driver_clean_proc
```

14.1.16 Further Tools

Check for the appropriate makefile.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
procedure :: makefile_exists => prclib_driver_makefile_exists
```

⟨*Prclib interfaces: procedures*⟩+≡
```
function prclib_driver_makefile_exists (driver) result (flag)
  class(prclib_driver_t), intent(in) :: driver
  logical :: flag
  inquire (file = char (driver%basename) // ".makefile", exist = flag)
end function prclib_driver_makefile_exists
```

14.1.17 Load the library

Once the library has been linked, we can dlopen it and assign all procedure pointers to their proper places in the library driver object. The `loaded` flag is set only if all required pointers have become assigned.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
procedure :: load => prclib_driver_load
```

⟨*Prclib interfaces: procedures*⟩+≡
```
subroutine prclib_driver_load (driver, os_data, noerror)
  class(prclib_driver_t), intent(inout) :: driver
  type(os_data_t), intent(in) :: os_data
  logical, intent(in), optional :: noerror
  type(c_funptr) :: c_fptr
  logical :: ignore

  ignore = .false.;  if (present (noerror))  ignore = noerror

  driver%libname = os_get_dlname (driver%basename, os_data, noerror, noerror)
  if (driver%libname == "")  return
  select type (driver)
  type is (prclib_driver_dynamic_t)
     if (.not. dlaccess_is_open (driver%dlaccess)) then
        call dlaccess_init &
             (driver%dlaccess, var_str ("."), driver%libname, os_data)
        if (.not. ignore)  call driver%check_dlerror ()
     end if
     driver%loaded = dlaccess_is_open (driver%dlaccess)
  class default
     driver%loaded = .true.
  end select
  if (.not. driver%loaded)  return

  c_fptr = driver%get_c_funptr (var_str ("get_n_processes"))
  call c_f_procpointer (c_fptr, driver%get_n_processes)
  driver%loaded = driver%loaded .and. associated (driver%get_n_processes)

        nullify (driver%set_color_factors_ptr)
        nullify (driver%get_fptr)
      end subroutine prclib_driver_unload
```

This subroutine checks the `dlerror` content and issues a fatal error if it finds
an error there.

⟨*Prclib interfaces: prclib driver dynamic: TBP*⟩≡
```
      procedure :: check_dlerror => prclib_driver_check_dlerror
```

⟨*Prclib interfaces: procedures*⟩+≡
```
      subroutine prclib_driver_check_dlerror (driver)
        class(prclib_driver_dynamic_t), intent(in) :: driver
        if (dlaccess_has_error (driver%dlaccess)) then
           call msg_fatal (char (dlaccess_get_error (driver%dlaccess)))
        end if
```

```
      end subroutine prclib_driver_check_dlerror
```

Get the handle (C function pointer) for a given "feature" of the matrix element code, so it can be assigned to the appropriate procedure pointer slot. In the static case, this is a trivial pointer assignment, hard-coded into the driver type implementation.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure (prclib_driver_get_c_funptr), deferred :: get_c_funptr
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
      function prclib_driver_get_c_funptr (driver, feature) result (c_fptr)
        import
        class(prclib_driver_t), intent(inout) :: driver
        type(string_t), intent(in) :: feature
        type(c_funptr) :: c_fptr
      end function prclib_driver_get_c_funptr
    end interface
```

In the dynamic-library case, we call the DL interface to retrieve the C pointer to a named procedure.

⟨*Prclib interfaces: prclib driver dynamic: TBP*⟩+≡
```
    procedure :: get_c_funptr => prclib_driver_dynamic_get_c_funptr
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    function prclib_driver_dynamic_get_c_funptr (driver, feature) result (c_fptr)
      class(prclib_driver_dynamic_t), intent(inout) :: driver
      type(string_t), intent(in) :: feature
      type(c_funptr) :: c_fptr
      type(string_t) :: prefix, full_name
      prefix = driver%basename // "_"
      full_name = prefix // feature
      c_fptr = dlaccess_get_c_funptr (driver%dlaccess, full_name)
      call driver%check_dlerror ()
    end function prclib_driver_dynamic_get_c_funptr
```

14.1.18   MD5 sums

Recall the MD5 sum written in the Makefile

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: get_md5sum_makefile => prclib_driver_get_md5sum_makefile
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    function prclib_driver_get_md5sum_makefile (driver) result (md5sum)
      class(prclib_driver_t), intent(in) :: driver
      character(32) :: md5sum
      type(string_t) :: filename
      character(80) :: buffer
      logical :: exist
      integer :: u, iostat
      md5sum = ""
      filename = driver%basename // ".makefile"
```

```
      inquire (file = char (filename), exist = exist)
      if (exist) then
         u = free_unit ()
         open (u, file = char (filename), action = "read", status = "old")
         iostat = 0
         do
            read (u, "(A)", iostat = iostat)  buffer

14.1.19   Test

This is the master for calling self-test procedures.

⟨*Prclib interfaces: public*⟩+≡
```
        public :: prclib_interfaces_test
```
⟨*Prclib interfaces: tests*⟩≡
```
        subroutine prclib_interfaces_test (u, results)
          integer, intent(in) :: u
          type(test_results_t), intent(inout) :: results
        ⟨Prclib interfaces: execute tests⟩
        end subroutine prclib_interfaces_test
```

Empty process list

Test 1: Create a driver object and display its contents. One of the feature lists
references a writer procedure; this is just a dummy that does nothing useful.

⟨*Prclib interfaces: execute tests*⟩≡
```
        call test (prclib_interfaces_1, "prclib_interfaces_1", &
```

```
                "create driver object", &
                u, results)
```

⟨*Prclib interfaces: tests*⟩+≡

```
    subroutine prclib_interfaces_1 (u)
      integer, intent(in) :: u
      class(prclib_driver_t), allocatable :: driver
      character(32), parameter :: md5sum = "prclib_interfaces_1_md5sum      "
      class(prc_writer_t), pointer :: test_writer_1

      write (u, "(A)")  "* Test output: prclib_interfaces_1"
      write (u, "(A)")  "*   Purpose: display the driver object contents"
      write (u, *)
      write (u, "(A)")  "* Create a prclib driver object"
      write (u, "(A)")

      call dispatch_prclib_driver (driver, var_str ("prclib"), var_str (""))
      call driver%init (3)
      call driver%set_md5sum (md5sum)

      allocate (test_writer_1_t :: test_writer_1)

      call driver%set_record (1, var_str ("test1"), var_str ("test_model"), &
           [var_str ("init")], test_writer_1)

      call driver%set_record (2, var_str ("test2"), var_str ("foo_model"), &
           [var_str ("another_proc")], test_writer_1)

      call driver%set_record (3, var_str ("test3"), var_str ("test_model"), &
           [var_str ("init"), var_str ("some_proc")], test_writer_1)

      call driver%write (u)

      deallocate (test_writer_1)

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: prclib_interfaces_1"
    end subroutine prclib_interfaces_1
```

The writer: the procedures write just comment lines. We can fix an instance
of this as a parameter (since it has no mutable content) and just reference the
fixed parameter.

NOTE: temporarily made public.

⟨*Prclib interfaces: test types*⟩≡

      call driver%write (u)

      write (u, "(A)")
      write (u, "(A)")  "* Write the driver file"
      write (u, "(A)")  "* File contents:"
      write (u, "(A)")
```

1781

```
      call driver%generate_driver_code (u)

      deallocate (test_writer_1)
      deallocate (test_writer_2)

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: prclib_interfaces_2"
    end subroutine prclib_interfaces_2
```

A writer with wrapper code: the procedures again write just comment lines.
Since all procedures are NOPASS, we can reuse two of the TBP.

⟨*Prclib interfaces: test types*⟩+≡
```
    type, extends (prc_writer_f_module_t) :: test_writer_2_t
     contains
       procedure, nopass :: type_name => test_writer_2_type_name
       procedure :: write_makefile_code => test_writer_2_mk
       procedure :: write_source_code => test_writer_2_src
       procedure :: write_interface => test_writer_2_if
       procedure :: write_wrapper => test_writer_2_wr
    end type test_writer_2_t
```

⟨*Prclib interfaces: tests*⟩+≡
```
    function test_writer_2_type_name () result (string)
      type(string_t) :: string
      string = "test_2"
    end function test_writer_2_type_name

    subroutine test_writer_2_mk (writer, unit, id, os_data, testflag)
      class(test_writer_2_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      type(os_data_t), intent(in) :: os_data
      logical, intent(in), optional :: testflag
      write (unit, "(5A)")  "# Makefile code for process ", char (id), &
           " goes here."
    end subroutine test_writer_2_mk

    subroutine test_writer_2_src (writer, id)
      class(test_writer_2_t), intent(in) :: writer
      type(string_t), intent(in) :: id
    end subroutine test_writer_2_src

    subroutine test_writer_2_if (writer, unit, id, feature)
      class(test_writer_2_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id, feature
      write (unit, "(2x,9A)")  "! Interface code for ", &
         char (writer%get_module_name (id)), "_", &
         char (writer%get_procname (feature)), " goes here."
    end subroutine test_writer_2_if

    subroutine test_writer_2_wr (writer, unit, id, feature)
      class(test_writer_2_t), intent(in) :: writer
```

1782

```
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id, feature
      write (unit, *)
      write (unit, "(9A)")  "! Wrapper code for ", &
          char (writer%get_c_procname (id, feature)), " goes here."
    end subroutine test_writer_2_wr
```

Process library makefile

Test 3: Write the makefile for compiling and linking the process library (processes and driver code). There are two processes, one with one method, one with two methods.

To have predictable output, we reset the system-dependent initial components of `os_data` to known values.

⟨*Prclib interfaces: execute tests*⟩+≡
```
    call test (prclib_interfaces_3, "prclib_interfaces_3", &
        "write makefile", &
        u, results)
```

⟨*Prclib interfaces: tests*⟩+≡
```
    subroutine prclib_interfaces_3 (u)
      integer, intent(in) :: u
      class(prclib_driver_t), allocatable :: driver
      type(os_data_t) :: os_data
      character(32), parameter :: md5sum = "prclib_interfaces_3_md5sum      "
      class(prc_writer_t), pointer :: test_writer_1, test_writer_2

      call os_data_init (os_data)
      os_data%fc = "fortran-compiler"
      os_data%whizard_includes = "-I module-dir"

This version of test-code writer actually writes an interface and wrapper code. The wrapped function is a no-parameter function with integer result.

The stored MD5 sum may be modified.

We will reuse this later, therefore public.

    end subroutine check_file
```

14.2 Abstract process core configuration

In this module, we define abstract data types that handle the method-specific part of defining a process (including all of its options) and accessing an external matrix element.

There are no unit tests, these are deferred to the `process_libraries` module below.

⟨`prc_core_def.f90`⟩≡
  ⟨*File header*⟩

  module prc_core_def

  ⟨*Use strings*⟩
  ⟨*Use file utils*⟩
    use diagnostics !NODEP!

    use process_constants
    use prclib_interfaces

  ⟨*Standard module head*⟩

  ⟨*Prc core def: public*⟩

⟨*Prc core def: types*⟩

⟨*Prc core def: interfaces*⟩

```
contains
```

⟨*Prc core def: procedures*⟩

```
end module prc_core_def
```

14.2.1 Process core definition type

For storing configuration data that depend on the specific process variant, we introduce a polymorphic type. At this point, we just declare an abstract base type. This allows us to defer the implementation to later modules.

There should be no components that need explicit finalization, otherwise we would have to call a finalizer from the `process_component_def_t` wrapper.

⟨*Prc core def: public*⟩≡
```
    public :: prc_core_def_t
```

⟨*Prc core def: types*⟩≡
```
    type, abstract :: prc_core_def_t
      class(prc_writer_t), allocatable :: writer
     contains
     ⟨Prc core def: process core def: TBP⟩
    end type prc_core_def_t
```

Interfaces for the deferred methods.

This returns a string. No passed argument; the string is constant and depends just on the type.

⟨*Prc core def: process core def: TBP*⟩≡
```
    procedure (prc_core_def_get_string), nopass, deferred :: type_string
```

⟨*Prc core def: interfaces*⟩≡
```
    abstract interface
      function prc_core_def_get_string () result (string)
        import
        type(string_t) :: string
      end function prc_core_def_get_string
    end interface
```

The `write` method should display the content completely.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure (prc_core_def_write), deferred :: write
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
      subroutine prc_core_def_write (object, unit)
        import
        class(prc_core_def_t), intent(in) :: object
        integer, intent(in) :: unit
      end subroutine prc_core_def_write
```

```
      end interface
```

The `read` method should fill the content completely.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure (prc_core_def_read), deferred :: read
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_core_def_read (object, unit)
         import
         class(prc_core_def_t), intent(out) :: object
         integer, intent(in) :: unit
       end subroutine prc_core_def_read
    end interface
```

This communicates a MD5 checksum to the writer inside the `core_def` object, if there is any. Usually, this checksum is not yet known at the time when the writer is initialized.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure :: set_md5sum => prc_core_def_set_md5sum
```

⟨*Prc core def: procedures*⟩≡
```
    subroutine prc_core_def_set_md5sum (core_def, md5sum)
      class(prc_core_def_t), intent(inout) :: core_def
      character(32) :: md5sum
      if (allocated (core_def%writer))  core_def%writer%md5sum = md5sum
    end subroutine prc_core_def_set_md5sum
```

Allocate an appropriate driver object which corresponds to the chosen process core definition.

For internal matrix element (i.e., those which do not need external code), the driver should have access to all matrix element information from the beginning. In short, it is the matrix-element code.

For external matrix elements, the driver will get access to the external matrix element code.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure(prc_core_def_allocate_driver), deferred :: allocate_driver
```

⟨*Prc core def: interfaces*⟩+≡
```
    interface
       subroutine prc_core_def_allocate_driver (object, driver, basename)
         import
         class(prc_core_def_t), intent(in) :: object
         class(prc_core_driver_t), intent(out), allocatable :: driver
         type(string_t), intent(in) :: basename
       end subroutine prc_core_def_allocate_driver
    end interface
```

This flag tells whether the particular variant needs external code. We implement a default function which returns false. The flag depends only on the type, therefore we implement it as `nopass`.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure, nopass :: needs_code => prc_core_def_needs_code
```

1807

⟨*Prc core def: procedures*⟩+≡
```
    function prc_core_def_needs_code () result (flag)
      logical :: flag
      flag = .false.
    end function prc_core_def_needs_code
```

This subroutine allocates an array which holds the name of all features that this process core implements. This feature applies to matrix element code that is not coded as a Fortran module but communicates via independent library functions, which follow the C calling conventions. The addresses of those functions are returned as C function pointers, which can be converted into Fortran procedure pointers. The conversion is done in code specific for the process variant; here we just retrieve the C function pointer.

The array returned here serves the purpose of writing specific driver code. The driver interfaces only those C functions which are supported for the given process core.

If the process core does not require external code, this array is meaningless.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure(prc_core_def_get_features), nopass, deferred &
        :: get_features
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
      subroutine prc_core_def_get_features (features)
        import
        type(string_t), dimension(:), allocatable, intent(out) :: features
      end subroutine prc_core_def_get_features
    end interface
```

Assign pointers to the process-specific procedures to the driver, if the process is external.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure(prc_core_def_connect), deferred :: connect
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
      subroutine prc_core_def_connect (def, lib_driver, i, proc_driver)
        import
        class(prc_core_def_t), intent(in) :: def
        class(prclib_driver_t), intent(in) :: lib_driver
        integer, intent(in) :: i
        class(prc_core_driver_t), intent(inout) :: proc_driver
      end subroutine prc_core_def_connect
    end interface
```

14.2.2 Process core template

We must be able to automatically allocate a process core definition object with the appropriate type, given only the type name.

To this end, we introduce a `prc_template_t` type which is simply a wrapper for an empty `prc_core_def_t` object. Choosing one of the templates from an array, we can allocate the target object.

⟨*Prc core def: public*⟩+≡
```
public :: prc_template_t
```

⟨*Prc core def: types*⟩+≡
```
type :: prc_template_t
   class(prc_core_def_t), allocatable :: core_def
end type prc_template_t
```

The allocation routine. We use the `source` option of the `allocate` statement. The `mold` option would probably more appropriate, but is a F2008 feature.

⟨*Prc core def: public*⟩+≡
```
public :: allocate_core_def
```

⟨*Prc core def: procedures*⟩+≡
```
subroutine allocate_core_def (template, name, core_def)
  type(prc_template_t), dimension(:), intent(in) :: template
  type(string_t), intent(in) :: name
  class(prc_core_def_t), allocatable :: core_def
  integer :: i
  do i = 1, size (template)
     if (template(i)%core_def%type_string () == name) then
        allocate (core_def, source = template(i)%core_def)
        return
     end if
  end do
end subroutine allocate_core_def
```

14.2.3 Process driver

For each process component, we implement a driver object which holds the calls to the matrix element and various auxiliary routines as procedure pointers. Any actual calculation will use this object to communicate with the process.

Depending on the type of process (as described by a corresponding `prc_core_def` object), the procedure pointers may refer to external or internal code, and there may be additional procedures for certain types. The base type defined here is abstract.

⟨*Prc core def: public*⟩+≡
```
public :: prc_core_driver_t
```

⟨*Prc core def: types*⟩+≡
```
type, abstract :: prc_core_driver_t
 contains
 ⟨Prc core def: process driver: TBP⟩
end type prc_core_driver_t
```

This returns the process type. No reference to contents.

⟨*Prc core def: process driver: TBP*⟩≡
```
procedure(prc_core_driver_type_name), nopass, deferred :: type_name
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
       function prc_core_driver_type_name () result (type)
         import
         type(string_t) :: type
       end function prc_core_driver_type_name
    end interface
```

14.2.4   Process driver for intrinsic process

This is an abstract extension for the driver type. It has one additional method, namely a subroutine that fills the record of constant process data. For an external process, this task is performed by the external library driver instead.

⟨*Prc core def: public*⟩+≡
```
    public :: process_driver_internal_t
```

⟨*Prc core def: types*⟩+≡
```
    type, extends (prc_core_driver_t), abstract :: process_driver_internal_t
     contains
     ⟨Prc core def: process driver internal: TBP⟩
    end type process_driver_internal_t
```

⟨*Prc core def: process driver internal: TBP*⟩≡
```
    procedure(process_driver_fill_constants), deferred :: fill_constants
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
       subroutine process_driver_fill_constants (driver, data)
         import
         class(process_driver_internal_t), intent(in) :: driver
         type(process_constants_t), intent(out) :: data
       end subroutine process_driver_fill_constants
    end interface
```

14.3   Particle Specifiers

In this module we introduce a type for specifying a particle or particle alternative. In addition to the particle specifiers (strings separated by colons), the type contains an optional flag `polarized` and a string `decay`. If the `polarized` flag is set, particle polarization information should be kept when generating events for this process. If the `decay` string is set, it is the ID of a decay process which should be applied to this particle when generating events.

In input/output form, the `polarized` flag is indicated by an asterisk (`*`) in brackets, and the `decay` is indicated by its ID in brackets.

The `read` and `write` procedures in this module are not type-bound but generic procedures which handle scalar and array arguments.

⟨`particle_specifiers.f90`⟩≡
  ⟨*File header*⟩

```
module particle_specifiers

⟨Use strings⟩
⟨Use file utils⟩
  use diagnostics !NODEP!
  use unit_tests

⟨Standard module head⟩

⟨Particle specifiers: public⟩

⟨Particle specifiers: types⟩

⟨Particle specifiers: interfaces⟩

contains

⟨Particle specifiers: procedures⟩

⟨Particle specifiers: tests⟩

end module particle_specifiers
```

14.3.1 Base type

This is an abstract type which can hold a single particle or an expression.

⟨*Particle specifiers: types*⟩≡
```
    type, abstract :: prt_spec_expr_t
     contains
     ⟨Particle specifiers: prt spec expr: TBP⟩
    end type prt_spec_expr_t
```

Output, as a string.

⟨*Particle specifiers: prt spec expr: TBP*⟩≡
```
    procedure (prt_spec_expr_to_string), deferred :: to_string
```

⟨*Particle specifiers: interfaces*⟩≡
```
    abstract interface
       function prt_spec_expr_to_string (object) result (string)
         import
         class(prt_spec_expr_t), intent(in) :: object
         type(string_t) :: string
       end function prt_spec_expr_to_string
    end interface
```

Call an `expand` method for all enclosed subexpressions (before handling the current expression).

⟨*Particle specifiers: prt spec expr: TBP*⟩+≡
```
    procedure (prt_spec_expr_expand_sub), deferred :: expand_sub
```

⟨*Particle specifiers: interfaces*⟩+≡
```
    abstract interface
       subroutine prt_spec_expr_expand_sub (object)
```

```
        import
        class(prt_spec_expr_t), intent(inout) :: object
      end subroutine prt_spec_expr_expand_sub
    end interface
```

14.3.2   Wrapper type

This wrapper can hold a particle expression of any kind. We need it so we can
make variadic arrays.

⟨*Particle specifiers: public*⟩≡
```
    public :: prt_expr_t
```

⟨*Particle specifiers: types*⟩+≡
```
    type :: prt_expr_t
      class(prt_spec_expr_t), allocatable :: x
     contains
```
⟨*Particle specifiers: prt expr: TBP*⟩
```
    end type prt_expr_t
```

Output as a string: delegate.

⟨*Particle specifiers: prt expr: TBP*⟩≡
```
    procedure :: to_string => prt_expr_to_string
```

⟨*Particle specifiers: procedures*⟩≡
```
    recursive function prt_expr_to_string (object) result (string)
      class(prt_expr_t), intent(in) :: object
      type(string_t) :: string
      if (allocated (object%x)) then
         string = object%x%to_string ()
      else
         string = ""
      end if
    end function prt_expr_to_string
```

Allocate the expression as a particle specifier and copy the value.

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
    procedure :: init_spec => prt_expr_init_spec
```

⟨*Particle specifiers: procedures*⟩+≡
```
    subroutine prt_expr_init_spec (object, spec)
      class(prt_expr_t), intent(out) :: object
      type(prt_spec_t), intent(in) :: spec
      allocate (prt_spec_t :: object%x)
      select type (x => object%x)
      type is (prt_spec_t)
         x = spec
      end select
    end subroutine prt_expr_init_spec
```

Allocate as a list/sum and allocate for a given length

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
    procedure :: init_list => prt_expr_init_list
    procedure :: init_sum => prt_expr_init_sum
```

⟨*Particle specifiers: procedures*⟩+≡
```
subroutine prt_expr_init_list (object, n)
  class(prt_expr_t), intent(out) :: object
  integer, intent(in) :: n
  allocate (prt_spec_list_t :: object%x)
  select type (x => object%x)
  type is (prt_spec_list_t)
     allocate (x%expr (n))
  end select
end subroutine prt_expr_init_list

subroutine prt_expr_init_sum (object, n)
  class(prt_expr_t), intent(out) :: object
  integer, intent(in) :: n
  allocate (prt_spec_sum_t :: object%x)
  select type (x => object%x)
  type is (prt_spec_sum_t)
     allocate (x%expr (n))
  end select
end subroutine prt_expr_init_sum
```

Return the number of terms. This is unity, except if the expression is a sum.

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
procedure :: get_n_terms => prt_expr_get_n_terms
```

⟨*Particle specifiers: procedures*⟩+≡
```
function prt_expr_get_n_terms (object) result (n)
  class(prt_expr_t), intent(in) :: object
  integer :: n
  if (allocated (object%x)) then
     select type (x => object%x)
     type is (prt_spec_sum_t)
        n = size (x%expr)
     class default
        n = 1
     end select
  else
     n = 0
  end if
end function prt_expr_get_n_terms
```

Transform one of the terms, as returned by the previous method, to an array of particle specifiers. The array has more than one entry if the selected term is a list. This makes sense only if the expression has been completely expanded, so the list contains only atoms.

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
procedure :: term_to_array => prt_expr_term_to_array
```

⟨*Particle specifiers: procedures*⟩+≡
```
recursive subroutine prt_expr_term_to_array (object, array, i)
  class(prt_expr_t), intent(in) :: object
  type(prt_spec_t), dimension(:), intent(inout), allocatable :: array
  integer, intent(in) :: i
  integer :: j
```

```
      if (allocated (array))  deallocate (array)
      select type (x => object%x)
      type is (prt_spec_t)
         allocate (array (1))
         array(1) = x
      type is (prt_spec_list_t)
         allocate (array (size (x%expr)))
         do j = 1, size (array)
            select type (y => x%expr(j)%x)
            type is (prt_spec_t)
               array(j) = y
            end select
         end do
      type is (prt_spec_sum_t)
         call x%expr(i)%term_to_array (array, 1)
      end select
    end subroutine prt_expr_term_to_array
```

14.3.3   The atomic type

The trivial case is a single particle, including optional decay and polarization attributes.

Definition

The particle is unstable if the `decay` array is allocated. The `polarized` flag and decays may not be set simultaneously.

⟨*Particle specifiers: public*⟩+≡
```
    public :: prt_spec_t
```

⟨*Particle specifiers: types*⟩+≡
```
    type, extends (prt_spec_expr_t) :: prt_spec_t
      private
      type(string_t) :: name
      logical :: polarized = .false.
      type(string_t), dimension(:), allocatable :: decay
     contains
     ⟨Particle specifiers: prt spec: TBP⟩
    end type prt_spec_t
```

I/O

Output. Old-style subroutines.

⟨*Particle specifiers: public*⟩+≡
```
    public :: prt_spec_write
```

⟨*Particle specifiers: interfaces*⟩+≡
```
    interface prt_spec_write
       module procedure prt_spec_write1
       module procedure prt_spec_write2
    end interface prt_spec_write
```

⟨*Particle specifiers: procedures*⟩+≡
```
    subroutine prt_spec_write1 (object, unit, advance)
      type(prt_spec_t), intent(in) :: object
      integer, intent(in), optional :: unit
      character(len=*), intent(in), optional :: advance

    end if
  end subroutine prt_spec_read1
```

Read a particle specifier array, given as a single string. The array is allocated
to the correct size.

⟨*Particle specifiers: procedures*⟩+≡

```
  pure subroutine prt_spec_read2 (prt_spec, string)
    type(prt_spec_t), dimension(:), intent(out), allocatable :: prt_spec
    type(string_t), intent(in) :: string
    type(string_t) :: buffer
    integer :: c, i, n
    n = 0
    buffer = string
    do
       n = n + 1
       c = scan (buffer, ",")
       if (c == 0)  exit
       buffer = extract (buffer, c+1)
    end do
    allocate (prt_spec (n))
    buffer = string
    do i = 1, size (prt_spec)
       c = scan (buffer, ",")
       if (c == 0)  c = len (buffer) + 1
       call prt_spec_read (prt_spec(i), &
            trim (adjustl (extract (buffer, 1, c-1))))
       buffer = extract (buffer, c+1)
    end do
  end subroutine prt_spec_read2
```

Constructor

Initialize a particle specifier.

⟨*Particle specifiers: public*⟩+≡
```
public :: new_prt_spec
```

⟨*Particle specifiers: interfaces*⟩+≡
```
interface new_prt_spec
   module procedure new_prt_spec
   module procedure new_prt_spec_polarized
   module procedure new_prt_spec_unstable
end interface new_prt_spec
```

⟨*Particle specifiers: procedures*⟩+≡
```
elemental function new_prt_spec (name) result (prt_spec)
  type(string_t), intent(in) :: name
  type(prt_spec_t) :: prt_spec
  prt_spec%name = name
end function new_prt_spec

elemental function new_prt_spec_polarized (name, polarized) result (prt_spec)
  type(string_t), intent(in) :: name
  logical, intent(in) :: polarized
  type(prt_spec_t) :: prt_spec
  prt_spec%name = name
  prt_spec%polarized = polarized
end function new_prt_spec_polarized

pure function new_prt_spec_unstable (name, decay) result (prt_spec)
  type(string_t), intent(in) :: name
  type(string_t), dimension(:), intent(in) :: decay
  type(prt_spec_t) :: prt_spec
  prt_spec%name = name
  allocate (prt_spec%decay (size (decay)))
  prt_spec%decay = decay
end function new_prt_spec_unstable
```

Access Methods

Return the particle name without qualifiers

⟨*Particle specifiers: prt spec: TBP*⟩≡
```
procedure :: get_name => prt_spec_get_name
```

⟨*Particle specifiers: procedures*⟩+≡
```
elemental function prt_spec_get_name (prt_spec) result (name)
  class(prt_spec_t), intent(in) :: prt_spec
  type(string_t) :: name
  name = prt_spec%name
end function prt_spec_get_name
```

Return the name with qualifiers

⟨*Particle specifiers: prt spec: TBP*⟩+≡
```
procedure :: to_string => prt_spec_to_string
```

⟨*Particle specifiers: procedures*⟩+≡
```
    function prt_spec_to_string (object) result (string)
      class(prt_spec_t), intent(in) :: object
      type(string_t) :: string
      integer :: i
      string = object%name
      if (allocated (object%decay)) then
         string = string // "("
         do i = 1, size (object%decay)
            if (i > 1)  string = string // " + "
            string = string // object%decay(i)
         end do
         string = string // ")"
      else if (object%polarized) then
         string = string // "(*)"
      end if
    end function prt_spec_to_string
```

Return the polarization flag

⟨*Particle specifiers: prt spec: TBP*⟩+≡
```
    procedure :: is_polarized => prt_spec_is_polarized
```
⟨*Particle specifiers: procedures*⟩+≡
```
    elemental function prt_spec_is_polarized (prt_spec) result (flag)
      class(prt_spec_t), intent(in) :: prt_spec
      logical :: flag
      flag = prt_spec%polarized
    end function prt_spec_is_polarized
```

The particle is unstable if there is a decay array.

⟨*Particle specifiers: prt spec: TBP*⟩+≡
```
    procedure :: is_unstable => prt_spec_is_unstable
```
⟨*Particle specifiers: procedures*⟩+≡
```
    elemental function prt_spec_is_unstable (prt_spec) result (flag)
      class(prt_spec_t), intent(in) :: prt_spec
      logical :: flag
      flag = allocated (prt_spec%decay)
    end function prt_spec_is_unstable
```

Return the number of decay channels

⟨*Particle specifiers: prt spec: TBP*⟩+≡
```
    procedure :: get_n_decays => prt_spec_get_n_decays
```
⟨*Particle specifiers: procedures*⟩+≡
```
    elemental function prt_spec_get_n_decays (prt_spec) result (n)
      class(prt_spec_t), intent(in) :: prt_spec
      integer :: n
      if (allocated (prt_spec%decay)) then
         n = size (prt_spec%decay)
      else
         n = 0
      end if
    end function prt_spec_get_n_decays
```

Return the decay channels

⟨Particle specifiers: prt spec: TBP⟩+≡
```
    procedure :: get_decays => prt_spec_get_decays
```

⟨Particle specifiers: procedures⟩+≡
```
    subroutine prt_spec_get_decays (prt_spec, decay)
      class(prt_spec_t), intent(in) :: prt_spec
      type(string_t), dimension(:), allocatable, intent(out) :: decay
      if (allocated (prt_spec%decay)) then
          allocate (decay (size (prt_spec%decay)))
          decay = prt_spec%decay
      else
          allocate (decay (0))
      end if
    end subroutine prt_spec_get_decays
```

Miscellaneous

There is nothing to expand here:

⟨Particle specifiers: prt spec: TBP⟩+≡
```
    procedure :: expand_sub => prt_spec_expand_sub
```

⟨Particle specifiers: procedures⟩+≡
```
    subroutine prt_spec_expand_sub (object)
      class(prt_spec_t), intent(inout) :: object
    end subroutine prt_spec_expand_sub
```

14.3.4   List

A list of particle specifiers, indicating, e.g., the final state of a process.

⟨Particle specifiers: public⟩+≡
```
    public :: prt_spec_list_t
```

⟨Particle specifiers: types⟩+≡
```
    type, extends (prt_spec_expr_t) :: prt_spec_list_t
      type(prt_expr_t), dimension(:), allocatable :: expr
     contains
```
⟨Particle specifiers: prt spec list: TBP⟩
```
    end type prt_spec_list_t
```

Output: Concatenate the components. Insert brackets if the component is also a list. The components of the `expr` array, if any, should all be filled.

⟨Particle specifiers: prt spec list: TBP⟩≡
```
    procedure :: to_string => prt_spec_list_to_string
```

⟨Particle specifiers: procedures⟩+≡
```
    recursive function prt_spec_list_to_string (object) result (string)
      class(prt_spec_list_t), intent(in) :: object
      type(string_t) :: string
      integer :: i
      string = ""
      if (allocated (object%expr)) then
```

```
        do i = 1, size (object%expr)
           if (i > 1)  string = string // ", "
           select type (x => object%expr(i)%x)
           type is (prt_spec_list_t)
              string = string // "(" // x%to_string () // ")"
           class default
              string = string // x%to_string ()
           end select
        end do
     end if
  end function prt_spec_list_to_string
```

Flatten: if there is a subexpression which is also a list, include the components as direct members of the current list.

⟨*Particle specifiers: prt spec list: TBP*⟩+≡
```
     procedure :: flatten => prt_spec_list_flatten
```

⟨*Particle specifiers: procedures*⟩+≡
```
  subroutine prt_spec_list_flatten (object)
    class(prt_spec_list_t), intent(inout) :: object
    type(prt_expr_t), dimension(:), allocatable :: tmp_expr
    integer :: i, n_flat, i_flat
    n_flat = 0
    do i = 1, size (object%expr)
       select type (y => object%expr(i)%x)
       type is (prt_spec_list_t)
          n_flat = n_flat + size (y%expr)
       class default
          n_flat = n_flat + 1
       end select
    end do
    if (n_flat > size (object%expr)) then
       allocate (tmp_expr (n_flat))
       i_flat = 0
       do i = 1, size (object%expr)
          select type (y => object%expr(i)%x)
          type is (prt_spec_list_t)
             tmp_expr (i_flat + 1 : i_flat + size (y%expr)) = y%expr
             i_flat = i_flat + size (y%expr)
          class default
             tmp_expr (i_flat + 1) = object%expr(i)
             i_flat = i_flat + 1
          end select
       end do
    end if
    if (allocated (tmp_expr)) &
         call move_alloc (from = tmp_expr, to = object%expr)
  end subroutine prt_spec_list_flatten
```

Convert a list of sums into a sum of lists. (Subexpressions which are not sums are left untouched.)

⟨*Particle specifiers: procedures*⟩+≡
```
  subroutine distribute_prt_spec_list (object)
```

```fortran
      class(prt_spec_expr_t), intent(inout), allocatable :: object
      class(prt_spec_expr_t), allocatable :: new_object
      integer, dimension(:), allocatable :: n, ii
      integer :: k, n_expr, n_terms, i_term
      select type (object)
      type is (prt_spec_list_t)
         n_expr = size (object%expr)
         allocate (n (n_expr), source = 1)
         allocate (ii (n_expr), source = 1)
         do k = 1, size (object%expr)
            select type (y => object%expr(k)%x)
            type is (prt_spec_sum_t)
               n(k) = size (y%expr)
            end select
         end do
         n_terms = product (n)
         if (n_terms > 1) then
            allocate (prt_spec_sum_t :: new_object)
            select type (new_object)
            type is (prt_spec_sum_t)
               allocate (new_object%expr (n_terms))
               do i_term = 1, n_terms
                  allocate (prt_spec_list_t :: new_object%expr(i_term)%x)
                  select type (x => new_object%expr(i_term)%x)
                  type is (prt_spec_list_t)
                     allocate (x%expr (n_expr))
                     do k = 1, n_expr
                        select type (y => object%expr(k)%x)
                        type is (prt_spec_sum_t)
                           x%expr(k) = y%expr(ii(k))
                        class default
                           x%expr(k) = object%expr(k)
                        end select
                     end do
                  end select
                  INCR_INDEX: do k = n_expr, 1, -1
                     if (ii(k) < n(k)) then
                        ii(k) = ii(k) + 1
                        exit INCR_INDEX
                     else
                        ii(k) = 1
                     end if
                  end do INCR_INDEX
               end do
            end select
         end if
      end select
      if (allocated (new_object)) call move_alloc (from = new_object, to = object)
    end subroutine distribute_prt_spec_list
```

Apply **expand** to all components of the list.

⟨*Particle specifiers: prt spec list: TBP*⟩+≡
```fortran
    procedure :: expand_sub => prt_spec_list_expand_sub
```

⟨*Particle specifiers: procedures*⟩+≡
```
recursive subroutine prt_spec_list_expand_sub (object)
  class(prt_spec_list_t), intent(inout) :: object
  integer :: i
  if (allocated (object%expr)) then
     do i = 1, size (object%expr)
        call object%expr(i)%expand ()
     end do
  end if
end subroutine prt_spec_list_expand_sub
```

14.3.5 Sum

A sum of particle specifiers, indicating, e.g., a sum of final states.

⟨*Particle specifiers: public*⟩+≡
```
public :: prt_spec_sum_t
```

⟨*Particle specifiers: types*⟩+≡
```
type, extends (prt_spec_expr_t) :: prt_spec_sum_t
  type(prt_expr_t), dimension(:), allocatable :: expr
 contains
 ⟨Particle specifiers: prt spec sum: TBP⟩
end type prt_spec_sum_t
```

Output: Concatenate the components. Insert brackets if the component is a list or also a sum. The components of the `expr` array, if any, should all be filled.

⟨*Particle specifiers: prt spec sum: TBP*⟩≡
```
procedure :: to_string => prt_spec_sum_to_string
```

⟨*Particle specifiers: procedures*⟩+≡
```
recursive function prt_spec_sum_to_string (object) result (string)
  class(prt_spec_sum_t), intent(in) :: object
  type(string_t) :: string
  integer :: i
  string = ""
  if (allocated (object%expr)) then
     do i = 1, size (object%expr)
        if (i > 1)  string = string // " + "
        select type (x => object%expr(i)%x)
        type is (prt_spec_list_t)
           string = string // "(" // x%to_string () // ")"
        type is (prt_spec_sum_t)
           string = string // "(" // x%to_string () // ")"
        class default
           string = string // x%to_string ()
        end select
     end do
  end if
end function prt_spec_sum_to_string
```

Flatten: if there is a subexpression which is also a sum, include the components as direct members of the current sum.

This is identical to `prt_spec_list_flatten` above, except for the type.

⟨*Particle specifiers: prt spec sum: TBP*⟩+≡

```
    procedure :: flatten => prt_spec_sum_flatten
```

⟨*Particle specifiers: procedures*⟩+≡

```
    subroutine prt_spec_sum_flatten (object)
      class(prt_spec_sum_t), intent(inout) :: object
      type(prt_expr_t), dimension(:), allocatable :: tmp_expr
      integer :: i, n_flat, i_flat
      n_flat = 0
      do i = 1, size (object%expr)
         select type (y => object%expr(i)%x)
         type is (prt_spec_sum_t)
            n_flat = n_flat + size (y%expr)
            class default
            n_flat = n_flat + 1
         end select
      end do
      if (n_flat > size (object%expr)) then
         allocate (tmp_expr (n_flat))
         i_flat = 0
         do i = 1, size (object%expr)
            select type (y => object%expr(i)%x)
            type is (prt_spec_sum_t)
               tmp_expr (i_flat + 1 : i_flat + size (y%expr)) = y%expr
               i_flat = i_flat + size (y%expr)
            class default
               tmp_expr (i_flat + 1) = object%expr(i)
               i_flat = i_flat + 1
            end select
         end do
      end if
      if (allocated (tmp_expr)) &
           call move_alloc (from = tmp_expr, to = object%expr)
    end subroutine prt_spec_sum_flatten
```

Apply `expand` to all terms in the sum.

⟨*Particle specifiers: prt spec sum: TBP*⟩+≡

```
    procedure :: expand_sub => prt_spec_sum_expand_sub
```

⟨*Particle specifiers: procedures*⟩+≡

```
    recursive subroutine prt_spec_sum_expand_sub (object)
      class(prt_spec_sum_t), intent(inout) :: object
      integer :: i
      if (allocated (object%expr)) then
         do i = 1, size (object%expr)
            call object%expr(i)%expand ()
         end do
      end if
    end subroutine prt_spec_sum_expand_sub
```

14.3.6 Expression Expansion

The `expand` method transforms each particle specifier expression into a sum of lists, according to the rules

$$a, (b, c) \to a, b, c \tag{14.1}$$
$$a + (b + c) \to a + b + c \tag{14.2}$$
$$a, b + c \to (a, b) + (a, c) \tag{14.3}$$

Note that the precedence of comma and plus are opposite to this expansion, so the parentheses in the final expression are necessary.

We assume that subexpressions are filled, i.e., arrays are allocated.

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
    procedure :: expand => prt_expr_expand
```

⟨*Particle specifiers: procedures*⟩+≡
```
    recursive subroutine prt_expr_expand (expr)
      class(prt_expr_t), intent(inout) :: expr
      if (allocated (expr%x)) then

14.4   Process library access

Processes (the code and data that are necessary for evaluating matrix elements of a particular process or process component) are organized in process libraries. In full form, process libraries contain generated and dynamically compiled and linked code, so they are actual libraries on the OS level. Alternatively, there may be simple processes that can be generated without referring to external libraries, and external libraries that are just linked in.

This module interfaces the OS to create, build, and use process libraries.

We work with two related data structures. There is the list of process configurations that stores the user input and data derived from it. A given process

configuration list is scanned for creating a process library, which consists of both data and code. The creation step involves calling external programs and incorporating external code.

For the subsequent integration and event generation steps, we read the process library. We also support partial (re)creation of the process library. To this end, we should be able to reconstruct the configuration data records from the process library.

14.4.1 Auxiliary stuff

Here is a small subroutine that strips the left-hand side and the equals sign off an equation.

⟨*Process libraries: procedures*⟩≡
```
subroutine strip_prefix (buffer)
  character(*), intent(inout) :: buffer
  type(string_t) :: string, prefix
  string = buffer
  call split (string, prefix, "=")
  buffer = string
end subroutine strip_prefix
```

14.4.2 Process definition objects

We collect process configuration data in a derived type, `process_def_t`. A process can be a collection of several components which are treated as a single entity for the purpose of observables and event generation. Multiple process components may initially be defined by the user. The system may add additional components, e.g., subtraction terms. The common data type is `process_component_def_t`. Within each component, there are several universal data items, and a part which depend on the particular process variant. The latter is covered by an abstract type `prc_core_def_t` and its extensions.

Wrapper for components

We define a wrapper type for the configuration of individual components.

The string `basename` is used for building file, module, and function names for the current process component. Initially, it will be built from the corresponding process basename by appending an alphanumeric suffix.

The logical `initial` tells whether this is a user-defined (true) or system-generated (false) configuration.

The numbers `n_in`, `n_out`, and `n_tot` denote the incoming, outgoing and total number of particles (partons) participating in the process component, respectively. These are the nominal particles, as input by the user (recombination may change the particle content, for the output events).

The string arrays `prt_in` and `prt_out` hold the particle specifications as provided by the user. For a system-generated process component, they remain deallocated.

The `method` string is used to determine the type of process matrix element and how it is obtained.

The `description` string collects the information about particle content and method in a single human-readable string.

The pointer object `core_def` is allocated according to the actual process variant, which depends on the method. The subobject holds any additional configuration data that is relevant for the process component.

We assume that no finalizer is needed.

⟨*Process libraries: public*⟩≡

      else
         write (u, *)
      end if
    end subroutine process_component_def_show
```

Compute the MD5 sum of a process component. We reset the stored MD5 sum
to the empty string (so a previous value is not included in the calculation), the
write a temporary file and calculate the MD5 sum of that file.

This implies that all data that are displayed by the `write` method become
part of the MD5 sum calculation.

The `model` is not part of the object, but must be included in the MD5 sum. Otherwise, modifying the model and nothing else would not trigger remaking the process-component source. Note that the model parameters may change later and therefore are not incorporated.

After the MD5 sum of the component has been computed, we communicate it to the `writer` subobject of the specific `core_def` component. Although these types are abstract, the MD5-related features are valid for the abstract types.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: compute_md5sum => process_component_def_compute_md5sum
```

⟨*Process libraries: procedures*⟩+≡
```
subroutine process_component_def_compute_md5sum (component, model)
  class(process_component_def_t), intent(inout) :: component
  type(model_t), intent(in), pointer :: model
  integer :: u
  component%md5sum = ""
  u = free_unit ()
  open (u, status = "scratch", action = "readwrite")
  if (associated (model))  write (u, "(A32)")  model_get_md5sum (model)
  call component%write (u)
  rewind (u)
  component%md5sum = md5sum (u)
  close (u)
  if (allocated (component%core_def)) then
     call component%core_def%set_md5sum (component%md5sum)
  end if
end subroutine process_component_def_compute_md5sum
```

Allocate the process driver (with a suitable type) for a process component. For internal processes, we may set all data already at this stage.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: allocate_driver => process_component_def_allocate_driver
```

⟨*Process libraries: procedures*⟩+≡
```
subroutine process_component_def_allocate_driver (component, driver)
  class(process_component_def_t), intent(in) :: component
  class(prc_core_driver_t), intent(out), allocatable :: driver
  if (allocated (component%core_def)) then
     call component%core_def%allocate_driver (driver, component%basename)
  end if
end subroutine process_component_def_allocate_driver
```

Tell whether the process core needs external code.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: needs_code => process_component_def_needs_code
```

⟨*Process libraries: procedures*⟩+≡
```
function process_component_def_needs_code (component) result (flag)
  class(process_component_def_t), intent(in) :: component
  logical :: flag
  flag = component%core_def%needs_code ()
end function process_component_def_needs_code
```

If there is external code, the `core_def` subobject should provide a writer object. This method returns a pointer to the writer.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: get_writer_ptr => process_component_def_get_writer_ptr
```

⟨*Process libraries: procedures*⟩+≡
```
function process_component_def_get_writer_ptr (component) result (writer)
  class(process_component_def_t), intent(in), target :: component
  class(prc_writer_t), pointer :: writer
  writer => component%core_def%writer
end function process_component_def_get_writer_ptr
```

Return an array which holds the names of all C functions that this process component implements.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: get_features => process_component_def_get_features
```

⟨*Process libraries: procedures*⟩+≡
```
function process_component_def_get_features (component) result (features)
  class(process_component_def_t), intent(in) :: component
  type(string_t), dimension(:), allocatable :: features
  call component%core_def%get_features (features)
end function process_component_def_get_features
```

Assign procedure pointers in the `driver` component (external processes). For internal processes, this is meaningless.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: connect => process_component_def_connect
```

⟨*Process libraries: procedures*⟩+≡
```
subroutine process_component_def_connect &
    (component, lib_driver, i, proc_driver)
  class(process_component_def_t), intent(in) :: component
  class(prclib_driver_t), intent(in) :: lib_driver
  integer, intent(in) :: i
  class(prc_core_driver_t), intent(inout) :: proc_driver
  select type (proc_driver)
  class is (process_driver_internal_t)
     ! nothing to do
  class default
     call component%core_def%connect (lib_driver, i, proc_driver)
  end select
end subroutine process_component_def_connect
```

Return a pointer to the process core definition, which is of abstract type.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: get_core_def_ptr => process_component_get_core_def_ptr
```

⟨*Process libraries: procedures*⟩+≡
```
function process_component_get_core_def_ptr (component) result (ptr)
  class(process_component_def_t), intent(in), target :: component
  class(prc_core_def_t), pointer :: ptr
  ptr => component%core_def
end function process_component_get_core_def_ptr
```

Return nominal particle counts, as input by the user.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: get_n_in  => process_component_def_get_n_in
procedure :: get_n_out => process_component_def_get_n_out
procedure :: get_n_tot => process_component_def_get_n_tot
```

⟨*Process libraries: procedures*⟩+≡
```
function process_component_def_get_n_in (component) result (n_in)
  class(process_component_def_t), intent(in) :: component
  integer :: n_in
  n_in = component%n_in
end function process_component_def_get_n_in

function process_component_def_get_n_out (component) result (n_out)
  class(process_component_def_t), intent(in) :: component
  integer :: n_out
  n_out = component%n_out
end function process_component_def_get_n_out

function process_component_def_get_n_tot (component) result (n_tot)
  class(process_component_def_t), intent(in) :: component
  integer :: n_tot
  n_tot = component%n_tot
end function process_component_def_get_n_tot
```

Allocate and return string arrays for the incoming and outgoing particles.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: get_prt_in => process_component_def_get_prt_in
procedure :: get_prt_out => process_component_def_get_prt_out
```

⟨*Process libraries: procedures*⟩+≡
```
subroutine process_component_def_get_prt_in (component, prt)
  class(process_component_def_t), intent(in) :: component
  type(string_t), dimension(:), intent(out), allocatable :: prt
  integer :: i
  allocate (prt (component%n_in))
  do i = 1, component%n_in
     prt(i) = component%prt_in(i)%to_string ()
  end do
end subroutine process_component_def_get_prt_in

subroutine process_component_def_get_prt_out (component, prt)
  class(process_component_def_t), intent(in) :: component
  type(string_t), dimension(:), intent(out), allocatable :: prt
  integer :: i
  allocate (prt (component%n_out))
  do i = 1, component%n_out
     prt(i) = component%prt_out(i)%to_string ()
  end do
end subroutine process_component_def_get_prt_out
```

Return the MD5 sum.

⟨*Process libraries: process component def: TBP*⟩+≡
```
procedure :: get_md5sum => process_component_def_get_md5sum
```

1837

⟨*Process libraries: procedures*⟩+≡
```
    function process_component_def_get_md5sum (component) result (md5sum)
      class(process_component_def_t), intent(in) :: component
      character(32) :: md5sum
      md5sum = component%md5sum
    end function process_component_def_get_md5sum
```

Process definition

The process component definitions are collected in a common process definition object.

The `id` is the ID string that the user has provided for identifying this process. It must be a string that is allowed as part of a Fortran variable name, since it may be used for generating code.

The number `n_in` is 1 or 2 for a decay or scattering process, respectively. This must be identical to `n_in` for all components.

The initial and extra component definitions (see above) are allocated as the `initial` and `extra` arrays, respectively. The latter are determined from the former.

The `md5sum` is used to verify the integrity of the configuration.

⟨*Process libraries: public*⟩+≡
```
    public :: process_def_t
```

⟨*Process libraries: types*⟩+≡
```
    type :: process_def_t
      private
      type(string_t) :: id
      integer :: num_id = 0
      type(model_t), pointer :: model => null ()
      type(string_t) :: model_name
      integer :: n_in  = 0
      integer :: n_initial = 0
      integer :: n_extra = 0
      type(process_component_def_t), dimension(:), allocatable :: initial
      type(process_component_def_t), dimension(:), allocatable :: extra
      character(32) :: md5sum = ""
     contains
     ⟨Process libraries: process def: TBP⟩
    end type process_def_t
```

Write the process definition including components:

⟨*Process libraries: process def: TBP*⟩≡
```
    procedure :: write => process_def_write
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_def_write (object, unit)
      class(process_def_t), intent(in) :: object
      integer, intent(in) :: unit
      integer :: i
      write (unit, "(1x,A,A,A)") "ID = '", char (object%id), "'"
      if (object%num_id /= 0) &
           write (unit, "(1x,A,I0)")  "ID(num) = ", object%num_id
```

```
      select case (object%n_in)
      case (1);  write (unit, "(1x,A)")  "Decay"
      case (2);  write (unit, "(1x,A)")  "Scattering"
      case default
         write (unit, "(1x,A)")  "[Undefined process]"
         return
      end select
      if (object%model_name /= "") then
         write (unit, "(1x,A,A)")  "Model = ", char (object%model_name)
      else
         write (unit, "(1x,A)")  "Model = [undefined]"
      end if
      write (unit, "(1x,A,I0)")  "Initially defined component(s) = ", &
           object%n_initial
      write (unit, "(1x,A,I0)")  "Extra generated component(s)   = ", &
           object%n_extra
      write (unit, "(1x,A,A,A)") "MD5 sum   = '", object%md5sum, "'"
      if (allocated (object%initial)) then
         do i = 1, size (object%initial)
            write (unit, "(1x,A,I0)")  "Component #", i
            call object%initial(i)%write (unit)
         end do
      end if
      if (allocated (object%extra)) then
         do i = 1, size (object%extra)
            write (unit, "(1x,A,I0)")  "Component #", object%n_initial + i
            call object%extra(i)%write (unit)
         end do
      end if
    end subroutine process_def_write
```

Read the process definition including components.

⟨*Process libraries: process def: TBP*⟩+≡
```
    procedure :: read => process_def_read
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_def_read (object, unit, core_def_templates)
      class(process_def_t), intent(out) :: object
      integer, intent(in) :: unit
      type(prc_template_t), dimension(:), intent(in) :: core_def_templates
      integer :: i, i1, i2
      character(80) :: buffer, ref
      read (unit, "(A)")  buffer
      call strip_prefix (buffer)
      i1 = scan (buffer, "'")
      i2 = scan (buffer, "'", back=.true.)
      if (i2 > i1) then
         object%id = buffer(i1+1:i2-1)
      else
         object%id = ""
      end if

      read (unit, "(A)")  buffer
      select case (buffer(2:11))
```

```fortran
      case ("Decay      "); object%n_in = 1
      case ("Scattering"); object%n_in = 2
      case default
         return
      end select

      read (unit, "(A)")  buffer
      call strip_prefix (buffer)
      object%model_name = trim (adjustl (buffer))
      if (object%model_name == "[undefined]")  object%model_name = ""

      read (unit, "(A)")  buffer
      call strip_prefix (buffer)
      read (buffer, *)  object%n_initial

      read (unit, "(A)")  buffer
      call strip_prefix (buffer)
      read (buffer, *)  object%n_extra

      read (unit, "(A)")  buffer
      call strip_prefix (buffer)
      read (buffer(3:34), "(A32)")  object%md5sum

      if (object%n_initial > 0) then
         allocate (object%initial (object%n_initial))
         do i = 1, object%n_initial
            read (unit, "(A)")  buffer
            write (ref, "(1x,A,I0)")  "Component #", i
            if (buffer /= ref)  return                 ! Wrong component header
            call object%initial(i)%read (unit, core_def_templates)
         end do
      end if

   end subroutine process_def_read
```

Short account.

⟨*Process libraries: process def: TBP*⟩+≡
```fortran
      procedure :: show => process_def_show
```

⟨*Process libraries: procedures*⟩+≡
```fortran
   subroutine process_def_show (object, unit)
     class(process_def_t), intent(in) :: object
     integer, intent(in) :: unit
     integer :: i
     write (unit, "(4x,A)", advance="no") char (object%id)
     if (object%num_id /= 0) &
         write (unit, "(1x,'(',I0,')')", advance="no")  object%num_id
     if (object%model_name /= "") &
         write (unit, "(1x,'[',A,']')")  char (object%model_name)
     if (allocated (object%initial)) then
       do i = 1, size (object%initial)
          call object%initial(i)%show (unit)
       end do
     end if
```

```
      if (allocated (object%extra)) then
         do i = 1, size (object%extra)
            call object%extra(i)%show (unit)
         end do
      end if
    end subroutine process_def_show
```

Initialize an entry (initialize the process definition inside). We allocate the 'initial' set of components. Extra components remain unallocated.

The model should be present as a pointer. This allows us to retrieve the model's MD5 sum. However, for various tests it is sufficient to have the name.

We create the basenames for the process components by appending a suffix which we increment for each component.

⟨*Process libraries: process def: TBP*⟩+≡
```
    procedure :: init => process_def_init
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_def_init (def, id, &
         model, model_name, n_in, n_components, num_id)
      class(process_def_t), intent(out) :: def
      type(string_t), intent(in), optional :: id
      type(model_t), intent(in), optional, target :: model
      type(string_t), intent(in), optional :: model_name
      integer, intent(in), optional :: n_in
      integer, intent(in), optional :: n_components
      integer, intent(in), optional :: num_id
      character(16) :: suffix
      integer :: i
      if (present (id)) then
         def%id = id
      else
         def%id = ""
      end if
      if (present (num_id)) then
         def%num_id = num_id
      end if
      if (present (model)) then
         def%model => model
         def%model_name = model%get_name ()

         allocate (def%initial (n_components))
      end if
      def%initial%initial = .true.
      def%initial%method      = ""
```

```
      do i = 1, def%n_initial
         write (suffix, "(A,I0)")  "_i", i
         def%initial(i)%basename = def%id // trim (suffix)
      end do
      def%initial%description = ""
    end subroutine process_def_init
```

Initialize an initial component. The particle content must be specified. The process core block is not (yet) allocated.

    We assume that the particle arrays match the `n_in` and `n_out` values in size. The model is referred to by name; it is identified as an existing model later. The index `i` must refer to an existing element of the component array.

    Data specific for the process core of a component are imported as the `core_def` argument. We should allocate an object of class `prc_core_def_t` with the appropriate specific type, fill it, and transfer it to the process component definition here. The allocation is moved, so the original allocated object is returned empty.

⟨*Process libraries: process def: TBP*⟩+≡
```
    procedure :: import_component => process_def_import_component
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_def_import_component (def, &

     end if
   end associate
 end subroutine process_def_import_component
```

Compute the MD5 sum for this process definition. We compute the MD5 sums for all components individually, than concatenate a string of those and compute the MD5 sum of this string. We also include the model name. All other data part of the component definitions.

⟨*Process libraries: process def: TBP*⟩+≡
```
    procedure :: compute_md5sum => process_def_compute_md5sum
```

⟨*Process libraries: procedures*⟩+≡
```
  subroutine process_def_compute_md5sum (def)
    class(process_def_t), intent(inout) :: def
    integer :: i
    type(string_t) :: buffer
    buffer = def%model_name
    do i = 1, def%n_initial
       call def%initial(i)%compute_md5sum (def%model)
       buffer = buffer // def%initial(i)%md5sum
    end do
    do i = 1, def%n_extra
       call def%extra(i)%compute_md5sum (def%model)
       buffer = buffer // def%initial(i)%md5sum
    end do
    def%md5sum = md5sum (char (buffer))
  end subroutine process_def_compute_md5sum
```

Return the MD5 sum of the process or of a process component.

⟨*Process libraries: process def: TBP*⟩+≡
```
    procedure :: get_md5sum => process_def_get_md5sum
```

⟨*Process libraries: procedures*⟩+≡
```
  function process_def_get_md5sum (def, i_component) result (md5sum)
    class(process_def_t), intent(in) :: def
    integer, intent(in), optional :: i_component
    character(32) :: md5sum
    if (present (i_component)) then
       md5sum = def%initial(i_component)%md5sum
    else
       md5sum = def%md5sum
```

```
      end if
    end function process_def_get_md5sum
```

This query tells whether a specific process component relies on external code. This includes all traditional WHIZARD matrix elements which rely on O'MEGA for code generation. Other process components (trivial decays, subtraction terms) do not require external code.

NOTE: Implemented only for initial component.

The query is passed to the process component.

⟨*Process libraries: process def: TBP*⟩+≡
```
    procedure :: needs_code => process_def_needs_code
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_def_needs_code (def, i_component) result (flag)
      class(process_def_t), intent(in) :: def
      integer, intent(in) :: i_component
      logical :: flag
      flag = def%initial(i_component)%needs_code ()
    end function process_def_needs_code
```

Process definition list

A list of process definitions is the starting point for creating a process library. The list is built when reading the user input. When reading an existing process library, the list is used for cross-checking and updating the configuration.

We need a type for the list entry. The simplest way is to extend the process definition type, so all methods apply to the process definition directly.

⟨*Process libraries: public*⟩+≡
```
    public :: process_def_entry_t
```

⟨*Process libraries: types*⟩+≡
```
    type, extends (process_def_t) :: process_def_entry_t
      private
      type(process_def_entry_t), pointer :: next => null ()
    end type process_def_entry_t
```

This is the type for the list itself.

⟨*Process libraries: types*⟩+≡
```
    type :: process_def_list_t
      private
      type(process_def_entry_t), pointer :: first => null ()
      type(process_def_entry_t), pointer :: last => null ()
     contains
     ⟨Process libraries: process def list: TBP⟩
    end type process_def_list_t
```

The deallocates the list iteratively. We assume that the list entries do not need finalization themselves.

⟨*Process libraries: process def list: TBP*⟩≡
```
    procedure :: final => process_def_list_final
```

⟨*Process libraries: procedures*⟩+≡

```
subroutine process_def_list_final (list)
  class(process_def_list_t), intent(inout) :: list
  type(process_def_entry_t), pointer :: current
  nullify (list%last)
  do while (associated (list%first))
     current => list%first
     list%first => current%next
     deallocate (current)
  end do
end subroutine process_def_list_final
```

Write the complete list.

⟨*Process libraries: process def list: TBP*⟩+≡

```
procedure :: write => process_def_list_write
```

⟨*Process libraries: procedures*⟩+≡

```
subroutine process_def_list_write (object, unit, libpath)
  class(process_def_list_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: libpath
  type(process_def_entry_t), pointer :: entry
  integer :: i, u
  u = output_unit (unit)
  if (associated (object%first)) then
     i = 1
     entry => object%first
     do while (associated (entry))
        write (u, "(1x,A,I0,A)")  "Process #", i, ":"
        call entry%write (u)
        i = i + 1
        entry => entry%next
        if (associated (entry))  write (u, *)
     end do
  else
     write (u, "(1x,A)")  "Process definition list: [empty]"
  end if
end subroutine process_def_list_write
```

Short account.

⟨*Process libraries: process def list: TBP*⟩+≡

```
procedure :: show => process_def_list_show
```

⟨*Process libraries: procedures*⟩+≡

```
subroutine process_def_list_show (object, unit)
  class(process_def_list_t), intent(in) :: object
  integer, intent(in), optional :: unit
  type(process_def_entry_t), pointer :: entry
  integer :: u
  u = output_unit (unit)
  if (associated (object%first)) then
     write (u, "(2x,A)")  "Processes:"
     entry => object%first
     do while (associated (entry))
```

```
            call entry%show (u)
            entry => entry%next
         end do
      else
         write (u, "(2x,A)")  "Processes: [empty]"
      end if
   end subroutine process_def_list_show
```

Read the complete list. We need an array of templates for the component sub-objects of abstract `prc_core_t` type, to allocate them with the correct specific type.

NOTE: Error handling is missing. Reading will just be aborted on error, or an I/O error occurs.

⟨*Process libraries: process def list: TBP*⟩+≡
```
   procedure :: read => process_def_list_read
```

⟨*Process libraries: procedures*⟩+≡
```
   subroutine process_def_list_read (object, unit, core_def_templates)
     class(process_def_list_t), intent(out) :: object
     integer, intent(in) :: unit
     type(prc_template_t), dimension(:), intent(in) :: core_def_templates
     type(process_def_entry_t), pointer :: entry
     character(80) :: buffer, ref
     integer :: i
     read (unit, "(A)")  buffer
     write (ref, "(1x,A)")  "Process definition list: [empty]"
     if (buffer == ref)  return          ! OK: empty library
     backspace (unit)
     READ_ENTRIES: do i = 1, huge (0)
        if (i > 1) read (unit, *, end=1)
        read (unit, "(A)")  buffer

        write (ref, "(1x,A,I0,A)")  "Process #", i, ":"
        if (buffer /= ref)  return       ! Wrong process header: done.
        allocate (entry)
        call entry%read (unit, core_def_templates)
        call object%append (entry)
     end do READ_ENTRIES
 1   continue                            ! EOF: done
   end subroutine process_def_list_read
```

Append an entry to the list. The entry should be allocated as a pointer, and the pointer allocation is transferred. The original pointer is returned null.

⟨*Process libraries: process def list: TBP*⟩+≡
```
   procedure :: append => process_def_list_append
```

⟨*Process libraries: procedures*⟩+≡
```
   subroutine process_def_list_append (list, entry)
     class(process_def_list_t), intent(inout) :: list
     type(process_def_entry_t), intent(inout), pointer :: entry
     if (list%contains (entry%id)) then
        call msg_fatal ("Recording process: '" // char (entry%id) &
             // "' has already been defined")
```

```
      end if
      if (associated (list%first)) then
         list%last%next => entry
      else
         list%first => entry
      end if
      list%last => entry
      entry => null ()
   end subroutine process_def_list_append
```

Probe the process definition list

Return the number of processes supported by the library.

⟨*Process libraries: process def list: TBP*⟩+≡
```
   procedure :: get_n_processes => process_def_list_get_n_processes
```

⟨*Process libraries: procedures*⟩+≡
```
   function process_def_list_get_n_processes (list) result (n)
     integer :: n
     class(process_def_list_t), intent(in) :: list
     type(process_def_entry_t), pointer :: current
     n = 0
     current => list%first
     do while (associated (current))
        n = n + 1
        current => current%next
     end do
   end function process_def_list_get_n_processes
```

Allocate an array with the process IDs supported by the library.

⟨*Process libraries: process def list: TBP*⟩+≡
```
   procedure :: get_process_id_list => process_def_list_get_process_id_list
```

⟨*Process libraries: procedures*⟩+≡
```
   subroutine process_def_list_get_process_id_list (list, id)
     class(process_def_list_t), intent(in) :: list
     type(string_t), dimension(:), allocatable, intent(out) :: id
     type(process_def_entry_t), pointer :: current
     integer :: i
     allocate (id (list%get_n_processes ()))
     i = 0

            end do
            n = current%n_initial
            do i = 1, current%n_extra
               description(n + i) = current%extra(i)%description
            end do
            return
         end if
         current => current%next
      end do
   end subroutine process_def_list_get_component_description_list
```

14.4.3   Process library

The process library object is the interface between the process definition data, as provided by the user, generated or linked process code on file, and the process run data that reference the process code.

Process library entry

For each process component that is part of the library, there is a separate library entry (`process_library_entry_t`. The library entry connects a process definition with the specific code (if any) in the compiled driver library.

The `status` indicates how far the process has been processed by the system (definition, code generation, compilation, linking). A process with status `STAT_LOADED` is accessible for computing matrix elements.

The `def` pointer identifies the corresponding process definition. The process component within that definition is identified by the `i_component` index.

The `i_external` index refers to the compiled library driver. If it is zero, there is no associated matrix-element code.

The `driver` component holds the pointers to the matrix-element specific functions, in particular the matrix element function itself.

⟨*Process libraries: types*⟩+≡
```
type :: process_library_entry_t
  private
  integer :: status = STAT_UNKNOWN
  type(process_def_t), pointer :: def => null ()
  integer :: i_component = 0
  integer :: i_external = 0
  class(prc_core_driver_t), allocatable :: driver
 contains
 ⟨Process libraries: process library entry: TBP⟩
end type process_library_entry_t
```

Here are the available status codes. An entry starts with `UNKNOWN` status. Once the association with a valid process definition is established, the status becomes `CONFIGURED`. If matrix element source code is to be generated by the system or provided from elsewhere, `CODE_GENERATED` indicates that this is done. The `COMPILED` status is next, it also applies to processes which are accessed as precompiled binaries. Finally, the library is linked and process pointers are set; this is marked as `LOADED`.

For a process library, the initial status is `OPEN`, since process definitions may be added. After configuration, the process content is fixed and the status becomes `CONFIGURED`. The further states are as above, always referring to the lowest status among the process entries.

⟨*Process libraries: parameters*⟩≡
```
integer, parameter :: STAT_UNKNOWN = 0
integer, parameter :: STAT_OPEN = 1
integer, parameter :: STAT_CONFIGURED = 2
integer, parameter :: STAT_SOURCE = 3
integer, parameter :: STAT_COMPILED = 4
integer, parameter :: STAT_LINKED = 5
integer, parameter :: STAT_ACTIVE = 6
```

These are the associated code letters, for output:

⟨*Process libraries: parameters*⟩+≡
```
character, dimension(0:6), parameter :: STATUS_LETTER = &
     ["?", "o", "f", "s", "c", "l", "a"]
```

1852

This produces a condensed account of the library entry. The status is indicated by a letter in brackets, then the ID and component index of the associated process definition, finally the library index, if available.

⟨*Process libraries: process library entry: TBP*⟩≡
```
    procedure :: to_string => process_library_entry_to_string
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_entry_to_string (object) result (string)
      type(string_t) :: string
      class(process_library_entry_t), intent(in) :: object
      character(32) :: buffer
      string = "[" // STATUS_LETTER(object%status) // "]"
      select case (object%status)
      case (STAT_UNKNOWN)
      case default
         if (associated (object%def)) then
            write (buffer, "(I0)")  object%i_component
            string = string // " " // object%def%id // "." // trim (buffer)
         end if
         if (object%i_external /= 0) then
            write (buffer, "(I0)")  object%i_external
            string = string // " = ext:" // trim (buffer)
         else
            string = string // " = int"
         end if
         if (allocated (object%driver)) then
            string = string // " (" // object%driver%type_name () // ")"
         end if
      end select
    end function process_library_entry_to_string
```

Initialize with data. Used for the unit tests.

⟨*Process libraries: process library entry: TBP*⟩+≡
```
    procedure :: init => process_library_entry_init
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_entry_init (object, &
         status, def, i_component, i_external)
      class(process_library_entry_t), intent(out) :: object
      integer, intent(in) :: status
      type(process_def_t), target, intent(in) :: def
      integer, intent(in) :: i_component
      integer, intent(in) :: i_external
      object%status = status
      object%def => def
      object%i_component = i_component
      object%i_external = i_external
    end subroutine process_library_entry_init
```

Assign pointers for all process-specific features. We have to combine the method from the `core_def` specification, the assigned pointers within the library driver, the index within that driver, and the process driver which should receive the links.

⟨*Process libraries: process library entry: TBP*⟩+≡

```
        procedure :: connect => process_library_entry_connect
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_entry_connect (entry, lib_driver, i)
      class(process_library_entry_t), intent(inout) :: entry
      class(prclib_driver_t), intent(in) :: lib_driver
      integer, intent(in) :: i
      call entry%def%initial(entry%i_component)%connect &
           (lib_driver, i, entry%driver)
    end subroutine process_library_entry_connect
```

The process library object

The `process_library_t` type is an extension of the `process_def_list_t` type. Thus, it automatically contains the process definition list.

The `basename` identifies the library generically.

The `external` flag is true if any process within the library needs external code, so the library must correspond to an actual code library (statically or dynamically linked).

The `entry` array contains all process components that can be handled by this library. Each entry refers to the process (component) definition and to the associated external matrix element code, if there is any.

The `driver` object is needed only if `external` is true. This object handles all interactions with external matrix-element code.

The `md5sum` summarizes the complete `process_def_list_t` base object. It can be used to check if the library configuration has changed.

⟨*Process libraries: public*⟩+≡
```
    public :: process_library_t
```

⟨*Process libraries: types*⟩+≡
```
    type, extends (process_def_list_t) :: process_library_t
      private
      type(string_t) :: basename
      integer :: n_entries = 0
      logical :: external = .false.
      integer :: status = STAT_UNKNOWN
      logical :: static = .false.
      logical :: driver_exists = .false.
      logical :: makefile_exists = .false.
      type(process_library_entry_t), dimension(:), allocatable :: entry
      class(prclib_driver_t), allocatable :: driver
      character(32) :: md5sum = ""
    contains
    ⟨Process libraries: process library: TBP⟩
    end type process_library_t
```

For the output, we write first the metadata and the DL access record, then the library entries in short form, and finally the process definition list which is the base object.

Don't write the MD5 sum since this is used to generate it.

⟨*Process libraries: process library: TBP*⟩≡
```
    procedure :: write => process_library_write
```

1854

⟨*Process libraries: procedures*⟩+≡

```
subroutine process_library_write (object, unit, libpath)
  class(process_library_t), intent(in) :: object

The initializer defines just the basename. We may now add process definitions to the library.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: init => process_library_init
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_init (lib, basename)
      class(process_library_t), intent(out) :: lib
      type(string_t), intent(in) :: basename
      lib%basename = basename
      lib%status = STAT_OPEN
      call msg_message ("Process library '" // char (basename) &
            // "': initialized")
    end subroutine process_library_init
```

This alternative initializer declares the library as static. We should now add process definitions to the library, but all external process code exists already. We need the driver object, and we should check the defined processes against the stored ones.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: init_static => process_library_init_static
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_init_static (lib, basename)

      lib%static = .true.
      call msg_message ("Static process library '" // char (basename) &
            // "': initialized")
    end subroutine process_library_init_static
```

The `configure` procedure scans the allocated entries in the process definition list. The configuration proceeds in three passes.

In the first pass, we scan the process definition list and count the number of process components and the number of components which need external code. This is used to allocate the `entry` array.

In the second pass, we initialize the `entry` elements which connect process definitions, process driver objects, and external code.

In the third pass, we initialize the library driver object, allocating an entry for each external matrix element.

NOTE: Currently we handle only `initial` process components; `extra` components are ignored.

Compute the MD5 sum. We concatenate the individual MD5 sums of all processes (which, in turn, are derived from the MD5 sums of their components) and compute the MD5 sum of that.

This should be executed *after* configuration, where the driver was initialized, since otherwise the MD5 sum stored in the driver would be overwritten.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: compute_md5sum => process_library_compute_md5sum
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_compute_md5sum (lib)
      class(process_library_t), intent(inout) :: lib
      type(process_def_entry_t), pointer :: def_entry
      type(string_t) :: buffer
      buffer = lib%basename

   end if
 end subroutine process_library_write_driver
```

Update the compilation status of an external library.

Strictly speaking, this is not necessary for a one-time run, since the individual library methods will update the status themselves. However, it allows us to identify compilation steps that we can skip because the file exists or is already loaded, for the whole library or for particular entries.

Independently, the building process is controlled by a makefile. Thus, previous files are reused if they are not modified by the current compilation.

1. If it is not already loaded, attempt to load the library. If successful, check the overall MD5 sum. If it matches, just keep it loaded and mark as ACTIVE. If not, check the MD5 sum for all linked process components. Where it matches, mark the entry as COMPILED. Then, unload the library and mark as CONFIGURED.

   Thus, we can identify compiled files for all matrix elements which are accessible via the previous compiled library, even if it is no longer up to date.

2. If the library is now in CONFIGURED state, look for valid source files. Each entry that is just in CONFIGURED state will advance to SOURCE if the MD5 sum matches. Finally, advance the whole library to SOURCE if all entries are at least in this condition.

            end if
        end select
    end if
  end subroutine process_library_update_status
```

This procedure triggers code generation for all processes where this is possible.

We generate code only for external processes of status `STAT_CONFIGURED`, which then advance to `STAT_SOURCE`. If, for a particular process, the status is already advanced, we do not remove previous files, so `make` will consider them as up to date if they exist. Otherwise, we remove those files to force a fresh `make`.

Finally, if any source code has been generated, we need a driver file.

⟨*Process libraries: procedures*⟩+≡
```
      subroutine process_library_make_link (lib, os_data, keep_old_source)
        class(process_library_t), intent(inout) :: lib
        type(os_data_t), intent(in) :: os_data
        logical, intent(in), optional :: keep_old_source
        if (lib%external .and. .not. lib%static) then
           select case (lib%status)
           case (STAT_CONFIGURED:STAT_SOURCE)
              call lib%make_compile (os_data, keep_old_source)
           end select
           if (signal_is_pending ())  return
           select case (lib%status)
           case (STAT_COMPILED)
              call msg_message ("Process library '" // char (lib%basename) &
                   // "': linking")
              call lib%driver%make_link (os_data)
              lib%entry%status = STAT_LINKED
              lib%status = STAT_LINKED
           end select
        end if
      end subroutine process_library_make_link
```

Load the process library, i.e., assign pointers to the library functions.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: load => process_library_load
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_load (lib, os_data, keep_old_source)
      class(process_library_t), intent(inout) :: lib
      type(os_data_t), intent(in) :: os_data
      logical, intent(in), optional :: keep_old_source
      select case (lib%status)
      case (STAT_CONFIGURED:STAT_COMPILED)
         call lib%make_link (os_data, keep_old_source)
      end select
      if (signal_is_pending ())  return
      select case (lib%status)
      case (STAT_LINKED)
         if (lib%external) then
            call msg_message ("Process library '" // char (lib%basename) &
                 // "': loading")
            call lib%driver%load (os_data)
            call lib%load_entries ()
         end if
         lib%entry%status = STAT_ACTIVE
         lib%status = STAT_ACTIVE
      end select
    end subroutine process_library_load
```

This is the actual loading part for the process methods.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: load_entries => process_library_load_entries
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_load_entries (lib)
      class(process_library_t), intent(inout) :: lib
      integer :: i
      do i = 1, size (lib%entry)
         associate (entry => lib%entry(i))
           if (entry%i_external /= 0) then
              call entry%connect (lib%driver, entry%i_external)
           end if
         end associate
      end do
    end subroutine process_library_load_entries
```

Unload the library, if possible. This reverts the status to "linked".

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: unload => process_library_unload
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_unload (lib)
      class(process_library_t), intent(inout) :: lib
      select case (lib%status)
      case (STAT_ACTIVE)
         if (lib%external) then
```

```
            call msg_message ("Process library '" // char (lib%basename) &
                  // "': unloading")
            call lib%driver%unload ()
         end if
         lib%entry%status = STAT_LINKED
         lib%status = STAT_LINKED
      end select
    end subroutine process_library_unload
```

Unload, clean all generated files and revert the library status. If `distclean` is set, also remove the makefile and the driver source.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: clean => process_library_clean
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_clean (lib, os_data, distclean)
      class(process_library_t), intent(inout) :: lib
      type(os_data_t), intent(in) :: os_data
      logical, intent(in) :: distclean
      call lib%unload ()
      if (lib%external .and. .not. lib%static) then
         call msg_message ("Process library '" // char (lib%basename) &
               // "': removing old files")
         if (distclean) then
            call lib%driver%distclean (os_data)
         else
            call lib%driver%clean (os_data)
         end if
      end if
      where (lib%entry%i_external /= 0)
         lib%entry%status = STAT_CONFIGURED
      elsewhere
         lib%entry%status = STAT_LINKED
      end where
      if (lib%external) then
         lib%status = STAT_CONFIGURED
      else
         lib%status = STAT_LINKED
      end if
    end subroutine process_library_clean
```

Unload and clean the compiled library and all generated object files, so force a recompilation.

⟨*XXX Process libraries: process library: TBP*⟩≡
```
    procedure :: clean_objects => process_library_clean_objects
```

⟨*XXX Process libraries: procedures*⟩≡
```
    subroutine process_library_clean_objects (lib, os_data)
      class(process_library_t), intent(inout) :: lib
      type(os_data_t), intent(in) :: os_data
      call lib%unload ()
      if (lib%external .and. .not. lib%static) then
         call msg_message ("Process library '" // char (lib%basename) &
               // "': removing compiled objects")
```

```
      call lib%driver%clean_library (os_data)
      call lib%driver%clean_objects (os_data)
   end if
   where (lib%entry%i_external /= 0)
      lib%entry%status = STAT_CONFIGURED
   elsewhere
      lib%entry%status = STAT_LINKED
   end where
   if (lib%external) then
      lib%status = STAT_CONFIGURED
   else
      lib%status = STAT_LINKED
   end if
end subroutine process_library_clean_objects
```

Unload and revert the library status to INITIAL. This allows for appending new processes. No files are deleted.

⟨*Process libraries: process library: TBP*⟩+≡
```
   procedure :: open => process_library_open
```

⟨*Process libraries: procedures*⟩+≡
```
subroutine process_library_open (lib)
  class(process_library_t), intent(inout) :: lib
  select case (lib%status)
  case (STAT_OPEN)
  case default
     call lib%unload ()
     if (.not. lib%static) then
        lib%entry%status = STAT_OPEN
        lib%status = STAT_OPEN
        call msg_message ("Process library '" // char (lib%basename) &
             // "': open")
     else
        call msg_error ("Static process library '" // char (lib%basename) &
             // "': processes can't be appended")
     end if
  end select
end subroutine process_library_open
```

14.4.4 Use the library

Return the base name of the library

⟨*Process libraries: process library: TBP*⟩+≡
```
   procedure :: get_name => process_library_get_name
```

⟨*Process libraries: procedures*⟩+≡
```
function process_library_get_name (lib) result (name)
  class(process_library_t), intent(in) :: lib
  type(string_t) :: name
  name = lib%basename
end function process_library_get_name
```

Once activated, we view the process library object as an interface for accessing the matrix elements.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: is_active => process_library_is_active
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_is_active (lib) result (flag)
      logical :: flag
      class(process_library_t), intent(in) :: lib
      flag = lib%status == STAT_ACTIVE
    end function process_library_is_active
```

Retrieve constants using the process library driver. We assume that the process code has been loaded, if external.

⟨*Process libraries: process library entry: TBP*⟩+≡
```
    procedure :: fill_constants => process_library_entry_fill_constants
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_entry_fill_constants (entry, driver, data)
      class(process_library_entry_t), intent(in) :: entry
      class(prclib_driver_t), intent(in) :: driver
      type(process_constants_t), intent(out) :: data
      integer :: i
      if (entry%i_external /= 0) then
         i = entry%i_external
         data%id          = driver%get_process_id (i)
         data%model_name = driver%get_model_name (i)
         data%md5sum      = driver%get_md5sum (i)
         data%openmp_supported = driver%get_openmp_status (i)
         data%n_in  = driver%get_n_in  (i)
         data%n_out = driver%get_n_out (i)
         data%n_flv = driver%get_n_flv (i)
         data%n_hel = driver%get_n_hel (i)
         data%n_col = driver%get_n_col (i)
         data%n_cin = driver%get_n_cin (i)
         data%n_cf  = driver%get_n_cf  (i)
         call driver%set_flv_state (i, data%flv_state)
         call driver%set_hel_state (i, data%hel_state)
         call driver%set_col_state (i, data%col_state, data%ghost_flag)
         call driver%set_color_factors (i, data%color_factors, data%cf_index)
      else
         select type (proc_driver => entry%driver)
         class is (process_driver_internal_t)
            call proc_driver%fill_constants (data)
         end select
      end if
    end subroutine process_library_entry_fill_constants
```

Retrieve the constants and a connected driver for a process, identified by a process ID and a subprocess index. We scan the process entries until we have found a match.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: connect_process => process_library_connect_process
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_connect_process &
        (lib, id, i_component, data, proc_driver)
      class(process_library_t), intent(in) :: Lib
      type(string_t), intent(in) :: id
      integer, intent(in) :: i_component
      type(process_constants_t), intent(out) :: data
      class(prc_core_driver_t), allocatable, intent(out) :: proc_driver
      integer :: i
      do i = 1, size (lib%entry)
         associate (entry => lib%entry(i))
           if (entry%def%id == id .and. entry%i_component == i_component) then
              call entry%fill_constants (lib%driver, data)
              allocate (proc_driver, source=entry%driver)
              return
           end if
         end associate
      end do
      call msg_fatal ("Process library '" // char (lib%basename) &
                // "': process '" // char (id) // "' not found")
    end subroutine process_library_connect_process
```

14.4.5 Collect model-specific libraries

This returns appropriate linker flags for the model parameter libraries that are
used by the generated matrix element. At the end, the main libwhizard is
appended (again), because functions from that may be reqired.

Extra models in the local user space need to be treated individually.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: get_modellibs_ldflags => process_library_get_modellibs_ldflags
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_get_modellibs_ldflags (prc_lib, os_data) result (flags)
      class(process_library_t), intent(in) :: prc_lib
      type(os_data_t), intent(in) :: os_data
      type(string_t) :: flags
      type(string_t), dimension(:), allocatable :: models
      type(string_t) :: modelname, modellib, modellib_full
      logical :: exist
      integer :: i, j, mi
      flags = " -lomega"
      if ((.not. os_data%use_testfiles) .and. &
               os_dir_exist (os_data%whizard_models_libpath_local)) &
                 flags = flags // " -L" // os_data%whizard_models_libpath_local
      flags = flags // " -L" // os_data%whizard_models_libpath
      allocate (models(prc_lib%n_entries + 1))
      models = ""
      mi = 1
      if (allocated (prc_lib%entry)) then
         SCAN: do i = 1, prc_lib%n_entries
            if (associated (prc_lib%entry(i)%def)) then
               if (associated (prc_lib%entry(i)%def%model)) then
                  modelname = model_get_name (prc_lib%entry(i)%def%model)
```

1868

```
                else
                    cycle SCAN
                end if
            else
                cycle SCAN
            end if
            do j = 1, mi
                if (models(mi) == modelname) cycle SCAN
            end do
            models(mi) = modelname
            mi = mi + 1
            if (os_data%use_libtool) then
                modellib = "libparameters_" // modelname // ".la"
            else
                modellib = "libparameters_" // modelname // ".a"
            end if
            exist = .false.
            if (.not. os_data%use_testfiles) then
                modellib_full = os_data%whizard_models_libpath_local &
                        // "/" // modellib
                inquire (file=char (modellib_full), exist=exist)
            end if
            if (.not. exist) then
                modellib_full = os_data%whizard_models_libpath &
                        // "/" // modellib
                inquire (file=char (modellib_full), exist=exist)
            end if
            if (exist) flags = flags // " -lparameters_" // modelname
        end do SCAN
    end if
    deallocate (models)
    flags = flags // " -lwhizard"
end function process_library_get_modellibs_ldflags
```

14.4.6 Test

This is the master for calling self-test procedures.

⟨*Process libraries: public*⟩+≡
```
    public :: process_libraries_test
```

⟨*Process libraries: tests*⟩≡
```
    subroutine process_libraries_test (u, results)
        integer, intent(in) :: u
        type(test_results_t), intent(inout) :: results
```
⟨*Process libraries: execute tests*⟩
```
    end subroutine process_libraries_test
```

Empty process list

Test 1: Write an empty process list.

⟨*Process libraries: execute tests*⟩≡

```
    call test (process_libraries_1, "process_libraries_1", &
        "empty process list", &
        u, results)
```

⟨Process libraries: tests⟩+≡
```
    subroutine process_libraries_1 (u)
      integer, intent(in) :: u
      type(process_def_list_t) :: process_def_list

      write (u, "(A)")  "* Test output: process_libraries_1"
      write (u, "(A)")  "*   Purpose: Display an empty process definition list"
      write (u, "(A)")

      call process_def_list%write (u)

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: process_libraries_1"
    end subroutine process_libraries_1
```

Process definition list

Test 2: Process definition list with processes and components. Construct the list, write to file, read it in again, and display. Finalize and delete the list after use.

We define a trivial 'test' type for the process variant. The test type contains just one (meaningless) data item, which is an integer.

⟨Process libraries: test declarations⟩≡
```
    type, extends (prc_core_def_t) :: prcdef_2_t
      integer :: data = 0
      logical :: file = .false.
     contains
     ⟨Process libraries: prcdef 2: TBP⟩
    end type prcdef_2_t
```

The process variant is named 'test'.

⟨Process libraries: prcdef 2: TBP⟩≡
```
    procedure, nopass :: type_string => prcdef_2_type_string
```

⟨Process libraries: tests⟩+≡
```
    function prcdef_2_type_string () result (string)
      type(string_t) :: string
      string = "test"
    end function prcdef_2_type_string
```

Write the contents (the integer value).

⟨Process libraries: prcdef 2: TBP⟩+≡
```
    procedure :: write => prcdef_2_write
```

⟨Process libraries: tests⟩+≡
```
    subroutine prcdef_2_write (object, unit)
      class(prcdef_2_t), intent(in) :: object
      integer, intent(in) :: unit
```

```
      write (unit, "(3x,A,I0)")  "Test data          = ", object%data
    end subroutine prcdef_2_write
```

Recover the integer value.

⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure :: read => prcdef_2_read
```

⟨*Process libraries: tests*⟩+≡
```
    subroutine prcdef_2_read (object, unit)
      class(prcdef_2_t), intent(out) :: object
      integer, intent(in) :: unit
      character(80) :: buffer
      read (unit, "(A)")  buffer
      call strip_prefix (buffer)
      read (buffer, *)  object%data
    end subroutine prcdef_2_read
```

No external procedures.

⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure, nopass :: get_features => prcdef_2_get_features
```

⟨*Process libraries: tests*⟩+≡
```
    subroutine prcdef_2_get_features (features)
      type(string_t), dimension(:), allocatable, intent(out) :: features
      allocate (features (0))
    end subroutine prcdef_2_get_features
```

No code generated.

⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure :: generate_code => prcdef_2_generate_code
```

⟨*Process libraries: tests*⟩+≡
```
    subroutine prcdef_2_generate_code (object, &
         basename, model_name, prt_in, prt_out)
      class(prcdef_2_t), intent(in) :: object
      type(string_t), intent(in) :: basename
      type(string_t), intent(in) :: model_name
      type(string_t), dimension(:), intent(in) :: prt_in
      type(string_t), dimension(:), intent(in) :: prt_out
    end subroutine prcdef_2_generate_code
```

Allocate the driver with the appropriate type.

⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure :: allocate_driver => prcdef_2_allocate_driver
```

⟨*Process libraries: tests*⟩+≡
```
    subroutine prcdef_2_allocate_driver (object, driver, basename)
      class(prcdef_2_t), intent(in) :: object
      class(prc_core_driver_t), intent(out), allocatable :: driver
      type(string_t), intent(in) :: basename
      allocate (prctest_2_t :: driver)
    end subroutine prcdef_2_allocate_driver
```

Nothing to connect.

⟨Process libraries: prcdef 2: TBP⟩+≡
```
procedure :: connect => prcdef_2_connect
```

⟨Process libraries: tests⟩+≡
```
subroutine prcdef_2_connect (def, lib_driver, i, proc_driver)
  class(prcdef_2_t), intent(in) :: def
  class(prclib_driver_t), intent(in) :: lib_driver
  integer, intent(in) :: i
  class(prc_core_driver_t), intent(inout) :: proc_driver
end subroutine prcdef_2_connect
```

The associated driver type.

⟨Process libraries: types⟩+≡
```
type, extends (process_driver_internal_t) :: prctest_2_t
 contains
 ⟨Process libraries: prctest 2: TBP⟩
end type prctest_2_t
```

Return the type name.

⟨Process libraries: prctest 2: TBP⟩≡
```
procedure, nopass :: type_name => prctest_2_type_name
```

⟨Process libraries: procedures⟩+≡
```
function prctest_2_type_name () result (type)
  type(string_t) :: type
  type = "test"
end function prctest_2_type_name
```

This should fill constant process data. We do not check those here, however, therefore nothing done.

⟨Process libraries: prctest 2: TBP⟩+≡
```
procedure :: fill_constants => prctest_2_fill_constants
```

⟨Process libraries: procedures⟩+≡
```
subroutine prctest_2_fill_constants (driver, data)
  class(prctest_2_t), intent(in) :: driver
  type(process_constants_t), intent(out) :: data
end subroutine prctest_2_fill_constants
```

Here is the actual test.

For reading, we need a list of templates, i.e., an array containing allocated objects for all available process variants. This is the purpose of `process_core_templates`. Here, we have only a single template for the 'test' variant.

⟨Process libraries: execute tests⟩+≡
```
call test (process_libraries_2, "process_libraries_2", &
     "process definition list", &
     u, results)
```

⟨*Process libraries: tests*⟩+≡

```
    subroutine process_libraries_2 (u)
      integer, intent(in) :: u
      type(prc_template_t), dimension(:), allocatable :: process_core_templates
      type(process_def_list_t) :: process_def_list
      type(process_def_entry_t), pointer :: entry => null ()
      class(prc_core_def_t), allocatable :: test_def
      integer :: scratch_unit

      write (u, "(A)")  "* Test output: process_libraries_2"
      write (u, "(A)")  "* Purpose: Construct a process definition list,"
      write (u, "(A)")  "*          write it to file and reread it"

```

```
      write (u, "(A)")
      write (u, "(A)")   "* Test output end: process_libraries_4"
   end subroutine process_libraries_4
```

Build workflow for test matrix element

Test 5: We write source code for a dummy process.

We define another trivial type for the process variant. The test type contains just no variable data, but produces code on file.

⟨*Process libraries: test declarations*⟩+≡
```
   type, extends (prc_core_def_t) :: prcdef_5_t
    contains
    ⟨Process libraries: prcdef 5: TBP⟩
   end type prcdef_5_t
```

The process variant is named `test_file`.

⟨*Process libraries: prcdef 5: TBP*⟩≡
```
   procedure, nopass :: type_string => prcdef_5_type_string
```

⟨*Process libraries: tests*⟩+≡
```
   function prcdef_5_type_string () result (string)
     type(string_t) :: string
     string = "test_file"
   end function prcdef_5_type_string
```

We reuse the writer `test_writer_4` from the previous module.

⟨*Process libraries: prcdef 5: TBP*⟩+≡
```
   procedure :: init => prcdef_5_init
```

⟨*Process libraries: tests*⟩+≡
```
   subroutine prcdef_5_init (object)
     class(prcdef_5_t), intent(out) :: object
     allocate (test_writer_4_t :: object%writer)
   end subroutine prcdef_5_init
```

Nothing to write.

⟨*Process libraries: prcdef 5: TBP*⟩+≡
```
   procedure :: write => prcdef_5_write
```

⟨*Process libraries: tests*⟩+≡
```
   subroutine prcdef_5_write (object, unit)
     class(prcdef_5_t), intent(in) :: object
     integer, intent(in) :: unit
   end subroutine prcdef_5_write
```

Nothing to read.

⟨*Process libraries: prcdef 5: TBP*⟩+≡
```
   procedure :: read => prcdef_5_read
```

⟨*Process libraries: tests*⟩+≡
```
    subroutine prcdef_5_read (object, unit)
      class(prcdef_5_t), intent(out) :: object
      integer, intent(in) :: unit
    end subroutine prcdef_5_read
```

Allocate the driver with the appropriate type.
⟨*Process libraries: prcdef 5: TBP*⟩+≡
```
    procedure :: allocate_driver => prcdef_5_allocate_driver
```

⟨*Process libraries: tests*⟩+≡
```
    subroutine prcdef_5_allocate_driver (object, driver, basename)
      class(prcdef_5_t), intent(in) :: object
      class(prc_core_driver_t), intent(out), allocatable :: driver
      type(string_t), intent(in) :: basename
      allocate (prctest_5_t :: driver)
    end subroutine prcdef_5_allocate_driver
```

This time we need code:
⟨*Process libraries: prcdef 5: TBP*⟩+≡
```
    procedure, nopass :: needs_code => prcdef_5_needs_code
```

⟨*Process libraries: tests*⟩+≡
```
    function prcdef_5_needs_code () result (flag)
      logical :: flag
      flag = .true.
    end function prcdef_5_needs_code
```

For the test case, we implement a single feature `proc1`.
⟨*Process libraries: prcdef 5: TBP*⟩+≡
```
    procedure, nopass :: get_features => prcdef_5_get_features
```

⟨*Process libraries: tests*⟩+≡
```
    subroutine prcdef_5_get_features (features)
      type(string_t), dimension(:), allocatable, intent(out) :: features
      allocate (features (1))
      features = [ var_str ("proc1") ]
    end subroutine prcdef_5_get_features
```

Nothing to connect.
⟨*Process libraries: prcdef 5: TBP*⟩+≡
```
    procedure :: connect => prcdef_5_connect
```

⟨*Process libraries: tests*⟩+≡
```
    subroutine prcdef_5_connect (def, lib_driver, i, proc_driver)
      class(prcdef_5_t), intent(in) :: def
      class(prclib_driver_t), intent(in) :: lib_driver
      integer, intent(in) :: i
      class(prc_core_driver_t), intent(inout) :: proc_driver
    end subroutine prcdef_5_connect
```

The driver type.

⟨*Process libraries: types*⟩+≡
```
type, extends (prc_core_driver_t) :: prctest_5_t
 contains
 ⟨Process libraries: prctest 5: TBP⟩
end type prctest_5_t
```

Return the type name.

⟨*Process libraries: prctest 5: TBP*⟩≡
```
procedure, nopass :: type_name => prctest_5_type_name
```

⟨*Process libraries: tests*⟩+≡
```
function prctest_5_type_name () result (type)
  type(string_t) :: type
  type = "test_file"
end function prctest_5_type_name
```

Here is the actual test:

⟨*Process libraries: execute tests*⟩+≡
```
call test (process_libraries_5, "process_libraries_5", &
     "build external process library", &
     u, results)
```

⟨*Process libraries: tests*⟩+≡
```
subroutine process_libraries_5 (u)
  integer, intent(in) :: u
  type(process_library_t) :: lib
  type(process_def_entry_t), pointer :: entry
  class(prc_core_def_t), allocatable :: core_def
  type(os_data_t) :: os_data

  write (u, "(A)")  "* Test output: process_libraries_5"
  write (u, "(A)")  "* Purpose: build a process library with an &
       &external (pseudo) matrix element"

  write (u, "(A)")
  call lib%make_link (os_data)

  call lib%write (u, libpath = .false.)

  call lib%final ()

  write (u, "(A)")
  write (u, "(A)")  "* Test output end: process_libraries_5"
end subroutine process_libraries_5
```

Build and load library with test matrix element

Test 6: We write source code for a dummy process.

This process variant is identical to the previous case, but it supports a driver for the test procedure 'proc1'.

⟨*Process libraries: test declarations*⟩+≡
```
    type, extends (prc_core_def_t) :: prcdef_6_t
     contains
     ⟨Process libraries: prcdef 6: TBP⟩
    end type prcdef_6_t
```

The process variant is named `test_file`.

⟨Process libraries: prcdef 6: TBP⟩≡
```
procedure, nopass :: type_string => prcdef_6_type_string
```

⟨Process libraries: tests⟩+≡
```
function prcdef_6_type_string () result (string)
  type(string_t) :: string
  string = "test_file"
end function prcdef_6_type_string
```

We reuse the writer `test_writer_4` from the previous module.

⟨Process libraries: prcdef 6: TBP⟩+≡
```
procedure :: init => prcdef_6_init
```

⟨Process libraries: tests⟩+≡
```
subroutine prcdef_6_init (object)
  class(prcdef_6_t), intent(out) :: object
  allocate (test_writer_4_t :: object%writer)
  call object%writer%init_test ()
end subroutine prcdef_6_init
```

Nothing to write.

⟨Process libraries: prcdef 6: TBP⟩+≡
```
procedure :: write => prcdef_6_write
```

⟨Process libraries: tests⟩+≡
```
subroutine prcdef_6_write (object, unit)
  class(prcdef_6_t), intent(in) :: object
  integer, intent(in) :: unit
end subroutine prcdef_6_write
```

Nothing to read.

⟨Process libraries: prcdef 6: TBP⟩+≡
```
procedure :: read => prcdef_6_read
```

⟨Process libraries: tests⟩+≡
```
subroutine prcdef_6_read (object, unit)
  class(prcdef_6_t), intent(out) :: object
  integer, intent(in) :: unit
end subroutine prcdef_6_read
```

Allocate the driver with the appropriate type.

⟨Process libraries: prcdef 6: TBP⟩+≡
```
procedure :: allocate_driver => prcdef_6_allocate_driver
```

⟨Process libraries: tests⟩+≡
```
subroutine prcdef_6_allocate_driver (object, driver, basename)
  class(prcdef_6_t), intent(in) :: object
  class(prc_core_driver_t), intent(out), allocatable :: driver
  type(string_t), intent(in) :: basename
  allocate (prctest_6_t :: driver)
end subroutine prcdef_6_allocate_driver
```

This time we need code:

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
procedure, nopass :: needs_code => prcdef_6_needs_code
```

⟨*Process libraries: tests*⟩+≡
```
function prcdef_6_needs_code () result (flag)
  logical :: flag
  flag = .true.
end function prcdef_6_needs_code
```

For the test case, we implement a single feature `proc1`.

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
procedure, nopass :: get_features => prcdef_6_get_features
```

⟨*Process libraries: tests*⟩+≡
```
subroutine prcdef_6_get_features (features)
  type(string_t), dimension(:), allocatable, intent(out) :: features
  allocate (features (1))
  features = [ var_str ("proc1") ]
end subroutine prcdef_6_get_features
```

The interface of the only specific feature.

⟨*Process libraries: interfaces*⟩≡
```
abstract interface
  subroutine proc1_t (n) bind(C)
    import
    integer(c_int), intent(out) :: n
  end subroutine proc1_t
end interface
```

Connect the feature `proc1` with the process driver.

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
procedure :: connect => prcdef_6_connect
```

⟨*Process libraries: tests*⟩+≡
```
subroutine prcdef_6_connect (def, lib_driver, i, proc_driver)
  class(prcdef_6_t), intent(in) :: def
  class(prclib_driver_t), intent(in) :: lib_driver
  integer, intent(in) :: i
  class(prc_core_driver_t), intent(inout) :: proc_driver
  integer(c_int) :: pid, fid
  type(c_funptr) :: fptr
  select type (proc_driver)
  type is  (prctest_6_t)
    pid = i
    fid = 1
    call lib_driver%get_fptr (pid, fid, fptr)
    call c_f_procpointer (fptr, proc_driver%proc1)
  end select
end subroutine prcdef_6_connect
```

The driver type.

⟨*Process libraries: types*⟩+≡
```
type, extends (prc_core_driver_t) :: prctest_6_t
  procedure(proc1_t), nopass, pointer :: proc1 => null ()
 contains
 ⟨Process libraries: prctest 6: TBP⟩
 end type prctest_6_t
```

Return the type name.

⟨*Process libraries: prctest 6: TBP*⟩≡
```
procedure, nopass :: type_name => prctest_6_type_name
```

⟨*Process libraries: tests*⟩+≡
```

14.5   Process Library Stacks

For storing and handling multiple libraries, we define process library stacks.
These are ordinary stacks where new entries are pushed onto the top.

⟨prclib_stacks.f90⟩≡
  ⟨*File header*⟩

```
  module prclib_stacks
```

  ⟨*Use strings*⟩
  ⟨*Use file utils*⟩
```
    use unit_tests
    use os_interface
    use models

    use process_libraries
```

  ⟨*Standard module head*⟩

  ⟨*Prclib stacks: public*⟩

  ⟨*Prclib stacks: types*⟩

```
  contains
```

  ⟨*Prclib stacks: procedures*⟩

  ⟨*Prclib stacks: tests*⟩

```
  end module prclib_stacks
```

14.5.1 The stack entry type

A stack entry is a process library object, augmented by a pointer to the next entry. We do not need specific methods, all relevant methods are inherited.

On higher level, process libraries should be prepared as process entry objects.

⟨*Prclib stacks: public*⟩≡
```
    public :: prclib_entry_t
```

⟨*Prclib stacks: types*⟩≡
```
    type, extends (process_library_t) :: prclib_entry_t
       type(prclib_entry_t), pointer :: next => null ()
    end type prclib_entry_t
```

14.5.2 The prclib stack type

For easy conversion and lookup it is useful to store the filling number in the object. The content is stored as a linked list.

⟨*Prclib stacks: public*⟩+≡
```
    public :: prclib_stack_t
```

⟨*Prclib stacks: types*⟩+≡
```
    type :: prclib_stack_t
       integer :: n = 0
       type(prclib_entry_t), pointer :: first => null ()
     contains
     ⟨Prclib stacks: prclib stack: TBP⟩
    end type prclib_stack_t
```

Finalizer. Iteratively deallocate the stack entries. The resulting empty stack can be immediately recycled, if necessary.

⟨*Prclib stacks: prclib stack: TBP*⟩≡
```
    procedure :: final => prclib_stack_final
```

⟨*Prclib stacks: procedures*⟩≡
```
    subroutine prclib_stack_final (object)
      class(prclib_stack_t), intent(inout) :: object
      type(prclib_entry_t), pointer :: lib
      do while (associated (object%first))
         lib => object%first
         object%first => lib%next
         call lib%final ()
         deallocate (lib)
      end do
      object%n = 0
    end subroutine prclib_stack_final
```

Output. The entries on the stack will be ordered LIFO, i.e., backwards.

⟨*Prclib stacks: prclib stack: TBP*⟩+≡
```
    procedure :: write => prclib_stack_write
```

⟨Prclib stacks: procedures⟩+≡

```
    subroutine prclib_stack_write (object, unit, libpath)
      class(prclib_stack_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: libpath
      type(prclib_entry_t), pointer :: lib
      integer :: u
      u = output_unit (unit)
      call write_separator_double (u)
      select case (object%n)
      case (0)
        write (u, "(1x,A)")  "Process library stack: [empty]"
      case default
        write (u, "(1x,A)")  "Process library stack:"
        lib => object%first
        do while (associated (lib))
          call write_separator (u)
          call lib%write (u, libpath)
          lib => lib%next
        end do
      end select
      call write_separator_double (u)
    end subroutine prclib_stack_write
```

14.5.3   Operating on Stacks

We take a library entry pointer and push it onto the stack. The previous pointer
is nullified. Subsequently, the library entry is 'owned' by the stack and will be
finalized when the stack is deleted.

⟨Prclib stacks: prclib stack: TBP⟩+≡

```
    procedure :: push => prclib_stack_push
```

⟨Prclib stacks: procedures⟩+≡

```
    subroutine prclib_stack_push (stack, lib)
      class(prclib_stack_t), intent(inout) :: stack
      type(prclib_entry_t), intent(inout), pointer :: lib
      lib%next => stack%first
      stack%first => lib
      lib => null ()
      stack%n = stack%n + 1
    end subroutine prclib_stack_push
```

14.5.4   Accessing Contents

Return a pointer to the topmost stack element. The result type is just the bare
`process_library_t`. There is no `target` attribute required since the stack
elements are allocated via pointers.

⟨Prclib stacks: prclib stack: TBP⟩+≡

```
    procedure :: get_first_ptr => prclib_stack_get_first_ptr
```

⟨*Prclib stacks: procedures*⟩+≡
```
function prclib_stack_get_first_ptr (stack) result (ptr)
  class(prclib_stack_t), intent(in) :: stack
  type(process_library_t), pointer :: ptr
  ptr => stack%first%process_library_t
end function prclib_stack_get_first_ptr
```

Return a complete list of the libraries (names) in the stack. The list is in the order in which the elements got pushed onto the stack, so the 'first' entry is listed last.

⟨*Prclib stacks: prclib stack: TBP*⟩+≡
```
procedure :: get_names => prclib_stack_get_names
```

⟨*Prclib stacks: procedures*⟩+≡
```
subroutine prclib_stack_get_names (stack, libname)
  class(prclib_stack_t), intent(in) :: stack
  type(string_t), dimension(:), allocatable, intent(out) :: libname
  type(prclib_entry_t), pointer :: lib
  integer :: i
  allocate (libname (stack%n))
  i = stack%n
  lib => stack%first
  do while (associated (lib))
     libname(i) = lib%get_name ()
     i = i - 1
     lib => lib%next
  end do
end subroutine prclib_stack_get_names
```

Return a pointer to the library with given name.

⟨*Prclib stacks: prclib stack: TBP*⟩+≡
```
procedure :: get_library_ptr => prclib_stack_get_library_ptr
```

⟨*Prclib stacks: procedures*⟩+≡
```
function prclib_stack_get_library_ptr (stack, libname) result (ptr)
  class(prclib_stack_t), intent(in) :: stack
  type(string_t), intent(in) :: libname
  type(process_library_t), pointer :: ptr
  type(prclib_entry_t), pointer :: current
  current => stack%first
  do while (associated (current))
     if (current%get_name () == libname) then
        ptr => current%process_library_t
        return
     end if
     current => current%next
  end do
  ptr => null ()
end function prclib_stack_get_library_ptr
```

14.5.5   Unit tests

⟨*Prclib stacks: public*⟩+≡

```
    public :: prclib_stacks_test
```

⟨*Prclib stacks: tests*⟩≡
```
    subroutine prclib_stacks_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
    ⟨Prclib stacks: execute tests⟩
    end subroutine prclib_stacks_test
```

Write an empty process library stack

The most trivial test is to write an uninitialized process library stack.

⟨*Prclib stacks: execute tests*⟩≡
```
    call test (prclib_stacks_1, "prclib_stacks_1", &
        "write an empty process library stack", &
        u, results)
```

⟨*Prclib stacks: tests*⟩+≡
```
    subroutine prclib_stacks_1 (u)
      integer, intent(in) :: u
      type(prclib_stack_t) :: stack

      write (u, "(A)")  "* Test output: prclib_stacks_1"
      write (u, "(A)")  "*   Purpose: display an empty process library stack"
      write (u, "(A)")

      call stack%write (u)

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: prclib_stacks_1"

    end subroutine prclib_stacks_1
```

Fill a process library stack

Fill a process library stack with two (identical) processes.

⟨*Prclib stacks: execute tests*⟩+≡
```
    call test (prclib_stacks_2, "prclib_stacks_2", &
        "fill a process library stack", &
        u, results)
```

⟨*Prclib stacks: tests*⟩+≡
```
    subroutine prclib_stacks_2 (u)
      integer, intent(in) :: u
      type(prclib_stack_t) :: stack
      type(prclib_entry_t), pointer :: lib

      write (u, "(A)")  "* Test output: prclib_stacks_2"
      write (u, "(A)")  "*   Purpose: fill a process library stack"
      write (u, "(A)")

      write (u, "(A)")  "* Initialize two (empty) libraries &
```

```
         &and push them on the stack"
    write (u, "(A)")

    allocate (lib)
    call lib%init (var_str ("lib1"))
    call stack%push (lib)

    allocate (lib)
    call lib%init (var_str ("lib2"))
    call stack%push (lib)

    call stack%write (u)

    write (u, "(A)")
    write (u, "(A)")  "* Cleanup"

    call stack%final ()

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: prclib_stacks_2"

  end subroutine prclib_stacks_2
```

14.6   Trivial matrix element for tests

For the purpose of testing the workflow, we implement here two matrix elements
with the simplest possible structure.

   This matrix element generator can only generate a single scattering process
and a single decay process. The scattering process is a quartic interaction of
a massless, neutral and colorless scalar **s** with unit coupling results in a trivial
$2 \to 2$ scattering process. The matrix element is implemented internally, so we
do not need the machinery of external process libraries. The decay process is a
decay of **s** into a pair of colored fermions **f**.

⟨prc_test.f90⟩≡
  ⟨*File header*⟩

```
  module prc_test

    use iso_c_binding !NODEP!
    use kinds !NODEP!
⟨Use strings⟩
    use unit_tests
    use os_interface

    use process_constants
    use prclib_interfaces
    use prc_core_def
    use particle_specifiers
    use process_libraries
```

  ⟨*Standard module head*⟩

⟨*Test ME: public*⟩

⟨*Test ME: types*⟩

```
contains
```

⟨*Test ME: procedures*⟩

⟨*Test ME: tests*⟩

```
end module prc_test
```

14.6.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

⟨*Test ME: public*⟩≡
```
public :: prc_test_def_t
```

⟨*Test ME: types*⟩≡
```
type, extends (prc_core_def_t) :: prc_test_def_t
  type(string_t) :: model_name
  type(string_t), dimension(:), allocatable :: prt_in
  type(string_t), dimension(:), allocatable :: prt_out
 contains
 ⟨Test ME: test me def: TBP⟩
end type prc_test_def_t
```

⟨*Test ME: test me def: TBP*⟩≡
```
procedure, nopass :: type_string => prc_test_def_type_string
```

⟨*Test ME: procedures*⟩≡
```
function prc_test_def_type_string () result (string)
  type(string_t) :: string
  string = "test_me"
end function prc_test_def_type_string
```

There is no 'feature' here since there is no external code.

⟨*Test ME: test me def: TBP*⟩+≡
```
procedure, nopass :: get_features => prc_test_def_get_features
```

⟨*Test ME: procedures*⟩+≡
```
subroutine prc_test_def_get_features (features)
  type(string_t), dimension(:), allocatable, intent(out) :: features
  allocate (features (0))
end subroutine prc_test_def_get_features
```

Initialization: set some data (not really useful).

⟨*Test ME: test me def: TBP*⟩+≡
```
procedure :: init => prc_test_def_init
```

1897

⟨*Test ME: procedures*⟩+≡
```
subroutine prc_test_def_init (object, model_name, prt_in, prt_out)
  class(prc_test_def_t), intent(out) :: object
  type(string_t), intent(in) :: model_name
  type(string_t), dimension(:), intent(in) :: prt_in
  type(string_t), dimension(:), intent(in) :: prt_out
  object%model_name = model_name
  allocate (object%prt_in (size (prt_in)))
  object%prt_in = prt_in
  allocate (object%prt_out (size (prt_out)))
  object%prt_out = prt_out
end subroutine prc_test_def_init
```

Write/read process- and method-specific data. (No-op)

⟨*Test ME: test me def: TBP*⟩+≡
```
procedure :: write => prc_test_def_write
```

⟨*Test ME: procedures*⟩+≡
```
subroutine prc_test_def_write (object, unit)
  class(prc_test_def_t), intent(in) :: object
  integer, intent(in) :: unit
end subroutine prc_test_def_write
```

⟨*Test ME: test me def: TBP*⟩+≡
```
procedure :: read => prc_test_def_read
```

⟨*Test ME: procedures*⟩+≡
```
subroutine prc_test_def_read (object, unit)
  class(prc_test_def_t), intent(out) :: object
  integer, intent(in) :: unit
end subroutine prc_test_def_read
```

Allocate the driver for test ME matrix elements. We get the actual component ID (basename), and we can transfer all process-specific data from the process definition.

⟨*Test ME: test me def: TBP*⟩+≡
```
procedure :: allocate_driver => prc_test_def_allocate_driver
```

⟨*Test ME: procedures*⟩+≡
```
subroutine prc_test_def_allocate_driver (object, driver, basename)
  class(prc_test_def_t), intent(in) :: object
  class(prc_core_driver_t), intent(out), allocatable :: driver
  type(string_t), intent(in) :: basename
  allocate (prc_test_t :: driver)
  select type (driver)
  type is (prc_test_t)
     driver%id = basename
     driver%model_name = object%model_name
     select case (size (object%prt_in))
     case (1);  driver%scattering = .false.
     case (2);  driver%scattering = .true.
     end select
  end select
```

```
      end subroutine prc_test_def_allocate_driver
```

Nothing to connect. This subroutine will not be called.

⟨*Test ME: test me def: TBP*⟩+≡
```
    procedure :: connect => prc_test_def_connect
```

⟨*Test ME: procedures*⟩+≡
```
    subroutine prc_test_def_connect (def, lib_driver, i, proc_driver)
      class(prc_test_def_t), intent(in) :: def
      class(prclib_driver_t), intent(in) :: lib_driver
      integer, intent(in) :: i
      class(prc_core_driver_t), intent(inout) :: proc_driver
    end subroutine prc_test_def_connect
```

14.6.2   Driver

⟨*Test ME: public*⟩+≡
```
    public :: prc_test_t
```

⟨*Test ME: types*⟩+≡
```
    type, extends (process_driver_internal_t) :: prc_test_t
      type(string_t) :: id
      type(string_t) :: model_name
      logical :: scattering = .true.
     contains
     ⟨Test ME: test me driver: TBP⟩
    end type prc_test_t
```

In contrast to generic matrix-element implementations, we can hard-wire the amplitude method as a type-bound procedure.

⟨*Test ME: test me driver: TBP*⟩≡
```
    procedure, nopass :: get_amplitude => prc_test_get_amplitude
```

⟨*Test ME: procedures*⟩+≡
```
    function prc_test_get_amplitude (p) result (amp)
      complex(default) :: amp
      real(default), dimension(:,:), intent(in) :: p
      amp = 1
    end function prc_test_get_amplitude
```

The reported type is the same as for the `prc_test_def_t` type.

⟨*Test ME: test me driver: TBP*⟩+≡
```
    procedure, nopass :: type_name => prc_test_type_name
```

⟨*Test ME: procedures*⟩+≡
```
    function prc_test_type_name () result (string)
      type(string_t) :: string
      string = "test_me"
    end function prc_test_type_name
```

Fill process constants.

⟨*Test ME: test me driver: TBP*⟩+≡
```
    procedure :: fill_constants => prc_test_fill_constants
```

⟨Test ME: procedures⟩+≡

```fortran
subroutine prc_test_fill_constants (driver, data)
  class(prc_test_t), intent(in) :: driver
  type(process_constants_t), intent(out) :: data
  data%id = driver%id
  data%model_name = driver%model_name
  if (driver%scattering) then
     data%n_in  = 2
     data%n_out = 2
     data%n_flv = 1
     data%n_hel = 1
     data%n_col = 1
     data%n_cin = 2
     data%n_cf  = 1
     allocate (data%flv_state (4, 1))
     data%flv_state = 25
     allocate (data%hel_state (4, 1))
     data%hel_state = 0
     allocate (data%col_state (2, 4, 1))
     data%col_state = 0
     allocate (data%ghost_flag (4, 1))
     data%ghost_flag = .false.
     allocate (data%color_factors (1))
     data%color_factors = 1
     allocate (data%cf_index (2, 1))
     data%cf_index = 1
  else
     data%n_in  = 1
     data%n_out = 2
     data%n_flv = 1
     data%n_hel = 2
     data%n_col = 1
     data%n_cin = 2
     data%n_cf  = 1
     allocate (data%flv_state (3, 1))
     data%flv_state(:,1) = [25, 6, -6]
     allocate (data%hel_state (3, 2))
     data%hel_state(:,1) = [0, 1,-1]
     data%hel_state(:,2) = [0,-1, 1]
     allocate (data%col_state (2, 3, 1))
     data%col_state = reshape ([0,0, 1,0, 0,-1], [2,3,1])
     allocate (data%ghost_flag (3, 1))
     data%ghost_flag = .false.
     allocate (data%color_factors (1))
     data%color_factors = 3
     allocate (data%cf_index (2, 1))
     data%cf_index = 1
  end if
end subroutine prc_test_fill_constants
```

14.6.3 Shortcut

Since this module is there for testing purposes, we set up a subroutine that does all the work at once: create a library with the two processes (scattering and decay), configure and load, and set up the driver.

⟨*Test ME: public*⟩+≡
```
    public :: prc_test_create_library
```

⟨*Test ME: procedures*⟩+≡
```
    subroutine prc_test_create_library &
        (libname, lib, scattering, decay, procname1, procname2)
      type(string_t), intent(in) :: libname
      type(process_library_t), intent(out) :: lib
      logical, intent(in), optional :: scattering, decay
      type(string_t), intent(in), optional :: procname1, procname2
      type(string_t) :: model_name, procname
      type(string_t), dimension(:), allocatable :: prt_in, prt_out
      class(prc_core_def_t), allocatable :: def
      type(process_def_entry_t), pointer :: entry
      type(os_data_t) :: os_data
      logical :: sca, dec
      sca = .true.;   if (present (scattering))  sca = scattering
      dec = .false.;  if (present (decay))       dec = decay

      call os_data_init (os_data)
      call lib%init (libname)
      model_name = "Test"

      if (sca) then
         if (present (procname1)) then
            procname = procname1
         else
            procname = libname
         end if
         allocate (prt_in (2), prt_out (2))
         prt_in  = [var_str ("s"), var_str ("s")]
         prt_out = [var_str ("s"), var_str ("s")]
         allocate (prc_test_def_t :: def)
         select type (def)
         type is (prc_test_def_t)
            call def%init (model_name, prt_in, prt_out)
         end select
         allocate (entry)
         call entry%init (procname, model_name = model_name, &
              n_in = 2, n_components = 1)
         call entry%import_component (1, n_out = size (prt_out), &
              prt_in  = new_prt_spec (prt_in), &
              prt_out = new_prt_spec (prt_out), &
              method  = var_str ("test_me"), &
              variant = def)
         call lib%append (entry)
      end if

      if (dec) then
         if (present (procname2)) then
```

```
         procname = procname2
      else
         procname = libname
      end if
      if (allocated (prt_in))  deallocate (prt_in, prt_out)
      allocate (prt_in (1), prt_out (2))
      prt_in  = [var_str ("s")]
      prt_out = [var_str ("f"), var_str ("fbar")]
      allocate (prc_test_def_t :: def)
      select type (def)
      type is (prc_test_def_t)
         call def%init (model_name, prt_in, prt_out)
      end select
      allocate (entry)
      call entry%init (procname, model_name = model_name, &
           n_in = 1, n_components = 1)
      call entry%import_component (1, n_out = size (prt_out), &
           prt_in  = new_prt_spec (prt_in), &
           prt_out = new_prt_spec (prt_out), &
           method  = var_str ("test_decay"), &
           variant = def)
      call lib%append (entry)
    end if

    call lib%configure (os_data)
    call lib%load (os_data)
  end subroutine prc_test_create_library
```

14.6.4   Test

This is the master for calling self-test procedures.

⟨*Test ME: public*⟩+≡
```
    public :: prc_test_test
```

⟨*Test ME: tests*⟩≡
```
    subroutine prc_test_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
    ⟨Test ME: execute tests⟩
  end subroutine prc_test_test
```

Generate and load the scattering process

The process is $ss \to ss$, where s is a trivial scalar particle, for vanishing mass and unit coupling. We initialize the process, build the library, and compute the particular matrix element for momenta of unit energy and right-angle scattering. (The scattering is independent of angle.) The matrix element is equal to unity.

⟨*Test ME: execute tests*⟩≡
```
    call test (prc_test_1, "prc_test_1", &
        "build and load trivial process", &
        u, results)
```

⟨Test ME: tests⟩+≡

```

Generate and load the decay process

The process is $s \to f\bar{f}$, where s is a trivial scalar particle and f is a colored fermion. We initialize the process, build the library, and compute the particular matrix element for a fixed momentum configuration. (The decay is independent of angle.) The matrix element is equal to unity.

```

Chapter 15

Integration and Process Objects

This is the central part of the WHIZARD package. It provides the functionality for evaluating structure functions, kinematics and matrix elements, integration and event generation. It combines the various parts that deal with those tasks individually and organizes the data transfer between them.

integration_results This module handles results from integrating processes. It records passes and iterations, calculates statistical averages, and provides the user output of integration results.

prc_core Here, we define the abstract `prc_core_t` type which handles all specific features of kinematics matrix-element evaluation that depend on a particular class of processes.

parton_states A `parton_state_t` object represents an elementary partonic interaction. There are two versions: one for the isolated elementary process, one for the elementary process convoluted with the structure-function chain. The parton state is an effective state. It needs not coincide with the seed-kinematics state which is used in evaluating phase space.

processes Here, all pieces are combined for the purpose of evaluating the elementary processes. The whole algorithm is coded in terms of abstract data types as defined in the appropriate modules: `prc_core` for matrix-element evaluation, `prc_core_def` for the associated configuration and driver, `sf_base` for beams and structure-functions, `phs_base` for phase space, and `mci_base` for integration and event generation.

process_stacks Process stacks collect process objects.

15.1 Integration results

We record integration results and errors in a dedicated type. This allows us to do further statistics such as weighted average, chi-squared, grouping by integration passes, etc.

Note WHIZARD 2.2.0: This code is taken from the previous `processes` module essentially unchanged and converted into a separate module. It lacks an overhaul and, in particular, self-tests.

⟨integration_results.f90⟩≡

```
module integration_results

  use limits, only: FMT_12, FMT_14, GML_MIN_RANGE_RATIO !NODEP!
  use limits, only: INTEGRATION_ERROR_TOLERANCE !NODEP!
```
⟨*Use kinds*⟩
⟨*Use strings*⟩
⟨*Use file utils*⟩
```
  use diagnostics !NODEP!
  use md5
  use os_interface
  use mci_base
```

⟨*Standard module head*⟩

⟨*Integration results: public*⟩

⟨*Integration results: parameters*⟩

⟨*Integration results: types*⟩

```
contains
```

⟨*Integration results: procedures*⟩

```
end module integration_results
```

15.1.1 Integration results entry

This object collects the results of an integration pass and makes them available to the outside.

The results object has to distinguish the process type:

We store the process type, the index of the integration pass and the absolute iteration index, the number of iterations contained in this result (for averages), and the integral (cross section or partial width), error estimate, efficiency.

For intermediate results, we set a flag if this result is an improvement w.r.t. previous ones.

The process type indicates decay or scattering. Dummy entries (skipped iterations) have a process type of `PRC_UNKNOWN`.

⟨*Integration results: types*⟩≡

```
    type :: integration_entry_t
      private
      integer :: process_type = PRC_UNKNOWN
      integer :: pass = 0
      integer :: it = 0
      integer :: n_it = 0
      integer :: n_calls = 0
      logical :: improved = .false.
      real(default) :: integral = 0
```

```
    real(default) :: error = 0
    real(default) :: efficiency = 0
    real(default) :: chi2 = 0
    real(default), dimension(:), allocatable :: chain_weights
  end type integration_entry_t
```

The possible values of the type indicator:

⟨*Integration results: parameters*⟩≡
```
    integer, parameter, public :: PRC_UNKNOWN = 0
    integer, parameter, public :: PRC_DECAY = 1
    integer, parameter, public :: PRC_SCATTERING = 2
```

Initialize with all relevant data

⟨*Integration results: procedures*⟩≡
```
    subroutine integration_entry_init (entry, &
         process_type, pass, it, n_it, n_calls, improved, &
         integral, error, efficiency, chi2, chain_weights)
      type(integration_entry_t), intent(out) :: entry
      integer, intent(in) :: process_type, pass, it, n_it, n_calls
      logical, intent(in) :: improved
      real(default), intent(in) :: integral, error, efficiency
      real(default), intent(in), optional :: chi2
      real(default), dimension(:), intent(in), optional :: chain_weights
      entry%process_type = process_type
      entry%pass = pass
      entry%it = it
      entry%n_it = n_it
      entry%n_calls = n_calls
      entry%improved = improved
      entry%integral = integral
      entry%error = error
      entry%efficiency = efficiency
      if (present (chi2)) &
           entry%chi2 = chi2
      if (present (chain_weights)) then
         allocate (entry%chain_weights (size (chain_weights)))
         entry%chain_weights = chain_weights
      end if
    end subroutine integration_entry_init
```

Access values, some of them computed on demand:

⟨*Integration results: procedures*⟩+≡
```
    elemental function integration_entry_get_pass (entry) result (n)
      integer :: n
      type(integration_entry_t), intent(in) :: entry
      n = entry%pass
    end function integration_entry_get_pass

    real(default) :: err
    type(integration_entry_t), intent(in) :: entry
    err = entry%error
  end function integration_entry_get_error

  elemental function integration_entry_get_relative_error (entry) result (err)
    real(default) :: err
    type(integration_entry_t), intent(in) :: entry
    if (entry%integral /= 0) then
       err = entry%error / entry%integral
    else
       err = 0
    end if
  end function integration_entry_get_relative_error

  elemental function integration_entry_get_accuracy (entry) result (acc)
    real(default) :: acc
    type(integration_entry_t), intent(in) :: entry
    acc = accuracy (entry%integral, entry%error, entry%n_calls)
  end function integration_entry_get_accuracy

  elemental function accuracy (integral, error, n_calls) result (acc)
    real(default) :: acc
    real(default), intent(in) :: integral, error
    integer, intent(in) :: n_calls
    if (integral /= 0) then
       acc = error / integral * sqrt (real (n_calls, default))
    else
       acc = 0
    end if
  end function accuracy

  elemental function integration_entry_get_efficiency (entry) result (eff)
    real(default) :: eff
    type(integration_entry_t), intent(in) :: entry
    eff = entry%efficiency
  end function integration_entry_get_efficiency

  elemental function integration_entry_get_chi2 (entry) result (chi2)
    real(default) :: chi2
    type(integration_entry_t), intent(in) :: entry
    chi2 = entry%chi2
  end function integration_entry_get_chi2

  elemental function integration_entry_has_improved (entry) result (flag)
```

```
      logical :: flag
      type(integration_entry_t), intent(in) :: entry
      flag = entry%improved
    end function integration_entry_has_improved

    elemental function integration_entry_get_n_groves (entry) result (n_groves)
      integer :: n_groves
      type(integration_entry_t), intent(in) :: entry
      if (allocated (entry%chain_weights)) then
         n_groves = size (entry%chain_weights, 1)
      else
         n_groves = 0
      end if
    end function integration_entry_get_n_groves
```

Output. This writes the header line for the result account below:

⟨*Integration results: procedures*⟩+≡
```
    subroutine write_header (process_type, unit, logfile)
      integer, intent(in) :: process_type
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: logfile
      character(5) :: phys_unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      select case (process_type)
      case (PRC_DECAY);       phys_unit = "[GeV]"
      case (PRC_SCATTERING); phys_unit = "[fb] "
      case default
         phys_unit = ""
      end select
      write (msg_buffer, "(A)") &
           "It      Calls  Integral" // phys_unit // &
           " Error" // phys_unit // &
           "  Err[%]    Acc  Eff[%]   Chi2 N[It] |"
      call msg_message (unit=u, logfile=logfile)
    end subroutine write_header
```

This writes a separator for result display:

⟨*Integration results: procedures*⟩+≡
```
    subroutine write_hline (unit)
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      write (u, "(A)")  "|" // (repeat ("-", 77)) // "|"
      flush (u)
    end subroutine write_hline

    subroutine write_dline (unit)
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit);  if (u < 0)  return
      write (u, "(A)")  "|" // (repeat ("=", 77)) // "|"
      flush (u)
```

1914

```
      end subroutine write_dline
```

This writes the standard result account into one screen line. The verbose version
uses multiple lines and prints the unabridged values. Dummy entries are not
written.

⟨*Integration results: procedures*⟩+≡

```

```
      end do
      write (u, *)
    end if
  end subroutine integration_entry_write_chain_weights
```

Compute the average for all entries in the specified integration pass. The integrals are weighted w.r.t. their individual errors.

The quoted error of the result is the expected error, computed from the weighted average of the given individual errors.

This should be compared to the actual distribution of the results, from which we also can compute an error estimate if there is more than one iteration. The ratio of the distribution error and the averaged error, is the χ^2 value.

All error distributions are assumed Gaussian, of course. The χ^2 value is a partial check for this assumption. If it is significantly greater than unity, there is something wrong with the individual errors.

The efficiency returned is the one of the last entry in the integration pass.

If any error vanishes, averaging by this algorithm would fail. In this case, we simply average the entries and use the deviations from this average (if any) to estimate the error.

15.1.2   Combined integration results

We collect a list of results which grows during the execution of the program. This is implemented as an array which grows if necessary; so we can easily compute averages.

   We implement this as an extension of the `mci_results_t` which is defined in `mci_base` as an abstract type. We thus decouple the implementation of the integrator from the implementation of the results display, but nevertheless can record intermediate results during integration. This implies that the present extension implements a `record` method.

⟨*Integration results: public*⟩≡
```
    public :: integration_results_t
```

⟨*Integration results: types*⟩+≡
```
    type, extends (mci_results_t) :: integration_results_t
      private
      integer :: process_type = PRC_UNKNOWN
      integer :: current_pass = 0
      integer :: n_pass = 0
      integer :: n_it = 0
      logical :: screen = .false.
      integer :: unit = 0
      real(default) :: error_threshold = 0
      type(integration_entry_t), dimension(:), allocatable :: entry
      type(integration_entry_t), dimension(:), allocatable :: average
   contains
```

⟨*Integration results: integration results: TBP*⟩
```
    end type integration_results_t
```

The array is extended in chunks of 10 entries.

⟨*Integration results: parameters*⟩+≡
```
    integer, parameter :: RESULTS_CHUNK_SIZE = 10
```

The standard does not require to explicitly initialize the integers; however, some gfortran version has a bug here and misses the default initialization in the type definition.

⟨*Integration results: integration results: TBP*⟩≡
```
    procedure :: init => integration_results_init
```

⟨*Integration results: procedures*⟩+≡
```
    subroutine integration_results_init (results, process_type)
      class(integration_results_t), intent(out) :: results
      integer, intent(in) :: process_type
      results%process_type = process_type
      results%n_pass = 0
      results%n_it = 0
      allocate (results%entry (RESULTS_CHUNK_SIZE))
      allocate (results%average (RESULTS_CHUNK_SIZE))
    end subroutine integration_results_init
```

Set addititional parameters: the `error_threshold` declares that any error value (in absolute numbers) smaller than this is to be considered zero.

⟨*Integration results: integration results: TBP*⟩+≡
```
    procedure :: set_error_threshold => integration_results_set_error_threshold
```

⟨*Integration results: procedures*⟩+≡
```
    subroutine integration_results_set_error_threshold (results, error_threshold)
      class(integration_results_t), intent(inout) :: results
      real(default), intent(in) :: error_threshold
      results%error_threshold = error_threshold
    end subroutine integration_results_set_error_threshold
```

Output (ASCII format). The `verbose` format is used for writing the header in grid files.

⟨*Integration results: integration results: TBP*⟩+≡
```
    procedure :: write => integration_results_write
```

⟨*Integration results: procedures*⟩+≡

  end if
  flush (u)
end subroutine integration_results_write
```

During integration, we do not want to print all results at once, but each inter-
mediate result as soon as we get it. Thus, the previous procedure is chopped in
pieces. First piece: store the output unit and a flag whether we want to print
to standard output as well. Then write the header if the results are still empty,

i.e., before integration has started. The second piece writes a single result to the saved output channels. We call this from the `record` method, which can be called from the integrator directly. The third piece writes the average result, once a pass has been completed. The fourth piece writes a footer (if any), assuming that this is the final result.

    end function integration_results_iterations_are_consistent
```

Discard all results starting from the specified iteration.

⟨*Integration results: procedures*⟩+≡
```
    subroutine integration_results_discard (results, it)
      type(integration_results_t), intent(inout) :: results
      integer, intent(in) :: it
      if (it <= results%n_it) then
        select case (it)
        case (:1)
           results%n_it = 0
           results%n_pass = 0
           results%current_pass = 0
        case default
           results%n_it = it - 1
           results%n_pass = maxval (results%entry(1:results%n_it)%pass)
           results%current_pass = results%n_pass
```

```
          end select
       end if
    end subroutine integration_results_discard
```

Expand the list of entries if the limit has been reached:

⟨*Integration results: integration results: TBP*⟩+≡
```
    procedure :: expand => integration_results_expand
```

⟨*Integration results: procedures*⟩+≡
```
    subroutine integration_results_expand (results)
      class(integration_results_t), intent(inout) :: results
      type(integration_entry_t), dimension(:), allocatable :: entry_tmp
      if (results%n_it == size (results%entry)) then
         allocate (entry_tmp (results%n_it))
         entry_tmp = results%entry
         deallocate (results%entry)
         allocate (results%entry (results%n_it + RESULTS_CHUNK_SIZE))
         results%entry(:results%n_it) = entry_tmp
         deallocate (entry_tmp)
      end if
      if (results%n_pass == size (results%average)) then
         allocate (entry_tmp (results%n_pass))
         entry_tmp = results%average
         deallocate (results%average)
         allocate (results%average (results%n_it + RESULTS_CHUNK_SIZE))
         results%average(:results%n_pass) = entry_tmp
         deallocate (entry_tmp)
      end if
    end subroutine integration_results_expand
```

Increment the `current_pass` counter. Can be done before integration; after integration, the recording method may use the value of this counter to define the entry.

⟨*Integration results: integration results: TBP*⟩+≡
```
    procedure :: new_pass => integration_results_new_pass
```

⟨*Integration results: procedures*⟩+≡
```
    subroutine integration_results_new_pass (results)
      class(integration_results_t), intent(inout) :: results
      results%current_pass = results%current_pass + 1
    end subroutine integration_results_new_pass
```

Append a new entry to the list and, if appropriate, compute the average.

⟨*Integration results: integration results: TBP*⟩+≡
```
    procedure :: append_entry => integration_results_append_entry
```

⟨*Integration results: procedures*⟩+≡
```
    subroutine integration_results_append_entry (results, entry)
      class(integration_results_t), intent(inout) :: results
      type(integration_entry_t), intent(in), optional :: entry
      if (results%n_it == 0) then
         results%n_it = 1
         results%n_pass = 1
      else
```

```
        call results%expand ()

      call results%append_entry (entry)
    end subroutine integration_results_append_null
```

Record an integration pass executed by an `mci` integrator object.

There is a tolerance below we treat an error (relative to the integral) as zero.

⟨*Limits: public parameters*⟩+≡
```
    real(default), parameter, public :: INTEGRATION_ERROR_TOLERANCE = 1e-10
```

⟨*Integration results: integration results: TBP*⟩+≡
```
    procedure :: record => integration_results_record
```

⟨*Integration results: procedures*⟩+≡
```
    subroutine integration_results_record &
        (object, n_it, n_calls, integral, error, efficiency, &
         chain_weights, suppress)
      class(integration_results_t), intent(inout) :: object
      integer, intent(in) :: n_it, n_calls
      real(default), intent(in) :: integral, error, efficiency
      real(default), dimension(:), intent(in), optional :: chain_weights
      real(default) :: err
      logical, intent(in), optional :: suppress

      if (abs (error) >= abs (integral) * INTEGRATION_ERROR_TOLERANCE) then
         err = error
      else
         err = 0
      end if
      call object%append (n_it, n_calls, integral, err, efficiency, chain_weights)
      call object%display_current (suppress)
    end subroutine integration_results_record
```

15.1.3   Access results

Return true if the results object has entries.

⟨*Integration results: integration results: TBP*⟩+≡
```
    procedure :: exist => integration_results_exist
```

⟨*Integration results: procedures*⟩+≡
```
    function integration_results_exist (results) result (flag)
      logical :: flag
      class(integration_results_t), intent(in) :: results
      flag = results%n_pass > 0
    end function integration_results_exist
```

Retrieve information from the results record. If `last` is set and true, take the last iteration. If `it` is set instead, take this iteration. If `pass` is set, take this average. If none is set, take the final average.

If the result would be invalid, the entry is not assigned. Due to default initialization, this returns a null entry.

⟨*Integration results: integration results: TBP*⟩+≡
```
procedure :: get_entry => results_get_entry
```

⟨*Integration results: procedures*⟩+≡
```
function results_get_entry (results, last, it, pass) result (entry)

    function integration_results_get_last_it (results) result (it)
      integer :: it
      type(integration_results_t), intent(in) :: results
      it = results%n_it
    end function integration_results_get_last_it
```

Return the index of the best iteration (lowest accuracy value) within the current pass. If none qualifies, return zero.

⟨*Integration results: procedures*⟩+≡
```
    function integration_results_get_best_it (results) result (it)
      integer :: it
      type(integration_results_t), intent(in) :: results
      integer :: i
      real(default) :: acc, acc_best
      acc_best = -1
      it = 0
      do i = 1, results%n_it
         if (results%entry(i)%pass == results%n_pass) then
            acc = integration_entry_get_accuracy (results%entry(i))
            if (acc_best < 0 .or. acc <= acc_best) then
               acc_best = acc
               it = i
            end if
         end if
      end do
```

```
            end function integration_results_get_best_it
```

Compute the MD5 sum by printing everything and checksumming the resulting file.

⟨*Integration results: procedures*⟩+≡
```
      function integration_results_get_md5sum (results) result (md5sum_results)
        character(32) :: md5sum_results
        type(integration_results_t), intent(in) :: results
        integer :: u
        u = free_unit ()
        open (unit = u, status = "scratch", action = "readwrite")
        call integration_results_write (results, u, verbose=.true.)
        rewind (u)
        md5sum_results = md5sum (u)
        close (u)
      end function integration_results_get_md5sum
```

This is (ab)used to suppress numerical noise when integrating constant matrix elements.

⟨*Integration results: integration results: TBP*⟩+≡
```

15.2   Abstract process core

In this module we provide abstract data types for process classes. Each process
class represents a set of processes which are handled by a common "method",
e.g., by the O'MEGA matrix-element generator. The process class is also able to
select a particular implementation for the phase-space and integration modules.

For a complete implementation of a process class, we have to provide exten-
sions of the following abstract types:

prc_core_def_t process and matrix-element configuration

prc_writer_t (optional) writing external matrix-element code

prc_driver_t accessing the matrix element (internal or external)

prc_core_t evaluating kinematics and matrix element. The process core also
   selects phase-space and integrator implementations as appropriate for the
   process class and configuration.

In the actual process-handling data structures, each process component con-
tains an instance of such a process class as its core. This allows us to keep the
processes module below, which supervises matrix-element evaluation, integra-
tion, and event generation, free of any reference to concrete implementations
(for the process class, phase space, and integrator).

There are no unit tests, these are deferred to the `processes` module.

15.2.1 The process core

The process core is of abstract data type. Different types of matrix element will be represented by different implementations.

⟨*Prc core: public*⟩≡
    `public :: prc_core_t`

⟨*Prc core: types*⟩≡
    `type, abstract :: prc_core_t`
      `class(prc_core_def_t), pointer :: def => null ()`
      `logical :: data_known = .false.`
      `type(process_constants_t) :: data`
      `class(prc_core_driver_t), allocatable :: driver`
      `logical :: use_color_factors = .false.`
      `integer :: nc = 3`
     `contains`
     ⟨*Prc core: process core: TBP*⟩
    `end type prc_core_t`

In any case there must be an output routine.

⟨*Prc core: process core: TBP*⟩≡
```
    procedure(prc_core_write), deferred :: write
```

⟨*Prc core: interfaces*⟩≡
```
    abstract interface
       subroutine prc_core_write (object, unit)
         import
         class(prc_core_t), intent(in) :: object
         integer, intent(in), optional :: unit
       end subroutine prc_core_write
    end interface
```

For initialization, we assign a pointer to the process entry in the relevant library. This allows us to access all process functions via the implementation of `prc_core_t`.

We declare the `object` as `intent(inout)`, since just after allocation it may be useful to store some extra data in the object, which we can then use in the actual initialization. This applies to extensions of `prc_core` which override the `init` method.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure :: init => prc_core_init
    procedure :: base_init => prc_core_init
```

⟨*Prc core: procedures*⟩≡
```
    subroutine prc_core_init (object, def, lib, id, i_component)
      class(prc_core_t), intent(inout) :: object
      class(prc_core_def_t), intent(in), target :: def
      type(process_library_t), intent(in), target :: lib
      type(string_t), intent(in) :: id
      integer, intent(in) :: i_component
      object%def => def
      call lib%connect_process (id, i_component, object%data, object%driver)
      object%data_known = .true.
    end subroutine prc_core_init
```

Return true if the matrix element generation was successful. This can be tested by looking at the number of generated flavor states, which should be nonzero.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure :: has_matrix_element => prc_core_has_matrix_element
```

⟨*Prc core: procedures*⟩+≡
```
    function prc_core_has_matrix_element (object) result (flag)
      class(prc_core_t), intent(in) :: object
      logical :: flag
      flag = object%data%n_flv /= 0
    end function prc_core_has_matrix_element
```

Return true if a MC dataset should be attached to this process component. False if it shares the dataset with another component.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_get_flag), deferred :: needs_mcset
```

1938

⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
       function prc_core_get_flag (object) result (flag)
         import
         class(prc_core_t), intent(in) :: object
         logical :: flag
       end function prc_core_get_flag
    end interface
```

Return an integer number
⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
       function prc_core_get_integer (object) result (i)
         import
         class(prc_core_t), intent(in) :: object
         integer :: i
       end function prc_core_get_integer
    end interface
```

Return the number of distinct terms requested by this process component.
⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_get_integer), deferred :: get_n_terms
```
Tell whether a particular combination of flavor/helicity/color state is allowed for the matrix element.
⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_is_allowed), deferred :: is_allowed
```

⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
       function prc_core_is_allowed (object, i_term, f, h, c) result (flag)
         import
         class(prc_core_t), intent(in) :: object
         integer, intent(in) :: i_term, f, h, c
         logical :: flag
       end function prc_core_is_allowed
    end interface
```

Set the constant process data for a specific term. By default, these are the constants stored inside the object, ignoring the term index. Type extensions may override this and provide term-specific data.
⟨*Prc core: process core: TBP*⟩+≡
```
    procedure :: get_constants => prc_core_get_constants
```

⟨*Prc core: procedures*⟩+≡
```
    subroutine prc_core_get_constants (object, data, i_term)
      class(prc_core_t), intent(in) :: object
      type(process_constants_t), intent(out) :: data
      integer, intent(in) :: i_term
      data = object%data
    end subroutine prc_core_get_constants
```

The strong coupling is not among the process constants. The default implementation is to return a negative number, which indicates that α_s is not available. This may be overridden by an implementation that provides an (event-specific) value. The value can be stored in the `tmp` workspace.

⟨*Prc core: process core: TBP*⟩+≡
```
procedure :: get_alpha_s => prc_core_get_alpha_s
```

⟨*Prc core: procedures*⟩+≡
```
function prc_core_get_alpha_s (object, tmp) result (alpha)
  class(prc_core_t), intent(in) :: object
  class(workspace_t), intent(in), allocatable :: tmp
  real(default) :: alpha
  alpha = -1
end function prc_core_get_alpha_s
```

Allocate the workspace associated to a process component. The default is that there is no workspace, so we do nothing. A type extension may override this and allocate a workspace object of appropriate type, which can be used in further calculations.

In any case, the `intent(out)` attribute deletes any previously allocated workspace.

⟨*Prc core: process core: TBP*⟩+≡
```
procedure :: allocate_workspace => prc_core_ignore_workspace
```

⟨*Prc core: procedures*⟩+≡
```
subroutine prc_core_ignore_workspace (object, tmp)
  class(prc_core_t), intent(in) :: object
  class(workspace_t), intent(inout), allocatable :: tmp
end subroutine prc_core_ignore_workspace
```

Initialize the structure-function instance that corresponds to a process component. In ordinary cases, this amounts to a straightforward copy of the given template, but the process core may also choose to modify the setup, and it may access its own workspace.

The `sf_chain_instance` is the object that we want to prepare. The `sf_chain` argument is a template for its structure. For the initialization, we also need the number of channels `n_channel`.

Note: crash with nagfor 5.3.1 if `sf_chain_instance` is declared `intent(out)`, as would be more appropriate.

⟨*Prc core: process core: TBP*⟩+≡
```
procedure :: init_sf_chain => prc_core_init_sf_chain
```

⟨*Prc core: procedures*⟩+≡
```
subroutine prc_core_init_sf_chain &
    (object, sf_chain_instance, sf_chain, n_channel, tmp)
  class(prc_core_t), intent(in) :: object
  type(sf_chain_instance_t), intent(inout), target :: sf_chain_instance
  type(sf_chain_t), intent(in), target :: sf_chain
  integer, intent(in) :: n_channel
  class(workspace_t), intent(inout), allocatable :: tmp
  call sf_chain_instance%init (sf_chain, n_channel)
end subroutine prc_core_init_sf_chain
```

Compute the momenta in the hard interaction, taking the seed kinematics as input. The `i_term` index tells us which term we want to compute. (The standard method is to just transfer the momenta to the hard interaction.)

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_compute_hard_kinematics), deferred :: &
        compute_hard_kinematics
```

⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_core_compute_hard_kinematics &
            (object, p_seed, i_term, int_hard, tmp)
         import
         class(prc_core_t), intent(in) :: object
         type(vector4_t), dimension(:), intent(in) :: p_seed
         integer, intent(in) :: i_term
         type(interaction_t), intent(inout) :: int_hard
         class(workspace_t), intent(inout), allocatable :: tmp
       end subroutine prc_core_compute_hard_kinematics
    end interface
```

Compute the momenta in the effective interaction, taking the hard kinematics as input. (This is called only if parton recombination is to be applied for the process variant.)

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_compute_eff_kinematics), deferred :: &
        compute_eff_kinematics
```

⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_core_compute_eff_kinematics &
            (object, i_term, int_hard, int_eff, tmp)
         import
         class(prc_core_t), intent(in) :: object
         integer, intent(in) :: i_term
         type(interaction_t), intent(in) :: int_hard
         type(interaction_t), intent(inout) :: int_eff
         class(workspace_t), intent(inout), allocatable :: tmp
       end subroutine prc_core_compute_eff_kinematics
    end interface
```

Recover the missing pieces. We know the incoming momenta of the `p_seed` array and the outgoing momenta of the `int_eff` interaction. We have to recover the outgoing momenta of `p_seed` and the incoming momenta of `int_eff`.

(The trivial case is that these are identical.)

Furthermore, if `int_hard` and `int_eff` are not aliased, we have to set the momenta there. In the trivial case, `int_eff` is a pointer to `int_hard`, so `int_hard` should not be touched at all.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_recover_kinematics), deferred :: &
        recover_kinematics
```

⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_core_recover_kinematics &
            (object, p_seed, int_hard, int_eff, tmp)
          import
          class(prc_core_t), intent(in) :: object
          type(vector4_t), dimension(:), intent(inout) :: p_seed
          type(interaction_t), intent(inout) :: int_hard
          type(interaction_t), intent(inout) :: int_eff
          class(workspace_t), intent(inout), allocatable :: tmp
       end subroutine prc_core_recover_kinematics
    end interface
```

The process core must implement this function. Here, `j` is the index of the particular term we want to compute. The amplitude may depend on the factorization and renormalization scales.

The `tmp` (workspace) argument may be used if it is provided by the caller. Otherwise, the routine should compute the result directly.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_compute_amplitude), deferred :: compute_amplitude
```

⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
       function prc_core_compute_amplitude &
            (object, j, p, f, h, c, fac_scale, ren_scale, tmp) result (amp)
          import
          class(prc_core_t), intent(in) :: object
          integer, intent(in) :: j
          type(vector4_t), dimension(:), intent(in) :: p
          integer, intent(in) :: f, h, c
          real(default), intent(in) :: fac_scale, ren_scale
          class(workspace_t), intent(inout), allocatable, optional :: tmp
          complex(default) :: amp
       end function prc_core_compute_amplitude
    end interface
```

15.2.2 Storage for intermediate results

The abstract `workspace_t` type allows process cores to set up temporary workspace. The object is an extra argument for each of the individual calculations between kinematics setup and matrix-element evaluation.

⟨*Prc core: public*⟩+≡
```
    public :: workspace_t
```

⟨*Prc core: types*⟩+≡
```
    type, abstract :: workspace_t
     contains
       procedure(workspace_write), deferred :: write
    end type workspace_t
```

For debugging, we should at least have an output routine.

⟨*Prc core: interfaces*⟩+≡
```
abstract interface
   subroutine workspace_write (object, unit)
     import
     class(workspace_t), intent(in) :: object
     integer, intent(in), optional :: unit
   end subroutine workspace_write
end interface
```

15.2.3   Helicity selection data

This is intended for use with `O'MEGA`, but may also be made available to other process methods. We set thresholds for counting the times a specific helicity amplitude is zero. When the threshold is reached, we skip this amplitude in subsequent calls.

For initializing the helicity counters, we need an object that holds the two parameters, the threshold (large real number) and the cutoff (integer).

A helicity value suppressed by more than `threshold` (a value which multiplies `epsilon`, to be compared with the average of the current amplitude, default is 10^{10}) is treated as zero. A matrix element is assumed to be zero and not called again if it has been zero `cutoff` times.

⟨*Prc core: public*⟩+≡
```
public :: helicity_selection_t
```

⟨*Prc core: types*⟩+≡
```
type :: helicity_selection_t
   logical :: active = .false.
   real(default) :: threshold = 0
   integer :: cutoff = 0
 contains
 ⟨Prc core: helicity selection: TBP⟩
end type helicity_selection_t
```

Output. If the selection is inactive, print nothing.

⟨*Prc core: helicity selection: TBP*⟩≡
```
procedure :: write => helicity_selection_write
```

⟨*Prc core: procedures*⟩+≡
```
subroutine helicity_selection_write (object, unit)
  class(helicity_selection_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
  if (object%active) then
     write (u, "(3x,A)")  "Helicity selection data:"
     write (u, "(5x,A,ES17.10)") &
           "threshold =", object%threshold
     write (u, "(5x,A,I0)") &
           "cutoff    = ", object%cutoff
  end if
end subroutine helicity_selection_write
```

15.3 Process observables

We define an abstract `subevt_expr_t` object as an extension of the `subevt_t` type. The object contains a local variable list, variable instances (as targets for pointers in the variable list), and evaluation trees. The evaluation trees reference both the variables and the `subevt`.

There are two instances of the abstract type: one for process instances, one for physical events. Both have a common logical expression `selection` which determines whether the object passes user-defined cuts.

The intention is that we fill the `subevt_t` base object and compute the variables once we have evaluated a kinematical phase space point (or a complete event). We then evaluate the expressions and can use the results in further calculations.

The `process_expr_t` extension contains furthermore scale and weight expressions. The `event_expr_t` extension contains a reweighting-factor expression and a logical expression for event analysis. In practice, we will link the variable list of the `event_obs` object to the variable list of the currently active `process_obs` object, such that the process variables are available to both objects. Event variables are meaningful only for physical events.

      if (object%has_selection) then
          call eval_tree_final (object%selection)
      end if
    end subroutine subevt_expr_final
```

15.3.2   Initialization

Initialization: define local variables and establish pointers.

The common variables are `sqrts` (the nominal beam energy, fixed), `sqrts_hat` (the actual energy), `n_in`, `n_out`, and `n_tot` for the `subevt`. With the exception of `sqrts`, all are implemented as pointers to subobjects.

⟨*Subevt expr: subevt expr: TBP*⟩+≡
```
    procedure (subevt_expr_setup_vars), deferred :: setup_vars
    procedure :: base_setup_vars => subevt_expr_setup_vars
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine subevt_expr_setup_vars (expr, sqrts)
      class(subevt_expr_t), intent(inout), target :: expr
      real(default), intent(in) :: sqrts
      call var_list_final (expr%var_list)
      call var_list_append_real (expr%var_list, &
          var_str ("sqrts"), sqrts, &
          locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_real_ptr (expr%var_list, &
          var_str ("sqrts_hat"), expr%sqrts_hat, &
          is_known = expr%subevt_filled, &
          locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_int_ptr (expr%var_list, &
          var_str ("n_in"), expr%n_in, &
          is_known = expr%subevt_filled, &
          locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_int_ptr (expr%var_list, &
          var_str ("n_out"), expr%n_out, &
          is_known = expr%subevt_filled, &
          locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_int_ptr (expr%var_list, &
          var_str ("n_tot"), expr%n_tot, &
          is_known = expr%subevt_filled, &
          locked = .true., verbose = .false., intrinsic = .true.)
    end subroutine subevt_expr_setup_vars
```

Link a variable list to the local one. This could be done event by event, but before evaluating expressions.

⟨Subevt expr: subevt expr: TBP⟩+≡
```
    procedure :: link_var_list => subevt_expr_link_var_list
```

⟨Subevt expr: procedures⟩+≡
```
    subroutine subevt_expr_link_var_list (expr, var_list)
      class(subevt_expr_t), intent(inout) :: expr
      type(var_list_t), intent(in), target :: var_list
      call var_list_link (expr%var_list, var_list)
    end subroutine subevt_expr_link_var_list
```

Compile the selection expression. If the pointer is disassociated, there is no expression.

⟨Subevt expr: subevt expr: TBP⟩+≡
```
    procedure :: setup_selection => subevt_expr_setup_selection
```

⟨Subevt expr: procedures⟩+≡
```
    subroutine subevt_expr_setup_selection (expr, pn_selection)
      class(subevt_expr_t), intent(inout), target :: expr
      type(parse_node_t), intent(in), pointer :: pn_selection
      if (associated (pn_selection)) then
         call eval_tree_init_lexpr (expr%selection, &
              pn_selection, expr%var_list, expr%subevt_t)
         expr%has_selection = .true.
      end if
    end subroutine subevt_expr_setup_selection
```

15.3.3 Evaluation

Reset to initial state, i.e., mark the `subevt` as invalid.

⟨Subevt expr: subevt expr: TBP⟩+≡
```
    procedure :: reset => subevt_expr_reset
    procedure :: base_reset => subevt_expr_reset
```

⟨Subevt expr: procedures⟩+≡
```
    subroutine subevt_expr_reset (expr)
      class(subevt_expr_t), intent(inout) :: expr
      expr%subevt_filled = .false.
    end subroutine subevt_expr_reset
```

Evaluate the selection expression and return the result. There is also a deferred version: this should evaluate the remaining expressions if the event has passed.

⟨Subevt expr: subevt expr: TBP⟩+≡
```
    procedure :: base_evaluate => subevt_expr_evaluate
```

⟨Subevt expr: procedures⟩+≡
```
    subroutine subevt_expr_evaluate (expr, passed)
      class(subevt_expr_t), intent(inout) :: expr
      logical, intent(out) :: passed
      if (expr%has_selection) then
         call eval_tree_evaluate (expr%selection)
```

```
         if (eval_tree_result_is_known (expr%selection)) then
            passed = eval_tree_get_log (expr%selection)
         else
            call msg_error ("Evaluate selection expression: result undefined")
            passed = .false.
         end if
      else
         passed = .true.
      end if
   end subroutine subevt_expr_evaluate
```

15.3.4 Implementation for partonic events

This implementation contains the expressions that we can evaluate for the partonic process during integration.

⟨*Subevt expr: public*⟩≡
```
    public :: parton_expr_t
```

⟨*Subevt expr: types*⟩+≡
```
    type, extends (subevt_expr_t) :: parton_expr_t
       integer, dimension(:), allocatable :: i_beam
       integer, dimension(:), allocatable :: i_in
       integer, dimension(:), allocatable :: i_out
       logical :: has_scale = .false.
       logical :: has_fac_scale = .false.
       logical :: has_ren_scale = .false.
       logical :: has_weight = .false.
       type(eval_tree_t) :: scale
       type(eval_tree_t) :: fac_scale
       type(eval_tree_t) :: ren_scale
       type(eval_tree_t) :: weight
     contains
     ⟨Subevt expr: parton expr: TBP⟩
    end type parton_expr_t
```

Finalizer.

⟨*Subevt expr: parton expr: TBP*⟩≡
```
    procedure :: final => parton_expr_final
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine parton_expr_final (object)
      class(parton_expr_t), intent(inout) :: object
      call object%base_final ()
      if (object%has_scale) then
         call eval_tree_final (object%scale)
      end if
      if (object%has_fac_scale) then
         call eval_tree_final (object%fac_scale)
      end if
      if (object%has_ren_scale) then
         call eval_tree_final (object%ren_scale)
      end if
      if (object%has_weight) then
```

```
        call eval_tree_final (object%weight)
      end if
    end subroutine parton_expr_final
```

Output: continue writing the active expressions, after the common selection expression.

Note: the `prefix` argument is declared in the `write` method of the `subevt_t` base type. Here, it is unused.

⟨*Subevt expr: parton expr: TBP*⟩+≡
```

            call eval_tree_write (object%weight, u)
         end if
      end if
    end subroutine parton_expr_write
```

Define variables.

⟨*Subevt expr: parton expr: TBP*⟩+≡
```
    procedure :: setup_vars => parton_expr_setup_vars
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine parton_expr_setup_vars (expr, sqrts)
      class(parton_expr_t), intent(inout), target :: expr
```

```
      real(default), intent(in) :: sqrts
      call expr%base_setup_vars (sqrts)
    end subroutine parton_expr_setup_vars
```

Compile the scale expressions. If a pointer is disassociated, there is no expression.

⟨*Subevt expr: parton expr: TBP*⟩+≡
```
    procedure :: setup_scales => parton_expr_setup_scales
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine parton_expr_setup_scales &
        (expr, pn_scale, pn_fac_scale, pn_ren_scale)
      class(parton_expr_t), intent(inout), target :: expr
      type(parse_node_t), intent(in), pointer :: pn_scale
      type(parse_node_t), intent(in), pointer :: pn_fac_scale, pn_ren_scale
      if (associated (pn_scale)) then
         call eval_tree_init_expr (expr%scale, &
              pn_scale, expr%var_list, expr%subevt_t)
         expr%has_scale = .true.
      end if
      if (associated (pn_fac_scale)) then
         call eval_tree_init_expr (expr%fac_scale, &
              pn_fac_scale, expr%var_list, expr%subevt_t)
         expr%has_fac_scale = .true.
      end if
      if (associated (pn_ren_scale)) then
         call eval_tree_init_expr (expr%ren_scale, &
              pn_ren_scale, expr%var_list, expr%subevt_t)
         expr%has_ren_scale = .true.
      end if
    end subroutine parton_expr_setup_scales
```

Compile the weight expression.

⟨*Subevt expr: parton expr: TBP*⟩+≡
```
    procedure :: setup_weight => parton_expr_setup_weight
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine parton_expr_setup_weight (expr, pn_weight)
      class(parton_expr_t), intent(inout), target :: expr
      type(parse_node_t), intent(in), pointer :: pn_weight
      if (associated (pn_weight)) then
         call eval_tree_init_expr (expr%weight, &
              pn_weight, expr%var_list, expr%subevt_t)
         expr%has_weight = .true.
      end if
    end subroutine parton_expr_setup_weight
```

Filling the partonic state consists of two parts. The first routine prepares the subevt without assigning momenta. It takes the particles from an `interaction_t`. It needs the indices and flavors for the beam, incoming, and outgoing particles.

We can assume that the particle content of the subevt does not change.

1950

Therefore, we set the event variables `n_in`, `n_out`, `n_tot` already in this initialization step.

⟨*Subevt expr: parton expr: TBP*⟩+≡
```
    procedure :: setup_subevt => parton_expr_setup_subevt
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine parton_expr_setup_subevt (expr, int, &
         i_beam, i_in, i_out, f_beam, f_in, f_out)
      class(parton_expr_t), intent(inout) :: expr
      type(interaction_t), intent(in), target :: int
      integer, dimension(:), intent(in) :: i_beam, i_in, i_out
      type(flavor_t), dimension(:), intent(in) :: f_beam, f_in, f_out
      allocate (expr%i_beam (size (i_beam)))
      allocate (expr%i_in (size (i_in)))
      allocate (expr%i_out (size (i_out)))
      expr%i_beam = i_beam
      expr%i_in = i_in
      expr%i_out = i_out
      call interaction_to_subevt (int, &
           expr%i_beam, expr%i_in, expr%i_out, expr%subevt_t)
      call subevt_set_pdg_beam     (expr%subevt_t, flavor_get_pdg (f_beam))
      call subevt_set_pdg_incoming (expr%subevt_t, flavor_get_pdg (f_in))
      call subevt_set_pdg_outgoing (expr%subevt_t, flavor_get_pdg (f_out))
      call subevt_set_p2_beam     (expr%subevt_t, flavor_get_mass (f_beam) ** 2)
      call subevt_set_p2_incoming (expr%subevt_t, flavor_get_mass (f_in)   ** 2)
      call subevt_set_p2_outgoing (expr%subevt_t, flavor_get_mass (f_out)  ** 2)
      expr%n_in  = size (i_in)
      expr%n_out = size (i_out)
      expr%n_tot = expr%n_in + expr%n_out
    end subroutine parton_expr_setup_subevt
```

The second part takes the momenta from the interaction object and thus completes the subevt. The partonic energy can then be computed.

```

15.3.5   Implementation for full events

This implementation contains the expressions that we can evaluate for the full event. It also contains data that pertain to the event, suitable for communication with external event formats. These data simultaneously serve as pointer targets for the variable lists hidden in the expressions (eval trees).

Squared matrix element and weight values: when reading events from file, the `ref` value is the number in the file, while the `prc` value is the number that we calculate from the momenta in the file, possibly with different parameters. When generating events the first time, or if we do not recalculate, the numbers should coincide. Furthermore, the array of `alt` values is copied from an array of alternative event records. These values should represent calculated values.

⟨*Subevt expr: public*⟩+≡
```
    public :: event_expr_t
```

⟨*Subevt expr: types*⟩+≡
```
    type, extends (subevt_expr_t) :: event_expr_t

      real(default), dimension(:), allocatable :: weight_alt
    contains
    ⟨Subevt expr: event expr: TBP⟩
    end type event_expr_t
```

Finalizer for the expressions.

⟨*Subevt expr: event expr: TBP*⟩≡
```
    procedure :: final => event_expr_final
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine event_expr_final (object)
      class(event_expr_t), intent(inout) :: object
      call object%base_final ()
      if (object%has_reweight) then
         call eval_tree_final (object%reweight)
      end if
      if (object%has_analysis) then
         call eval_tree_final (object%analysis)
      end if
    end subroutine event_expr_final
```

Output: continue writing the active expressions, after the common selection expression.

Note: the `prefix` argument is declared in the `write` method of the `subevt_t` base type. Here, it is unused.

⟨*Subevt expr: event expr: TBP*⟩+≡
```
    procedure :: write => event_expr_write
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine event_expr_write (object, unit, prefix)
      class(event_expr_t), intent(in) :: object
      integer, intent(in), optional :: unit

15.4 Parton states

A `parton_state_t` object contains the effective kinematics and dynamics of an elementary partonic interaction, with or without the beam/structure function state included. The type is abstract and has two distinct extensions. The `isolated_state_t` extension describes the isolated elementary interaction where the `int_eff` subobject contains the complex transition amplitude, exclusive in all quantum numbers. The particle content and kinematics describe the effective partonic state. The `connected_state_t` extension contains the partonic `subevt` and the expressions for cuts and scales which use it.

In the isolated state, the effective partonic interaction may either be identical to the hard interaction, in which case it is just a pointer to the latter. Or it may involve a rearrangement of partons, in which case we allocate it explicitly and flag this by `int_is_allocated`.

The `trace` evaluator contains the absolute square of the effective transition amplitude matrix, summed over final states. It is also summed over initial states, depending on the the beam setup allows. The result is used for integration.

The `matrix` evaluator is the counterpart of `trace` which is kept exclusive in all observable quantum numbers. The `flows` evaluator is furthermore exclusive in colors, but neglecting all color interference. The `matrix` and `flows` evaluators are filled only for sampling points that become part of physical events.

Note: It would be natural to make the evaluators allocatable. However, this causes memory corruption in gfortran 4.6.3. The extra `has_XXX` flags indicate whether evaluators are active, instead.

This module contains no unit tests. The tests are covered by the `processes` module below.

15.4.1 Abstract base type

The common part are the evaluators, one for the trace (summed over all quantum numbers), one for the transition matrix (summed only over unobservable quantum numbers), and one for the flow distribution (transition matrix without interferences, exclusive in color flow).

⟨*Parton states: types*⟩≡
    type, abstract :: parton_state_t
       logical :: has_trace = .false.
       logical :: has_matrix = .false.

```
    logical :: has_flows = .false.
    type(evaluator_t) :: trace
    type(evaluator_t) :: matrix
    type(evaluator_t) :: flows
  contains
  ⟨Parton states: parton state: TBP⟩
  end type parton_state_t
```

The `isolated_state_t` extension contains the `sf_chain_eff` object and the (hard) effective interaction `int_eff`, separately, both implemented as a pointer. The evaluators (trace, matrix, flows) apply to the hard interaction only.

If the effective interaction differs from the hard interaction, the pointer is allocated explicitly. Analogously for `sf_chain_eff`.

⟨*Parton states: public*⟩≡
```
    public :: isolated_state_t
```

⟨*Parton states: types*⟩+≡
```
    type, extends (parton_state_t) :: isolated_state_t
      logical :: sf_chain_is_allocated = .false.
      type(sf_chain_instance_t), pointer :: sf_chain_eff => null ()
      logical :: int_is_allocated = .false.
      type(interaction_t), pointer :: int_eff => null ()
    contains
    ⟨Parton states: isolated state: TBP⟩
    end type isolated_state_t
```

The `connected_state_t` extension contains all data that enable the evaluation of observables for the effective connected state. The evaluators connect the (effective) structure-function chain and hard interaction that were kept separate in the `isolated_state_t`.

The `flows_sf` evaluator is an extended copy of the structure-function

The `expr` subobject consists of the `subevt`, a simple event record, expressions for cuts etc. which refer to this record, and a `var_list` which contains event-specific variables, linked to the process variable list. Variables used within the expressions are looked up in `var_list`.

⟨*Parton states: types*⟩+≡
```
    public :: connected_state_t
```

⟨*Parton states: types*⟩+≡
```
    type, extends (parton_state_t) :: connected_state_t
      logical :: has_flows_sf = .false.
      type(evaluator_t) :: flows_sf
      logical :: has_expr = .false.
      type(parton_expr_t) :: expr
    contains
    ⟨Parton states: connected state: TBP⟩
    end type connected_state_t
```

Output: each evaluator is written only when it is active. The `sf_chain` is only written if it is explicitly allocated.

⟨*Parton states: parton state: TBP*⟩≡

          call state%sf_chain_eff%final ()
        end if
      end select
    end subroutine parton_state_final
```

15.4.2   Common Initialization

Initialize the isolated parton state. In this version, the effective structure-function chain `sf_chain_eff` and the effective interaction `int_eff` both are trivial pointers to the seed structure-function chain and to the hard interaction, respectively.

⟨*Parton states: isolated state: TBP*⟩≡

```
    procedure :: init => isolated_state_init_pointers
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine isolated_state_init_pointers (state, sf_chain, int)
      class(isolated_state_t), intent(out) :: state
      type(sf_chain_instance_t), intent(in), target :: sf_chain
      type(interaction_t), intent(in), target :: int
      state%sf_chain_eff => sf_chain
      state%int_eff => int
    end subroutine isolated_state_init_pointers
```

15.4.3 Evaluator initialization: isolated state

Create an evaluator for the trace of the squared transition matrix. The trace goes over all outgoing quantum numbers. Whether we trace over incoming quantum numbers other than color, depends on the given `qn_mask_in`.

There are two options: explicitly computing the color factor table (`use_cf` false; `nc` defined), or taking the color factor table from the hard matrix element data.

⟨*Parton states: isolated state: TBP*⟩+≡
```
    procedure :: setup_square_trace => isolated_state_setup_square_trace
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine isolated_state_setup_square_trace (state, core, qn_mask_in, &
         col)
      class(isolated_state_t), intent(inout), target :: state
      class(prc_core_t), intent(in) :: core
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: qn_mask_in
      integer, dimension(:), intent(in) :: col
      type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
      associate (data => core%data)
        allocate (qn_mask (data%n_in + data%n_out))
        qn_mask(:data%n_in) = &
              new_quantum_numbers_mask (.false., .true., .false.) &
              .or. qn_mask_in
        qn_mask(data%n_in+1:) = &
            new_quantum_numbers_mask (.true., .true., .true.)
      if (core%use_color_factors) then
        call evaluator_init_square (state%trace, &
             state%int_eff, qn_mask, &
             data%cf_index, data%color_factors, col, nc=core%nc)
      else
        call evaluator_init_square (state%trace, &
             state%int_eff, qn_mask, nc=core%nc)
      end if
      end associate
      state%has_trace = .true.
    end subroutine isolated_state_setup_square_trace
```

Setup the evaluator for the transition matrix, exclusive in helicities where this is requested.

For all unstable final-state particles we keep polarization according to the applicable decay options. If the process is a decay itself, this applies also to the initial state.

For all polarized final-state particles, we keep polarization including off-diagonal entries. We drop helicity completely for unpolarized final-state particles.

For the initial state, if the particle has not been handled yet, we apply the provided `qn_mask_in` which communicates the beam properties.

⟨*Parton states: isolated state: TBP*⟩+≡
```
    procedure :: setup_square_matrix => isolated_state_setup_square_matrix
```
⟨*Parton states: procedures*⟩+≡
```
    subroutine isolated_state_setup_square_matrix &
        (state, core, model, qn_mask_in, col)
      class(isolated_state_t), intent(inout), target :: state
      class(prc_core_t), intent(in) :: core
      type(model_t), intent(in), target :: model
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: qn_mask_in

      type(flavor_t), dimension(:), allocatable :: flv
      integer :: i
      logical :: helmask, helmask_hd
      associate (data => core%data)
        allocate (qn_mask (data%n_in + data%n_out))
        allocate (flv (data%n_flv))
        do i = 1, data%n_in + data%n_out
           call flavor_init (flv, data%flv_state(i,:), model)
           if ((data%n_in == 1 .or. i > data%n_in) &
                .and. any (.not. flavor_is_stable (flv))) then
              helmask = all (flavor_decays_isotropically (flv))
              helmask_hd = all (flavor_decays_diagonal (flv))
              qn_mask(i) = new_quantum_numbers_mask (.false., .true., helmask, &
                   mask_hd = helmask_hd)
           else if (i > data%n_in) then
              helmask = all (.not. flavor_is_polarized (flv))
              qn_mask(i) = new_quantum_numbers_mask (.false., .true., helmask)
           else
              qn_mask(i) = new_quantum_numbers_mask (.false., .true., .false.) &
                   .or. qn_mask_in(i)
           end if
        end do
      if (core%use_color_factors) then
         call evaluator_init_square (state%matrix, &
              state%int_eff, qn_mask, &
              data%cf_index, data%color_factors, col, nc=core%nc)
      else
         call evaluator_init_square (state%matrix, state%int_eff, &
              qn_mask, nc=core%nc)
      end if
      end associate
      state%has_matrix = .true.
    end subroutine isolated_state_setup_square_matrix
```

This procedure initializes the evaluator that computes the contributions to color flows, neglecting color interference. The incoming-particle mask can be used to sum over incoming flavor.

Helicity handling: see above.

        do i = 1, data%n_in + data%n_out
          call flavor_init (flv, data%flv_state(i,:), model)
          if ((data%n_in == 1 .or. i > data%n_in) &
              .and. any (.not. flavor_is_stable (flv))) then
            helmask = all (flavor_decays_isotropically (flv))
            helmask_hd = all (flavor_decays_diagonal (flv))
            qn_mask(i) = new_quantum_numbers_mask (.false., .false., helmask, &
                mask_hd = helmask_hd)
          else if (i > data%n_in) then
            helmask = all (.not. flavor_is_polarized (flv))
            qn_mask(i) = new_quantum_numbers_mask (.false., .false., helmask)
          else
            qn_mask(i) = new_quantum_numbers_mask (.false., .false., .false.) &
              .or. qn_mask_in(i)
          end if
        end do
        call evaluator_init_square (state%flows, state%int_eff, qn_mask, &
            expand_color_flows = .true.)
      end associate
      state%has_flows = .true.
    end subroutine isolated_state_setup_square_flows
```

15.4.4 Evaluator initialization: connected state

Setup a trace evaluator as a product of two evaluators (incoming state, effective interaction). In the result, all quantum numbers are summed over.

If the optional `int` interaction is provided, use this for the first factor in the convolution. Otherwise, use the final interaction of the stored `sf_chain`.

⟨*Parton states: connected state: TBP*⟩≡
```
    procedure :: setup_connected_trace => connected_state_setup_connected_trace
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_connected_trace (state, isolated, int)
      class(connected_state_t), intent(inout), target :: state
      type(isolated_state_t), intent(in), target :: isolated
      type(interaction_t), intent(in), optional, target :: int
```

```
      type(quantum_numbers_mask_t) :: mask
      type(interaction_t), pointer :: src_int
      mask = new_quantum_numbers_mask (.true., .true., .true.)
      if (present (int)) then
         src_int => int
      else
         src_int => isolated%sf_chain_eff%get_out_int_ptr ()
      end if
      call evaluator_init_product &
           (state%trace, src_int, isolated%trace, mask, mask)
      state%has_trace = .true.
    end subroutine connected_state_setup_connected_trace
```

Setup a matrix evaluator as a product of two evaluators (incoming state, effective interation). In the intermediate state, color and helicity is summed over. In the final state, we keep the quantum numbers which are present in the original evaluators.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: setup_connected_matrix => connected_state_setup_connected_matrix
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_connected_matrix (state, isolated, int)
      class(connected_state_t), intent(inout), target :: state
      type(isolated_state_t), intent(in), target :: isolated
      type(interaction_t), intent(in), optional, target :: int
      type(quantum_numbers_mask_t) :: mask
      type(interaction_t), pointer :: src_int
      mask = new_quantum_numbers_mask (.false., .true., .true.)
      if (present (int)) then
         src_int => int
      else
         src_int => isolated%sf_chain_eff%get_out_int_ptr ()
      end if
      call evaluator_init_product &
           (state%matrix, src_int, isolated%matrix, mask)
      state%has_matrix = .true.
    end subroutine connected_state_setup_connected_matrix
```

Setup a matrix evaluator as a product of two evaluators (incoming state, effective interation). In the intermediate state, only helicity is summed over. In the final state, we keep the quantum numbers which are present in the original evaluators.

If the optional `int` interaction is provided, use this for the first factor in the convolution. Otherwise, use the final interaction of the stored `sf_chain`, after creating an intermediate interaction that includes a correlated color state. We assume that for a caller-provided `int`, this is not necessary.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: setup_connected_flows => connected_state_setup_connected_flows
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_connected_flows (state, isolated, int)
      class(connected_state_t), intent(inout), target :: state
      type(isolated_state_t), intent(in), target :: isolated
      type(interaction_t), intent(in), optional, target :: int
```

```
    type(quantum_numbers_mask_t) :: mask
    type(interaction_t), pointer :: src_int
    mask = new_quantum_numbers_mask (.false., .false., .true.)
    if (present (int)) then
       src_int => int
    else
       src_int => isolated%sf_chain_eff%get_out_int_ptr ()
       call evaluator_init_color_contractions (state%flows_sf, src_int)
       state%has_flows_sf = .true.
       src_int => evaluator_get_int_ptr (state%flows_sf)
    end if
    call evaluator_init_product &
         (state%flows, src_int, isolated%flows, mask)
    state%has_flows = .true.
  end subroutine connected_state_setup_connected_flows
```

15.4.5   Cuts and expressions

Set up the `subevt` that corresponds to the connected interaction. The index arrays refer to the interaction.

We assign the particles as follows: the beam particles are the first two (decay process: one) entries in the trace evaluator. The incoming partons are identified by their link to the outgoing partons of the structure-function chain. The outgoing partons are those of the trace evaluator, which include radiated partons during the structure-function chain.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: setup_subevt => connected_state_setup_subevt
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_subevt (state, sf_chain, f_beam, f_in, f_out)
      class(connected_state_t), intent(inout), target :: state
      type(sf_chain_instance_t), intent(in), target :: sf_chain
      type(flavor_t), dimension(:), intent(in) :: f_beam, f_in, f_out
      integer :: n_beam, n_in, n_out, n_vir, n_tot, i, j
      integer, dimension(:), allocatable :: i_beam, i_in, i_out
      integer :: sf_out_i
      type(interaction_t), pointer :: int, sf_int
      int => evaluator_get_int_ptr (state%trace)
      sf_int => sf_chain%get_out_int_ptr ()
      n_beam = size (f_beam)
      n_in = size (f_in)
      n_out = size (f_out)
      n_vir = interaction_get_n_vir (int)
      n_tot = interaction_get_n_tot (int)
      allocate (i_beam (n_beam), i_in (n_in), i_out (n_out))
      i_beam = [(i, i = 1, n_beam)]
      do j = 1, n_in
         sf_out_i = sf_chain%get_out_i (j)
         i_in(j) = interaction_find_link (int, sf_int, sf_out_i)
      end do
      i_out = [(i, i = n_vir + 1, n_tot)]
      call state%expr%setup_subevt (int, &
```

```
          i_beam, i_in, i_out, f_beam, f_in, f_out)
    state%has_expr = .true.
  end subroutine connected_state_setup_subevt
```

Initialize the variable list specific for this state/term. We insert event variables
(`sqrts_hat`) and link the process variable list. The variable list acquires pointers
to subobjects of `state`, which must therefore have a `target` attribute.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: setup_var_list => connected_state_setup_var_list
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_var_list (state, process_var_list, beam_data)
      class(connected_state_t), intent(inout), target :: state
      type(var_list_t), intent(in), target :: process_var_list
      type(beam_data_t), intent(in) :: beam_data
      call state%expr%setup_vars (beam_data_get_sqrts (beam_data))
      call state%expr%link_var_list (process_var_list)
    end subroutine connected_state_setup_var_list
```

Allocate the cut expression etc.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: setup_expressions => connected_state_setup_expressions
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_expressions (state, &
         pn_cuts, pn_scale, pn_fac_scale, pn_ren_scale, pn_weight)
      class(connected_state_t), intent(inout), target :: state
      type(parse_node_t), intent(in), pointer :: pn_cuts
      type(parse_node_t), intent(in), pointer :: pn_scale
      type(parse_node_t), intent(in), pointer :: pn_fac_scale
      type(parse_node_t), intent(in), pointer :: pn_ren_scale
      type(parse_node_t), intent(in), pointer :: pn_weight
      call state%expr%setup_selection (pn_cuts)
      call state%expr%setup_scales (pn_scale, pn_fac_scale, pn_ren_scale)
      call state%expr%setup_weight (pn_weight)
    end subroutine connected_state_setup_expressions
```

Reset the expression object: invalidate the subevt.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: reset_expressions => connected_state_reset_expressions
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_reset_expressions (state)
      class(connected_state_t), intent(inout) :: state
      if (state%has_expr)  call state%expr%reset ()
    end subroutine connected_state_reset_expressions
```

15.4.6 Evaluation

Transfer momenta to the trace evaluator and fill the `subevt` with this effective
kinematics, if applicable.

Note: we may want to apply a boost for the `subevt`.

⟨*Parton states: parton state: TBP*⟩+≡
```
procedure :: receive_kinematics => parton_state_receive_kinematics
```

⟨*Parton states: procedures*⟩+≡
```
subroutine parton_state_receive_kinematics (state)
  class(parton_state_t), intent(inout), target :: state
  type(interaction_t), pointer :: int
  if (state%has_trace) then
     call evaluator_receive_momenta (state%trace)
     select type (state)
     class is (connected_state_t)
        if (state%has_expr) then
           int => evaluator_get_int_ptr (state%trace)
           call state%expr%fill_subevt (int)
        end if
     end select
  end if
end subroutine parton_state_receive_kinematics
```

Recover kinematics: We assume that the trace evaluator is filled with momenta. Send those momenta back to the sources, then fill the variables and subevent as above.

The incoming momenta of the connected state are not connected to the isolated state but to the beam interaction. Therefore, the incoming momenta within the isolated state do not become defined, yet. Instead, we reconstruct the beam (and ISR) momentum configuration.

⟨*Parton states: parton state: TBP*⟩+≡
```
procedure :: send_kinematics => parton_state_send_kinematics
```

⟨*Parton states: procedures*⟩+≡
```
subroutine parton_state_send_kinematics (state)
  class(parton_state_t), intent(inout), target :: state
  type(interaction_t), pointer :: int
  if (state%has_trace) then
     call evaluator_send_momenta (state%trace)
     select type (state)
     class is (connected_state_t)
        int => evaluator_get_int_ptr (state%trace)
        call state%expr%fill_subevt (int)
     end select
  end if
end subroutine parton_state_send_kinematics
```

Evaluate the expressions. The routine evaluates first the cut expression. If the event passes, it evaluates the other expressions. Where no expressions are defined, default values are inserted.

⟨*Parton states: connected state: TBP*⟩+≡
```
procedure :: evaluate_expressions => connected_state_evaluate_expressions
```

⟨*Parton states: procedures*⟩+≡
```
subroutine connected_state_evaluate_expressions (state, passed, &
     scale, fac_scale, ren_scale, weight)
```

1976

```
      class(connected_state_t), intent(inout) :: state
      logical, intent(out) :: passed
      real(default), intent(out) :: scale, fac_scale, ren_scale, weight
      if (state%has_expr) then
         call state%expr%evaluate (passed, scale, fac_scale, ren_scale, weight)
      end if
   end subroutine connected_state_evaluate_expressions
```

Evaluate the structure-function chain, if it is allocated explicitly. The argument
is the factorization scale.

If the chain is merely a pointer, the chain should already be evaluated at
this point.

⟨*Parton states: isolated state: TBP*⟩+≡
```
   procedure :: evaluate_sf_chain => isolated_state_evaluate_sf_chain
```

⟨*Parton states: procedures*⟩+≡
```
   subroutine isolated_state_evaluate_sf_chain (state, fac_scale)
     class(isolated_state_t), intent(inout) :: state
     real(default), intent(in) :: fac_scale
     if (state%sf_chain_is_allocated) then
        call state%sf_chain_eff%evaluate (fac_scale)
     end if
   end subroutine isolated_state_evaluate_sf_chain
```

Evaluate the trace.

⟨*Parton states: parton state: TBP*⟩+≡
```
   procedure :: evaluate_trace => parton_state_evaluate_trace
```

⟨*Parton states: procedures*⟩+≡
```
   subroutine parton_state_evaluate_trace (state)
     class(parton_state_t), intent(inout) :: state
     if (state%has_trace) then
        call state%trace%evaluate ()
     end if
   end subroutine parton_state_evaluate_trace
```

Evaluate the extra evaluators that we need for physical events.

⟨*Parton states: parton state: TBP*⟩+≡
```
   procedure :: evaluate_event_data => parton_state_evaluate_event_data
```

⟨*Parton states: procedures*⟩+≡
```
   subroutine parton_state_evaluate_event_data (state)
     class(parton_state_t), intent(inout) :: state
     select type (state)
     type is (connected_state_t)
        if (state%has_flows_sf) then
           call evaluator_receive_momenta (state%flows_sf)
           call state%flows_sf%evaluate ()
        end if
     end select
     if (state%has_matrix) then
        call evaluator_receive_momenta (state%matrix)
        call state%matrix%evaluate ()
```

```
      end if
      if (state%has_flows) then
         call evaluator_receive_momenta (state%flows)
         call state%flows%evaluate ()
      end if
   end subroutine parton_state_evaluate_event_data
```

Normalize the helicity density matrix by its trace, i.e., factor out the trace and put it into an overall normalization factor. The trace and flow evaluators are unchanged.

⟨*Parton states: parton state: TBP*⟩+≡
```
   procedure :: normalize_matrix_by_trace => &
        parton_state_normalize_matrix_by_trace
```

⟨*Parton states: procedures*⟩+≡
```
   subroutine parton_state_normalize_matrix_by_trace (state)
     class(parton_state_t), intent(inout) :: state
     if (state%has_matrix) then
        call evaluator_normalize_by_trace (state%matrix)
     end if
   end subroutine parton_state_normalize_matrix_by_trace
```

15.4.7   Accessing the state

Three functions return a pointer to the event-relevant interactions.

⟨*Parton states: parton state: TBP*⟩+≡
```
   procedure :: get_trace_int_ptr => parton_state_get_trace_int_ptr
   procedure :: get_matrix_int_ptr => parton_state_get_matrix_int_ptr
   procedure :: get_flows_int_ptr => parton_state_get_flows_int_ptr
```

⟨*Parton states: procedures*⟩+≡
```
   function parton_state_get_trace_int_ptr (state) result (ptr)
     class(parton_state_t), intent(in), target :: state
     type(interaction_t), pointer :: ptr
     if (state%has_trace) then
        ptr => evaluator_get_int_ptr (state%trace)
     else
        ptr => null ()
     end if
   end function parton_state_get_trace_int_ptr

   function parton_state_get_matrix_int_ptr (state) result (ptr)
     class(parton_state_t), intent(in), target :: state
     type(interaction_t), pointer :: ptr
     if (state%has_matrix) then
        ptr => evaluator_get_int_ptr (state%matrix)
     else
        ptr => null ()
     end if
   end function parton_state_get_matrix_int_ptr

   function parton_state_get_flows_int_ptr (state) result (ptr)
```

```
      class(parton_state_t), intent(in), target :: state
      type(interaction_t), pointer :: ptr
      if (state%has_flows) then
         ptr => evaluator_get_int_ptr (state%flows)
      else
         ptr => null ()
      end if
   end function parton_state_get_flows_int_ptr
```

Return the indices of the beam particles and the outgoing particles within the
trace (and thus, matrix and flows) evaluator, respectively.

⟨*Parton states: connected state: TBP*⟩+≡
```
   procedure :: get_beam_index => connected_state_get_beam_index
   procedure :: get_in_index => connected_state_get_in_index
```

⟨*Parton states: procedures*⟩+≡
```
   subroutine connected_state_get_beam_index (state, i_beam)
     class(connected_state_t), intent(in) :: state
     integer, dimension(:), intent(out) :: i_beam
     call state%expr%get_beam_index (i_beam)
   end subroutine connected_state_get_beam_index

   subroutine connected_state_get_in_index (state, i_in)
     class(connected_state_t), intent(in) :: state
     integer, dimension(:), intent(out) :: i_in
     call state%expr%get_in_index (i_in)
   end subroutine connected_state_get_in_index
```

15.5   Complete Elementary Processes

This module combines hard interactions, phase space, and (for scatterings)
structure functions and interfaces them to the integration module.

The process object implements the combination of a fixed beam and structure-
function setup with a number of elementary processes. The latter are called
process components. The process object represents an entity which is suppos-
edly observable. It should be meaningful to talk about the cross section of a
process.

The individual components of a process are, technically, processes them-
selves, but they may have unphysical cross sections which have to be added for
a physical result. Process components may be exclusive tree-level elementary
processes, dipole subtraction term, loop corrections, etc.

The beam and structure function setup is common to all process components.
Thus, there is only one instance of this part.

The process may be a scattering process or a decay process. In the latter
case, there are no structure functions, and the beam setup consists of a single
particle. Otherwise, the two classes are treated on the same footing.

Once a sampling point has been chosen, a process determines a set of partons
with a correlated density matrix of quantum numbers. In general, each sampling
point will generate, for each process component, one or more distinct parton

configurations. This is the `computed` state. The computed state is the subject of the multi-channel integration algorithm.

For NLO computations, it is necessary to project the computed states onto another set of parton configurations (e.g., by recombining certain pairs). This is the `observed` state. When computing partonic observables, the information is taken from the observed state.

For the purpose of event generation, we will later select one parton configuration from the observed state and collapse the correlated quantum state. This configuration is then dressed by applying parton shower, decays and hadronization. The decay chain, in particular, combines a scattering process with possible subsequent decay processes on the parton level, which are full-fledged process objects themselves.

15.5.1 The Process Object

A process object is the workspace for creating process instances for event generation. After initialization, its contents are filled by integration passes which shape the integration grids and compute cross sections. Processes are set up initially from user-level configuration data. After calculating integrals and thus developing integration grid data, the program may use a process object or a copy of it for the purpose of generating events

The process object consists of several subobjects with their specific purposes. The corresponding types are defined below. (Technically, the subobject type definitions have to come before the process type definition, but with NOWEB

magic we reverse this order here.)

The `type` determines whether we are considering a decay or a scattering process.

The `meta` object describes the process and its environment. All contents become fixed when the object is initialized.

The `config` object holds physical and technical configuration data that have been obtained during process initialization, and which are common to all process components.

The individual process components are configured in the `component` objects. These objects contain more configuration parameters and workspace, as needed for the specific process variant.

The `term` objects describe parton configurations which are technically used as phase-space points. Each process component may split into several terms with distinct kinematics and particle content. Furthermore, each term may project on a different physical state, e.g., by particle recombination. The `term` object provides the framework for this projection, for applying cuts, weight, and thus completing the process calculation.

The `beam_config` object describes the incoming particles, either the decay mother or the scattering beams. It also contains the structure-function information.

The `mci_entry` objects configure a MC input parameter set and integrator, each. The number of parameters depends on the process component and on the beam and structure-function setup.

           mci_entry
    contains
    ⟨*Processes: process: TBP*⟩
    end type process_t
```

This procedure is an important debugging and inspection tool; it is not used during normal operation. The process object is written to a file (identified by unit, which may also be standard output). Optional flags determine whether we show everything or just the interesting parts.

```

Process setup

Initialize a process. We need a process library, the name of the process, and a
run ID.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: init => process_init
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_init &
         (process, proc_id, run_id, lib, os_data, qcd, rng_factory, model_list)
      class(process_t), intent(out) :: process
      type(string_t), intent(in) :: proc_id
      type(string_t), intent(in) :: run_id
      type(process_library_t), intent(in), target :: lib
      type(os_data_t), intent(in) :: os_data
      type(qcd_t), intent(in) :: qcd
      class(rng_factory_t), intent(inout), allocatable :: rng_factory
      type(model_list_t), intent(inout) :: model_list
      if (.not. lib%is_active ()) then
         call msg_bug ("Process init: inactive library not handled yet")
      end if
      if (.not. lib%contains (proc_id)) then
         call msg_fatal ("Process library doesn't contain process '" &
              // char (proc_id) // "'")
         return
      end if
      associate (meta => process%meta)
        call meta%init (proc_id, run_id, lib)
        call process%config%init (meta, os_data, qcd, rng_factory, model_list)
```

```
      allocate (process%component (meta%n_components))
    end associate
  end subroutine process_init
```

Store a snapshot of a variable list. We link this snapshot to the current model instance and use it to update the model parameters in this instance. After update, synchronize the var list, i.e., fetch any new values of derived parameters.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: set_var_list => process_set_var_list
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_set_var_list (process, var_list)
      class(process_t), intent(inout) :: process
      type(var_list_t), intent(in) :: var_list
      call var_list_init_snapshot (process%meta%var_list, var_list)
      call var_list_set_original_pointers (process%meta%var_list, &
          model_get_var_list_ptr (process%config%model))
      call var_list_restore (process%meta%var_list)
      call model_parameters_update (process%config%model)
      call var_list_synchronize (process%meta%var_list, &
          model_get_var_list_ptr (process%config%model))
    end subroutine process_set_var_list
```

Initialize the process components, one by one, using a template for the process core object. The template is taken only for allocating the correct type; the contents are set by extracting the process entry from the library.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: init_component => process_init_component
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_init_component &
        (process, index, core_template, mci_template, phs_config_template)
      class(process_t), intent(inout) :: process
      integer, intent(in) :: index
      class(prc_core_t), intent(in), allocatable :: core_template
      class(mci_t), intent(in), allocatable :: mci_template
      class(phs_config_t), intent(in), allocatable :: phs_config_template
      call process%component(index)%init (index, &
          process%meta, process%config, &
          core_template, mci_template, phs_config_template)
      if (.not. process%component(index)%active) then
        call process%meta%deactivate_component(index)
      end if
    end subroutine process_init_component
```

Determine the process terms for each process component.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: setup_terms => process_setup_terms
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_setup_terms (process)
      class(process_t), intent(inout) :: process
      type(model_t), pointer :: model
```

```
      integer :: i, j, k
      integer, dimension(:), allocatable :: n_entry
      integer :: n_components, n_tot
      model => process%config%model
      n_components = process%meta%n_components
      allocate (n_entry (n_components), source = 0)
      do i = 1, n_components
         associate (component => process%component(i))
           if (component%active)  n_entry(i) = component%core%get_n_terms ()
         end associate
      end do
      n_tot = sum (n_entry)
      allocate (process%term (n_tot))
      k = 0
      do i = 1, n_components
         associate (component => process%component(i))
           if (.not. component%active)  cycle
           associate (core => component%core)
             allocate (component%i_term (n_entry(i)))
             do j = 1, n_entry(i)
                component%i_term(j) = k + j
                call process%term(k+j)%init (k+j, i, j, core, model)
             end do
           end associate
         end associate
         k = k + n_entry(i)
      end do
      process%config%n_terms = n_tot
    end subroutine process_setup_terms
```

Initialize the beam setup. This is the trivial version where the incoming state of the matrix element coincides with the initial state of the process. For a scattering process, we need the c.m. energy, all other variables are set to their default values (no polarization, lab frame and c.m. frame coincide, etc.)

We assume that all components consistently describe a scattering process, i.e., two incoming particles.

Note: The current layout of the `beam_data_t` record requires that the flavor for each beam is unique. For processes with multiple flavors in the initial state, one has to set up beams explicitly. This restriction could be removed by extending the code in the `beams` module.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: setup_beams_sqrts => process_setup_beams_sqrts
```

⟨*Processes: procedures*⟩+≡
```

            end do
        end subroutine process_check_masses
```

For some structure functions we need to get the list of initial state flavors. This
is a two-dimensional array. The first index is the beam index, the second index
is the component index. Each array element is itself a PDG array object, which
consists of the list of incoming PDG values for this beam and component.

⟨*Processes: process: TBP*⟩+≡

      end if
    end subroutine process_setup_beams_beam_structure
```

Notify the user about beam setup.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: beams_startup_message => process_beams_startup_message
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_beams_startup_message (process, unit, beam_structure)
      class(process_t), intent(in) :: process
      integer, intent(in), optional :: unit
      type(beam_structure_t), intent(in), optional :: beam_structure
      call process%beam_config%startup_message (unit, beam_structure)
    end subroutine process_beams_startup_message
```

We complete the kinematics configuration after the beam setup, but before
we configure the chain of structure functions. The reason is that we need the
total energy `sqrts` for the kinematics, but the structure-function setup requires
the number of channels, which depends on the kinematics configuration. For
instance, the kinematics module may return the need for parameterizing an
s-channel resonance.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: configure_phs => process_configure_phs
```

1991

⟨*Processes: procedures*⟩+≡
```
subroutine process_configure_phs (process, rebuild, ignore_mismatch)
  class(process_t), intent(inout) :: process
  logical, intent(in), optional :: rebuild
  logical, intent(in), optional :: ignore_mismatch
  real(default) :: sqrts
  integer :: i
  sqrts = process%get_sqrts ()
  do i = 1, process%meta%n_components
    associate (component => process%component(i))
      if (component%active) then
        call component%configure_phs &
             (sqrts, process%beam_config, rebuild, ignore_mismatch)
      end if
    end associate
  end do
end subroutine process_configure_phs
```

Insert the structure-function configuration data. First allocate the storage, then insert data one by one. The third procedure declares a mapping (of the MC input parameters) for a specific channel and structure-function combination.

We take the number of channels from the corresponding entry in the `config_data` section.

Otherwise, these a simple wrapper routines. The extra level in the call tree may allow for simple addressing of multiple concurrent beam configurations, not implemented currently.

If we do not want structure functions, we simply do not call those procedures.

⟨*Processes: process: TBP*⟩+≡
```
procedure :: init_sf_chain => process_init_sf_chain
generic :: set_sf_channel => set_sf_channel_single
procedure :: set_sf_channel_single => process_set_sf_channel
generic :: set_sf_channel => set_sf_channel_array
procedure :: set_sf_channel_array => process_set_sf_channel_array
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_init_sf_chain (process, sf_config, sf_trace_file)
  class(process_t), intent(inout) :: process
  type(sf_config_t), dimension(:), intent(in) :: sf_config
  type(string_t), intent(in), optional :: sf_trace_file
  type(string_t) :: file
  if (present (sf_trace_file)) then
    if (sf_trace_file /= "") then
      file = sf_trace_file
    else
      file = process%get_id () // "_sftrace.dat"
    end if
    call process%beam_config%init_sf_chain (sf_config, file)
  else
    call process%beam_config%init_sf_chain (sf_config)
  end if
end subroutine process_init_sf_chain

subroutine process_set_sf_channel (process, c, sf_channel)
```

```
      class(process_t), intent(inout) :: process
      integer, intent(in) :: c
      type(sf_channel_t), intent(in) :: sf_channel
      call process%beam_config%set_sf_channel (c, sf_channel)
    end subroutine process_set_sf_channel

    subroutine process_set_sf_channel_array (process, sf_channel)
      class(process_t), intent(inout) :: process
      type(sf_channel_t), dimension(:), intent(in) :: sf_channel
      integer :: c
      call process%beam_config%allocate_sf_channels (size (sf_channel))
      do c = 1, size (sf_channel)
         call process%beam_config%set_sf_channel (c, sf_channel(c))
      end do
    end subroutine process_set_sf_channel_array
```

Notify about the structure-function setup.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: sf_startup_message => process_sf_startup_message
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_sf_startup_message (process, sf_string, unit)
      class(process_t), intent(in) :: process
      type(string_t), intent(in) :: sf_string
      integer, intent(in), optional :: unit
      call process%beam_config%sf_startup_message (sf_string, unit)
    end subroutine process_sf_startup_message
```

As soon as both the kinematics configuration and the structure-function setup are complete, we match parameterizations (channels) for both. The matching entries are (re)set in the component phase-space configuration, while the structure-function configuration is left intact.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: collect_channels => process_collect_channels
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_collect_channels (process, coll)
      class(process_t), intent(inout) :: process
      type(phs_channel_collection_t), intent(inout) :: coll
      integer :: i
      do i = 1, process%meta%n_components
         associate (component => process%component(i))
           if (component%active) then
              call component%collect_channels (coll)
           end if
         end associate
      end do
    end subroutine process_collect_channels
```

Independently, we should be able to check if any component doesn't contain phase-space parameters. Such a process can only be integrated if there are structure functions.

⟨*Processes: process: TBP*⟩+≡

1993

```
      procedure :: contains_trivial_component => process_contains_trivial_component
```
⟨*Processes: procedures*⟩+≡
```
    function process_contains_trivial_component (process) result (flag)
      class(process_t), intent(in) :: process

      process%config%pn_weight => pn_weight
    end subroutine process_set_weight
```

1995

MD5 sum

The MD5 sum of the process object should reflect the state completely, including integration results. It is used for checking the integrity of event files. This global checksum includes checksums for the various parts. In particular, the MCI object receives a checksum that includes the configuration of all configuration parts relevant for an individual integration. This checksum is used for checking the integrity of integration grids.

We do not need MD5 sums for the process terms, since these are generated from the component definitions.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: compute_md5sum => process_compute_md5sum
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_compute_md5sum (process)
      class(process_t), intent(inout) :: process
      integer :: i
      call process%config%compute_md5sum ()
      do i = 1, process%config%n_components
         associate (component => process%component(i))
           if (component%active) then
              call component%compute_md5sum ()
           end if
         end associate
      end do
      call process%beam_config%compute_md5sum ()
      do i = 1, process%config%n_mci
         call process%mci_entry(i)%compute_md5sum &
              (process%config, process%component, process%beam_config)
      end do
    end subroutine process_compute_md5sum
```

Integration and event generation

The sampler test should just evaluate the squared matrix element `n_calls` times, discarding the results, and return. This can be done before integration, e.g., for timing estimates.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: sampler_test => process_sampler_test
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_sampler_test (process, instance, i_mci, n_calls)
      class(process_t), intent(inout) :: process
      type(process_instance_t), intent(inout), target :: instance
      integer, intent(in) :: i_mci
      integer, intent(in) :: n_calls
      call process%mci_entry(i_mci)%sampler_test (instance, n_calls)
    end subroutine process_sampler_test
```

Integrate the process, using a previously initialized process instance. We select one of the available MCI integrators by its index `i_mci` and thus integrate

over (structure functions and) phase space for the associated (group of) process component(s).

The finalizer should be called after all integration passes have been completed. It will, for instance, write a summary of the integration results.

`integrate_dummy` does a "dummy" integration in the sense that nothing is done but just empty integration results appended.

⟨*Processes: process: TBP*⟩+≡
```
procedure :: integrate => process_integrate
procedure :: final_integration => process_final_integration
procedure :: integrate_dummy => process_integrate_dummy
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_integrate (process, instance, i_mci, n_it, n_calls, &
     adapt_grids, adapt_weights, final, pacify)
  class(process_t), intent(inout) :: process
  type(process_instance_t), intent(inout) :: instance
  integer, intent(in) :: i_mci
  integer, intent(in) :: n_it
  integer, intent(in) :: n_calls
  logical, intent(in), optional :: adapt_grids
  logical, intent(in), optional :: adapt_weights
  logical, intent(in), optional :: final, pacify
  call process%mci_entry(i_mci)%integrate (instance, n_it, n_calls, &
       adapt_grids, adapt_weights, final, pacify)
end subroutine process_integrate

subroutine process_final_integration (process, i_mci)
  class(process_t), intent(inout) :: process
  integer, intent(in) :: i_mci
  call process%mci_entry(i_mci)%final_integration ()
end subroutine process_final_integration

subroutine process_integrate_dummy (process)
  class(process_t), intent(inout) :: process
  type(integration_results_t) :: results
  integer :: u_log
  u_log = logfile_unit ()
  call results%init (process%meta%type)
  call results%display_init (process%meta%type, screen = .true., unit = u_log)
  call results%new_pass ()
  call results%record (1, 0, 0._default, 0._default, 0._default)
  call results%display_final ()
end subroutine process_integrate_dummy
```

Display the final results for the sum of all components. (This is useful, obviously, only if there is more than one component.)

⟨*Processes: process: TBP*⟩+≡
```
procedure :: display_summed_results => process_display_summed_results
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_display_summed_results (process)

            call process%term(i)%write_state_summary &
                 (process%component(i_component)%core, unit)
         end if
      end do
    end subroutine process_write_state_summary
```

2000

Prepare event generation for the specified MCI entry. This implies, in particular, checking the phase-space file.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: prepare_simulation => process_prepare_simulation
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_prepare_simulation (process, i_mci)
      class(process_t), intent(inout) :: process
      integer, intent(in) :: i_mci
      call process%mci_entry(i_mci)%prepare_simulation ()
    end subroutine process_prepare_simulation
```

Generate a weighted event. We select one of the available MCI integrators by its index `i_mci` and thus generate an event for the associated (group of) process component(s). The arguments exactly correspond to the initializer and finalizer above.

The resulting event is stored in the `prcoess_instance` object, which also holds the workspace of the integrator.

Note: The `process` object is declared `intent(inout)` because it contains the random-number state, which changes for each event. Otherwise, all volatile data are inside the `instance` object.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: generate_weighted_event => process_generate_weighted_event
    procedure :: generate_unweighted_event => process_generate_unweighted_event
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_generate_weighted_event (process, instance, i_mci)
      class(process_t), intent(inout) :: process
      type(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_mci
      call process%mci_entry(i_mci)%generate_weighted_event (instance)
    end subroutine process_generate_weighted_event

    subroutine process_generate_unweighted_event (process, instance, i_mci)
      class(process_t), intent(inout) :: process
      type(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_mci
      call process%mci_entry(i_mci)%generate_unweighted_event (instance)
    end subroutine process_generate_unweighted_event
```

This replaces the event generation methods for the situation that the process instance object has been filled by other means (i.e., reading and/or recalculating its contents). We just have to fill in missing MCI data, especially the event weight.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: recover_event => process_recover_event
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_recover_event (process, instance, i_term)
      class(process_t), intent(inout) :: process
      type(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      call process%mci_entry(instance%i_mci)%recover_event (instance, i_term)
```

```
     end subroutine process_recover_event
```

Retrieve process data

Tell whether integral (and error) are known.

⟨*Processes: process: TBP*⟩+≡
```
    generic :: has_integral => has_integral_tot, has_integral_mci
    procedure :: has_integral_tot => process_has_integral_tot
    procedure :: has_integral_mci => process_has_integral_mci
```

⟨*Processes: procedures*⟩+≡
```
    function process_has_integral_mci (process, i_mci) result (flag)
      class(process_t), intent(in) :: process
      integer, intent(in) :: i_mci
      logical :: flag
      flag = process%mci_entry(i_mci)%has_integral ()
    end function process_has_integral_mci

    function process_has_integral_tot (process) result (flag)
      class(process_t), intent(in) :: process
      logical :: flag
      integer :: i
      flag = .true.

      else
         efficiency = 0
      end if
```

```
      end function process_get_efficiency_tot
```

Return the MD5 sums that summarize the process component definitions. These values should be independent of parameters, beam details, expressions, etc. They can be used for checking the integrity of a process when reusing an old event file.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_md5sum_prc => process_get_md5sum_prc
```

⟨*Processes: procedures*⟩+≡
```
    function process_get_md5sum_prc (process, i_component) result (md5sum)
      class(process_t), intent(in) :: process
      integer, intent(in) :: i_component
      character(32) :: md5sum
      if (process%component(i_component)%active) then
         md5sum = process%component(i_component)%config%get_md5sum ()
      else
         md5sum = ""
      end if
    end function process_get_md5sum_prc
```

Return the MD5 sums that summarize the state of the MCI integrators. These values should encode all process data, integration and phase space configuration, etc., and the integration results. They can thus be used for checking the integrity of an event-generation setup when reusing an old event file.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_md5sum_mci => process_get_md5sum_mci
```

⟨*Processes: procedures*⟩+≡
```
    function process_get_md5sum_mci (process, i_mci) result (md5sum)
      class(process_t), intent(in) :: process
      integer, intent(in) :: i_mci
      character(32) :: md5sum
      md5sum = process%mci_entry(i_mci)%get_md5sum ()
    end function process_get_md5sum_mci
```

Return the MD5 sum of the process configuration. This should encode the process setup, data, and expressions, but no integration results.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_md5sum_cfg => process_get_md5sum_cfg
```

⟨*Processes: procedures*⟩+≡
```
    function process_get_md5sum_cfg (process) result (md5sum)
      class(process_t), intent(in) :: process
      character(32) :: md5sum
      md5sum = process%config%md5sum
    end function process_get_md5sum_cfg
```

15.5.2 Metadata

This information describes the process and its environment. It is fixed upon initialization.

The `id` string is the name of the process object, as given by the user. The matrix element generator will use this string for naming Fortran procedures and types, so it should qualify as a Fortran name.

The `num_id` is meaningful if nonzero. It is used for communication with external programs or file standards which do not support string IDs.

The `run_id` string distinguishes among several runs for the same process. It identifies process instances with respect to adapted integration grids and similar run-specific data. The run ID is kept when copying processes for creating instances, however, so it does not distinguish event samples.

The `var_list` is a snapshot of the variable list, taken at the point where the process was initialized.

The `lib` pointer accesses the process library where the process definition and the process driver are located.

The `lib_index` is the index of entry in the process library that corresponds to the current process.

The `component_id` array identifies the individual process components.

The `component_description` is an array of human-readable strings that characterize the process components, for instance `a, b => c, d`.

The `active` mask array marks those components which are active. The others are skipped.

```

15.5.3   Generic Configuration Data

This information concerns physical and technical properties of the process. It is fixed upon initialization, using data from the process specification and the variable list.

The number `n_in` is the number of incoming beam particles, simultaneously the number of incoming partons, 1 for a decay and 2 for a scattering process. (The number of outgoing partons may depend on the process component.)

The number `n_components` is the number of components that constitute the current process.

The number `n_terms` is the number of distinct contributions to the scattering matrix that constitute the current process. Each component may generate several terms.

The number `n_mci` is the number of independent MC integration configurations that this process uses. Distinct process components that share a MCI configuration may be combined pointwise. (Nevertheless, a given MC variable set may correspond to several "nearby" kinematical configurations.) This is also

the number of distinct sampling-function results that this process can generate. Process components that use distinct variable sets are added only once after an integration pass has completed.

The `model` pointer identifies the physics model and its parameters. This is a pointer to an external object.

The `rng_factory` component spawns independent random-number generators for use in integration, event generation, and event postprocessing.

Various `parse_node_t` objects are taken from the SINDARIN input. They encode expressions for evaluating cuts and scales. The workspaces for evaluating those expressions are set up in the `effective_state` subobjects. Note that these are really pointers, so the actual nodes are not stored inside the process object.

The `md5sum` is taken and used to verify the process configuration when re-reading data from file.

⟨*Processes: process part types*⟩+≡
```
type :: process_config_data_t
  private
  integer :: n_in = 0
  integer :: n_components = 0
  integer :: n_terms = 0
  integer :: n_mci = 0
  type(os_data_t) :: os_data
  class(rng_factory_t), allocatable :: rng_factory
  type(string_t) :: model_name

      write (u, "(3x,A,A,A)")  "MD5 sum (config)  = '", config%md5sum, "'"
   end if
end subroutine process_config_data_write
```

Initialize. We use information from the process metadata and from the process library, given the process ID. We also store the currently active OS data set.

Using the model name that the library gives us, we try to load the model here. Reading from the global model library, we are sure that we are looking at the model associated to the process, not the selected one at the user level. However, when the mode names are the same, the models will be identical.

Instead of storing a model pointer, we create an instance which contains the current values of model parameters. The captured values are now disconnected from user-level changes and will stay for the lifetime of the process object. Allocating the model via a pointer guarantees the `target` attribute.

The RNG factory object is imported by moving the allocation.

⟨*Processes: process config data: TBP*⟩+≡
```
   procedure :: init => process_config_data_init
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_config_data_init &
     (config, meta, os_data, qcd, rng_factory, model_list)
  class(process_config_data_t), intent(out) :: config
  type(process_metadata_t), intent(in) :: meta
  type(os_data_t), intent(in) :: os_data
  type(qcd_t), intent(in) :: qcd
  class(rng_factory_t), intent(inout), allocatable :: rng_factory
  type(model_list_t), intent(inout) :: model_list
  type(string_t) :: filename
  type(model_t), pointer :: model
  config%n_in = meta%lib%get_n_in (meta%id)
  config%n_components = size (meta%component_id)
  config%os_data = os_data
  config%qcd = qcd
  call move_alloc (from = rng_factory, to = config%rng_factory)
  config%model_name = meta%lib%get_model_name (meta%id)
  if (config%model_name /= "") then
     filename = config%model_name // ".mdl"
     call model_list%read_model (config%model_name, &
          filename, config%os_data, model)
     allocate (config%model)
     call model_init_instance (config%model, model)
  end if
end subroutine process_config_data_init
```

Since the captured model is a separate object allocated via a pointer, we need a finalizer.

⟨*Processes: process config data: TBP*⟩+≡
```
    procedure :: final => process_config_data_final
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_config_data_final (config)
      class(process_config_data_t), intent(inout) :: config
      if (associated (config%model)) then
         call model_final (config%model)
         deallocate (config%model)
      end if
    end subroutine process_config_data_final
```

Compute the MD5 sum of the configuration data. This encodes, in particular, the model and the expressions for cut, scales, weight, etc. It should not contain the IDs and number of components, etc., since the MD5 sum should be useful for integrating individual components.

This is done only once. If the MD5 sum is nonempty, the calculation is skipped.

⟨*Processes: process config data: TBP*⟩+≡
```
    procedure :: compute_md5sum => process_config_data_compute_md5sum
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_config_data_compute_md5sum (config)
      class(process_config_data_t), intent(inout) :: config
      integer :: u
      if (config%md5sum == "") then
         u = free_unit ()
         open (u, status = "scratch", action = "readwrite")
         call config%write (u, counters = .false., os_data = .false., &
              rng_factory = .false., model = .true., expressions = .true.)
         rewind (u)
         config%md5sum = md5sum (u)
         close (u)
      end if
    end subroutine process_config_data_compute_md5sum
```

15.5.4 Beam configuration

The object `data` holds all details about the initial beam configuration. The allocatable array `sf` holds the structure-function configuration blocks. There are `n_strfun` entries in the structure-function chain (not counting the initial beam object). We maintain `n_channel` independent parameterizations of this chain. If this is greater than zero, we need a multi-channel sampling algorithm, where for each point one channel is selected to generate kinematics.

The number of parameters that are required for generating a structure-function chain is `n_sfpar`.

The flag `azimuthal_dependence` tells whether the process setup is symmetric about the beam axis in the c.m. system. This implies that there is no transversal beam polarization. The flag `lab_is_cm_frame` is obvious.

⟨*Processes: process part types*⟩+≡

```
type :: process_beam_config_t
   private
   type(beam_data_t) :: data
   integer :: n_strfun = 0
   integer :: n_channel = 1
   integer :: n_sfpar = 0

            end if
         end if
      end if
    end subroutine process_beam_config_write
```

The beam data have a finalizer. We assume that there is none for the structure-function data.

⟨*Processes: process beam config: TBP*⟩+≡

```
      procedure :: final => process_beam_config_final
```
⟨*Processes: procedures*⟩+≡
```
    subroutine process_beam_config_final (object)
      class(process_beam_config_t), intent(inout) :: object
      call beam_data_final (object%data)
    end subroutine process_beam_config_final
```

Initialize the beam setup with a given beam structure object.

⟨*Processes: process beam config: TBP*⟩+≡
```
    procedure :: init_beam_structure => process_beam_config_init_beam_structure
```
⟨*Processes: procedures*⟩+≡
```
    subroutine process_beam_config_init_beam_structure &
        (beam_config, beam_structure, sqrts, model, decay_rest_frame)
      class(process_beam_config_t), intent(out) :: beam_config
      type(beam_structure_t), intent(in) :: beam_structure
      logical, intent(in), optional :: decay_rest_frame
      real(default), intent(in) :: sqrts
      type(model_t), intent(in), target :: model
      call beam_data_init_structure (beam_config%data, &
          beam_structure, sqrts, model, decay_rest_frame)
      beam_config%lab_is_cm_frame = beam_data_cm_frame (beam_config%data)
    end subroutine process_beam_config_init_beam_structure
```

Initialize the beam setup for a scattering process with specified flavor combination, other properties taken from the beam structure object (if any).

⟨*Processes: process beam config: TBP*⟩+≡
```
    procedure :: init_scattering => process_beam_config_init_scattering
```
⟨*Processes: procedures*⟩+≡
```
    subroutine process_beam_config_init_scattering &
        (beam_config, flv_in, sqrts, beam_structure)
      class(process_beam_config_t), intent(out) :: beam_config
      type(flavor_t), dimension(2), intent(in) :: flv_in
      real(default), intent(in) :: sqrts

      if (status <= STAT_FAILED_KINEMATICS) then
         counter%failed_kinematics = counter%failed_kinematics + 1
      else if (status <= STAT_FAILED_CUTS) then
         counter%failed_cuts = counter%failed_cuts + 1
      else if (status <= STAT_PASSED_CUTS) then
         counter%passed = counter%passed + 1
      else
         counter%evaluated = counter%evaluated + 1
      end if
      counter%total = counter%total + 1
    end subroutine process_counter_record
```

15.5.5   Multi-channel integration

The `process_mci_entry_t` block contains, for each process component that is integrated independently, the configuration data for its MC input parameters. Each input parameter set is handled by a `mci_t` integrator.

The MC input parameter set is broken down into the parameters required by the structure-function chain and the parameters required by the phase space of the elementary process.

The MD5 sum collects all information about the associated processes that may affect the integration. It does not contain the MCI object itself or integration results.

MC integration is organized in passes. Each pass may consist of several iterations, and for each iteration there is a number of calls. We store explicitly the values that apply to the current pass. Previous values are archived in the `results` object.

The `counter` receives the counter statistics from the associated process instance, for diagnostics.

The `results` object records results, broken down in passes and iterations.

⟨*Processes: process part types*⟩+≡
```
type :: process_mci_entry_t
   integer :: i_mci = 0
   integer, dimension(:), allocatable :: i_component
   integer :: process_type = PRC_UNKNOWN
   integer :: n_par = 0
   integer :: n_par_sf = 0
   integer :: n_par_phs = 0

      end if
    end subroutine process_mci_entry_write
```

Write the weights that are assigned to the chains of channels (call groves in the
`wood` phase-space implementation. This depends on the implementation and is
delegated to the `mci` component.

⟨*Processes: process mci entry: TBP*⟩+≡
```
    procedure :: write_chain_weights => process_mci_entry_write_chain_weights
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_mci_entry_write_chain_weights (mci_entry, unit)
      class(process_mci_entry_t), intent(in) :: mci_entry
      integer, intent(in), optional :: unit
      if (allocated (mci_entry%mci)) then
         call mci_entry%mci%write_chain_weights (unit)
      end if
    end subroutine process_mci_entry_write_chain_weights
```

Initialize. From the existing configuration, we obtain the number of channels
and the number of parameters, separately for the structure-function chain and
for the associated process component. We assume that the phase-space object
has already been configured.

The allocation of the MCI integrator with the appropriate concrete type is
the duty of the process core.

We assume that there is only one component associated with a MCI entry.
This restriction should be relaxed.

⟨*Processes: process mci entry: TBP*⟩+≡

         call mci_entry%mci%set_md5sum (mci_entry%md5sum)
      end if
    end subroutine process_mci_entry_compute_md5sum
```

Test the MCI sampler by calling it a given number of time, discarding the results. The instance should be initialized.

The `mci_entry` is `intent(inout)` because the integrator contains the random-number state.

⟨*Processes: process mci entry: TBP*⟩+≡
```
    procedure :: sampler_test => process_mci_entry_sampler_test
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_mci_entry_sampler_test (mci_entry, instance, n_calls)
      class(process_mci_entry_t), intent(inout) :: mci_entry
      type(process_instance_t), intent(inout), target :: instance
      integer, intent(in) :: n_calls
      call instance%choose_mci (mci_entry%i_mci)
      call instance%reset_counter ()
      call mci_entry%mci%sampler_test (instance, n_calls)
      mci_entry%counter = instance%get_counter ()
    end subroutine process_mci_entry_sampler_test
```

Integrate. The instance should be initialized.

The `integrate` method counts as an integration pass; the pass count is increased by one. We transfer the pass parameters (number of iterations and number of calls) to the actual integration routine.

The `mci_entry` is `intent(inout)` because the integrator contains the random-number state.

Note: The results are written to screen and to logfile. This behavior is hardcoded.

⟨*Processes: process mci entry: TBP*⟩+≡
```

    end subroutine process_mci_entry_prepare_simulation
```

Generate an event. The instance should be initialized, otherwise event generation is directed by the `mci` integrator subobject. The integrator instance is contained in a `mci_work` subobject of the process instance, which simultaneously serves as the sampler object. (We avoid the anti-aliasing rules if we assume that the sampling itself does not involve the integrator instance contained in the process instance.)

Regarding weighted events, we only take events which are valid, which means that they have valid kinematics and have passed cuts. Therefore, we have a rejection loop. For unweighted events, the unweighting routine should already take care of this.

⟨*Processes: process mci entry: TBP*⟩+≡

    function process_mci_entry_get_md5sum (entry) result (md5sum)
      class(process_mci_entry_t), intent(in) :: entry
      character(32) :: md5sum
      md5sum = entry%mci%get_md5sum ()
    end function process_mci_entry_get_md5sum
```

15.5.6 Process Components

A process component is an individual contribution to a process (scattering or decay) which needs not be physical. The sum over all components should be physical.

The `index` indentifies this component within its parent process.

The actual process component is stored in the `core` subobject. We use a polymorphic subobject instead of an extension of `process_component_t`, because the individual entries in the array of process components can have different types. In short, `process_component_t` is a wrapper for the actual process variants.

If the `active` flag is false, we should skip this component. This happens if the associated process has vanishing matrix element.

The index array `i_term` points to the individual terms generated by this component. The indices refer to the parent process.

The index `i_mci` is the index of the MC integrator and parameter set which are associated to this process component.

⟨*Processes: process part types*⟩+≡
```
type :: process_component_t
  private
  type(process_component_def_t), pointer :: config => null ()
  integer :: index = 0
  class(prc_core_t), allocatable :: core
  logical :: active = .false.
  class(mci_t), allocatable :: mci_template
  integer, dimension(:), allocatable :: i_term
  integer :: i_mci = 0
  class(phs_config_t), allocatable :: phs_config
  character(32) :: md5sum_phs = ""
 contains
 ⟨Processes: process component: TBP⟩
end type process_component_t
```

Finalizer. The MCI template may (potentially) need a finalizer. The process configuration finalizer may include closing an open scratch file.

⟨*Processes: process component: TBP*⟩≡
```
procedure :: final => process_component_final
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_component_final (object)
  class(process_component_t), intent(inout) :: object
  if (allocated (object%mci_template)) then
     call object%mci_template%final ()
  end if
  if (allocated (object%phs_config)) then
     call object%phs_config%final ()
  end if
end subroutine process_component_final
```

The meaning of `verbose` depends on the process variant.

⟨*Processes: process component: TBP*⟩+≡
```
procedure :: write => process_component_write
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_component_write (object, unit)
  class(process_component_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
  if (allocated (object%core)) then
     write (u, "(1x,A,I0)")  "Component #", object%index
     if (associated (object%config)) then

      allocate (component%core, source=core_template)
      call component%core%init (component%config%get_core_def_ptr (), &
          meta%lib, meta%id, i_component)
      component%active = component%core%has_matrix_element ()
      if (component%active) then
         if (allocated (mci_template)) &
              allocate (component%mci_template, source=mci_template)
         allocate (component%phs_config, source=phs_config_template)
         call component%phs_config%init (component%core%data, config%model)
```

```
            end if
      end subroutine process_component_init
```

Finalize the phase-space configuration.

⟨*Processes: process component: TBP*⟩+≡
```
      procedure :: configure_phs => process_component_configure_phs
```

⟨*Processes: procedures*⟩+≡
```
      subroutine process_component_configure_phs &
          (component, sqrts, beam_config, rebuild, ignore_mismatch)
        class(process_component_t), intent(inout) :: component
        real(default), intent(in) :: sqrts
        type(process_beam_config_t), intent(in) :: beam_config
        logical, intent(in), optional :: rebuild
        logical, intent(in), optional :: ignore_mismatch
        logical :: no_strfun
        no_strfun = beam_config%n_strfun == 0
        call component%phs_config%configure (sqrts, &
             azimuthal_dependence = beam_config%azimuthal_dependence, &
             sqrts_fixed = no_strfun, &
             cm_frame = beam_config%lab_is_cm_frame .and. no_strfun, &
             rebuild = rebuild, ignore_mismatch = ignore_mismatch)
        call component%phs_config%startup_message ()
      end subroutine process_component_configure_phs
```

The process component possesses two MD5 sums: the checksum of the component definition, which should be available when the component is initialized, and the phase-space MD5 sum, which is available after configuration.

⟨*Processes: process component: TBP*⟩+≡
```
      procedure :: compute_md5sum => process_component_compute_md5sum
```

⟨*Processes: procedures*⟩+≡
```
      subroutine process_component_compute_md5sum (component)
        class(process_component_t), intent(inout) :: component
        component%md5sum_phs = component%phs_config%get_md5sum ()
      end subroutine process_component_compute_md5sum
```

Match phase-space channels with structure-function channels, where applicable.
    This calls a method of the `phs_config` phase-space implementation.

⟨*Processes: process component: TBP*⟩+≡
```
      procedure :: collect_channels => process_component_collect_channels
```

⟨*Processes: procedures*⟩+≡
```
      subroutine process_component_collect_channels (component, coll)
        class(process_component_t), intent(inout) :: component
        type(phs_channel_collection_t), intent(inout) :: coll
        call component%phs_config%collect_channels (coll)
      end subroutine process_component_collect_channels
```

Return the number of phase-space parameters.

⟨*Processes: process component: TBP*⟩+≡
```
      procedure :: get_n_phs_par => process_component_get_n_phs_par
```

⟨*Processes: procedures*⟩+≡
```
    function process_component_get_n_phs_par (component) result (n_par)
      class(process_component_t), intent(in) :: component
      integer :: n_par
      n_par = component%phs_config%get_n_par ()
    end function process_component_get_n_phs_par
```

Return the incoming flavor combination as an array of PDG arrays, one for a decay or two for a scattering process.

⟨*Processes: process component: TBP*⟩+≡
```
    procedure :: get_pdg_in => process_component_get_pdg_in
```

⟨*Processes: procedures*⟩+≡
```
    function process_component_get_pdg_in (component) result (pdg_in)
      class(process_component_t), intent(in) :: component
      type(pdg_array_t), dimension(:), allocatable :: pdg_in
      type(pdg_array_t) :: pdg_tmp
      integer :: i
      associate (data => component%core%data)
        allocate (pdg_in (data%n_in))
        do i = 1, data%n_in
           pdg_tmp = data%flv_state(i,:)
           pdg_in(i) = sort_abs (pdg_tmp, unique = .true.)
        end do
      end associate
    end function process_component_get_pdg_in
```

15.5.7 Process terms

For straightforward tree-level calculations, each process component corresponds to a unique elementary interaction. However, in the case of NLO calculations with subtraction terms, a process component may split into several separate contributions to the scattering, which are qualified by interactions with distinct kinematics and particle content. We represent their configuration as `process_term_t` objects, the actual instances will be introduced below as `term_instance_t`. In any case, the process term contains an elementary interaction with a definite quantum-number and momentum content.

The index `i_term_global` identifies the term relative to the process.

The index `i_component` identifies the process component which generates this term, relative to the parent process.

The index `i_term` identifies the term relative to the process component (not the process).

The `data` subobject holds all process constants.

The number of allowed flavor/helicity/color combinations is stored as `n_allowed`. This is the total number of independent entries in the density matrix. For each combination, the index of the flavor, helicity, and color state is stored in the arrays `flv`, `hel`, and `col`, respectively.

The flag `rearrange` is true if we need to rearrange the particles of the hard interaction, to obtain the effective parton state.

The interaction `int` holds the quantum state for the (resolved) hard interaction, the parent-child relations of the particles, and their momenta. The

2032

momenta are not filled yet; this is postponed to copies of `int` which go into the process instances.

If recombination is in effect, we should allocate `int_eff` to describe the rearranged partonic state.

⟨*Processes: process part types*⟩+≡
```
type :: process_term_t
   integer :: i_term_global = 0
   integer :: i_component = 0
   integer :: i_term = 0
   integer :: n_allowed = 0
   type(process_constants_t) :: data
   real(default) :: alpha_s = 0
   integer, dimension(:), allocatable :: flv, hel, col
   logical :: rearrange = .false.
   type(interaction_t) :: int
   type(interaction_t), pointer :: int_eff => null ()
 contains
 ⟨Processes: process term: TBP⟩
end type process_term_t
```

For the output, we skip the process constants and the tables of allowed quantum numbers. Those can also be read off from the interaction object.

⟨*Processes: process term: TBP*⟩≡
```
procedure :: write => process_term_write
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_term_write (term, unit)
  class(process_term_t), intent(in) :: term
  integer, intent(in), optional :: unit
  integer :: u
  u = output_unit (unit)
  write (u, "(1x,A,I0)")  "Term #", term%i_term_global
  write (u, "(3x,A,I0)")  "Process component index     = ", &
       term%i_component
  write (u, "(3x,A,I0)")  "Term index w.r.t. component = ", &
       term%i_term
  write (u, "(3x,A,L1)")  "Rearrange partons           = ", &
       term%rearrange
  call write_separator (u)
  write (u, "(1x,A)")  "Hard interaction:"
  call write_separator (u)
  call interaction_write (term%int, u)
  if (term%rearrange) then
     call write_separator (u)
     write (u, "(1x,A)")  "Rearranged hard interaction:"
     call write_separator (u)
     call interaction_write (term%int_eff, u)
  end if
end subroutine process_term_write
```

Write an account of all quantum number states and their current status.

⟨*Processes: process term: TBP*⟩+≡
```
procedure :: write_state_summary => process_term_write_state_summary
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_term_write_state_summary (term, core, unit)
      class(process_term_t), intent(in) :: term
      class(prc_core_t), intent(in) :: core
      integer, intent(in), optional :: unit
      integer :: u, i, f, h, c
      type(state_iterator_t) :: it
      character :: sgn
      u = output_unit (unit)
      write (u, "(1x,A,I0)")  "Term #", term%i_term_global
      call state_iterator_init (it, interaction_get_state_matrix_ptr (term%int))
      do while (state_iterator_is_valid (it))
         i = state_iterator_get_me_index (it)
         f = term%flv(i)
         h = term%hel(i)
         c = term%col(i)
         if (core%is_allowed (term%i_term, f, h, c)) then
            sgn = "+"
         else
            sgn = " "
         end if
         write (u, "(1x,A1,1x,I0,2x)", advance="no")  sgn, i
         call quantum_numbers_write (state_iterator_get_quantum_numbers (it), u)
         write (u, *)
         call state_iterator_advance (it)
      end do
    end subroutine process_term_write_state_summary
```

Finalizer: the `int` and potentially `int_eff` components have a finalizer that we must call.

⟨*Processes: process term: TBP*⟩+≡
```
    procedure :: final => process_term_final
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_term_final (term)
      class(process_term_t), intent(inout) :: term
      call interaction_final (term%int)
      if (term%rearrange) then
         call interaction_final (term%int_eff)
         deallocate (term%int_eff)
      end if
    end subroutine process_term_final
```

Initialize the term. We copy the process constants from the `core` object and set up the `int` hard interaction accordingly.

The `alpha_s` value is useful for writing external event records. This is the constant value which may be overridden by a event-specific running value. If the model does not contain the strong coupling, the value is zero.

The `rearrange` part is commented out; this or something equivalent could become relevant for NLO algorithms.

⟨*Processes: process term: TBP*⟩+≡
```
    procedure :: init => process_term_init
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_term_init &
         (term, i_term_global, i_component, i_term, core, model)
      class(process_term_t), intent(inout), target :: term
      integer, intent(in) :: i_term_global
      integer, intent(in) :: i_component
      integer, intent(in) :: i_term
      class(prc_core_t), intent(in) :: core
      type(model_t), intent(in), target :: model
      type(var_list_t), pointer :: var_list
      term%i_term_global = i_term_global
      term%i_component = i_component
      term%i_term = i_term
      call core%get_constants (term%data, i_term)
      var_list => model_get_var_list_ptr (model)
      if (var_list_exists (var_list, var_str ("alphas"))) then
         term%alpha_s = var_list_get_rval (var_list, var_str ("alphas"))
      else
         term%alpha_s = -1
      end if
      call term%setup_interaction (core, model)
  !      if (term%rearrange) then
  !         call term%setup_effective_interaction (core, term%int, term%int_eff)
  !      end if
    end subroutine process_term_init
```

We fetch the process constants which determine the quantum numbers and use those to create the interaction. The interaction contains incoming and outgoing particles, no virtuals. The incoming particles are parents of the outgoing ones.

Keeping previous WHIZARD conventions, we invert the color assignment (but not flavor or helicity) for the incoming particles. When the color-flow square matrix is evaluated, this inversion is done again, so in the color-flow sequence we get the color assignments of the matrix element.

⟨*Processes: process term: TBP*⟩+≡
```
    procedure :: setup_interaction => process_term_setup_interaction
```

⟨*Processes: procedures*⟩+≡

           end do
        end do
     end do
     call interaction_freeze (term%int)
   end associate
 end subroutine process_term_setup_interaction
```

15.5.8   Default Iterations

If the user does not specify the passes and iterations for integration, we should
be able to give reasonable defaults. These depend on the process, therefore
we implement the following procedures as methods of the process object. The
algorithm is not very sophisticated yet, it may be improved by looking at the
process in more detail.

We investigate only the first process component, assuming that it character-
izes the complexity of the process reasonable well.

The number of passes is limited to two: one for adaption, one for integration.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_n_pass_default => process_get_n_pass_default
    procedure :: adapt_grids_default => process_adapt_grids_default
    procedure :: adapt_weights_default => process_adapt_weights_default
```

⟨*Processes: procedures*⟩+≡
```
    function process_get_n_pass_default (process) result (n_pass)
      class(process_t), intent(in) :: process
```

```
    integer :: n_pass
    integer :: n_eff
    type(process_component_def_t), pointer :: config
    config => process%component(1)%config
    n_eff = config%get_n_tot () - 2
    select case (n_eff)
    case (1)
       n_pass = 1
    case default
       n_pass = 2
    end select
  end function process_get_n_pass_default

  function process_adapt_grids_default (process, pass) result (flag)
    class(process_t), intent(in) :: process
    integer, intent(in) :: pass
    logical :: flag
    integer :: n_eff
    type(process_component_def_t), pointer :: config
    config => process%component(1)%config
    n_eff = config%get_n_tot () - 2
    select case (n_eff)
    case (1)
       flag = .false.
    case default
       select case (pass)
       case (1);  flag = .true.
       case (2);  flag = .false.
       case default
          call msg_bug ("adapt grids default: impossible pass index")
       end select
    end select
  end function process_adapt_grids_default

  function process_adapt_weights_default (process, pass) result (flag)
    class(process_t), intent(in) :: process
    integer, intent(in) :: pass
    logical :: flag
    integer :: n_eff
    type(process_component_def_t), pointer :: config
    config => process%component(1)%config
    n_eff = config%get_n_tot () - 2
    select case (n_eff)
    case (1)
       flag = .false.
    case default
       select case (pass)
       case (1);  flag = .true.
       case (2);  flag = .false.
       case default
          call msg_bug ("adapt weights default: impossible pass index")
       end select
    end select
  end function process_adapt_weights_default
```

The number of iterations and calls per iteration depends on the number of outgoing particles.

⟨*Processes: process: TBP*⟩+≡
```

15.5.9   Constant process data

The following methods return basic process data that stay constant after initialization.

The process and IDs.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_id => process_get_id
    procedure :: get_num_id => process_get_num_id
    procedure :: get_run_id => process_get_run_id
    procedure :: get_library_name => process_get_library_name
```
⟨*Processes: procedures*⟩+≡
```
    function process_get_id (process) result (id)
      class(process_t), intent(in) :: process
      type(string_t) :: id
      id = process%meta%id
    end function process_get_id

    function process_get_num_id (process) result (id)
      class(process_t), intent(in) :: process
      integer :: id
      id = process%meta%num_id
    end function process_get_num_id

    function process_get_run_id (process) result (id)
      class(process_t), intent(in) :: process
      type(string_t) :: id
      id = process%meta%run_id
    end function process_get_run_id

    function process_get_library_name (process) result (id)
      class(process_t), intent(in) :: process
      type(string_t) :: id
      id = process%meta%lib%get_name ()
    end function process_get_library_name
```

The number of incoming particles.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_n_in => process_get_n_in
```
⟨*Processes: procedures*⟩+≡
```
    function process_get_n_in (process) result (n)
      class(process_t), intent(in) :: process
```

```
      integer :: n
      n = process%config%n_in
    end function process_get_n_in
```

The number of MCI data sets.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_n_mci => process_get_n_mci
```

⟨*Processes: procedures*⟩+≡
```
    function process_get_n_mci (process) result (n)
      class(process_t), intent(in) :: process
      integer :: n
      n = process%config%n_mci
    end function process_get_n_mci
```

The number of process components, total.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_n_components => process_get_n_components
```

⟨*Processes: procedures*⟩+≡
```
    function process_get_n_components (process) result (n)
      class(process_t), intent(in) :: process
      integer :: n
      n = process%meta%n_components
    end function process_get_n_components
```

The number of process terms, total.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_n_terms => process_get_n_terms
```

⟨*Processes: procedures*⟩+≡
```
    function process_get_n_terms (process) result (n)
      class(process_t), intent(in) :: process
      integer :: n
      n = process%config%n_terms
    end function process_get_n_terms
```

Return the indices of the components that belong to a specific MCI entry.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_i_component => process_get_i_component
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_get_i_component (process, i_mci, i_component)
      class(process_t), intent(in) :: process
      integer, intent(in) :: i_mci
      integer, dimension(:), intent(out), allocatable :: i_component
      associate (mci_entry => process%mci_entry(i_mci))
        allocate (i_component (size (mci_entry%i_component)))
        i_component = mci_entry%i_component
      end associate
    end subroutine process_get_i_component
```

Return the ID of a specific component.

⟨Processes: process: TBP⟩+≡
```
    procedure :: get_component_id => process_get_component_id
```

⟨Processes: procedures⟩+≡
```
    function process_get_component_id (process, i_component) result (id)
      class(process_t), intent(in) :: process
      integer, intent(in) :: i_component
      type(string_t) :: id
      id = process%meta%component_id(i_component)
    end function process_get_component_id
```

Return a pointer to the definition of a specific component.

⟨Processes: process: TBP⟩+≡
```
    procedure :: get_component_def_ptr => process_get_component_def_ptr
```

⟨Processes: procedures⟩+≡
```
    function process_get_component_def_ptr (process, i_component) result (ptr)
      class(process_t), intent(in) :: process
      integer, intent(in) :: i_component
      type(process_component_def_t), pointer :: ptr
      ptr => process%meta%lib%get_component_def_ptr (process%meta%id, i_component)
    end function process_get_component_def_ptr
```

These procedures extract and restore (by transferring the allocation) the process
core. This is useful for changing process parameters from outside this module.

⟨Processes: process: TBP⟩+≡
```
    procedure :: extract_component_core => process_extract_component_core
    procedure :: restore_component_core => process_restore_component_core
```

⟨Processes: procedures⟩+≡
```
    subroutine process_extract_component_core (process, i_component, core)
      class(process_t), intent(inout) :: process
      integer, intent(in) :: i_component
      class(prc_core_t), intent(inout), allocatable :: core
      call move_alloc (from = process%component(i_component)%core, to = core)
    end subroutine process_extract_component_core

    subroutine process_restore_component_core (process, i_component, core)
      class(process_t), intent(inout) :: process
      integer, intent(in) :: i_component
      class(prc_core_t), intent(inout), allocatable :: core
      call move_alloc (from = core, to = process%component(i_component)%core)
    end subroutine process_restore_component_core
```

The block of process constants.

⟨Processes: process: TBP⟩+≡
```
    procedure :: get_constants => process_get_constants
```

⟨Processes: procedures⟩+≡
```
    function process_get_constants (process, i) result (data)
      class(process_t), intent(in) :: process
      integer, intent(in) :: i
      type(process_constants_t) :: data
```

2041

```
      data = process%component(i)%core%data
   end function process_get_constants
```

Return the set of outgoing flavors that are associated with a particular term.
We deduce this from the effective interaction.

⟨*Processes: process: TBP*⟩+≡
```
   procedure :: get_term_flv_out => process_get_term_flv_out
```

⟨*Processes: procedures*⟩+≡
```
   subroutine process_get_term_flv_out (process, i_term, flv)
     class(process_t), intent(in), target :: process
     integer, intent(in) :: i_term
     type(flavor_t), dimension(:,:), allocatable, intent(out) :: flv
     type(interaction_t), pointer :: int
     int => process%term(i_term)%int_eff
     if (.not. associated (int))  int => process%term(i_term)%int
     call interaction_get_flv_out (int, flv)
   end subroutine process_get_term_flv_out
```

Return true if there is any unstable particle in any of the process terms. We
decide this based on the provided model instance, not the one that is stored in
the process object.

⟨*Processes: process: TBP*⟩+≡
```
   procedure :: contains_unstable => process_contains_unstable
```

⟨*Processes: procedures*⟩+≡
```
   function process_contains_unstable (process, model) result (flag)
     class(process_t), intent(in) :: process
     type(model_t), intent(in), target :: model
     logical :: flag
     integer :: i_term
     type(flavor_t), dimension(:,:), allocatable :: flv
     flag = .false.
     do i_term = 1, process%get_n_terms ()
        call process%get_term_flv_out (i_term, flv)
        call flavor_set_model (flv, model)
        flag = .not. all (flavor_is_stable (flv))
        deallocate (flv)
        if (flag)  return
     end do
   end function process_contains_unstable
```

The nominal process energy.

⟨*Processes: process: TBP*⟩+≡
```
   procedure :: get_sqrts => process_get_sqrts
```

⟨*Processes: procedures*⟩+≡
```
   function process_get_sqrts (process) result (sqrts)
     class(process_t), intent(in) :: process
     real(default) :: sqrts
     sqrts = beam_data_get_sqrts (process%beam_config%data)
   end function process_get_sqrts
```

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: has_matrix_element => process_has_matrix_element
```

⟨*Processes: procedures*⟩+≡
```
    function process_has_matrix_element (process, i) result (flag)
      class(process_t), intent(in) :: process
      integer, intent(in), optional :: i
      logical :: flag
      if (present (i)) then
         flag = process%component(i)%active
      else
         flag = any (process%component%active)
      end if
    end function process_has_matrix_element
```

Pointer to the beam data object.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_beam_data_ptr => process_get_beam_data_ptr
```

⟨*Processes: procedures*⟩+≡
```
    function process_get_beam_data_ptr (process) result (beam_data)
      class(process_t), intent(in), target :: process
      type(beam_data_t), pointer :: beam_data
      beam_data => process%beam_config%data
    end function process_get_beam_data_ptr
```

Return true if lab and c.m. frame coincide for this process.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: cm_frame => process_cm_frame
```

⟨*Processes: procedures*⟩+≡
```
    function process_cm_frame (process) result (flag)
      class(process_t), intent(in), target :: process
      logical :: flag
      type(beam_data_t), pointer :: beam_data
      beam_data => process%beam_config%data
      flag = beam_data_cm_frame (beam_data)
    end function process_cm_frame
```

Get the PDF set currently in use, if any.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_pdf_set => process_get_pdf_set
```

⟨*Processes: procedures*⟩+≡
```
    function process_get_pdf_set (process) result (pdf_set)
      class(process_t), intent(in) :: process
      integer :: pdf_set
      pdf_set = process%beam_config%get_pdf_set ()
    end function process_get_pdf_set
```

Pointer to the process variable list.

⟨*Processes: process: TBP*⟩+≡
```
    procedure :: get_var_list_ptr => process_get_var_list_ptr
```

⟨*Processes: procedures*⟩+≡
```
function process_get_var_list_ptr (process) result (ptr)
  class(process_t), intent(in), target :: process
  type(var_list_t), pointer :: ptr
  ptr => process%meta%var_list
end function process_get_var_list_ptr
```

Pointer to the common model.

⟨*Processes: process: TBP*⟩+≡
```
procedure :: get_model_ptr => process_get_model_ptr
```

⟨*Processes: procedures*⟩+≡
```
function process_get_model_ptr (process) result (ptr)
  class(process_t), intent(in) :: process
  type(model_t), pointer :: ptr
  ptr => process%config%model
end function process_get_model_ptr
```

Use the embedded RNG factory to spawn a new random-number generator instance. (This modifies the state of the factory.)

⟨*Processes: process: TBP*⟩+≡
```
procedure :: make_rng => process_make_rng
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_make_rng (process, rng)
  class(process_t), intent(inout) :: process
  class(rng_t), intent(out), allocatable :: rng
  if (allocated (process%config%rng_factory)) then
     call process%config%rng_factory%make (rng)
  else
     call msg_bug ("Process: make rng: factory not allocated")
  end if
end subroutine process_make_rng
```

15.5.10 Compute an amplitude

Each process variant should allow for computing an amplitude value directly, without generating a process instance.

The process component is selected by the index `i`. The term within the process component is selected by `j`. The momentum combination is transferred as the array `p`. The function sets the specific quantum state via the indices of a flavor `f`, helicity `h`, and color `c` combination. Each index refers to the list of flavor, helicity, and color states, respectively, as stored in the process data.

Optionally, we may set factorization and renormalization scale. If unset, the partonic c.m. energy is inserted.

The function checks arguments for validity. For invalid arguments (quantum states), we return zero.

⟨*Processes: process: TBP*⟩+≡
```
procedure :: compute_amplitude => process_compute_amplitude
```

⟨*Processes: procedures*⟩+≡

```
function process_compute_amplitude &
    (process, i, j, p, f, h, c, fac_scale, ren_scale) result (amp)
  class(process_t), intent(in) :: process
  integer, intent(in) :: i, j
  type(vector4_t), dimension(:), intent(in) :: p
  integer, intent(in) :: f, h, c
  real(default), intent(in), optional :: fac_scale, ren_scale
  real(default) :: fscale, rscale
  complex(default) :: amp
  amp = 0
  if (0 < i .and. i <= process%meta%n_components) then
     if (process%component(i)%active) then
        associate (data => process%component(i)%core%data)
          if (size (p) == data%n_in + data%n_out &
               .and. 0 < f .and. f <= data%n_flv &
               .and. 0 < h .and. h <= data%n_hel &
               .and. 0 < c .and. c <= data%n_col) then
             if (present (fac_scale)) then
                fscale = fac_scale
             else
                fscale = sum (p(data%n_in+1:)) ** 1
             end if
             if (present (ren_scale)) then
                rscale = ren_scale
             else
                rscale = fscale
             end if
             amp = process%component(i)%core% &
                  compute_amplitude (j, p, f, h, c, fscale, rscale)
          end if
        end associate
     else
        amp = 0
     end if
  end if
end function process_compute_amplitude
```

This is for suppression of numerical noise in the integration results stored in the `process_mci_entry` type. As the error and efficiency enter the MD5 sum, we recompute it.

⟨*Processes: process: TBP*⟩+≡

```
procedure :: pacify => process_pacify
```

⟨*Processes: procedures*⟩+≡

```
subroutine process_pacify (process, efficiency_reset, error_reset)
  class(process_t), intent(inout) :: process
  logical, intent(in), optional :: efficiency_reset, error_reset
  logical :: eff_reset, err_reset
  integer :: i
  eff_reset = .false.
  err_reset = .false.
  if (present (efficiency_reset))  eff_reset = efficiency_reset
  if (present (error_reset))  err_reset = error_reset
```

```
   if (allocated (process%mci_entry)) then
      do i = 1, size (process%mci_entry)
         call process%mci_entry(i)%results%pacify (efficiency_reset)
         if (allocated (process%mci_entry(i)%mci)) then
            if (process%mci_entry(i)%mci%error_known .and. err_reset) &

            select type (mci => process%mci_entry(i)%mci)
            type is (mci_vamp_t)
               call mci%pacify (efficiency_reset, error_reset)
               call mci%compute_md5sum ()
            end select
         end if
      end do
   end if
 end subroutine process_pacify
```

15.5.11   Process instances

Kinematics instance

In this data type we combine all objects (instances) necessary for generating (or recovering) a kinematical configuration. The components work together as an implementation of multi-channel phase space.

sf_chain is an instance of the structure-function chain. It is used both for generating kinematics and, after the proper scale has been determined, evaluating the structure function entries.

phs is an instance of the phase space for the elementary process.

The array f contains the products of the Jacobians that originate from parameter mappings in the structure-function chain or in the phase space. We allocate this explicitly if either sf_chain or phs are explicitly allocated, otherwise we can take over a pointer.

All components are implemented as pointers to (anonymous) targets. For each component, there is a flag that tells whether this component is to be regarded as a proper component ('owned' by the object) or as a pointer.

⟨*Processes: types*⟩+≡
```
   type :: kinematics_t
      integer :: n_in = 0
      integer :: n_channel = 0
      integer :: selected_channel = 0
      type(sf_chain_instance_t), pointer :: sf_chain => null ()
      class(phs_t), pointer :: phs => null ()
      real(default), dimension(:), pointer :: f => null ()
      real(default) :: phs_factor
      logical :: sf_chain_allocated = .false.
      logical :: phs_allocated = .false.
      logical :: f_allocated = .false.
    contains
    ⟨Processes: kinematics: TBP⟩
   end type kinematics_t
```

Output. Show only those components which are marked as owned.

⟨*Processes: kinematics: TBP*⟩≡
```
procedure :: write => kinematics_write
```

⟨*Processes: procedures*⟩+≡
```
subroutine kinematics_write (object, unit)
  class(kinematics_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, c
  u = output_unit (unit)
  if (object%f_allocated) then
      write (u, "(1x,A)")  "Flux * PHS volume:"
      write (u, "(2x,ES19.12)")  object%phs_factor
      write (u, "(1x,A)")  "Jacobian factors per channel:"
      do c = 1, size (object%f)
          write (u, "(3x,I0,':',1x,ES13.7)", advance="no")  c, object%f(c)
          if (c == object%selected_channel) then
             write (u, "(1x,A)")  "[selected]"
          else
             write (u, *)
          end if
      end do
  end if
  if (object%sf_chain_allocated) then
      call write_separator (u)
      call object%sf_chain%write (u)
  end if
  if (object%phs_allocated) then
      call write_separator (u)
      call object%phs%write (u)
  end if
end subroutine kinematics_write
```

Finalizer. Delete only those components which are marked as owned.

⟨*Processes: kinematics: TBP*⟩+≡
```
procedure :: final => kinematics_final
```

⟨*Processes: procedures*⟩+≡
```
subroutine kinematics_final (object)
  class(kinematics_t), intent(inout) :: object
  if (object%sf_chain_allocated) then

      sf_channel = k%phs%config%get_sf_channel (phs_channel)
      call k%sf_chain%compute_kinematics (sf_channel, mci_work%get_x_strfun ())
      call k%sf_chain%get_out_momenta (p(1:k%n_in))
      call k%phs%set_incoming_momenta (p(1:k%n_in))
      call k%phs%compute_flux ()
      call k%phs%select_channel (phs_channel)
      call k%phs%evaluate_selected_channel &
          (phs_channel, mci_work%get_x_process ())
      if (k%phs%q_defined) then
         call k%phs%get_outgoing_momenta (p(k%n_in+1:))
         k%phs_factor = k%phs%get_overall_factor ()
         success = .true.
      else
         k%phs_factor = 0
         success = .false.
      end if
    end subroutine kinematics_compute_selected_channel
```

Complete kinematics by filling the non-selected phase-space parameter arrays.

⟨*Processes: kinematics: TBP*⟩+≡
```
    procedure :: compute_other_channels => kinematics_compute_other_channels
```

⟨*Processes: procedures*⟩+≡
```
    subroutine kinematics_compute_other_channels (k, mci_work, phs_channel)
      class(kinematics_t), intent(inout) :: k
      type(mci_work_t), intent(in) :: mci_work
      integer, intent(in) :: phs_channel
      integer :: c, c_sf
      call k%phs%evaluate_other_channels (phs_channel)
      do c = 1, k%n_channel
         c_sf = k%phs%config%get_sf_channel (c)
         k%f(c) = k%sf_chain%get_f (c_sf) * k%phs%get_f (c)
      end do
    end subroutine kinematics_compute_other_channels
```

Just fetch the outgoing momenta of the `sf_chain` subobject, which become the incoming (seed) momenta of the hard interaction.

This is a stripped down-version of the above which we use when recovering kinematics. Momenta are known, but no MC parameters yet.

(We do not use the `get_out_momenta` method of the chain, since this relies on the structure-function interactions, which are not necessary filled here. We do rely on the momenta of the last evaluator in the chain, however.)

⟨*Processes: kinematics: TBP*⟩+≡
```
    procedure :: get_incoming_momenta => kinematics_get_incoming_momenta
```

⟨*Processes: procedures*⟩+≡
```
    subroutine kinematics_get_incoming_momenta (k, p)
      class(kinematics_t), intent(in) :: k
      type(vector4_t), dimension(:), intent(out) :: p
      type(interaction_t), pointer :: int
      integer :: i
      int => k%sf_chain%get_out_int_ptr ()
      do i = 1, k%n_in
         p(i) = interaction_get_momentum (int, k%sf_chain%get_out_i (i))
      end do
    end subroutine kinematics_get_incoming_momenta
```

This inverts the remainder of the above `compute` method. We know the momenta and recover the rest, as far as needed. If we select a channel, we can complete the inversion and reconstruct the MC parameter set.

⟨*Processes: kinematics: TBP*⟩+≡
```
    procedure :: recover_mcpar => kinematics_recover_mcpar
```

⟨*Processes: procedures*⟩+≡
```

      call mci_work%set_x_process (x_phs)
    end subroutine kinematics_recover_mcpar
```

Retrieve the MC input parameter array for a specific channel. We assume that the kinematics is complete, so this is known for all channels.

⟨*Processes: kinematics: TBP*⟩+≡
```
    procedure :: get_mcpar => kinematics_get_mcpar
```

⟨*Processes: procedures*⟩+≡
```
    subroutine kinematics_get_mcpar (k, phs_channel, r)
      class(kinematics_t), intent(in) :: k
      integer, intent(in) :: phs_channel
      real(default), dimension(:), intent(out) :: r
      integer :: sf_channel, n_par_sf, n_par_phs
      sf_channel = k%phs%config%get_sf_channel (phs_channel)
      n_par_phs = k%phs%config%get_n_par ()
      n_par_sf = k%sf_chain%config%get_n_bound ()
      if (n_par_sf > 0) then
         call k%sf_chain%get_mcpar (sf_channel, r(1:n_par_sf))
      end if
      if (n_par_phs > 0) then
         call k%phs%get_mcpar (phs_channel, r(n_par_sf+1:))
      end if
    end subroutine kinematics_get_mcpar
```

Evaluate the structure function chain, assuming that kinematics is known.

The status must be precisely `SF_DONE_KINEMATICS`. We thus avoid evaluating the chain twice via different pointers to the same target.

⟨*Processes: kinematics: TBP*⟩+≡
```
    procedure :: evaluate_sf_chain => kinematics_evaluate_sf_chain
```

⟨*Processes: procedures*⟩+≡
```
    subroutine kinematics_evaluate_sf_chain (k, fac_scale)
      class(kinematics_t), intent(inout) :: k
      real(default), intent(in) :: fac_scale
      select case (k%sf_chain%get_status ())
      case (SF_DONE_KINEMATICS)
```

```
        call k%sf_chain%evaluate (fac_scale)
      end select
    end subroutine kinematics_evaluate_sf_chain
```

Recover beam momenta, i.e., return the beam momenta stored in the current `sf_chain` to their source. This is a side effect.

⟨*Processes: kinematics: TBP*⟩+≡
```
    procedure :: return_beam_momenta => kinematics_return_beam_momenta
```

⟨*Processes: procedures*⟩+≡
```
    subroutine kinematics_return_beam_momenta (k)
      class(kinematics_t), intent(in) :: k
      call k%sf_chain%return_beam_momenta ()
    end subroutine kinematics_return_beam_momenta
```

Process component instance

The actual calculation of a sampling point is done from here.

The `config` pointer accesses the corresponding configuration in the `process` object.

The `active` flag indicates that we are currently computing this component, together with all other components that share the same MC parameter set. Inactive components are using a different MC parameter set and are not in use for this sampling point.

The `k_seed` subobject contains the kinematics (structure-function chain, phase space, etc.) that implements the 'seed' configuration of momenta. This version of the process kinematics is accessed by the MCI setup.

`p_seed` is the array of momenta that we compute from the MC input parameters, via the `k_seed` subobject. Depending on the process variant, these may or may not coincide with the momenta that enter the process terms associated to this component.

The `tmp` object can be used for storing intermediate results. Its precise type and contents depend on the process variant.

⟨*Processes: types*⟩+≡
```
    type :: component_instance_t
      type(process_component_t), pointer :: config => null ()
      logical :: active = .false.
      type(kinematics_t) :: k_seed
      type(vector4_t), dimension(:), allocatable :: p_seed
      logical :: sqme_known = .false.
      real(default) :: sqme = 0
      class(workspace_t), allocatable :: tmp
    contains
      ⟨Processes: component instance: TBP⟩
    end type component_instance_t
```

In the header, fetch the component index from the configuration record. `process_component_t` configuration block.

We write the `sf_chain` subobject only upon request, since its instances appear elsewhere.

⟨*Processes: component instance: TBP*⟩≡

```
          procedure :: write => component_instance_write
⟨Processes: procedures⟩+≡
      subroutine component_instance_write (object, unit, testflag)
        class(component_instance_t), intent(in) :: object
        integer, intent(in), optional :: unit
        logical, intent(in), optional :: testflag
        integer :: u, i
        u = output_unit (unit)
        if (object%active) then
           if (associated (object%config)) then

                " [inactive]"
        end if
        if (allocated (object%p_seed)) then
           write (u, "(1x,A)")  "Seed momenta:"
           do i = 1, size (object%p_seed)
              call vector4_write (object%p_seed(i), u, testflag = testflag)
           end do
        end if
        write (u, "(1x,A)")  "Squared matrix element:"
        if (object%sqme_known) then
           write (u, "(2x,ES19.12)")  object%sqme
        else
           write (u, "(2x,A)")  "[undefined]"
        end if
        call object%k_seed%write (u)
        if (allocated (object%tmp)) then
           call write_separator (u)
           call object%tmp%write (u)
        end if
      end subroutine component_instance_write
```

Finalizer

⟨*Processes: component instance: TBP*⟩+≡
```
      procedure :: final => component_instance_final
```

⟨*Processes: procedures*⟩+≡
```
      subroutine component_instance_final (object)
        class(component_instance_t), intent(inout) :: object
        call object%k_seed%final ()
      end subroutine component_instance_final
```

Initialize: associate the configuration pointer. Also initialize the process workspace, if there is anything to do. This initialization is a matter of the process core.

⟨*Processes: component instance: TBP*⟩+≡
```
      procedure :: init => component_instance_init
```

⟨*Processes: procedures*⟩+≡
```
    subroutine component_instance_init (component, config)
      class(component_instance_t), intent(out) :: component
      type(process_component_t), intent(in), target :: config
      integer :: n_in, n_tot
      component%config => config
      associate (core => component%config%core)
        n_in = core%data%n_in
        n_tot = n_in + core%data%n_out
        allocate (component%p_seed (n_tot))
        call core%allocate_workspace (component%tmp)
      end associate
    end subroutine component_instance_init
```

Initialize the seed-kinematics configuration. All subobjects are allocated explicitly.

⟨*Processes: component instance: TBP*⟩+≡
```
    procedure :: setup_kinematics => component_instance_setup_kinematics
```

⟨*Processes: procedures*⟩+≡
```
    subroutine component_instance_setup_kinematics (component, sf_chain, config)
      class(component_instance_t), intent(inout) :: component
      type(sf_chain_t), intent(in), target :: sf_chain
      type(process_beam_config_t), intent(in) :: config
      call component%k_seed%init_sf_chain &
           (component%config%core, sf_chain, config, component%tmp)
      call component%k_seed%init_phs (component%config%phs_config)
    end subroutine component_instance_setup_kinematics
```

Setup seed kinematics, starting from the MC parameter set given as argument. As a result, the `k_seed` kinematics object is evaluated (except for the structure-function matrix-element evaluation, which we postpone until we know the factorization scale), and we have a valid `p_seed` momentum array.

⟨*Processes: component instance: TBP*⟩+≡
```
    procedure :: compute_seed_kinematics => &
         component_instance_compute_seed_kinematics
```

⟨*Processes: procedures*⟩+≡
```
    subroutine component_instance_compute_seed_kinematics &
         (component, mci_work, phs_channel, success)
      class(component_instance_t), intent(inout), target :: component
      type(mci_work_t), intent(in) :: mci_work
      integer, intent(in) :: phs_channel
      logical, intent(out) :: success
      call component%k_seed%compute_selected_channel &
           (mci_work, phs_channel, component%p_seed, success)
    end subroutine component_instance_compute_seed_kinematics
```

Inverse: recover missing parts of the kinematics, given a complete set of seed momenta. Select a channel and reconstruct the MC parameter set.

⟨*Processes: component instance: TBP*⟩+≡
```
    procedure :: recover_mcpar => component_instance_recover_mcpar
```

2054

⟨*Processes: procedures*⟩+≡
```
subroutine component_instance_recover_mcpar (component, mci_work, phs_channel)
  class(component_instance_t), intent(inout), target :: component
  type(mci_work_t), intent(inout) :: mci_work
  integer, intent(in) :: phs_channel
  call component%k_seed%recover_mcpar &
       (mci_work, phs_channel, component%p_seed)
end subroutine component_instance_recover_mcpar
```

Compute the momenta in the hard interactions, one for each term that constitutes this process component. In simple cases this amounts to just copying momenta. In more advanced cases, we may generate distinct sets of momenta from the seed kinematics.

The interactions in the term instances are accessed individually. We may choose to calculate all terms at once together with the seed kinematics, use `component%tmp` for storage, and just fill the interactions here.

⟨*Processes: component instance: TBP*⟩+≡
```
procedure :: compute_hard_kinematics => &
     component_instance_compute_hard_kinematics
```

⟨*Processes: procedures*⟩+≡
```
subroutine component_instance_compute_hard_kinematics &
     (component, term, skip_term)
  class(component_instance_t), intent(inout) :: component
  type(term_instance_t), dimension(:), intent(inout) :: term
  integer, intent(in), optional :: skip_term
  integer :: j, i
  associate (core => component%config%core)
    associate (i_term => component%config%i_term)
      do j = 1, size (i_term)
         i = i_term(j)
         if (present (skip_term)) then
            if (i == skip_term)  cycle
         end if
         call core%compute_hard_kinematics &
              (component%p_seed, i, term(i)%int_hard, component%tmp)
      end do
    end associate
  end associate
end subroutine component_instance_compute_hard_kinematics
```

Here, we invert this. We fetch the incoming momenta which reside in the appropriate `sf_chain` object, stored within the `k_seed` subobject. On the other hand, we have the outgoing momenta of the effective interaction. We rely on the process core to compute the remaining seed momenta and to fill the momenta within the hard interaction. (The latter is trivial if hard and effective interaction coincide.)

After this is done, the incoming momenta in the trace evaluator that corresponds to the hard (effective) interaction, are still left undefined. We remedy this by calling `receive_kinematics` once.

⟨*Processes: component instance: TBP*⟩+≡
```
procedure :: recover_seed_kinematics => &
```

```
            component_instance_recover_seed_kinematics
```
⟨*Processes: procedures*⟩+≡
```
    subroutine component_instance_recover_seed_kinematics (component, term)
      class(component_instance_t), intent(inout) :: component
      type(term_instance_t), intent(inout) :: term
      integer :: n_in
      n_in = component%k_seed%n_in
      call component%k_seed%get_incoming_momenta (component%p_seed(1:n_in))
      associate (core => component%config%core)
        call core%recover_kinematics &
             (component%p_seed, term%int_hard, term%isolated%int_eff, &
             component%tmp)
        call term%isolated%receive_kinematics ()
      end associate
    end subroutine component_instance_recover_seed_kinematics
```

Compute the integration parameters for all channels except the selected one.

⟨*Processes: component instance: TBP*⟩+≡
```
    procedure :: compute_other_channels => &
         component_instance_compute_other_channels
```
⟨*Processes: procedures*⟩+≡
```
    subroutine component_instance_compute_other_channels &
         (component, mci_work, phs_channel)
      class(component_instance_t), intent(inout), target :: component
      type(mci_work_t), intent(in) :: mci_work

      type(term_instance_t), dimension(:), intent(in), target :: term
      type(interaction_t), pointer :: int
```

```
      real(default) :: sqme
      integer :: j, i
      component%sqme = 0
      associate (i_term => component%config%i_term)
        do j = 1, size (i_term)
           i = i_term(j)
           if (term(i)%passed) then
              int => evaluator_get_int_ptr (term(i)%connected%trace)
              sqme = interaction_get_matrix_element (int, 1)
              component%sqme = component%sqme + sqme * term(i)%weight
           end if
        end do
      end associate
      component%sqme_known = .true.
    end subroutine component_instance_evaluate_sqme
```

Term instance

A `term_instance_t` object contains all data that describe a term. Each process component consists of one or more distinct terms which may differ in kinematics, but whose squared transition matrices have to be added pointwise.

The `active` flag is set when this term is connected to an active process component. Inactive terms are skipped for kinematics and evaluation.

The `k_term` object is the instance of the kinematics setup (structure-function chain, phase space, etc.) that applies specifically to this term. In ordinary cases, it consists of straight pointers to the seed kinematics.

The `amp` array stores the amplitude values when we get them from evaluating the associated matrix-element code.

The `int_hard` interaction describes the elementary hard process. It receives the momenta and the amplitude entries for each sampling point.

The `isolated` object holds the effective parton state for the elementary interaction. The amplitude entries are computed from `int_hard`.

The `connected` evaluator set convolutes this scattering matrix with the beam (and possibly structure-function) density matrix.

The `checked` flag is set once we have applied cuts on this term. The result of this is stored in the `passed` flag. Once the term has passed cuts, we calculate the various scale and weight expressions.

⟨*Processes: types*⟩+≡

```

2058

```
      end if
   end subroutine term_instance_write
```

The interactions and evaluators must be finalized.

⟨*Processes: term instance: TBP*⟩+≡
```
   procedure :: final => term_instance_final
```

⟨*Processes: procedures*⟩+≡
```
   subroutine term_instance_final (term)
     class(term_instance_t), intent(inout) :: term
     call term%k_term%final ()
     call term%connected%final ()
     call term%isolated%final ()
     call interaction_final (term%int_hard)
   end subroutine term_instance_final
```

For initialization, we make use of defined assignment for the `interaction_t` type. This creates a deep copy.

The hard interaction (incoming momenta) is linked to the structure function instance. In the isolated state, we either set pointers to both, or we create modified copies (`rearrange`) as effective structure-function chain and interaction, respectively.

Finally, we set up the `subevt` component that will be used for evaluating observables, collecting particles from the trace evaluator in the effective connected state. Their quantum numbers must be determined by following back source links and set explicitly, since they are already eliminated in that trace.

The `rearrange` parts are still commented out; they could become relevant for a NLO algorithm.

    end subroutine term_instance_reset
```

Complete the kinematics computation for the effective parton states.
    We assume that the `compute_hard_kinematics` method of the process component instance has already been called, so the `int_hard` contains the correct

2061

hard kinematics. The duty of this procedure is first to compute the effective kinematics and store this in the `int_eff` effective interaction inside the `isolated` parton state. The effective kinematics may differ from the kinematics in the hard interaction. It may involve parton recombination or parton splitting. The `rearrange_partons` method is responsible for this part.

We may also call a method to compute the effective structure-function chain at this point. This is not implemented yet.

In the simple case that no rearrangement is necessary, as indicated by the `rearrange` flag, the effective interaction is a pointer to the hard interaction, and we can skip the rearrangement method. Similarly for the effective structure-function chain. (If we have an algorithm that uses rarrangement, it should evaluate `k_term` explicitly.)

The final step of kinematics setup is to transfer the effective kinematics to the evaluators and to the `subevt`.

⟨*Processes: term instance: TBP*⟩+≡
```
    procedure :: compute_eff_kinematics => &
         term_instance_compute_eff_kinematics
```

⟨*Processes: procedures*⟩+≡
```
    subroutine term_instance_compute_eff_kinematics (term, component)
      class(term_instance_t), intent(inout) :: term
      type(component_instance_t), dimension(:), intent(inout) :: component
      integer :: i_component, i_term
      term%checked = .false.
      term%passed = .false.
      if (term%config%rearrange) then
         ! should evaluate k_term first if allocated separately, not impl. yet
         i_component = term%config%i_component
         i_term = term%config%i_term
         associate (core => component(i_component)%config%core)
           call core%compute_eff_kinematics &
                (i_term, term%int_hard, term%isolated%int_eff, &
                component(i_component)%tmp)
         end associate
      end if
      call term%isolated%receive_kinematics ()
      call term%connected%receive_kinematics ()
    end subroutine term_instance_compute_eff_kinematics
```

Inverse. Reconstruct the connected state from the momenta in the trace evaluator (which we assume to be set), then reconstruct the isolated state as far as possible. The second part finalizes the momentum configuration, using the incoming seed momenta

⟨*Processes: term instance: TBP*⟩+≡
```
    procedure :: recover_hard_kinematics => &
         term_instance_recover_hard_kinematics
```

⟨*Processes: procedures*⟩+≡
```
    subroutine term_instance_recover_hard_kinematics (term, component)
      class(term_instance_t), intent(inout) :: term
      type(component_instance_t), dimension(:), intent(inout) :: component
      term%checked = .false.
      term%passed = .false.
```

```
        call term%connected%send_kinematics ()
        call term%isolated%send_kinematics ()
     end subroutine term_instance_recover_hard_kinematics
```

Check the term whether it passes cuts and, if successful, evaluate scales and weights. The factorization scale is also given to the term kinematics, enabling structure-function evaluation.

⟨*Processes: term instance: TBP*⟩+≡
```
     procedure :: evaluate_expressions => &
          term_instance_evaluate_expressions
```

⟨*Processes: procedures*⟩+≡
```
     subroutine term_instance_evaluate_expressions (term)
       class(term_instance_t), intent(inout) :: term
       call term%connected%evaluate_expressions (term%passed, &
            term%scale, term%fac_scale, term%ren_scale, term%weight)
       term%checked = .true.
     end subroutine term_instance_evaluate_expressions
```

Evaluate the trace: first evaluate the hard interaction, then the trace evaluator. We use the `evaluate_interaction` method of the process component which generated this term. The `subevt` and cut expressions are not yet filled.

The `component` argument is intent(inout) because the `compute_amplitude` method may modify the `tmp` workspace object.

⟨*Processes: term instance: TBP*⟩+≡
```
     procedure :: evaluate_interaction => term_instance_evaluate_interaction
```

⟨*Processes: procedures*⟩+≡
```
     subroutine term_instance_evaluate_interaction (term, component)
       class(term_instance_t), intent(inout) :: term
       type(component_instance_t), dimension(:), intent(inout) :: component
       integer :: i_component, i_term, i
       i_component = term%config%i_component
       i_term = term%config%i_term
       term%p_hard = interaction_get_momenta (term%int_hard)
       associate (core => component(i_component)%config%core)
         do i = 1, term%config%n_allowed
            term%amp(i) = core%compute_amplitude (i_term, term%p_hard, &
                 term%config%flv(i), term%config%hel(i), term%config%col(i), &
                 term%fac_scale, term%ren_scale, &
                 component(i_component)%tmp)
         end do
         call interaction_set_matrix_element (term%int_hard, term%amp)
       end associate
     end subroutine term_instance_evaluate_interaction
```

Evaluate the trace. First evaluate the structure-function chain (i.e., the density matrix of the incoming partons). Do this twice, in case the sf-chain instances within `k_term` and `isolated` differ. Next, evaluate the hard interaction, then compute the convolution with the initial state.

⟨*Processes: term instance: TBP*⟩+≡
```
     procedure :: evaluate_trace => term_instance_evaluate_trace
```

⟨*Processes: procedures*⟩+≡
```
    subroutine term_instance_evaluate_trace (term)
      class(term_instance_t), intent(inout) :: term
      call term%k_term%evaluate_sf_chain (term%fac_scale)
      call term%isolated%evaluate_sf_chain (term%fac_scale)
      call term%isolated%evaluate_trace ()
      call term%connected%evaluate_trace ()
    end subroutine term_instance_evaluate_trace
```

Evaluate the extra data that we need for processing the object as a physical
event.

⟨*Processes: term instance: TBP*⟩+≡
```
    procedure :: evaluate_event_data => term_instance_evaluate_event_data
```

⟨*Processes: procedures*⟩+≡
```
    subroutine term_instance_evaluate_event_data (term)
      class(term_instance_t), intent(inout) :: term
      call term%isolated%evaluate_event_data ()
      call term%connected%evaluate_event_data ()
    end subroutine term_instance_evaluate_event_data
```

Return data that might be useful for external processing. The factorization
scale:

⟨*Processes: term instance: TBP*⟩+≡
```
    procedure :: get_fac_scale => term_instance_get_fac_scale
```

⟨*Processes: procedures*⟩+≡
```
    function term_instance_get_fac_scale (term) result (fac_scale)
      class(term_instance_t), intent(in) :: term
      real(default) :: fac_scale
      fac_scale = term%fac_scale
    end function term_instance_get_fac_scale
```

We take the strong coupling from the process core. The value is calculated
when a new event is requested, so we should call it only after the event has been
evaluated. If it is not available there (a negative number is returned), we take
the value stored in the term configuration, which should be determined by the
model. If the model does not provide a value, the result is zero.

⟨*Processes: term instance: TBP*⟩+≡
```
    procedure :: get_alpha_s => term_instance_get_alpha_s
```

⟨*Processes: procedures*⟩+≡
```
    function term_instance_get_alpha_s (term, component) result (alpha_s)
      class(term_instance_t), intent(in) :: term
      type(component_instance_t), dimension(:), intent(in) :: component
      real(default) :: alpha_s
      integer :: i_component
      i_component = term%config%i_component
      associate (core => component(i_component)%config%core)
        alpha_s = core%get_alpha_s (component(i_component)%tmp)
      end associate
      if (alpha_s < 0)  alpha_s = term%config%alpha_s
    end function term_instance_get_alpha_s
```

MC parameter set and MCI instance

For each process component that is associated with a multi-channel integration (MCI) object, the `mci_work_t` object contains the currently active parameter set. It also holds the implementation of the `mci_instance_t` that the integrator needs for doing its work.

⟨*Processes: types*⟩+≡
```
type :: mci_work_t
   type(process_mci_entry_t), pointer :: config => null ()
   real(default), dimension(:), allocatable :: x
   class(mci_instance_t), pointer :: mci => null ()
   type(process_counter_t) :: counter
 contains
 ⟨Processes: mci work: TBP⟩
end type mci_work_t
```

First write configuration data, then the current values.

⟨*Processes: mci work: TBP*⟩≡
```
procedure :: write => mci_work_write
```

⟨*Processes: procedures*⟩+≡
```
subroutine mci_work_write (mci_work, unit, testflag)
  class(mci_work_t), intent(in) :: mci_work
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: testflag
  integer :: u, i
  u = output_unit (unit)
  write (u, "(1x,A,I0,A)")  "Active MCI instance #", &
       mci_work%config%i_mci, " ="
  write (u, "(2x)", advance="no")
  do i = 1, mci_work%config%n_par
     write (u, "(1x,F7.5)", advance="no")  mci_work%x(i)
     if (i == mci_work%config%n_par_sf) &
          write (u, "(1x,'|')", advance="no")
  end do
  write (u, *)
  if (associated (mci_work%mci)) then
     call mci_work%mci%write (u, pacify = testflag)
     call mci_work%counter%write (u)
  end if
end subroutine mci_work_write
```

The `mci` component may require finalization.

⟨*Processes: mci work: TBP*⟩+≡
```
procedure :: final => mci_work_final
```

⟨*Processes: procedures*⟩+≡
```
subroutine mci_work_final (mci_work)
  class(mci_work_t), intent(inout) :: mci_work
  if (associated (mci_work%mci)) then
     call mci_work%mci%final ()
     deallocate (mci_work%mci)
  end if
end subroutine mci_work_final
```

Initialize with the maximum length that we will need. Contents are not initialized.

The integrator inside the `mci_entry` object is responsible for allocating and initializing its own instance, which is referred to by a pointer in the `mci_work` object.

⟨*Processes: mci work: TBP*⟩+≡
```
    procedure :: init => mci_work_init
```

⟨*Processes: procedures*⟩+≡
```
    subroutine mci_work_init (mci_work, mci_entry)
      class(mci_work_t), intent(out) :: mci_work
      type(process_mci_entry_t), intent(in), target :: mci_entry
      mci_work%config => mci_entry
      allocate (mci_work%x (mci_entry%n_par))
      if (allocated (mci_entry%mci)) then
         call mci_entry%mci%allocate_instance (mci_work%mci)
         call mci_work%mci%init (mci_entry%mci)
      end if
    end subroutine mci_work_init
```

Set parameters explicitly, either all at once, or separately for the structure-function and process parts.

⟨*Processes: mci work: TBP*⟩+≡
```
    procedure :: set => mci_work_set
    procedure :: set_x_strfun => mci_work_set_x_strfun

```

The process instance

A process instance contains all process data that depend on the sampling point and thus change often. In essence, it is an event record at the elementary (parton) level. We do not call it such, to avoid confusion with the actual event records. If decays are involved, the latter are compositions of several elementary processes (i.e., their instances).

We implement the process instance as an extension of the `mci_sampler_t` that we need for computing integrals and generate events.

The base type contains: the `integrand`, the `selected_channel`, the two-dimensional array `x` of parameters, and the one-dimensional array `f` of Jacobians. These subobjects are public and used for communicating with the multichannel integrator.

The `process` pointer accesses the process of which this record is an instance. It is required whenever the calculation needs invariant configuration data, therefore the process should stay in memory for the whole lifetime of its instances.

The `evaluation_status` code is used to check the current status. In particular, failure at various stages is recorded there.

The `count` object records process evaluations, broken down according to status.

The `sqme` value is the single real number that results from evaluating and tracing the kinematics and matrix elements. This is the number that is handed over to an integration routine.

The `weight` value is the event weight. It is defined when an event has been generated from the process instance, either weighted or unweighted. The value is the `sqme` value times Jacobian weights from the integration, or unity, respectively.

The `i_mci` index chooses a subset of components that are associated with a common parameter set and integrator, i.e., that are added coherently.

The `sf_chain` subobject is a realization of the beam and structure-function configuration in the `process` object. It is not used for calculation directly

but serves as the template for the sf-chain instances that are contained in the `component` objects.

The `component` subobjects determine the state of each component.

The `term` subobjects are workspace for evaluating kinematics, matrix elements, cuts etc.

The `mci_work` subobject contains the array of real input parameters (random numbers) that generates the kinematical point. It also contains the workspace for the MC integrators. The active entry of the `mci_work` array is selected by the `i_mci` index above.

⟨*Processes: public*⟩+≡
```
    public :: process_instance_t
```

⟨*Processes: types*⟩+≡
```
    type, extends (mci_sampler_t) :: process_instance_t
       type(process_t), pointer :: process => null ()
       integer :: evaluation_status = STAT_UNDEFINED
       real(default) :: sqme = 0
       real(default) :: weight = 0
       real(default) :: excess = 0
       integer :: i_mci = 0
       integer :: selected_channel = 0
       type(sf_chain_t) :: sf_chain
       type(component_instance_t), dimension(:), allocatable :: component
       type(term_instance_t), dimension(:), allocatable :: term
       type(mci_work_t), dimension(:), allocatable :: mci_work
     contains
     ⟨Processes: process instance: TBP⟩
    end type process_instance_t
```

The output routine contains a header with the most relevant information about the process, copied from `process_metadata_write`. We mark the active components by an asterisk.

The next section is the MC parameter input. The following sections are written only if the evaluation status is beyond setting the parameters, or if the `verbose` option is set.

     instance%term%passed = .false.
     if (present (reset_mci)) then
        if (reset_mci)  instance%i_mci = 0
     end if
     instance%selected_channel = 0
     instance%evaluation_status = STAT_INITIAL
   end subroutine process_instance_reset
```

Activate the components and terms that correspond to a currently selected MCI
parameter set.

⟨*Processes: process instance: TBP*⟩+≡
```
      procedure :: activate => process_instance_activate
```

⟨*Processes: procedures*⟩+≡
```
   subroutine process_instance_activate (instance)
     class(process_instance_t), intent(inout) :: instance
     integer :: i, j
     associate (mci_work => instance%mci_work(instance%i_mci))
       instance%component(mci_work%get_active_components ())%active &
            = .true.
       do i = 1, size (instance%component)
          associate (component => instance%component(i))
            if (component%active) then
```

```
            do j = 1, size (component%config%i_term)
               instance%term(component%config%i_term(j))%active &
                     = .true.
            end do
         end if
       end associate
     end do
   end associate
   instance%evaluation_status = STAT_ACTIVATED
 end subroutine process_instance_activate
```

Initialization connects the instance with a process. All initial information is transferred from the process object. The process object contains templates for the interaction subobjects (beam and term), but no evaluators. The initialization routine creates evaluators for the matrix element trace, other evaluators are left untouched.

The `instance` object must have the `target` attribute (also in any caller) since the initialization routine assigns various pointers to subobject of `instance`.

⟨*Processes: process instance: TBP*⟩+≡

```
   procedure :: init => process_instance_init
```

⟨*Processes: procedures*⟩+≡

```
   subroutine process_instance_init (instance, process)
     class(process_instance_t), intent(out), target :: instance
     type(process_t), intent(in), target :: process
     integer :: i, i_component
     instance%process => process
     call instance%setup_sf_chain (process%beam_config)
     allocate (instance%mci_work (process%config%n_mci))
     do i = 1, size (instance%mci_work)
        call instance%mci_work(i)%init (process%mci_entry(i))
     end do
     allocate (instance%component (process%config%n_components))
     do i_component = 1, size (instance%component)
        if (process%component(i_component)%active) then
           associate (component => instance%component(i_component))
             call component%init (process%component(i_component))
             call component%setup_kinematics &
                  (instance%sf_chain, process%beam_config)
           end associate
        end if
     end do
     allocate (instance%term (process%config%n_terms))
     do i = 1, size (instance%term)
        associate (term => instance%term(i))
          i_component = process%term(i)%i_component
          if (i_component /= 0) then
             associate (component => instance%component(i_component))
               call term%init (process%term(i), &
                    component%k_seed, &
                    process%beam_config, &
                    process%component(i_component)%core, &
                    process%meta%var_list)
```

```
               call term%setup_expressions (process%meta, process%config)
             end associate
          end if
       end associate
    end do
    instance%evaluation_status = STAT_INITIAL
  end subroutine process_instance_init
```

Subroutine of the initialization above: initialize the beam and structure-function chain template. We establish pointers to the configuration data, so `beam_config` must have a `target` attribute.

The resulting chain is not used directly for calculation. It will acquire instances which are stored in the process-component instance objects.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: setup_sf_chain => process_instance_setup_sf_chain
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_setup_sf_chain (instance, config)
      class(process_instance_t), intent(inout) :: instance
      type(process_beam_config_t), intent(in), target :: config
      integer :: n_strfun
      n_strfun = config%n_strfun
      if (n_strfun /= 0) then
         call instance%sf_chain%init (config%data, config%sf)
      else
         call instance%sf_chain%init (config%data)
      end if
      if (config%sf_trace) then
         call instance%sf_chain%setup_tracing (config%sf_trace_file)
      end if
    end subroutine process_instance_setup_sf_chain
```

This initialization routine should be called only for process instances which we intend as a source for physical events. It initializes the evaluators in the parton states of the terms. They describe the (semi-)exclusive transition matrix and the distribution of color flow for the partonic process, convoluted with the beam and structure-function chain.

If the model is not provided explicitly, we may use the model instance that belongs to the process. However, an explicit model allows us to override particle settings.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: setup_event_data => process_instance_setup_event_data
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_setup_event_data (instance, model)
      class(process_instance_t), intent(inout), target :: instance
      type(model_t), intent(in), optional, target :: model
      type(model_t), pointer :: current_model
      integer :: i, i_component
      if (present (model)) then
         current_model => model
      else
         current_model => instance%process%config%model
```

```
      end if
      do i = 1, size (instance%term)
         associate (term => instance%term(i))
           if (associated (term%config)) then
              i_component = term%config%i_component
              associate (component => instance%process%component(i_component))
                call term%setup_event_data (component%core, current_model)
              end associate
           end if
         end associate
      end do
   end subroutine process_instance_setup_event_data
```

Choose a MC parameter set and the corresponding integrator.

The choice persists beyond calls of the `reset` method above. This method is automatically called here.

⟨*Processes: process instance: TBP*⟩+≡
```

```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_choose_mci (instance, i_mci)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_mci
      instance%i_mci = i_mci
      call instance%reset ()
    end subroutine process_instance_choose_mci
```

Explicitly set a MC parameter set. Works only if we are in initial state. We assume that the length of the parameter set is correct.

After setting the parameters, activate the components and terms that correspond to the chosen MC parameter set.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: set_mcpar => process_instance_set_mcpar
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_set_mcpar (instance, x)
      class(process_instance_t), intent(inout) :: instance
      real(default), dimension(:), intent(in) :: x
      if (instance%evaluation_status == STAT_INITIAL) then
         associate (mci_work => instance%mci_work(instance%i_mci))
           call mci_work%set (x)
         end associate
         call instance%activate ()
      end if
    end subroutine process_instance_set_mcpar
```

Receive the beam momentum/momenta from a source interaction. This applies to a cascade decay process instance, where the 'beam' momentum varies event by event.

The master beam momentum array is contained in the main structure function chain subobject `sf_chain`. The sf-chain instance that reside in the components will take their beam momenta from there.

The procedure transforms the instance status into `STAT_BEAM_MOMENTA`. For process instance with fixed beam, this intermediate status is skipped.

⟨*Processes: process instance: TBP*⟩+≡
```
procedure :: receive_beam_momenta => process_instance_receive_beam_momenta
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_instance_receive_beam_momenta (instance)
  class(process_instance_t), intent(inout) :: instance
  if (instance%evaluation_status >= STAT_INITIAL) then
     call instance%sf_chain%receive_beam_momenta ()
     instance%evaluation_status = STAT_BEAM_MOMENTA
  end if
end subroutine process_instance_receive_beam_momenta
```

Set the beam momentum/momenta explicitly. Otherwise, analogous to the previous procedure.

⟨*Processes: process instance: TBP*⟩+≡
```
procedure :: set_beam_momenta => process_instance_set_beam_momenta
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_instance_set_beam_momenta (instance, p)
  class(process_instance_t), intent(inout) :: instance
  type(vector4_t), dimension(:), intent(in) :: p
  if (instance%evaluation_status >= STAT_INITIAL) then
     call instance%sf_chain%set_beam_momenta (p)
     instance%evaluation_status = STAT_BEAM_MOMENTA
  end if
end subroutine process_instance_set_beam_momenta
```

Recover the initial beam momenta (those in the `sf_chain` component), given a valid (recovered) `sf_chain_instance` in one of the active components. We need to do this only if the lab frame is not the c.m. frame, otherwise those beams would be fixed anyway.

⟨*Processes: process instance: TBP*⟩+≡
```
procedure :: recover_beam_momenta => process_instance_recover_beam_momenta
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_instance_recover_beam_momenta (instance, i_term)
  class(process_instance_t), intent(inout) :: instance
  integer, intent(in) :: i_term
  integer :: i
  if (.not. instance%process%beam_config%lab_is_cm_frame) then
     if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        i = instance%term(i_term)%config%i_component
        call instance%component(i)%return_beam_momenta ()
     end if
  end if
end subroutine process_instance_recover_beam_momenta
```

Explicitly choose MC integration channel. We assume here that the channel count is identical for all active components.

⟨*Processes: process instance: TBP*⟩+≡
```
procedure :: select_channel => process_instance_select_channel
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_select_channel (instance, channel)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: channel
      instance%selected_channel = channel
    end subroutine process_instance_select_channel
```

First step of process evaluation: set up seed kinematics. That is, for each active process component, compute a momentum array from the MC input parameters.

If `skip_term` is set, we skip the component that accesses this term. We can assume that the associated data have already been recovered, and we are just computing the rest.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: compute_seed_kinematics => &
        process_instance_compute_seed_kinematics
```
⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_compute_seed_kinematics (instance, skip_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in), optional :: skip_term
      integer :: channel, skip_component, i
      logical :: success
      channel = instance%selected_channel
      if (channel == 0) then
         call msg_bug ("Compute seed kinematics: undefined integration channel")
      end if
      if (present (skip_term)) then
         skip_component = instance%term(skip_term)%config%i_component
      else
         skip_component = 0
      end if
      if (instance%evaluation_status >= STAT_ACTIVATED) then
         success = .true.
         do i = 1, size (instance%component)
            if (i == skip_component)  cycle
            if (instance%component(i)%active) then
               call instance%component(i)%compute_seed_kinematics &
                    (instance%mci_work(instance%i_mci), channel, success)
               if (.not. success)  exit
            end if
         end do
         if (success) then
            instance%evaluation_status = STAT_SEED_KINEMATICS
         else
            instance%evaluation_status = STAT_FAILED_KINEMATICS
         end if
      end if
    end subroutine process_instance_compute_seed_kinematics
```

Inverse: recover missing parts of the kinematics from the momentum configuration, which we know for a single term and component. Given a channel, reconstruct the MC parameter set.

⟨*Processes: process instance: TBP*⟩+≡

```
              procedure :: recover_mcpar => process_instance_recover_mcpar
⟨Processes: procedures⟩+≡
    subroutine process_instance_recover_mcpar (instance, i_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      integer :: channel
      integer :: i
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
          channel = instance%selected_channel
          if (channel == 0) then
             call msg_bug ("Recover MC parameters: undefined integration channel")
          end if
          i = instance%term(i_term)%config%i_component
          call instance%component(i)%recover_mcpar &
                     (instance%mci_work(instance%i_mci), channel)
      end if
    end subroutine process_instance_recover_mcpar
```

Second step of process evaluation: compute all momenta, for all active compo-
nents, from the seed kinematics.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: compute_hard_kinematics => &
        process_instance_compute_hard_kinematics
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_compute_hard_kinematics (instance, skip_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in), optional :: skip_term
      integer :: i
      if (instance%evaluation_status >= STAT_SEED_KINEMATICS) then
          do i = 1, size (instance%component)
             if (instance%component(i)%active) then
                call instance%component(i)% &
                        compute_hard_kinematics (instance%term, skip_term)
             end if
          end do
          instance%evaluation_status = STAT_HARD_KINEMATICS
      end if
    end subroutine process_instance_compute_hard_kinematics
```

Inverse: recover seed kinematics. We know the beam momentum configuration
and the outgoing momenta of the effective interaction, for one specific term.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: recover_seed_kinematics => &
        process_instance_recover_seed_kinematics
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_recover_seed_kinematics (instance, i_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
          associate (i_component => instance%term(i_term)%config%i_component)
            call instance%component(i_component)% &
```

```
                     recover_seed_kinematics (instance%term(i_term))
            end associate
        end if
    end subroutine process_instance_recover_seed_kinematics
```

Third step of process evaluation: compute the effective momentum configurations, for all active terms, from the hard kinematics.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: compute_eff_kinematics => &
        process_instance_compute_eff_kinematics
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_compute_eff_kinematics (instance, skip_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in), optional :: skip_term
      integer :: i
      if (instance%evaluation_status >= STAT_HARD_KINEMATICS) then
         do i = 1, size (instance%term)
            if (present (skip_term)) then
               if (i == skip_term)  cycle
            end if
            if (instance%term(i)%active) then
               call instance%term(i)% &
                    compute_eff_kinematics (instance%component)
            end if
         end do
         instance%evaluation_status = STAT_EFF_KINEMATICS
      end if
    end subroutine process_instance_compute_eff_kinematics
```

Inverse: recover the hard kinematics from effective kinematics for one term, then compute effective kinematics for the other terms.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: recover_hard_kinematics => &
        process_instance_recover_hard_kinematics
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_recover_hard_kinematics (instance, i_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      integer :: i
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
         call instance%term(i_term)%recover_hard_kinematics (instance%component)
         do i = 1, size (instance%term)
            if (i /= i_term) then
               if (instance%term(i)%active) then
                  call instance%term(i)% &
                       compute_eff_kinematics (instance%component)
               end if
            end if
         end do
         instance%evaluation_status = STAT_EFF_KINEMATICS
      end if
    end subroutine process_instance_recover_hard_kinematics
```

Fourth step of process evaluation: check cuts for all terms. Where sucessful, compute any scales and weights. Otherwise, deactive the term. If any of the terms has passed, set the state to `STAT_PASSED_CUTS`.

⟨*Processes: process instance: TBP*⟩+≡
```
procedure :: evaluate_expressions => &
    process_instance_evaluate_expressions
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_instance_evaluate_expressions (instance)
  class(process_instance_t), intent(inout) :: instance
  integer :: i
  if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
      do i = 1, size (instance%term)
          if (instance%term(i)%active) then
              call instance%term(i)%evaluate_expressions ()
          end if
      end do
      if (any (instance%term%passed)) then
          instance%evaluation_status = STAT_PASSED_CUTS
      else
          instance%evaluation_status = STAT_FAILED_CUTS
      end if
  end if
end subroutine process_instance_evaluate_expressions
```

Fifth step of process evaluation: fill the parameters for the non-selected ,channels, that have not been used for seeding. We should do this after evaluating cuts, since we may save some expensive calculations if the phase space point fails the cuts.

If `skip_term` is set, we skip the component that accesses this term. We can assume that the associated data have already been recovered, and we are just computing the rest.

⟨*Processes: process instance: TBP*⟩+≡
```
procedure :: compute_other_channels => &
    process_instance_compute_other_channels
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_instance_compute_other_channels (instance, skip_term)
  class(process_instance_t), intent(inout) :: instance
  integer, intent(in), optional :: skip_term
  integer :: channel, skip_component, i
  channel = instance%selected_channel
  if (channel == 0) then
      call msg_bug ("Compute other channels: undefined integration channel")
  end if
  if (present (skip_term)) then
      skip_component = instance%term(skip_term)%config%i_component
  else
      skip_component = 0
  end if
  if (instance%evaluation_status >= STAT_PASSED_CUTS) then
      do i = 1, size (instance%component)
```

2080

```
              if (i == skip_component)  cycle
              if (instance%component(i)%active) then
                 call instance%component(i)%compute_other_channels &
                       (instance%mci_work(instance%i_mci), channel)
              end if
           end do
        end if
     end subroutine process_instance_compute_other_channels
```

Sixth step of process evaluation: evaluate the matrix elements, and compute the trace (summed over quantum numbers) for all terms. Finally, sum up the terms, iterating over all active process components.

⟨*Processes: process instance: TBP*⟩+≡
```
     procedure :: evaluate_trace => process_instance_evaluate_trace
```

⟨*Processes: procedures*⟩+≡
```
     subroutine process_instance_evaluate_trace (instance)
       class(process_instance_t), intent(inout) :: instance
       integer :: i
       if (instance%evaluation_status >= STAT_PASSED_CUTS) then
          do i = 1, size (instance%term)
             associate (term => instance%term(i))
               if (term%active .and. term%passed) then
                  call term%evaluate_interaction (instance%component)
                  call term%evaluate_trace ()
               end if
             end associate
          end do
          instance%sqme = 0
          do i = 1, size (instance%component)
             associate (component => instance%component(i))
               if (component%active) then
                  call component%evaluate_sqme (instance%term)
                  instance%sqme = instance%sqme + component%sqme
               end if
             end associate
          end do
          instance%evaluation_status = STAT_EVALUATED_TRACE
       else
          ! failed kinematics, failed cuts: set sqme to zero
          instance%sqme = 0
       end if
     end subroutine process_instance_evaluate_trace
```

Final step of process evaluation: evaluate the matrix elements, and compute the trace (summed over quantum numbers) for all terms. Finally, sum up the terms, iterating over all active process components.

If `weight` is provided, we already know the kinematical event weight (the MCI weight which depends on the kinematics sampling algorithm, but not on the matrix element), so we do not need to take it from the MCI record.

⟨*Processes: process instance: TBP*⟩+≡
```
     procedure :: evaluate_event_data => process_instance_evaluate_event_data
```

2081

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_evaluate_event_data (instance, weight)
      class(process_instance_t), intent(inout) :: instance
      real(default), intent(in), optional :: weight
      integer :: i
      if (instance%evaluation_status >= STAT_EVALUATED_TRACE) then
         do i = 1, size (instance%term)
            associate (term => instance%term(i))
              if (term%active .and. term%passed) then
                 call term%evaluate_event_data ()
              end if
            end associate
         end do
         if (present (weight)) then
            instance%weight = weight
         else
            instance%weight = &
                 instance%mci_work(instance%i_mci)%mci%get_event_weight ()
            instance%excess = &
                 instance%mci_work(instance%i_mci)%mci%get_event_excess ()
         end if
         instance%evaluation_status = STAT_EVENT_COMPLETE
      else
         ! failed kinematics etc.: set weight to zero
         instance%weight = 0
      end if
    end subroutine process_instance_evaluate_event_data
```

For unweighted event generation, we should reset the reported event weight to unity (signed) or zero. The latter case is appropriate for an event which failed for whatever reason.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: normalize_weight => process_instance_normalize_weight
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_normalize_weight (instance)
      class(process_instance_t), intent(inout) :: instance
      if (instance%weight /= 0) then
         instance%weight = sign (1._default, instance%weight)
      end if
    end subroutine process_instance_normalize_weight
```

This is a convenience routine that performs the computations of the steps 1 to 5 in a single step. The arguments are the input for `set_mcpar`. After this, the evaluation status should be either `STAT_FAILED_KINEMATICS`, `STAT_FAILED_CUTS` or `STAT_EVALUATED_TRACE`.

Before calling this, we should call `choose_mci`.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: evaluate_sqme => process_instance_evaluate_sqme
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_evaluate_sqme (instance, channel, x)
      class(process_instance_t), intent(inout) :: instance
```

```
      integer, intent(in) :: channel
      real(default), dimension(:), intent(in) :: x
      call instance%reset ()
      call instance%set_mcpar (x)
      call instance%select_channel (channel)
      call instance%compute_seed_kinematics ()
      call instance%compute_hard_kinematics ()
      call instance%compute_eff_kinematics ()
      call instance%evaluate_expressions ()
      call instance%compute_other_channels ()
      call instance%evaluate_trace ()
    end subroutine process_instance_evaluate_sqme
```

This is the inverse. Assuming that the final trace evaluator contains a valid momentum configuration, recover kinematics and recalculate the matrix elements and their trace.

To be precise, we first recover kinematics for the given term and associated component, then recalculate from that all other terms and active components. The `channel` is not really required to obtain the matrix element, but it allows us to reconstruct the exact MC parameter set that corresponds to the given phase space point.

Before calling this, we should call `choose_mci`.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: recover => process_instance_recover
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_recover (instance, channel, i_term, update_sqme)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: channel
      integer, intent(in) :: i_term
      logical, intent(in) :: update_sqme
      call instance%activate ()
      instance%evaluation_status = STAT_EFF_KINEMATICS
      call instance%recover_hard_kinematics (i_term)
      call instance%recover_seed_kinematics (i_term)
      call instance%select_channel (channel)
      call instance%recover_mcpar (i_term)
      call instance%recover_beam_momenta (i_term)
      call instance%compute_seed_kinematics (i_term)
      call instance%compute_hard_kinematics (i_term)
      call instance%compute_eff_kinematics (i_term)
      call instance%compute_other_channels (i_term)
      call instance%evaluate_expressions ()
      if (update_sqme)  call instance%evaluate_trace ()
    end subroutine process_instance_recover
```

The `evaluate` method is required by the `sampler_t` base type of which the process instance is an extension.

The requirement is that after the process instance is evaluated, the integrand, the selected channel, the x array, and the f Jacobian array are exposed by the `sampler_t` object.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: evaluate => process_instance_evaluate
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_evaluate (sampler, c, x_in, val, x, f)
      class(process_instance_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(out) :: val
      real(default), dimension(:,:), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
      call sampler%evaluate_sqme (c, x_in)
      if (sampler%is_valid ())  call sampler%fetch (val, x, f)
      call sampler%record_call ()
    end subroutine process_instance_evaluate
```

The phase-space point is valid if the event has valid kinematics and has passed the cuts.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: is_valid => process_instance_is_valid
```

⟨*Processes: procedures*⟩+≡
```
    function process_instance_is_valid (sampler) result (valid)
      class(process_instance_t), intent(in) :: sampler
      logical :: valid
      valid = sampler%evaluation_status >= STAT_PASSED_CUTS
    end function process_instance_is_valid
```

The `rebuild` method should rebuild the kinematics section out of the `x_in` parameter set. The integrand value `val` should not be computed, but is provided as input.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: rebuild => process_instance_rebuild
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_rebuild (sampler, c, x_in, val, x, f)
      class(process_instance_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(in) :: val
      real(default), dimension(:,:), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
      call msg_bug ("process_instance_rebuild not implemented yet")
      x = 0
      f = 0
    end subroutine process_instance_rebuild
```

This is another method required by the `sampler_t` base type: fetch the data that are relevant for the MCI record.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: fetch => process_instance_fetch
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_fetch (sampler, val, x, f)
      class(process_instance_t), intent(in) :: sampler
      real(default), intent(out) :: val
```

```
        real(default), dimension(:,:), intent(out) :: x
        real(default), dimension(:), intent(out) :: f
        integer :: i, cc
        integer :: n_channel
        val = 0
        FIND_COMPONENT: do i = 1, size (sampler%component)
           associate (component => sampler%component(i))
             if (component%active) then
                 associate (k => component%k_seed)
                   n_channel = k%n_channel
                   do cc = 1, n_channel
                      call k%get_mcpar (cc, x(:,cc))
                   end do
                   f = k%f
                   val = sampler%sqme * k%phs_factor
                 end associate
                 exit FIND_COMPONENT
             end if
           end associate
        end do FIND_COMPONENT
      end subroutine process_instance_fetch
```

Initialize and finalize event generation for the specified MCI entry.

⟨*Processes: process instance: TBP*⟩+≡
```
      procedure :: init_simulation => process_instance_init_simulation
      procedure :: final_simulation => process_instance_final_simulation
```

⟨*Processes: procedures*⟩+≡
```
      subroutine process_instance_init_simulation (instance, i_mci, safety_factor)
        class(process_instance_t), intent(inout) :: instance
        integer, intent(in) :: i_mci
        real(default), intent(in), optional :: safety_factor
        call instance%mci_work(i_mci)%init_simulation (safety_factor)
      end subroutine process_instance_init_simulation

      subroutine process_instance_final_simulation (instance, i_mci)
        class(process_instance_t), intent(inout) :: instance
        integer, intent(in) :: i_mci
        call instance%mci_work(i_mci)%final_simulation ()
      end subroutine process_instance_final_simulation
```

15.5.12 Accessing the process instance

Once the seed kinematics is complete, we can retrieve the MC input parameters
for all channels, not just the seed channel.

Note: We choose the first active component. This makes sense only if the
seed kinematics is identical for all active components.

⟨*Processes: process instance: TBP*⟩+≡
```
      procedure :: get_mcpar => process_instance_get_mcpar
```

⟨*Processes: procedures*⟩+≡
```
      subroutine process_instance_get_mcpar (instance, channel, x)
```

```
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: channel
      real(default), dimension(:), intent(out) :: x
      integer :: i
      if (instance%evaluation_status >= STAT_SEED_KINEMATICS) then
         do i = 1, size (instance%component)
            if (instance%component(i)%active) then
               call instance%component(i)%k_seed%get_mcpar (channel, x)
               return
            end if
         end do
         call msg_bug ("Process instance: get_mcpar: no active channels")
      else
         call msg_bug ("Process instance: get_mcpar: no seed kinematics")
      end if
    end subroutine process_instance_get_mcpar
```

Return true if the sqme value is known. This also implies that the event is
kinematically valid and has passed all cuts.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: has_evaluated_trace => process_instance_has_evaluated_trace
```

⟨*Processes: procedures*⟩+≡
```
    function process_instance_has_evaluated_trace (instance) result (flag)
      class(process_instance_t), intent(in) :: instance
      logical :: flag
      flag = instance%evaluation_status >= STAT_EVALUATED_TRACE
    end function process_instance_has_evaluated_trace
```

Return true if the event is complete. In particular, the event must be kinemat-
ically valid, passed all cuts, and the event data have been computed.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: is_complete_event => process_instance_is_complete_event
```

⟨*Processes: procedures*⟩+≡
```
    function process_instance_is_complete_event (instance) result (flag)
      class(process_instance_t), intent(in) :: instance
      logical :: flag
      flag = instance%evaluation_status >= STAT_EVENT_COMPLETE
    end function process_instance_is_complete_event
```

Select a term for the process instance which is to provide the event record.

    Note: this should be done using random numbers and applying probabilities
for the various terms and components that belong to the selected MCI group.
The current implementation simply selects the first term for the first active
component.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: select_i_term => process_instance_select_i_term
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_select_i_term (instance, i_term)
      class(process_instance_t), intent(in) :: instance
      integer, intent(out) :: i_term
```

```
    integer :: i_mci, i_component
    i_mci = instance%i_mci
    i_component = instance%process%mci_entry(i_mci)%i_component(1)
    i_term = instance%process%component(i_component)%i_term(1)
  end subroutine process_instance_select_i_term
```

Return pointer to the master beam interaction.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: get_beam_int_ptr => process_instance_get_beam_int_ptr
```

⟨*Processes: procedures*⟩+≡
```
    function process_instance_get_beam_int_ptr (instance) result (ptr)
      class(process_instance_t), intent(in), target :: instance
      type(interaction_t), pointer :: ptr
      ptr => instance%sf_chain%get_beam_int_ptr ()
    end function process_instance_get_beam_int_ptr
```

Return pointers to the matrix and flows interactions, given a term index.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: get_trace_int_ptr => process_instance_get_trace_int_ptr
    procedure :: get_matrix_int_ptr => process_instance_get_matrix_int_ptr
    procedure :: get_flows_int_ptr => process_instance_get_flows_int_ptr
```

⟨*Processes: procedures*⟩+≡
```
    function process_instance_get_trace_int_ptr (instance, i_term) result (ptr)
      class(process_instance_t), intent(in), target :: instance
      integer, intent(in) :: i_term
      type(interaction_t), pointer :: ptr
      ptr => instance%term(i_term)%connected%get_trace_int_ptr ()
    end function process_instance_get_trace_int_ptr

    function process_instance_get_matrix_int_ptr (instance, i_term) result (ptr)
      class(process_instance_t), intent(in), target :: instance
      integer, intent(in) :: i_term
      type(interaction_t), pointer :: ptr
      ptr => instance%term(i_term)%connected%get_matrix_int_ptr ()
    end function process_instance_get_matrix_int_ptr

    function process_instance_get_flows_int_ptr (instance, i_term) result (ptr)
      class(process_instance_t), intent(in), target :: instance
      integer, intent(in) :: i_term
      type(interaction_t), pointer :: ptr
      ptr => instance%term(i_term)%connected%get_flows_int_ptr ()
    end function process_instance_get_flows_int_ptr
```

Return pointers to the parton states of a selected term.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: get_isolated_state_ptr => &
        process_instance_get_isolated_state_ptr
    procedure :: get_connected_state_ptr => &
        process_instance_get_connected_state_ptr
```

2087

⟨*Processes: procedures*⟩+≡
```
    function process_instance_get_isolated_state_ptr (instance, i_term) &
        result (ptr)
      class(process_instance_t), intent(in), target :: instance
      integer, intent(in) :: i_term
      type(isolated_state_t), pointer :: ptr
      ptr => instance%term(i_term)%isolated
    end function process_instance_get_isolated_state_ptr

    function process_instance_get_connected_state_ptr (instance, i_term) &
        result (ptr)
      class(process_instance_t), intent(in), target :: instance
      integer, intent(in) :: i_term
      type(connected_state_t), pointer :: ptr
      ptr => instance%term(i_term)%connected
    end function process_instance_get_connected_state_ptr
```

Return the indices of the beam particles and incoming partons within the currently active state matrix, respectively.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: get_beam_index => process_instance_get_beam_index
    procedure :: get_in_index => process_instance_get_in_index
```

⟨*Processes: procedures*⟩+≡
```
    subroutine process_instance_get_beam_index (instance, i_term, i_beam)
      class(process_instance_t), intent(in) :: instance
      integer, intent(in) :: i_term
      integer, dimension(:), intent(out) :: i_beam
      call instance%term(i_term)%connected%get_beam_index (i_beam)
    end subroutine process_instance_get_beam_index

    subroutine process_instance_get_in_index (instance, i_term, i_in)
      class(process_instance_t), intent(in) :: instance
      integer, intent(in) :: i_term
      integer, dimension(:), intent(out) :: i_in
      call instance%term(i_term)%connected%get_in_index (i_in)
    end subroutine process_instance_get_in_index
```

Return squared matrix element and event weight, and event weight excess where applicable.

⟨*Processes: process instance: TBP*⟩+≡
```
    procedure :: get_sqme => process_instance_get_sqme
    procedure :: get_weight => process_instance_get_weight
    procedure :: get_excess => process_instance_get_excess
```

⟨*Processes: procedures*⟩+≡
```
    function process_instance_get_sqme (instance) result (sqme)
      class(process_instance_t), intent(in) :: instance
      real(default) :: sqme
      if (instance%evaluation_status >= STAT_EVALUATED_TRACE) then
         sqme = instance%sqme
      else
         sqme = 0
      end if
```

```
      end function process_instance_get_sqme

      function process_instance_get_weight (instance) result (weight)
        class(process_instance_t), intent(in) :: instance
        real(default) :: weight
        if (instance%evaluation_status >= STAT_EVENT_COMPLETE) then
           weight = instance%weight
        else
           weight = 0
        end if
      end function process_instance_get_weight

      function process_instance_get_excess (instance) result (excess)
        class(process_instance_t), intent(in) :: instance
        real(default) :: excess
        if (instance%evaluation_status >= STAT_EVENT_COMPLETE) then
           excess = instance%excess
        else
           excess = 0
        end if
      end function process_instance_get_excess
```

Return the currently selected MCI channel.

⟨*Processes: process instance: TBP*⟩+≡
```
      procedure :: get_channel => process_instance_get_channel
```

⟨*Processes: procedures*⟩+≡
```
      function process_instance_get_channel (instance) result (channel)
        class(process_instance_t), intent(in) :: instance
        integer :: channel
        channel = instance%selected_channel
      end function process_instance_get_channel
```

Return factorization scale and strong coupling. We have to select a term instance.

⟨*Processes: process instance: TBP*⟩+≡
```
      procedure :: get_fac_scale => process_instance_get_fac_scale
      procedure :: get_alpha_s => process_instance_get_alpha_s
```

⟨*Processes: procedures*⟩+≡
```
      function process_instance_get_fac_scale (instance, i_term) result (fac_scale)
        class(process_instance_t), intent(in) :: instance
        integer, intent(in) :: i_term
        real(default) :: fac_scale
        fac_scale = instance%term(i_term)%get_fac_scale ()
      end function process_instance_get_fac_scale

      function process_instance_get_alpha_s (instance, i_term) result (alpha_s)
        class(process_instance_t), intent(in) :: instance
        integer, intent(in) :: i_term
        real(default) :: alpha_s
        alpha_s = instance%term(i_term)%get_alpha_s (instance%component)
      end function process_instance_get_alpha_s
```

Counter.

⟨*Processes: process instance: TBP*⟩+≡
```
procedure :: reset_counter => process_instance_reset_counter
procedure :: record_call => process_instance_record_call
procedure :: get_counter => process_instance_get_counter
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_instance_reset_counter (process_instance)
  class(process_instance_t), intent(inout) :: process_instance
  call process_instance%mci_work(process_instance%i_mci)%reset_counter ()
end subroutine process_instance_reset_counter

subroutine process_instance_record_call (process_instance)
  class(process_instance_t), intent(inout) :: process_instance
  call process_instance%mci_work(process_instance%i_mci)%record_call &
       (process_instance%evaluation_status)
end subroutine process_instance_record_call

function process_instance_get_counter (process_instance) result (counter)
  class(process_instance_t), intent(in) :: process_instance
  type(process_counter_t) :: counter
  counter = process_instance%mci_work(process_instance%i_mci)%get_counter ()
end function process_instance_get_counter
```

15.5.13   Particle sets

Here we provide two procedures that convert the process instance from/to a particle set. The conversion applies to the trace evaluator which has no quantum-number information, thus it involves only the momenta and the parent-child relations. We keep virtual particles.

Nevertheless, it is possible to reconstruct the complete structure from a particle set. The reconstruction implies a re-evaluation of the structure function and matrix-element codes.

The `i_term` index is needed for both input and output, to select among different active trace evaluators.

In both cases, the `instance` object must be properly initialized.

⟨*Processes: process instance: TBP*⟩+≡
```
procedure :: get_trace => process_instance_get_trace
procedure :: set_trace => process_instance_set_trace
```

⟨*Processes: procedures*⟩+≡
```
subroutine process_instance_get_trace (instance, pset, i_term)
  class(process_instance_t), intent(in), target :: instance
  type(particle_set_t), intent(out) :: pset
  integer, intent(in) :: i_term
  type(interaction_t), pointer :: int
  logical :: ok
  int => instance%get_trace_int_ptr (i_term)
  call particle_set_init (pset, ok, int, int, FM_IGNORE_HELICITY, &
       [0._default, 0._default], .false., .true.)
end subroutine process_instance_get_trace
```

2090

```
subroutine process_instance_set_trace (instance, pset, i_term, recover_beams)
  class(process_instance_t), intent(inout), target :: instance
  type(particle_set_t), intent(in) :: pset
  integer, intent(in) :: i_term
  logical, intent(in), optional :: recover_beams
  type(interaction_t), pointer :: int
  integer :: n_in
  int => instance%get_trace_int_ptr (i_term)
  n_in = instance%process%get_n_in ()
  call particle_set_fill_interaction (pset, int, n_in, recover_beams)
end subroutine process_instance_set_trace
```

The `pacify` subroutine has the purpose of setting numbers to zero which are (by comparing with a `tolerance` parameter) considered equivalent with zero. We do this in some unit tests. Here, we a apply this to the phase space subobject of the process instance.

⟨*Processes: public*⟩+≡
```
public :: pacify
```

⟨*Processes: interfaces*⟩≡
```
interface pacify
   module procedure pacify_process_instance
end interface pacify
```

⟨*Processes: procedures*⟩+≡
```
subroutine pacify_process_instance (instance)
  type(process_instance_t), intent(inout) :: instance
  integer :: i
  do i = 1, size (instance%component)
     call pacify (instance%component(i)%k_seed%phs)
  end do
end subroutine pacify_process_instance
```

15.5.14   Unit tests

⟨*Processes: public*⟩+≡
```
public :: processes_test
```

⟨*Processes: tests*⟩≡
```
subroutine processes_test (u, results)
  integer, intent(in) :: u
  type(test_results_t), intent(inout) :: results
  ⟨Processes: execute tests⟩
end subroutine processes_test
```

Test process type

For the following tests, we define a simple implementation of the abstract `prc_core_t`, designed such as to complement the `prc_test_t` process definition type.

Note that it is not given that the actual process is defined as `prc_test_t` type. We enforce this by calling `prc_test_create_library`. The driver component in the process core will then become of type `prc_test_t`.

⟨*Processes: public*⟩+≡
```
    public :: test_t
```

⟨*Processes: test types*⟩≡
```
    type, extends (prc_core_t) :: test_t
     contains
       procedure :: write => test_write
       procedure :: needs_mcset => test_needs_mcset
       procedure :: get_n_terms => test_get_n_terms
       procedure :: is_allowed => test_is_allowed
       procedure :: compute_hard_kinematics => test_compute_hard_kinematics
       procedure :: compute_eff_kinematics => test_compute_eff_kinematics
       procedure :: recover_kinematics => test_recover_kinematics
       procedure :: compute_amplitude => test_compute_amplitude
    end type test_t
```

⟨*Processes: tests*⟩+≡
```
    subroutine test_write (object, unit)
      class(test_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = output_unit (unit)
      write (u, "(3x,A)")  "test type implementing prc_test"
    end subroutine test_write
```

This process type always needs a MC parameter set and a single term. This only state is always allowed.

⟨*Processes: tests*⟩+≡
```
    function test_needs_mcset (object) result (flag)
      class(test_t), intent(in) :: object
      logical :: flag
      flag = .true.
    end function test_needs_mcset

    function test_get_n_terms (object) result (n)
      class(test_t), intent(in) :: object
      integer :: n
      n = 1
    end function test_get_n_terms

    function test_is_allowed (object, i_term, f, h, c) result (flag)
      class(test_t), intent(in) :: object
      integer, intent(in) :: i_term, f, h, c
      logical :: flag
      flag = .true.
    end function test_is_allowed
```

Transfer the generated momenta directly to the hard interaction in the (only) term. We assume that everything has been set up correctly, so the array fits.

⟨*Processes: tests*⟩+≡

```
subroutine test_compute_hard_kinematics &
    (object, p_seed, i_term, int_hard, tmp)
  class(test_t), intent(in) :: object
  type(vector4_t), dimension(:), intent(in) :: p_seed
  integer, intent(in) :: i_term
  type(interaction_t), intent(inout) :: int_hard
  class(workspace_t), intent(inout), allocatable :: tmp
  call interaction_set_momenta (int_hard, p_seed)
end subroutine test_compute_hard_kinematics
```

This procedure is not called for `test_t`, just a placeholder.

⟨*Processes: tests*⟩+≡
```
subroutine test_compute_eff_kinematics &
    (object, i_term, int_hard, int_eff, tmp)
  class(test_t), intent(in) :: object
  integer, intent(in) :: i_term
  type(interaction_t), intent(in) :: int_hard
  type(interaction_t), intent(inout) :: int_eff
  class(workspace_t), intent(inout), allocatable :: tmp
end subroutine test_compute_eff_kinematics
```

Transfer the incoming momenta of `p_seed` directly to the effective interaction, and vice versa for the outgoing momenta.

`int_hard` is left untouched since `int_eff` is an alias (via pointer) to it.

⟨*Processes: tests*⟩+≡
```
subroutine test_recover_kinematics &
    (object, p_seed, int_hard, int_eff, tmp)
  class(test_t), intent(in) :: object
  type(vector4_t), dimension(:), intent(inout) :: p_seed
  type(interaction_t), intent(inout) :: int_hard
  type(interaction_t), intent(inout) :: int_eff
  class(workspace_t), intent(inout), allocatable :: tmp
  integer :: n_in
  n_in = interaction_get_n_in (int_eff)
  call interaction_set_momenta (int_eff, p_seed(1:n_in), outgoing = .false.)
  p_seed(n_in+1:) = interaction_get_momenta (int_eff, outgoing = .true.)
end subroutine test_recover_kinematics
```

Compute the amplitude. The driver ignores all quantum numbers and, in fact, returns a constant. Nevertheless, we properly transfer the momentum vectors.

⟨*Processes: tests*⟩+≡
```
function test_compute_amplitude &
    (object, j, p, f, h, c, fac_scale, ren_scale, tmp) result (amp)
  class(test_t), intent(in) :: object
  integer, intent(in) :: j
  type(vector4_t), dimension(:), intent(in) :: p
  integer, intent(in) :: f, h, c
  real(default), intent(in) :: fac_scale, ren_scale
  class(workspace_t), intent(inout), allocatable, optional :: tmp
  complex(default) :: amp
  real(default), dimension(:,:), allocatable :: parray
  integer :: i, n_tot
```

```
      select type (driver => object%driver)
      type is (prc_test_t)
         if (driver%scattering) then
            n_tot = 4
         else
            n_tot = 3
         end if
         allocate (parray (0:3,n_tot))
         forall (i = 1:n_tot)  parray(:,i) = vector4_get_components (p(i))
         amp = driver%get_amplitude (parray)
      end select
    end function test_compute_amplitude
```

Write an empty process object

The most trivial test is to write an uninitialized process object.

⟨*Processes: execute tests*⟩≡
```
    call test (processes_1, "processes_1", &
         "write an empty process object", &
         u, results)
```

⟨*Processes: tests*⟩+≡
```
    subroutine processes_1 (u)
      integer, intent(in) :: u
      type(process_t) :: process

      write (u, "(A)")  "* Test output: processes_1"
      write (u, "(A)")  "*   Purpose: display an empty process object"
      write (u, "(A)")

      call process%write (.false., u)

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: processes_1"

    end subroutine processes_1
```

Initialize a process object

Initialize a process and display it.

⟨*Processes: execute tests*⟩+≡
```
    call test (processes_2, "processes_2", &
         "initialize a simple process object", &
         u, results)
```

⟨*Processes: tests*⟩+≡
```
    subroutine processes_2 (u)
      integer, intent(in) :: u
      type(process_library_t), target :: lib
      type(string_t) :: libname
      type(string_t) :: procname
      type(string_t) :: run_id
```

```
