<b>Foreword</b> .....	<b>xiii</b>
<b>Introduction</b> .....	<b>xiv</b>
<b>1. Scope</b> .....	<b>1</b>
<b>2. Conformance</b> .....	<b>2</b>
2.1 Document Conformance.....	2
2.2 Application Conformance .....	2
<b>3. Normative References</b> .....	<b>4</b>
<b>4. Terms and Definitions</b> .....	<b>8</b>
<b>5. Notational Conventions</b> .....	<b>11</b>
<b>6. Acronyms and Abbreviations</b> .....	<b>12</b>
<b>7. General Description</b> .....	<b>13</b>
<b>8. Additional Shared Parts</b> .....	<b>15</b>
8.1 VML Drawing Part .....	15
<b>9. WordprocessingML</b> .....	<b>17</b>
9.1 Part Summary (Part 1, §11.3) .....	17
9.1.1 Alternative Format Import Part (Part 1, §11.3.1) .....	17
9.1.2 Comments Part (Part 1, §11.3.2) .....	17
9.1.3 Document Settings Part (Part 1, §11.3.3) .....	17
9.1.4 Endnotes Part (Part 1, §11.3.4).....	17
9.1.5 Fonts Table Part (Part 1, §11.3.5) .....	17
9.1.6 Footer Part (Part 1, §11.3.6) .....	17
9.1.7 Footnotes Part (Part 1, §11.3.7).....	18
9.1.8 Glossary Document Part (Part 1, §11.3.8) .....	18
9.1.9 Header Part (Part 1, §11.3.9) .....	18
9.1.10 Main Document Part (Part 1, §11.3.10).....	18
9.1.11 Numbering Definitions Part (Part 1, §11.3.11) .....	18
9.1.12 Style Definitions Part (Part 1, §11.3.12).....	18
9.1.13 Web Settings Part (Part 1, §11.3.13).....	18
9.2 Document Template (Part 1, §11.4) .....	19
9.3 Framesets (Part 1, §11.5).....	19
9.4 Master Documents and Subdocuments (Part 1, §11.6) .....	19
9.5 Mail Merge Data Source (Part 1, §11.7) .....	19
9.6 Mail Merger Header Data Source (Part 1, §11.8) .....	19
9.7 XSL Transformation (Part 1, §11.9).....	19
<b>10. SpreadsheetML</b> .....	<b>20</b>
10.1 Part Summary (Part 1, §12.3) .....	20
10.1.1 Calculation Chain Part (Part 1, §12.3.1).....	20
10.1.2 Chartsheet Part (Part 1, §12.3.2) .....	20
10.1.3 Comments Part (Part 1, §12.3.3) .....	20

10.1.4	Connections Part (Part 1, §12.3.4).....	20
10.1.5	Custom Property Part (Part 1, §12.3.5).....	20
10.1.6	Custom XML Mappings Part (Part 1, §12.3.6).....	21
10.1.7	Dialogsheet Part (Part 1, §12.3.7).....	21
10.1.8	Drawings Part (Part 1, §12.3.8).....	21
10.1.9	External Workbook References Part (Part 1, §12.3.9).....	21
10.1.10	Metadata Part (Part 1, §12.3.10).....	21
10.1.11	Pivot Table Part (Part 1, §12.3.11).....	21
10.1.12	Pivot Table Cache Definition Part (Part 1, §12.3.12).....	21
10.1.13	Pivot Table Cache Records Part (Part 1, §12.3.13).....	22
10.1.14	Query Table Part (Part 1, §12.3.14).....	22
10.1.15	Shared Strings Table Part (Part 1, §12.3.15).....	22
10.1.16	Shared Workbook Revision Headers Part (Part 1, §12.3.16).....	22
10.1.17	Shared Workbook Revision Log Part (Part 1, §12.3.17).....	22
10.1.18	Shared Workbook User Data part (Part 1, §12.3.18).....	22
10.1.19	Single Cell Table Definitions Part (Part 1, §12.3.19).....	22
10.1.20	Styles Part (Part 1, §12.3.20).....	23
10.1.21	Table Definition Part (Part 1, §12.3.21).....	23
10.1.22	Volatile Dependencies Part (Part 1, §12.3.22).....	23
10.1.23	Workbook Part (Part 1, §12.3.23).....	23
10.1.24	Worksheet Part (Part 1, §12.3.24).....	23
10.2	External Workbooks (Part 1, §12.4).....	23
<b>11.</b>	<b>PresentationML.....</b>	<b>24</b>
11.1	Part Summary (Part 1, §13.3).....	24
11.1.1	Comment Authors Part (Part 1, §13.3.1).....	24
11.1.2	Comments Part (Part 1, §13.3.2).....	24
11.1.3	Handout Master Part (Part 1, §13.3.3).....	24
11.1.4	Notes Master Part (Part 1, §13.3.4).....	24
11.1.5	Notes Slide Part (Part 1, §13.3.5).....	24
11.1.6	Presentation Part (Part 1, §13.3.6).....	25
11.1.7	Presentation Properties Part (Part 1, §13.3.7).....	25
11.1.8	Slide Part (Part 1, §13.3.8).....	25
11.1.9	Slide Layout Part (Part 1, §13.3.9).....	25
11.1.10	Slide Master Part (Part 1, §13.3.10).....	25
11.1.11	Slide Synchronization Data Part (Part 1, §13.3.11).....	25
11.1.12	User Defined Tags Part (Part 1, §13.3.12).....	25
11.1.13	View Properties Part (Part 1, §13.3.13).....	26
11.2	HTML Publish Location (Part 1, §13.4).....	26
11.3	Slide Synchronization Server Location (Part 1, §13.5).....	26
<b>12.</b>	<b>DrawingML.....</b>	<b>27</b>
12.1	Part Summary (Part 1, §14.2).....	27
12.1.1	Chart Part (Part 1, §14.2.1).....	27
12.1.2	Chart Drawing Part (Part 1, §14.2.2).....	27
12.1.3	Diagram Colors Part (Part 1, §14.2.3).....	27
12.1.4	Diagram Data Part (Part 1, §14.2.4).....	27
12.1.5	Diagram Layout Definition Part (Part 1, §14.2.5).....	27
12.1.6	Diagram Style Part (Part 1, §14.2.6).....	28

12.1.7	Theme Part (Part 1, §14.2.7).....	28
12.1.8	Theme Override Part (Part 1, §14.2.8).....	28
12.1.9	Table Styles Part (Part 1, §14.2.9).....	28
<b>13.</b>	<b>Shared MLs.....</b>	<b>29</b>
13.1	Part Summary (Part 1, §15.2).....	29
13.1.1	Additional Characteristics Part (Part 1, §15.2.1).....	29
13.1.2	Audio Part (Part 1, §15.2.2).....	29
13.1.3	Bibliography Part (Part 1, §15.2.3).....	29
13.1.4	Content Part (Part 1, §15.2.4).....	29
13.1.5	Custom XML Data Storage Part (Part 1, §15.2.5).....	29
13.1.6	Custom XML Data Storage Properties Part (Part 1, §15.2.6).....	29
13.1.7	Embedded Control Persistence Part (Part 1, §15.2.9).....	30
13.1.8	Embedded Object Part (Part 1, §15.2.10).....	30
13.1.9	Embedded Package Part (Part 1, §15.2.11).....	30
13.1.10	Core File Properties Part (Part 1, §15.2.12.1).....	30
13.1.11	Custom File Properties Part (Part 1, §15.2.12.2).....	30
13.1.12	Extended File Properties Part (Part 1, §15.2.12.3).....	30
13.1.13	Font Part (Part 1, §15.2.13).....	30
13.1.14	Image Part (Part 1, §15.2.14).....	30
13.1.15	Printer Settings Part (Part 1, §15.2.15).....	30
13.1.16	Thumbnail Part (Part 1, §15.2.16).....	31
13.1.17	Video Part (Part 1, §15.2.17).....	31
13.2	Hyperlinks Part (Part 1, §15.3).....	31
<b>14.</b>	<b>WordprocessingML Reference Material.....</b>	<b>32</b>
14.1	Table of Contents.....	32
14.2	Paragraphs and Rich Formatting.....	35
14.2.1	Paragraphs.....	35
14.2.2	Run Content.....	37
14.3	Tables.....	39
14.3.1	left (Table Cell Leading Edge Border).....	39
14.3.2	left (Table Leading Edge Border).....	39
14.3.3	left (Table Cell Leading Margin Exception).....	39
14.3.4	left (Table Cell Leading Margin Default).....	40
14.3.5	right (Table Cell Trailing Edge Border).....	40
14.3.6	right (Table Trailing Edge Border).....	40
14.3.7	right (Table Cell Trailing Margin Default).....	40
14.3.8	right (Table Cell Trailing Margin Exception).....	40
14.3.9	Additional attribute for cnfStyle element (Part 1, §17.4.7).....	40
14.3.10	Additional attribute for cnfStyle element (Part 1, §17.4.8).....	42
14.3.11	Additional attribute for tblLook element (Part 1, §17.4.55).....	43
14.3.12	Additional attribute for tblLook element (Part 1, §17.4.56).....	43
14.3.13	hMerge (Horizontally Merged Cell).....	44
14.4	Fonts.....	46
14.4.1	Elements.....	46
14.5	Numbering.....	48
14.5.1	pict (Picture Numbering Symbol Properties).....	48
14.5.2	legacy (Legacy Numbering Level Properties).....	49

14.6	Annotations .....	50
14.6.1	Revisions .....	50
14.7	Settings .....	59
14.7.1	Legacy Password Hash Algorithm .....	59
14.7.2	Document Settings .....	66
14.7.3	Compatibility Settings .....	80
14.7.4	Web Page Settings .....	159
14.8	Miscellaneous Topics .....	160
14.8.1	Text Box Content .....	160
14.9	Fields and Hyperlinks .....	162
14.9.1	Syntax .....	162
14.9.2	Legacy language references .....	163
14.9.3	Use of DOS File Paths .....	170
14.9.4	Field definitions .....	170
14.9.5	fldData (Custom Field Data) .....	179
14.9.6	fldData (Custom Field Data) .....	180
14.9.7	hyperlink (Hyperlink) (Part 1, §17.16.22) .....	181
14.10	Simple Types .....	181
14.10.1	Additional member types for the union in ST_DecimalNumberOrPercent (Part 1, §17.18.11) ...	181
14.10.2	Additional enumeration values for ST_Jc (Part 1, §17.18.44) .....	181
14.10.3	Additional enumeration values for ST_JcTable (Part 1, §17.18.45) .....	181
14.10.4	Additional enumeration values for ST_NumberFormat (Part 1, §17.18.59) .....	182
14.10.5	Additional enumeration values for ST_StyleSort (Part 1, §17.18.82) .....	182
14.10.6	Additional enumeration values for ST_TabJc (Part 1, §17.18.84) .....	183
14.10.7	Additional enumeration values for ST_TextDirection (Part 1, §17.18.93) .....	183
14.10.8	Additional member types for the union in ST_TextScale (Part 1, §17.18.95) .....	183
14.10.9	ST_Cnf (Conditional Formatting Bitmask) .....	183
14.10.10	ST_UnqualifiedPercentage (Percentage Value Without Percent Sign) .....	185
14.10.11	ST_TextScaleDecimal (Text Expansion/Compression Percentage) .....	185
14.11	Changed attributes .....	186
14.11.1	Changed attribute for contentPart element (Part 1, §17.3.3.2) .....	186
14.11.2	Changed attribute for control element (Part 1, §17.3.3.3) .....	187
14.11.3	Changed attribute for movie element (Part 1, §17.3.3.17) .....	187
14.11.4	Changed attribute for objectEmbed element (Part 1, §17.3.3.20) .....	188
14.11.5	Changed attribute for objectLink element (Part 1, §17.3.3.21) .....	189
14.11.6	Changed attribute for bottom element (Part 1, §17.6.2) .....	189
14.11.7	Changed attribute for left element (Part 1, §17.6.7) .....	190
14.11.8	Changed attribute for printerSettings element (Part 1, §17.6.14) .....	191
14.11.9	Changed attribute for right element (Part 1, §17.6.15) .....	192
14.11.10	Changed attribute for top element (Part 1, §17.6.21) .....	192
14.11.11	Changed attribute for embedBold element (Part 1, §17.8.3.3) .....	194
14.11.12	Changed attribute for embedBoldItalic element (Part 1, §17.8.3.4) .....	194
14.11.13	Changed attribute for embedItalic element (Part 1, §17.8.3.5) .....	195
14.11.14	Changed attribute for embedRegular element (Part 1, §17.8.3.6) .....	196
14.11.15	Changed attribute for footerReference element (Part 1, §17.10.2) .....	196
14.11.16	Changed attribute for headerReference element (Part 1, §17.10.5) .....	197
14.11.17	Changed attribute for dataSource element (Part 1, §17.14.9) .....	198
14.11.18	Changed attribute for headerSource element (Part 1, §17.14.16) .....	198

14.11.19	Changed attribute for recipientData element (Part 1, §17.14.28)	199
14.11.20	Changed attribute for src element (Part 1, §17.14.30)	200
14.11.21	Changed attribute for attachedTemplate element (Part 1, §17.15.1.6)	200
14.11.22	Changed attribute for saveThroughXslt element (Part 1, §17.15.1.76)	201
14.11.23	Changed attribute for longDesc element (Part 1, §17.15.2.23)	201
14.11.24	Changed attribute for sourceFileName element (Part 1, §17.15.2.39)	202
14.11.25	Changed attribute for subDoc element (Part 1, §17.17.1.1)	203
14.11.26	Changed attribute for altChunk element (Part 1, §17.17.2.1)	203
<b>15.</b>	<b>SpreadsheetML Reference Material</b>	<b>205</b>
15.1	Table of Contents	205
15.2	Workbook	206
15.2.1	Additional attribute for fileSharing element (Part 1, §18.2.12)	206
15.2.2	Additional attribute for webPublishing element (Part 1, §18.2.24)	206
15.2.3	Additional attributes for workbookProtection element (Part 1, §18.2.29)	206
15.2.4	Modified content for Date Conversion for Serial Date-Times (Part 1, §18.17.4.1)	212
15.3	Worksheets	213
15.3.1	Worksheets	213
15.3.2	AutoFilter Settings	216
15.4	Styles	217
15.4.1	left (Leading Edge Border)	217
15.4.2	right (Trailing Edge Border)	217
15.5	Pivot Tables	217
15.5.1	Pivot Tables	217
15.6	External Data Connections	218
15.6.1	Additional attribute for textPr element (Part 1, §18.13.12)	218
15.7	Simple Types	218
15.7.1	Additional enumeration values for ST_PivotAreaType (Part 1, §18.18.58)	218
15.7.2	ST_UnsignedShortHex (Unsigned Short Hex)	218
15.7.3	Removed enumeration values for ST_CellType (Part 1, §18.18.11)	219
15.8	Formulas	219
15.8.1	Attribute synonym for c element (Part 1, §18.6.1)	219
15.8.2	Additional representation for dates and times (Part 1, §18.17.4)	219
15.9	Changed attributes	219
15.9.1	Changed attribute for externalReference element (Part 1, §18.2.8)	219
15.9.2	Changed attribute for pivotCache element (Part 1, §18.2.17)	219
15.9.3	Changed attribute for sheet element (Part 1, §18.2.19)	220
15.9.4	Changed attribute for control element (Part 1, §18.3.1.19)	220
15.9.5	Changed attribute for controlPr element (Part 1, §18.3.1.20)	220
15.9.6	Changed attribute for customPr element (Part 1, §18.3.1.22)	221
15.9.7	Changed attribute for dataRef element (Part 1, §18.3.1.30)	221
15.9.8	Changed attribute for drawing element (Part 1, §18.3.1.36)	221
15.9.9	Changed attribute for drawingHF element (Part 1, §18.3.1.37)	221
15.9.10	Changed attribute for hyperlink element (Part 1, §18.3.1.47)	222
15.9.11	Changed attribute for objectPr element (Part 1, §18.3.1.56)	222
15.9.12	Changed attribute for oleObject element (Part 1, §18.3.1.59)	222
15.9.13	Changed attribute for pageSetup element (Part 1, §18.3.1.63)	223
15.9.14	Changed attribute for pageSetup element (Part 1, §18.3.1.64)	223

15.9.15	Changed attribute for picture element (Part 1, §18.3.1.67).....	223
15.9.16	Changed attribute for pivotSelection element (Part 1, §18.3.1.69) .....	223
15.9.17	Changed attribute for tablePart element (Part 1, §18.3.1.94) .....	223
15.9.18	Changed attribute for pivotCacheDefinition element (Part 1, §18.10.1.67) .....	224
15.9.19	Changed attribute for rangeSet element (Part 1, §18.10.1.79).....	224
15.9.20	Changed attribute for worksheetSource element (Part 1, §18.10.1.95).....	224
15.9.21	Changed attribute for header element (Part 1, §18.11.1.1).....	224
15.9.22	Changed attribute for externalBook element (Part 1, §18.14.7).....	225
15.9.23	Changed attribute for oleLink element (Part 1, §18.14.11).....	225
<b>16.</b>	<b>PresentationML Reference Material .....</b>	<b>226</b>
16.1	Table of Contents.....	226
16.2	Presentation.....	227
16.2.1	Presentation Properties .....	227
16.3	Slides .....	235
16.3.1	Embedded Objects.....	235
16.4	Simple Types .....	236
16.4.1	ST_WebColorType (HTML Slide Navigation Control Colors).....	236
16.4.2	ST_WebEncoding (Web Encoding).....	236
16.4.3	ST_WebScreenSize (HTML/Web Screen Size Target) .....	236
16.5	Changed attributes .....	237
16.5.1	Changed attribute for bold element (Part 1, §19.2.1.1) .....	237
16.5.2	Changed attribute for boldItalic element (Part 1, §19.2.1.2) .....	238
16.5.3	Changed attribute for font element (Part 1, §19.2.1.13) .....	238
16.5.4	Changed attribute for handoutMasterId element (Part 1, §19.2.1.14).....	240
16.5.5	Changed attribute for italic element (Part 1, §19.2.1.16).....	240
16.5.6	Changed attribute for notesMasterId element (Part 1, §19.2.1.20) .....	241
16.5.7	Changed attribute for notesSz element (Part 1, §19.2.1.22).....	241
16.5.8	Changed attribute for regular element (Part 1, §19.2.1.29).....	242
16.5.9	Changed attribute for sld element (Part 1, §19.2.1.31).....	242
16.5.10	Changed attribute for sldId element (Part 1, §19.2.1.33).....	242
16.5.11	Changed attribute for sldMasterId element (Part 1, §19.2.1.36) .....	242
16.5.12	Changed attribute for SmartTags element (Part 1, §19.2.1.40) .....	243
16.5.13	Changed attribute for gridSpacing element (Part 1, §19.2.2.3).....	243
16.5.14	Changed attribute for origin element (Part 1, §19.2.2.9).....	244
16.5.15	Changed attribute for sld element (Part 1, §19.2.2.14).....	244
16.5.16	Changed attribute for bgRef element (Part 1, §19.3.1.3).....	245
16.5.17	Changed attribute for blipFill element (Part 1, §19.3.1.4).....	245
16.5.18	Changed attribute for clrMap element (Part 1, §19.3.1.6).....	245
16.5.19	Changed attribute for cNvPicPr element (Part 1, §19.3.1.11) .....	247
16.5.20	Changed attribute for cNvPr element (Part 1, §19.3.1.12).....	247
16.5.21	Changed attribute for cNvSpPr element (Part 1, §19.3.1.13).....	249
16.5.22	Changed attribute for contentPart element (Part 1, §19.3.1.14).....	249
16.5.23	Changed attribute for custData element (Part 1, §19.3.1.17).....	250
16.5.24	Changed attribute for grpSpPr element (Part 1, §19.3.1.23) .....	250
16.5.25	Changed attribute for sldLayoutId element (Part 1, §19.3.1.40).....	250
16.5.26	Changed attribute for spPr element (Part 1, §19.3.1.44) .....	250
16.5.27	Changed attribute for tags element (Part 1, §19.3.1.47) .....	251

16.5.28	Changed attribute for xfrm element (Part 1, §19.3.1.53).....	251
16.5.29	Changed attribute for control element (Part 1, §19.3.2.1).....	252
16.5.30	Changed attribute for oleObj element (Part 1, §19.3.2.4).....	252

# Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

ISO/IEC 29500-4 was prepared by ISO/IEC JTC 1, Information technology, Subcommittee SC 34, Document description and processing languages.

This third edition cancels and replaces the second edition (ISO/IEC 29500-4:2011), which has been technically revised by incorporation of the Amendment ISO/IEC 29500-4:2011/Amd.1:2012 and the Technical Corrigendum ISO/IEC 29500-4:2011/Cor.1:2012.

ISO/IEC 29500 consists of the following parts, under the general title *Information technology — Document description and processing languages — Office Open XML File Formats*:

- *Part 1: Fundamentals and Markup Language Reference*
- *Part 2: Open Packaging Conventions*
- *Part 3: Markup Compatibility and Extensibility*
- *Part 4: Transitional Migration Features*

Annex A forms a normative part of this Part of ISO/IEC 29500. Annexes B, C, and D are for information only.

This Part of ISO/IEC 29500 includes two annexes (Annex A and Annex B) that refer to data files provided in electronic form.

The document representation formats defined by this Part are different from the formats defined in the corresponding Part of ECMA-376:2006. Some of the differences are reflected in schema changes, as shown in Annex D of this Part.

# Introduction

ISO/IEC 29500 specifies a family of XML schemas, collectively called *Office Open XML*, which define the XML vocabularies for word-processing, spreadsheet, and presentation documents, as well as the packaging of documents that conform to these schemas.

The goal is to enable the implementation of the Office Open XML formats by the widest set of tools and platforms, fostering interoperability across office productivity applications and line-of-business systems, as well as to support and strengthen document archival and preservation, all in a way that is fully compatible with the existing corpus of Microsoft Office documents.

The intent of this Part of ISO/IEC 29500 is to enable a transitional period during which existing binary documents being migrated to ISO/IEC 29500 can make use of legacy features to preserve their fidelity, while noting that new documents should not use them. Part 1, §2.4, “Document Conformance”, notes that WML Strict, SML Strict and PML Strict documents do not use any of the features defined in Part 4.

This Part of ISO/IEC 29500 is normative for the current edition of ISO/IEC 29500, but is not guaranteed to be included in future revisions of that Standard. The intent is to enable the group responsible for maintenance of ISO/IEC 29500 to choose, at a later date, to remove this set of features from a revised version of that Standard.

In general, this Part of ISO/IEC 29500 augments Part 1, and inherits the provisions of that Part. Exceptions to this are indicated explicitly.

The following organizations have participated in the creation of ISO/IEC 29500 and their contributions are gratefully acknowledged:

Apple, Barclays Capital, BP, The British Library, Essilor, Intel, Microsoft, NextPage, Novell, Statoil, Toshiba, and the United States Library of Congress.

# Information technology — Document description and processing languages — Office Open XML File Formats

## Part 4:

## Transitional Migration Features

### 1. Scope

ISO/IEC 29500 defines a set of XML vocabularies for representing word-processing documents, spreadsheets and presentations. On the one hand, the goal of ISO/IEC 29500 is to represent faithfully the existing corpus of word-processing documents, spreadsheets and presentations that have been produced by Microsoft Office applications (from Microsoft Office 97 to Microsoft Office 2008, inclusive). It also specifies requirements for Office Open XML consumers and producers. On the other hand, the goal is to facilitate extensibility and interoperability by enabling implementations by multiple vendors and on multiple platforms.

This Part of ISO/IEC 29500 defines features for backward-compatibility and that are useful for high-quality migration of existing binary documents to ISO/IEC 29500. These features are used only by documents of conformance class WML Transitional (§2.1), SML Transitional (§2.1), or PML Transitional (§2.1). These features are sometimes needed for high-quality migration of existing binary documents to ISO/IEC 29500.

## 2. Conformance

### 2.1 Document Conformance

A document of conformance class Office Open XML Transitional shall be a package of conformance class OPC, as specified in ISO/IEC 29500-2, for which all the following shall hold:

- The document obeys all constraints specified in this Part of ISO/IEC 29500
- The document is of category Wordprocessing, Spreadsheet, or Presentation. These categories are defined in ISO/IEC 29500-1:2011 §4
- VML Drawing Parts (§8.1) are of conformance class MCE, as specified in ISO/IEC 29500-3. Any child elements of the root element of VMLDrawing Parts are valid against the VML schema shown in A.6, “VML”, after the removal of any extensions specified using the mechanisms in ISO/IEC 29500-3. VML Drawing Parts obey all constraints specified in this Part of ISO/IEC 29500
- For each OPC Part of the document of the types listed in §9.1 or ISO/IEC 29500-1:2011 §11.3, §12.3, §13.3, §14.2, and §15.2, all the following shall hold:
  - i. The part is of conformance class MCE, as specified in ISO/IEC 29500-3
  - ii. After the removal of any extensions using the mechanisms in ISO/IEC 29500-3, the part is valid against the Transitional W3C XML Schema (Annex A)

This Part of ISO/IEC 29500 uses the following further terms to refer to documents of conformance class Office Open XML Transitional:

- *WML Transitional*, if the document is of category Wordprocessing
- *SML Transitional*, if the document is of category Spreadsheet
- *PML Transitional*, if the document is of category Presentation

### 2.2 Application Conformance

Application conformance incorporates both syntax and semantics.

- A conforming consumer shall not reject any conforming documents of at least one document conformance class.
- A conforming producer shall be able to produce conforming documents of at least one document conformance class.
- A conforming application shall treat the information in Office Open XML documents in a manner consistent with the semantic definitions given in ISO/IEC 29500. An application's intended behavior need not require that application to process all of the information in an Office Open XML document. However, the information that it does process shall be processed in a manner that is consistent with the semantic definitions given in ISO/IEC 29500.

[Note: This note illustrates the third bullet above. Conforming applications might serve various functions. Examples include a viewer, an editor, and a back-end processor. Here is an illustration of how the third bullet applies to each of those examples:

- If a conforming viewer supports a given feature, then when it displays information using that feature, it respects the semantics of that feature as described in the Standard.
- If a conforming editor supports a given feature, then when it provides its user with an interface for manipulating information using that feature, it respects the semantics of that feature as described in the Standard.
- If a conforming back-end processor supports a given feature, then when that processor transforms or assembles information involving that feature, that processor respects the semantics of that feature as described in the Standard.

*end note]*

This Part of ISO/IEC 29500 defines the following application conformance classes:

- *WML Transitional*, if the application is a conforming application that is a consumer or producer of documents having conformance class WML Transitional.
- *SML Transitional*, if the application is a conforming application that is a consumer or producer of documents having conformance class SML Transitional.
- *PML Transitional*, if the application is a conforming application that is a consumer or producer of documents having conformance class PML Transitional.

## 4. Terms and Definitions

For the purposes of this document, the following terms and definitions apply. Other terms are defined where they appear in *italic* typeface, on the left side of a syntax rule, or within subclauses of language-specific grammars. Terms explicitly defined in this Part of ISO/IEC 29500 are not to be presumed to refer implicitly to similar terms defined elsewhere. [*Note: This part uses OPC-related terms, which are defined in ISO/IEC 29500-2. end note*]

**application** — A consumer or producer.

**behavior** — External appearance or action.

**behavior, implementation-defined** — Unspecified behavior where each implementation is expected to document that behavior, which would thereby promote predictability and reproducibility within any given implementation. (This term is sometimes called “application-defined behavior”.)

**behavior, locale-specific** — Behavior that depends on local conventions of nationality, culture, and language.

**behavior, unspecified** — Behavior where ISO/IEC 29500 makes no recommendations. [*Note: To add an extension, an implementer must use the extensibility mechanisms described by ISO/IEC 29500 rather than trying to do so by giving meaning to otherwise unspecified behavior. end note*]

**byte** — A sequence of 8 bits treated as a unit.

**comment** — A note that an author or reviewer attaches to content in a document. Although a consumer might choose to display comments, they are not considered part of the body of the document. A comment might include the text of the note, the comment author's name and initials, and date of creation, among other things.

**consumer** — A piece of software or a device that reads packages through a package implementer. A consumer is often designed to consume packages only for a specific physical package format.

**content type** — Describes the content stored in a part. Content types define a media type, a subtype, and an optional set of parameters, as defined in RFC 2616.

**document category** — One of the three categories of Office Open XML documents: Wordprocessing, Spreadsheet, and Presentation, defined as follows:

- A document whose package-relationship item contains a relationship to a Main Document part (Part 1, §11.3.10) is a document of category Wordprocessing.
- A document whose package-relationship item contains a relationship to a Workbook part (Part 1, §12.3.23) is a document of category Spreadsheet.

- A document whose package-relationship item contains a relationship to a Presentation part (Part 1, §13.3.6) is a document of category Presentation.

An Office Open XML document can contain one or more embedded Office Open XML packages (Part 1, §15.2.11) with each embedded package having any of the three document categories. However, the presence of these embedded packages does not change the category of the document.

**DOS file path** — A legacy file naming scheme which used a file name of at most eight characters, followed by a period ("."), followed by a filename extension of at most three characters. This name may be preceded by a slash-delimited path, and the combined structure may be preceded by a drive letter specifier. The grammar for DOS file paths is defined as follows:

```
filepath = [drive] [ folder] [filename]
filename = corefilename "." (0 * 3 validchar)
corefilename = (1 * 8 validchar)
validchar = uppercaseletter | decimaldigit | "!" | "#" | "$" | "%" | "&"
           | "'" | "\" | "-" | "@" | "^" | "_" | "`" | "{" | "}" | "~"
corefoldername = (1 * 8 validchar) | "." | ".."
folder = 1 * (corefoldername "\\") | "\\"
drive = uppercaseletter ":" "\\"
uppercaseletter = "A" | "B" | "C" | "D" | "E" | "F" | "G" | "H" | "I" | "J"
               | "K" | "L" | "M" | "N" | "O" | "P" | "Q" | "R" | "S" | "T" | "U" | "V"
               | "W" | "X" | "Y" | "Z"
decimaldigit = "0" | "1" | "2" | "3" | "4" | "5" | "6" | "7" | "8" | "9"
```

**DrawingML** — A set of conventions for specifying the location and appearance of drawing elements in an Office Open XML document.

**extension** — Any XML element, XML attribute, relationship, or part not explicitly included in ISO/IEC 29500, but that uses the extensibility mechanisms described by ISO/IEC 29500.

**Office Open XML document** — A rendition of a data stream formatted using the wordprocessing, spreadsheet, or presentation ML and its related MLs as described in ISO/IEC 29500-1 and ISO/IEC 29500-4. Such a document is represented as a package as described in ISO/IEC 29500-2.

**package** — A ZIP archive that conforms to the Open Packaging Conventions specification defined in ISO/IEC 29500-2.

**package, embedded** — A package that has been stored as the target of an Embedded Package relationship (Part 1, §15.2.11) in an Office Open XML document

**PresentationML** — A set of conventions for representing an Office Open XML document of category Presentation.

**producer** — A piece of software or a device that writes packages through a package implementer. A producer is often designed to produce packages according to a particular physical package format specification.

**relationship** — The kind of connection between a source part and a target part in a package. Relationships make the connections between parts directly discoverable without looking at the content in the parts, and without altering the parts themselves. (See also Package Relationships.)

**relationships part** — A part containing an XML representation of relationships.

**relationship, explicit** — A relationship in which a resource is referenced from a source part's XML using the Id attribute of a Relationship tag.

**relationship, implicit** — A relationship that is not explicit.

**SpreadsheetML** — A set of conventions for representing an Office Open XML document of category Spreadsheet.

**WordprocessingML** — A set of conventions for representing an Office Open XML document of category Wordprocessing.

## 5. Notational Conventions

The following typographical conventions are used in this Part of ISO/IEC 29500:

1. The first occurrence of a new term is written in italics. [*Example*: The text in ISO/IEC 29500 is divided into *normative* and *informative* categories. *end example*]
2. In each definition of a term in §4 (Terms and Definitions), the term is written in bold. [*Example*: **behavior** — External appearance or action. *end example*]
3. The tag name of an XML element is written using a distinct style and typeface. [*Example*: The bookmarkStart and bookmarkEnd elements specify ... *end example*]
4. The name of an XML attribute is written using a distinct style and typeface. [*Example*: The dropCap attribute specifies ... *end example*]
5. The value of an XML attribute is written using a constant-width style. [*Example*: The attribute value of auto specifies ... *end example*]
6. The qualified or unqualified name of a simple type, complex type, or base datatype is written using a distinct style and typeface. [*Example*: The possible values for this attribute are defined by the ST\_HexColor simple type. *end example*]

## 6. Acronyms and Abbreviations

**This clause is informative.**

The following acronyms and abbreviations are used throughout ISO/IEC 29500:

IEC — the International Electrotechnical Commission

ISO — the International Organization for Standardization

W3C — World Wide Web Consortium

**End of informative text.**

## 7. General Description

This Part of ISO/IEC 29500 is divided into the following subdivisions:

1. Front matter (clauses 1–7);
2. Main body (clauses 8–20);
3. Annexes

Examples are provided to illustrate possible forms of the constructions described. References are used to refer to related clauses. Notes are provided to give advice or guidance to implementers or programmers. Rationale provides explanatory material as to why something is or is not in ISO/IEC 29500. Annexes provide additional information or summarize the information contained in ISO/IEC 29500.

The following form the normative pieces of this Part of ISO/IEC 29500:

- Introduction
- Clauses 1–5, 7, and 8–20
- Annex A

The following form the informative pieces of this Part of ISO/IEC 29500:

- Clause 6
- Annex B–Annex D
- All notes
- All examples

Except for whole clauses or annexes that are identified as being informative, informative text that is contained within normative text is indicated in the following ways:

1. [*Example*: code fragment, possibly with some narrative ... *end example*]
2. [*Note*: narrative ... *end note*]
3. [*Rationale*: narrative ... *end rationale*]
4. [*Guidance*: narrative ... *end guidance*]

Unless stated otherwise in this Part, the functionality defined in Part 1 is applicable to Part 4. However, Part 4 uses namespaces that are different from those used by Part 1. As such, when examples in Part 1 are read in the context of Part 4, they should be understood in the context of the corresponding Part 4 namespaces.

## 8. Additional Shared Parts

### 8.1 VML Drawing Part

Content Type:	application/vnd.openxmlformats-officedocument.vmlDrawing
Root Namespace:	not applicable
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/vmlDrawing">http://schemas.openxmlformats.org/officeDocument/2006/relationships/vmlDrawing</a>

An instance of this part type contains markup in the Vector Markup Language (VML) syntax, which is used to provide an alternative image representation of objects stored in a SpreadsheetML or PresentationML document.

[*Note:* The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined in ISO/IEC 29500 for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a deprecated format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML. *end note*]

A package is permitted to contain zero or more VML Drawing parts, each of which shall be the target of an explicit relationship in a Handout Master (Part 1, §13.3.3), Notes Slide (Part 1, §13.3.5), Notes Master (Part 1, §13.3.4), Slide (Part 1, §13.3.8), Slide Layout (Part 1, §13.3.9), or Slide Master (Part 1, §13.3.10) part in a PresentationML document; or a Dialogsheet (Part 1, §12.3.7) or Worksheet part (Part 1, §12.3.24) in a SpreadsheetML document.

[*Example:* The following SpreadsheetML's package-relationship item contains one relationship, for the VML Drawing part stored in the ZIP item ../drawings/drawing1.vml:

```
<Relationships xmlns="...">
  <Relationship Id="rId8"
    Type="http://.../vmlDrawing" Target="../drawings/drawing1.vml"/>
</Relationships>
```

*end example]*

The root element for a part of this content type shall be xml in the null namespace, encapsulating an arbitrary amount of VML markup as defined by ISO/IEC 29500.

[*Example*: Consider the following VML Drawing part:

```
<xml>
  <v:shape ...>
    ...
  </v:shape>
  ...
</xml>
```

*end example*]

A VML Drawing part shall be located within the package containing the relationships part (expressed syntactically, the TargetMode attribute of the Relationship element shall be Internal).

A VML Drawing part is permitted to have explicit relationships to the following parts defined by ISO/IEC 29500:

- Image (Part 1, §15.2.14)

A VML Drawing part shall not have implicit or explicit relationships to any other part defined by ISO/IEC 29500.

## 9. WordprocessingML

The following parts, which are defined in subclauses within Part 1, §11, “WordprocessingML”, have different source relationships and/or root namespaces when used in documents of the Transitional conformance class:

### 9.1 Part Summary (Part 1, §11.3)

#### 9.1.1 Alternative Format Import Part (Part 1, §11.3.1)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/aFChunk">http://schemas.openxmlformats.org/officeDocument/2006/relationships/aFChunk</a>
----------------------	---

#### 9.1.2 Comments Part (Part 1, §11.3.2)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/comments">http://schemas.openxmlformats.org/officeDocument/2006/relationships/comments</a>

#### 9.1.3 Document Settings Part (Part 1, §11.3.3)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/settings">http://schemas.openxmlformats.org/officeDocument/2006/relationships/settings</a>

#### 9.1.4 Endnotes Part (Part 1, §11.3.4)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/endnotes">http://schemas.openxmlformats.org/officeDocument/2006/relationships/endnotes</a>

#### 9.1.5 Fonts Table Part (Part 1, §11.3.5)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/fontTable">http://schemas.openxmlformats.org/officeDocument/2006/relationships/fontTable</a>

#### 9.1.6 Footer Part (Part 1, §11.3.6)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
-----------------	---

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer">http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer</a>
----------------------	---

### 9.1.7 Footnotes Part (Part 1, §11.3.7)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/footnotes">http://schemas.openxmlformats.org/officeDocument/2006/relationships/footnotes</a>

### 9.1.8 Glossary Document Part (Part 1, §11.3.8)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/glossaryDocument">http://schemas.openxmlformats.org/officeDocument/2006/relationships/glossaryDocument</a>

### 9.1.9 Header Part (Part 1, §11.3.9)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/header">http://schemas.openxmlformats.org/officeDocument/2006/relationships/header</a>

### 9.1.10 Main Document Part (Part 1, §11.3.10)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/officeDocument">http://schemas.openxmlformats.org/officeDocument/2006/relationships/officeDocument</a>

### 9.1.11 Numbering Definitions Part (Part 1, §11.3.11)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/numbering">http://schemas.openxmlformats.org/officeDocument/2006/relationships/numbering</a>

### 9.1.12 Style Definitions Part (Part 1, §11.3.12)

Root Namespace:	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/styles">http://schemas.openxmlformats.org/officeDocument/2006/relationships/styles</a>

### 9.1.13 Web Settings Part (Part 1, §11.3.13)

Root	<a href="http://schemas.openxmlformats.org/wordprocessingml/2006/main">http://schemas.openxmlformats.org/wordprocessingml/2006/main</a>
------	---

Namespace:	
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/webSettings">http://schemas.openxmlformats.org/officeDocument/2006/relationships/webSettings</a>

## 9.2 Document Template (Part 1, §11.4)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/attachedTemplate">http://schemas.openxmlformats.org/officeDocument/2006/relationships/attachedTemplate</a>
----------------------	---

## 9.3 Framesets (Part 1, §11.5)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/frame">http://schemas.openxmlformats.org/officeDocument/2006/relationships/frame</a>
----------------------	---

## 9.4 Master Documents and Subdocuments (Part 1, §11.6)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/subDocument">http://schemas.openxmlformats.org/officeDocument/2006/relationships/subDocument</a>
----------------------	---

## 9.5 Mail Merge Data Source (Part 1, §11.7)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/mailMergeSource">http://schemas.openxmlformats.org/officeDocument/2006/relationships/mailMergeSource</a>
----------------------	---

## 9.6 Mail Merger Header Data Source (Part 1, §11.8)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/mailMergeHeaderSource">http://schemas.openxmlformats.org/officeDocument/2006/relationships/mailMergeHeaderSource</a>
----------------------	---

## 9.7 XSL Transformation (Part 1, §11.9)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/transform">http://schemas.openxmlformats.org/officeDocument/2006/relationships/transform</a>
----------------------	---

## 10. SpreadsheetML

The following parts, which are defined in subclauses within Part 1, §12, “SpreadsheetML”, have different source relationships and/or root namespaces when used in documents of the Transitional conformance class:

### 10.1 Part Summary (Part 1, §12.3)

#### 10.1.1 Calculation Chain Part (Part 1, §12.3.1)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/calcChain">http://schemas.openxmlformats.org/officeDocument/2006/relationships/calcChain</a>

#### 10.1.2 Chartsheet Part (Part 1, §12.3.2)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/chartsheet">http://schemas.openxmlformats.org/officeDocument/2006/relationships/chartsheet</a>

#### 10.1.3 Comments Part (Part 1, §12.3.3)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/comments">http://schemas.openxmlformats.org/officeDocument/2006/relationships/comments</a>

#### 10.1.4 Connections Part (Part 1, §12.3.4)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/connections">http://schemas.openxmlformats.org/officeDocument/2006/relationships/connections</a>

#### 10.1.5 Custom Property Part (Part 1, §12.3.5)

Root Namespace:	Not applicable
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/customProperty">http://schemas.openxmlformats.org/officeDocument/2006/relationships/customProperty</a>

### 10.1.6 Custom XML Mappings Part (Part 1, §12.3.6)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/xmlMaps">http://schemas.openxmlformats.org/officeDocument/2006/relationships/xmlMaps</a>

### 10.1.7 Dialogsheet Part (Part 1, §12.3.7)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/dialogsheet">http://schemas.openxmlformats.org/officeDocument/2006/relationships/dialogsheet</a>

### 10.1.8 Drawings Part (Part 1, §12.3.8)

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/spreadsheetDrawing">http://schemas.openxmlformats.org/drawingml/2006/spreadsheetDrawing</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/drawing">http://schemas.openxmlformats.org/officeDocument/2006/relationships/drawing</a>

### 10.1.9 External Workbook References Part (Part 1, §12.3.9)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/externalLink">http://schemas.openxmlformats.org/officeDocument/2006/relationships/externalLink</a>

### 10.1.10 Metadata Part (Part 1, §12.3.10)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/sheetMetadata">http://schemas.openxmlformats.org/officeDocument/2006/relationships/sheetMetadata</a>

### 10.1.11 Pivot Table Part (Part 1, §12.3.11)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/pivotTable">http://schemas.openxmlformats.org/officeDocument/2006/relationships/pivotTable</a>

### 10.1.12 Pivot Table Cache Definition Part (Part 1, §12.3.12)

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/pivotCacheDefinition">http://schemas.openxmlformats.org/officeDocument/2006/relationships/pivotCacheDefinition</a>

**10.1.13 Pivot Table Cache Records Part (Part 1, §12.3.13)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/pivotCacheRecords">http://schemas.openxmlformats.org/officeDocument/2006/relationships/pivotCacheRecords</a>

**10.1.14 Query Table Part (Part 1, §12.3.14)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/queryTable">http://schemas.openxmlformats.org/officeDocument/2006/relationships/queryTable</a>

**10.1.15 Shared Strings Table Part (Part 1, §12.3.15)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/sharedStrings">http://schemas.openxmlformats.org/officeDocument/2006/relationships/sharedStrings</a>

**10.1.16 Shared Workbook Revision Headers Part (Part 1, §12.3.16)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/revisionHeaders">http://schemas.openxmlformats.org/officeDocument/2006/relationships/revisionHeaders</a>

**10.1.17 Shared Workbook Revision Log Part (Part 1, §12.3.17)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/revisionLog">http://schemas.openxmlformats.org/officeDocument/2006/relationships/revisionLog</a>

**10.1.18 Shared Workbook User Data part (Part 1, §12.3.18)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/usernames">http://schemas.openxmlformats.org/officeDocument/2006/relationships/usernames</a>

**10.1.19 Single Cell Table Definitions Part (Part 1, §12.3.19)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/tableSingleCells">http://schemas.openxmlformats.org/officeDocument/2006/relationships/tableSingleCells</a>

**10.1.20 Styles Part (Part 1, §12.3.20)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/styles">http://schemas.openxmlformats.org/officeDocument/2006/relationships/styles</a>

**10.1.21 Table Definition Part (Part 1, §12.3.21)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/table">http://schemas.openxmlformats.org/officeDocument/2006/relationships/table</a>

**10.1.22 Volatile Dependencies Part (Part 1, §12.3.22)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/volatileDependencies">http://schemas.openxmlformats.org/officeDocument/2006/relationships/volatileDependencies</a>

**10.1.23 Workbook Part (Part 1, §12.3.23)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/officeDocument">http://schemas.openxmlformats.org/officeDocument/2006/relationships/officeDocument</a>

**10.1.24 Worksheet Part (Part 1, §12.3.24)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/spreadsheetml/2006/main">http://schemas.openxmlformats.org/spreadsheetml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/worksheet">http://schemas.openxmlformats.org/officeDocument/2006/relationships/worksheet</a>

**10.2 External Workbooks (Part 1, §12.4)**

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/externalLinkPath">http://schemas.openxmlformats.org/officeDocument/2006/relationships/externalLinkPath</a>
----------------------	---

# 11. PresentationML

The following parts, which are defined in subclauses within Part 1, §13, “PresentationML”, have different source relationships and/or root namespaces when used in documents of the Transitional conformance class:

## 11.1 Part Summary (Part 1, §13.3)

### 11.1.1 Comment Authors Part (Part 1, §13.3.1)

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/commentAuthors">http://schemas.openxmlformats.org/officeDocument/2006/relationships/commentAuthors</a>

### 11.1.2 Comments Part (Part 1, §13.3.2)

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/comments">http://schemas.openxmlformats.org/officeDocument/2006/relationships/comments</a>

### 11.1.3 Handout Master Part (Part 1, §13.3.3)

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/handoutMaster">http://schemas.openxmlformats.org/officeDocument/2006/relationships/handoutMaster</a>

### 11.1.4 Notes Master Part (Part 1, §13.3.4)

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/notesMaster">http://schemas.openxmlformats.org/officeDocument/2006/relationships/notesMaster</a>

### 11.1.5 Notes Slide Part (Part 1, §13.3.5)

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/notesSlide">http://schemas.openxmlformats.org/officeDocument/2006/relationships/notesSlide</a>

**11.1.6 Presentation Part (Part 1, §13.3.6)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/officeDocument">http://schemas.openxmlformats.org/officeDocument/2006/relationships/officeDocument</a>

**11.1.7 Presentation Properties Part (Part 1, §13.3.7)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/presProps">http://schemas.openxmlformats.org/officeDocument/2006/relationships/presProps</a>

**11.1.8 Slide Part (Part 1, §13.3.8)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/slide">http://schemas.openxmlformats.org/officeDocument/2006/relationships/slide</a>

**11.1.9 Slide Layout Part (Part 1, §13.3.9)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/slideLayout">http://schemas.openxmlformats.org/officeDocument/2006/relationships/slideLayout</a>

**11.1.10 Slide Master Part (Part 1, §13.3.10)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/slideMaster">http://schemas.openxmlformats.org/officeDocument/2006/relationships/slideMaster</a>

**11.1.11 Slide Synchronization Data Part (Part 1, §13.3.11)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/slideUpdateInfo">http://schemas.openxmlformats.org/officeDocument/2006/relationships/slideUpdateInfo</a>

**11.1.12 User Defined Tags Part (Part 1, §13.3.12)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/tags">http://schemas.openxmlformats.org/officeDocument/2006/relationships/tags</a>

### 11.1.13 View Properties Part (Part 1, §13.3.13)

Root Namespace:	<a href="http://schemas.openxmlformats.org/presentationml/2006/main">http://schemas.openxmlformats.org/presentationml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/viewProps">http://schemas.openxmlformats.org/officeDocument/2006/relationships/viewProps</a>

### 11.2 HTML Publish Location (Part 1, §13.4)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/htmlPubSaveAs">http://schemas.openxmlformats.org/officeDocument/2006/relationships/htmlPubSaveAs</a>
----------------------	---

### 11.3 Slide Synchronization Server Location (Part 1, §13.5)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/slideUpdateUrl">http://schemas.openxmlformats.org/officeDocument/2006/relationships/slideUpdateUrl</a>
----------------------	---

## 12. DrawingML

The following parts, which are defined in subclauses within Part 1, §14, “DrawingML”, have different source relationships and/or root namespaces when used in documents of the Transitional conformance class:

### 12.1 Part Summary (Part 1, §14.2)

#### 12.1.1 Chart Part (Part 1, §14.2.1)

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/chart">http://schemas.openxmlformats.org/drawingml/2006/chart</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/chart">http://schemas.openxmlformats.org/officeDocument/2006/relationships/chart</a>

#### 12.1.2 Chart Drawing Part (Part 1, §14.2.2)

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/chart">http://schemas.openxmlformats.org/drawingml/2006/chart</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/chartUserShapes">http://schemas.openxmlformats.org/officeDocument/2006/relationships/chartUserShapes</a>

#### 12.1.3 Diagram Colors Part (Part 1, §14.2.3)

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/diagram">http://schemas.openxmlformats.org/drawingml/2006/diagram</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramColors">http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramColors</a>

#### 12.1.4 Diagram Data Part (Part 1, §14.2.4)

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/diagram">http://schemas.openxmlformats.org/drawingml/2006/diagram</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramData">http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramData</a>

#### 12.1.5 Diagram Layout Definition Part (Part 1, §14.2.5)

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/diagram">http://schemas.openxmlformats.org/drawingml/2006/diagram</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramLayout">http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramLayout</a>

**12.1.6 Diagram Style Part (Part 1, §14.2.6)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/diagram">http://schemas.openxmlformats.org/drawingml/2006/diagram</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramQuickStyle">http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramQuickStyle</a>

**12.1.7 Theme Part (Part 1, §14.2.7)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/main">http://schemas.openxmlformats.org/drawingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/theme">http://schemas.openxmlformats.org/officeDocument/2006/relationships/theme</a>

**12.1.8 Theme Override Part (Part 1, §14.2.8)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/main">http://schemas.openxmlformats.org/drawingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/themeOverride">http://schemas.openxmlformats.org/officeDocument/2006/relationships/themeOverride</a>

**12.1.9 Table Styles Part (Part 1, §14.2.9)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/drawingml/2006/main">http://schemas.openxmlformats.org/drawingml/2006/main</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/tableStyles">http://schemas.openxmlformats.org/officeDocument/2006/relationships/tableStyles</a>

## 13. Shared MLs

The following parts, which are defined in subclauses within Part 1, §15, “Shared”, have different source relationships and/or root namespaces when used in documents of the Transitional conformance class:

### 13.1 Part Summary (Part 1, §15.2)

#### 13.1.1 Additional Characteristics Part (Part 1, §15.2.1)

Root Namespace:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/additionalCharacteristics">http://schemas.openxmlformats.org/officeDocument/2006/additionalCharacteristics</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXml">http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXml</a>

#### 13.1.2 Audio Part (Part 1, §15.2.2)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/audio">http://schemas.openxmlformats.org/officeDocument/2006/relationships/audio</a>
----------------------	---

#### 13.1.3 Bibliography Part (Part 1, §15.2.3)

Root Namespace:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/bibliography">http://schemas.openxmlformats.org/officeDocument/2006/bibliography</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXml">http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXml</a>

#### 13.1.4 Content Part (Part 1, §15.2.4)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXml">http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXml</a>
----------------------	---

#### 13.1.5 Custom XML Data Storage Part (Part 1, §15.2.5)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXml">http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXml</a>
----------------------	---

#### 13.1.6 Custom XML Data Storage Properties Part (Part 1, §15.2.6)

Root Namespace:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/customXmlDataProps">http://schemas.openxmlformats.org/officeDocument/2006/customXmlDataProps</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXmlProps">http://schemas.openxmlformats.org/officeDocument/2006/relationships/customXmlProps</a>

**13.1.7 Embedded Control Persistence Part (Part 1, §15.2.9)**

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/control">http://schemas.openxmlformats.org/officeDocument/2006/relationships/control</a>
----------------------	---

**13.1.8 Embedded Object Part (Part 1, §15.2.10)**

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/oleObject">http://schemas.openxmlformats.org/officeDocument/2006/relationships/oleObject</a>
----------------------	---

**13.1.9 Embedded Package Part (Part 1, §15.2.11)**

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/package">http://schemas.openxmlformats.org/officeDocument/2006/relationships/package</a>
----------------------	---

**13.1.10 Core File Properties Part (Part 1, §15.2.12.1)**

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/metadata/core-properties">http://schemas.openxmlformats.org/officeDocument/2006/relationships/metadata/core-properties</a>
----------------------	---

**13.1.11 Custom File Properties Part (Part 1, §15.2.12.2)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/custom-properties">http://schemas.openxmlformats.org/officeDocument/2006/custom-properties</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/custom-properties">http://schemas.openxmlformats.org/officeDocument/2006/relationships/custom-properties</a>

**13.1.12 Extended File Properties Part (Part 1, §15.2.12.3)**

Root Namespace:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/extended-properties">http://schemas.openxmlformats.org/officeDocument/2006/extended-properties</a>
Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/extended-properties">http://schemas.openxmlformats.org/officeDocument/2006/relationships/extended-properties</a>

**13.1.13 Font Part (Part 1, §15.2.13)**

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/font">http://schemas.openxmlformats.org/officeDocument/2006/relationships/font</a>
----------------------	---

**13.1.14 Image Part (Part 1, §15.2.14)**

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a>
----------------------	---

**13.1.15 Printer Settings Part (Part 1, §15.2.15)**

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/printerSettings">http://schemas.openxmlformats.org/officeDocument/2006/relationships/printerSettings</a>
----------------------	---

### 13.1.16 Thumbnail Part (Part 1, §15.2.16)

Source Relationship:	<a href="http://schemas.openxmlformats.org/package/2006/relationships/metadata/thumbnail">http://schemas.openxmlformats.org/package/2006/relationships/metadata/thumbnail</a>
----------------------	---

### 13.1.17 Video Part (Part 1, §15.2.17)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/video">http://schemas.openxmlformats.org/officeDocument/2006/relationships/video</a>
----------------------	---

## 13.2 Hyperlinks Part (Part 1, §15.3)

Source Relationship:	<a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/hyperlink">http://schemas.openxmlformats.org/officeDocument/2006/relationships/hyperlink</a>
----------------------	---

# 14. WordprocessingML Reference Material

[Note: For further information on the mapping of elements and attributes to OPC parts, see the Bibliography entry, “Information on elements, attributes, and OPC parts in ISO/IEC 29500 (OOXML)” . *end note*]

## 14.1 Table of Contents

This subclause is informative.

<b>14.2</b>	<b>Paragraphs and Rich Formatting .....</b>	<b>35</b>
14.2.1	Paragraphs .....	35
14.2.1.1	Additional attribute for cnfStyle element (Part 1, §17.3.1.8) .....	35
14.2.1.2	Additional attributes for ind element (Part 1, §17.3.1.12) .....	36
14.2.2	Run Content .....	37
14.2.2.1	control (Floating Embedded Control) .....	37
14.2.2.2	pict (VML Object) .....	39
<b>14.3</b>	<b>Tables .....</b>	<b>39</b>
14.3.1	left (Table Cell Leading Edge Border) .....	39
14.3.2	left (Table Leading Edge Border) .....	39
14.3.3	left (Table Cell Leading Margin Exception) .....	39
14.3.4	left (Table Cell Leading Margin Default) .....	40
14.3.5	right (Table Cell Trailing Edge Border) .....	40
14.3.6	right (Table Trailing Edge Border) .....	40
14.3.7	right (Table Cell Trailing Margin Default) .....	40
14.3.8	right (Table Cell Trailing Margin Exception) .....	40
14.3.9	Additional attribute for cnfStyle element (Part 1, §17.4.7) .....	40
14.3.10	Additional attribute for cnfStyle element (Part 1, §17.4.8) .....	42
14.3.11	Additional attribute for tblLook element (Part 1, §17.4.55) .....	43
14.3.12	Additional attribute for tblLook element (Part 1, §17.4.56) .....	43
14.3.13	hMerge (Horizontally Merged Cell) .....	44
<b>14.4</b>	<b>Fonts .....</b>	<b>46</b>
14.4.1	Elements .....	46
14.4.1.1	Additional attribute for charset element (Part 1, §17.8.3.2) .....	46
<b>14.5</b>	<b>Numbering .....</b>	<b>48</b>
14.5.1	pict (Picture Numbering Symbol Properties) .....	48
14.5.2	legacy (Legacy Numbering Level Properties) .....	49
<b>14.6</b>	<b>Annotations .....</b>	<b>50</b>
14.6.1	Revisions .....	50
14.6.1.1	numberingChange (Previous Numbering Field Properties) .....	50
14.6.1.2	numberingChange (Previous Paragraph Numbering Properties) .....	53
<b>14.7</b>	<b>Settings .....</b>	<b>59</b>

14.7.1 Legacy Password Hash Algorithm .....	59
14.7.2 Document Settings.....	66
14.7.2.1 hdrShapeDefaults (Default Properties for VML Objects in Header and Footer) .....	66
14.7.2.2 shapeDefaults (Default Properties for VML Objects in Main Document) .....	67
14.7.2.3 Additional attributes for documentProtection element (Part 1, §17.15.1.29).....	67
14.7.2.4 Additional attribute for stylePaneFormatFilter element (Part 1, §17.15.1.85).....	73
14.7.2.5 Additional attributes for writeProtection element (Part 1, §17.15.1.93).....	74
14.7.3 Compatibility Settings.....	80
14.7.3.1 alignTablesRowByRow (Align Table Rows Independently) .....	81
14.7.3.2 allowSpaceOfSameStyleInTable (Allow Contextual Spacing of Paragraphs in Tables) .....	82
14.7.3.3 autofitToFirstFixedWidthCell (Allow Table Columns To Exceed Preferred Widths of Constituent Cells) .....	84
14.7.3.4 autoSpaceLikeWord95 (Incorrectly Adjust Text Spacing for Specific Unicode Ranges) .....	86
14.7.3.5 cachedColBalance (Use Cached Paragraph Information for Column Balancing).....	87
14.7.3.6 convMailMergeEsc (Treat Backslash Quotation Delimiter as Two Quotation Marks) .....	88
14.7.3.7 displayHangulFixedWidth (Always Use Fixed Width for Hangul Characters) .....	89
14.7.3.8 doNotAutofitConstrainedTables (Do Not AutoFit Tables To Fit Next To Wrapped Objects).....	90
14.7.3.9 doNotBreakConstrainedForcedTable (Don't Break Table Rows Around Floating Tables).....	91
14.7.3.10 doNotBreakWrappedTables (Do Not Allow Floating Tables To Break Across Pages).....	93
14.7.3.11 doNotSnapToGridInCell (Do Not Snap to Document Grid in Table Cells with Objects) .....	94
14.7.3.12 doNotSuppressIndentation (Do Not Ignore Floating Objects When Calculating Paragraph Indentation) .....	95
14.7.3.13 doNotSuppressParagraphBorders (Do Not Suppress Paragraph Borders Next To Frames).....	97
14.7.3.14 doNotUseEastAsianBreakRules (Do Not Compress Compressible Characters When Using Document Grid).....	98
14.7.3.15 doNotUseHTMLParagraphAutoSpacing (Use Fixed Paragraph Spacing for HTML Auto Setting) ...	99
14.7.3.16 doNotUseIndentAsNumberingTabStop (Ignore Hanging Indent When Creating Tab Stop After Numbering) .....	101
14.7.3.17 doNotVertAlignCellWithSp (Don't Vertically Align Cells Containing Floating Objects) .....	102
14.7.3.18 doNotVertAlignInTxbx (Ignore Vertical Alignment in Textboxes).....	104
14.7.3.19 doNotWrapTextWithPunct (Do Not Allow Hanging Punctuation With Character Grid) .....	106
14.7.3.20 footnoteLayoutLikeWW8 (Ignore Page Break from Continuous Section Break) .....	107
14.7.3.21 forgetLastTabAlignment (Ignore Width of Last Tab Stop When Aligning Paragraph If It Is Not Left Aligned) .....	110
14.7.3.22 growAutofit (Allow Tables to AutoFit Into Page Margins) .....	112
14.7.3.23 layoutRawTableWidth (Ignore Space Before Table When Deciding If Table Should Wrap Floating Object) .....	113
14.7.3.24 layoutTableRowsApart (Allow Table Rows to Wrap Inline Objects Independently) .....	115
14.7.3.25 lineWrapLikeWord6 (Ignore Compression of Full-Width Punctuation Ending a Line) .....	116
14.7.3.26 mwSmallCaps (Use Specific Small Caps Algorithm) .....	117
14.7.3.27 noColumnBalance (Do Not Balance Text Columns within a Section) .....	118
14.7.3.28 noExtraLineSpacing (Do Not Center Content on Lines With Exact Line Height).....	120
14.7.3.29 noLeading (Do Not Add Leading Between Lines of Text).....	121
14.7.3.30 noSpaceRaiseLower (Do Not Increase Line Height for Raised/Lowered Text) .....	123
14.7.3.31 noTabHangInd (Do Not Create Custom Tab Stop for Hanging Indent).....	123
14.7.3.32 printBodyTextBeforeHeader (Print Body Text before Header/Footer Contents).....	125
14.7.3.33 printColBlack (Print Colors as Black And White without Dithering) .....	126
14.7.3.34 selectFldWithFirstOrLastChar (Select Field When First or Last Character Is Selected) .....	126

14.7.3.35	shapeLayoutLikeWW8 (Ignore Text Wrapping around Objects at Bottom of Page)	127
14.7.3.36	showBreaksInFrames (Display Page/Column Breaks Present in Frames)	130
14.7.3.37	spacingInWholePoints (Only Expand/Condense Text By Whole Points)	132
14.7.3.38	splitPgBreakAndParaMark (Always Move Paragraph Mark to Page after a Page Break)	134
14.7.3.39	subFontBySize (Require Exact Size During Font Substitution)	135
14.7.3.40	suppressBottomSpacing (Ignore Exact Line Height for Last Line on Page)	136
14.7.3.41	suppressSpacingAtTopOfPage (Ignore Minimum Line Height for First Line on Page)	138
14.7.3.42	suppressSpBfAfterPgBrk (Do Not Use Space Before On First Line After a Page Break)	140
14.7.3.43	suppressTopSpacing (Ignore Minimum and Exact Line Height for First Line on Page)	142
14.7.3.44	suppressTopSpacingWP (Use Static Text Leading)	143
14.7.3.45	swapBordersFacingPages (Swap Paragraph Borders on Odd Numbered Pages)	143
14.7.3.46	truncateFontHeightsLikeWP6 (Use Truncated Integer Division For Font Calculation)	146
14.7.3.47	underlineTabInNumList (Underline Following Character Following Numbering)	147
14.7.3.48	useAltKinsokuLineBreakRules (Use Alternate Set of East Asian Line Breaking Rules)	148
14.7.3.49	useAnsiKerningPairs (Use ANSI Kerning Pairs from Fonts)	149
14.7.3.50	useFELayout (Do Not Bypass East Asian/Complex Script Layout Code)	149
14.7.3.51	useNormalStyleForList (Do Not Automatically Apply List Paragraph Style To Bulleted/Numbered Text)	150
14.7.3.52	usePrinterMetrics (Use Printer Metrics To Display Documents)	151
14.7.3.53	useSingleBorderforContiguousCells (Use Simplified Rules For Table Border Conflicts)	152
14.7.3.54	useWord2002TableStyleRules (Incorrectly Display Top Border of Conditional Columns)	153
14.7.3.55	useWord97LineBreakRules (Use Incorrect Inter-Character Spacing Rules)	155
14.7.3.56	wpJustification (Fit To Expanded Width When Performing Full Justification)	157
14.7.3.57	wpSpaceWidth (Use Specific Space Width)	158
14.7.3.58	wrapTrailSpaces (Line Wrap Trailing Spaces)	158

## 14.2 Paragraphs and Rich Formatting

### 14.2.1 Paragraphs

#### 14.2.1.1 Additional attribute for cnfStyle element (Part 1, §17.3.1.8)

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description
val (Conditional Formatting Bit Mask)	<p>Specifies the set of conditional formatting properties that have been applied to this object.</p> <p>These properties are expressed using a string serialization of a binary bitmask for each of the following properties (reading from the first character position right):</p> <ul style="list-style-type: none"> <li>• First Row - Is this the first row of the table?</li> <li>• Last Row - Is this the last row of the table?</li> <li>• First Column - Does this belong to the first column of the table?</li> <li>• Last Column - Does this belong to the last column of the table?</li> <li>• Band 1 Vertical - Does this belong to a column which should receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered columns (e.g. 1,3,5,...)</li> <li>• Band 2 Vertical - Does this belong to a column which should receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered columns (e.g. 2,4,6,...)</li> <li>• Band 1 Horizontal - Does this receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered rows (e.g. 1,3,5,...)</li> <li>• Band 2 Horizontal - Does this receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered rows (e.g. 2,4,6,...)</li> <li>• NE Cell - Is this part of the top-right corner of the table?</li> </ul>

Attributes	Description
	<ul style="list-style-type: none"> <li>NW Cell - Is this part of the top-left corner of the table?</li> <li>SE Cell - Is this part of the bottom-right corner of the table?</li> <li>SW Cell - Is this part of the bottom-left corner of the table?</li> </ul> <p>For each of these properties, a value of 1 in the specified character position in the string means that the value is true, a value of 0 means false. All values shall be specified.</p> <p>[<i>Example:</i> Consider a paragraph in the top right corner of a table with a table style applied. This paragraph would need to specify the following WordprocessingML:</p> <pre>&lt;w:p&gt;   &lt;w:pPr&gt;     &lt;w:cnfStyle w:val="101000000100" /&gt;     ...   &lt;/w:pPr&gt;   ... &lt;/w:p&gt;</pre> <p>This paragraph specifies that it has the conditional properties from the table style for the first column, first row, and the NW corner of the parent table by setting the appropriate bits in the val attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Cnf simple type (§14.10.8).</p>

#### 14.2.1.2 Additional attributes for ind element (Part 1, §17.3.1.12)

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description
left (Start Indentation)	<p>Semantically equivalent to the start attribute.</p> <p>The possible values for this attribute are defined by the ST_SignedTwipsMeasure simple type (Part 1, §17.18.81).</p>
leftChars (Start Indentation in Character Units)	<p>Semantically equivalent to the startChars attribute.</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (Part 1, §17.18.10).</p>
right (End Indentation)	<p>Semantically equivalent to the end attribute.</p> <p>The possible values for this attribute are defined by the ST_SignedTwipsMeasure simple type (Part 1, §17.18.81).</p>
rightChars (End Indentation in Character Units)	<p>Semantically equivalent to the endChars attribute.</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (Part 1, §17.18.10).</p>

## 14.2.2 Run Content

### 14.2.2.1 control (Floating Embedded Control)

This element specifies that the parent VML object is a representation of an embedded control at the current location in the document. This element shall be used to associate the VML data with the appropriate embedded control settings and properties when the document is displayed.

If the embedded control is not present, cannot be loaded due to application settings, or is not supported, then the VML data shall be used to provide an image representation of the control at the appropriate location in the document.

[*Example:* Consider a run which consists of an embedded control. That run would be specified using the following WordprocessingML:

```
<w:r>
  <w:pict>
    ...
    <w:control r:id="rId99" w:shapeid="shape01" ... />
  </w:pict>
</w:r>
```

The control element indicates that the parent VML object contains the positioning and last known image representation of an embedded control, whose settings and properties are stored on this element. *end example]*

Attributes	Description
id (Embedded Control Properties Relationship Reference)  Namespace: .../officeDocument/2006/relationships	<p>Specifies the relationship ID for the relationship which contains the properties for this embedded control. This property bag is contained in a separate part within the Office Open XML package.</p> <p>The relationship explicitly targeted by this attribute shall be of type <code>http://schemas.openxmlformats.org/officeDocument/2006/relationships/control</code> or the document shall be considered non-conformant.</p> <p>If this attribute is omitted, then the embedded control shall be given no property bag when instantiated.</p> <p>[<i>Example:</i> Consider the following WordprocessingML markup for an embedded control in a document:</p> <pre>&lt;w:control r:id="rId5" w:name="CheckBox1" w:shapeid="_x0000_s1027" /&gt;</pre> <p>The id attribute in the relationship reference namespace specifies that the relationship with relationship ID rId5 must contain the property data for this embedded control. <i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).
name (Unique Name for Embedded Control)	<p>Specifies a unique name for this embedded control. This name shall be unique across all controls in this document.</p> <p>[<i>Example</i>: Consider the following WordprocessingML markup for an embedded control in a document:</p> <pre>&lt;w:control r:id="rId5" w:name="CheckBox1" w:shapeid="_x0000_s1027" /&gt;</pre> <p>The name attribute specifies that the unique name for this control must be CheckBox1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>
shapeid (Shape Reference)	<p>Specifies the shape ID for a shape which shall be used to define the presentation and location of this embedded control within the document if the control is floating using the DrawingML syntax.</p> <p>[<i>Note</i>: This positioning data is sufficient to display the control in any case where:</p> <ul style="list-style-type: none"> <li>• The embedded control is not on the current machine</li> <li>• Embedded controls are disabled</li> <li>• Embedded controls of this control type are not supported</li> </ul> <p><i>end note</i>]</p> <p>This shape ID reference is resolved by looking for a DrawingML object whose id attribute matches the value specified within this attribute. If no such shape exists, then the control shall be rendered inline in the document content at the current run content location.</p> <p>If this attribute is omitted, then this embedded control shall be displayed inline in the current location in the parent run.</p> <p>[<i>Example</i>: Consider the following WordprocessingML markup for an embedded control in a document:</p> <pre>&lt;w:control r:id="rId5" w:name="CheckBox1" w:shapeid="10" /&gt;</pre> <p>The shapeid attribute specifies that the DrawingML object with an id attribute value of 10 must contain the positioning data for this embedded control. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT\\_Control](#)) is located in §A.1. *end note*]

#### 14.2.2.2 pict (VML Object)

This element specifies that an object is located at this position in the run's contents. The layout properties of this object are specified using the VML syntax (§19.1).

[*Example:* Consider a run which consists of an object specified using VML. That run would be specified using the following WordprocessingML:

```
<w:r>
  <w:pict>
    ...
  </w:pict>
</w:r>
```

The pict element indicates that an object specified in VML is located at the current position in the run (e.g. a floating embedded control). *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT\\_Picture](#)) is located in §A.1. *end note*]

### 14.3 Tables

#### 14.3.1 left (Table Cell Leading Edge Border)

This element is semantically equivalent to start (Part 1, §17.4.34), specified above.

For tables which have the bidiVisual property (Part 1, §17.4.1) applied, this border is applied to the right edge of the cell.

This element's content model is defined by the common border properties definition in Part 1, §17.3.4.

#### 14.3.2 left (Table Leading Edge Border)

This element is semantically equivalent to start (Part 1, §17.4.37), specified above.

For tables which have the bidiVisual property (Part 1, §17.4.1) applied, this border is applied to the right edge of the table.

This element's content model is defined by the common border properties definition in Part 1, §17.3.4.

#### 14.3.3 left (Table Cell Leading Margin Exception)

This element is semantically equivalent to start (Part 1, §17.4.36), specified above.

For tables which have the bidiVisual property (Part 1, §17.4.1) applied, this cell margin is applied to the right edge of the cell.

This element's content model is defined by the common table measurement definition in Part 1, §17.4.88.

#### **14.3.4 left (Table Cell Leading Margin Default)**

This element is semantically equivalent to start (Part 1, §17.4.35), specified above.

For tables which have the `bidiVisual` property (Part 1, §17.4.1) applied, this cell margin is applied to the right edge of the cell.

This element's content model is defined by the common table measurement definition in Part 1, §17.4.88.

#### **14.3.5 right (Table Cell Trailing Edge Border)**

This element is semantically equivalent to end (Part 1, §17.4.12), specified above.

For tables which have the `bidiVisual` property (Part 1, §17.4.1) applied, this border is applied to the left edge of the cell.

This element's content model is defined by the common border properties definition in Part 1, §17.3.4.

#### **14.3.6 right (Table Trailing Edge Border)**

This element is semantically equivalent to end (Part 1, §17.4.13), specified above.

For tables which have the `bidiVisual` property (Part 1, §17.4.1) applied, this border is applied to the left edge of the table.

This element's content model is defined by the common border properties definition in Part 1, §17.3.4.

#### **14.3.7 right (Table Cell Trailing Margin Default)**

This element is semantically equivalent to end (Part 1, §17.4.11), specified above.

For tables which have the `bidiVisual` property (Part 1, §17.4.1) applied, this cell margin is applied to the left edge of the cell.

This element's content model is defined by the common table measurement definition in Part 1, §17.4.88.

#### **14.3.8 right (Table Cell Trailing Margin Exception)**

This element is semantically equivalent to end (Part 1, §17.4.10), specified above.

For tables which have the `bidiVisual` property (Part 1, §17.4.1) applied, this cell margin is applied to the left edge of the cell.

This element's content model is defined by the common table measurement definition in Part 1, §17.4.88.

#### **14.3.9 Additional attribute for `cnfStyle` element (Part 1, §17.4.7)**

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description
val (Conditional Formatting Bit Mask)	<p>Specifies the set of conditional formatting properties that have been applied to this object.</p> <p>These properties are expressed using a string serialization of a binary bitmask for each of the following properties (reading from the first character position right):</p> <ul style="list-style-type: none"> <li>• First Row - Is this the first row of the table?</li> <li>• Last Row - Is this the last row of the table?</li> <li>• First Column - Does this belong to the first column of the table?</li> <li>• Last Column - Does this belong to the last column of the table?</li> <li>• Band 1 Vertical - Does this belong to a column which should receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered columns (e.g. 1,3,5,...)</li> <li>• Band 2 Vertical - Does this belong to a column which should receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered columns (e.g. 2,4,6...)</li> <li>• Band 1 Horizontal - Does this receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered rows (e.g. 1,3,5,...)</li> <li>• Band 2 Horizontal - Does this receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered rows (e.g. 2,4,6...)</li> <li>• NE Cell - Is this part of the top-right corner of the table?</li> <li>• NW Cell - Is this part of the top-left corner of the table?</li> <li>• SE Cell - Is this part of the bottom-right corner of the table?</li> <li>• SW Cell - Is this part of the bottom-left corner of the table?</li> </ul> <p>For each of these properties, a value of 1 in the specified character position in the string means that the value is true, a value of 0 means false. All values shall be specified.</p> <p>[Example: Consider a paragraph in the top right corner of a table with a table style applied. This paragraph would need to specify the following WordprocessingML:</p> <pre> &lt;w:p&gt;   &lt;w:pPr&gt;     &lt;w:cnfStyle w:val="101000000100" /&gt;     ...   &lt;/w:pPr&gt;   ... &lt;/w:p&gt; </pre> <p>This paragraph specifies that it has the conditional properties from the table style for the first column, first row, and the NW corner of the parent table by setting the appropriate bits in the val attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Cnf simple type (§14.10.8).</p>

### 14.3.10 Additional attribute for cnfStyle element (Part 1, §17.4.8)

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description
val (Conditional Formatting Bit Mask)	<p>Specifies the set of conditional formatting properties that have been applied to this object.</p> <p>These properties are expressed using a string serialization of a binary bitmask for each of the following properties (reading from the first character position right):</p> <ul style="list-style-type: none"> <li>• First Row - Is this the first row of the table?</li> <li>• Last Row - Is this the last row of the table?</li> <li>• First Column - Does this belong to the first column of the table?</li> <li>• Last Column - Does this belong to the last column of the table?</li> <li>• Band 1 Vertical - Does this belong to a column which should receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered columns (e.g. 1,3,5,...)</li> <li>• Band 2 Vertical - Does this belong to a column which should receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered columns (e.g. 2,4,6...)</li> <li>• Band 1 Horizontal - Does this receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered rows (e.g. 1,3,5,...)</li> <li>• Band 2 Horizontal - Does this receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered rows (e.g. 2,4,6...)</li> <li>• NE Cell - Is this part of the top-right corner of the table?</li> <li>• NW Cell - Is this part of the top-left corner of the table?</li> <li>• SE Cell - Is this part of the bottom-right corner of the table?</li> <li>• SW Cell - Is this part of the bottom-left corner of the table?</li> </ul> <p>For each of these properties, a value of 1 in the specified character position in the string means that the value is true, a value of 0 means false. All values shall be specified.</p> <p>[Example: Consider a paragraph in the top right corner of a table with a table style applied. This paragraph would need to specify the following WordprocessingML:</p> <pre>&lt;w:p&gt;   &lt;w:pPr&gt;     &lt;w:cnfStyle w:val="101000000100" /&gt;     ...   &lt;/w:pPr&gt;   ... &lt;/w:p&gt;</pre> <p>This paragraph specifies that it has the conditional properties from the table style for the</p>

Attributes	Description
	<p>first column, first row, and the NW corner of the parent table by setting the appropriate bits in the val attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Cnf simple type (§14.10.8).</p>

### 14.3.11 Additional attribute for tblLook element (Part 1, §17.4.55)

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description
val (Bitmask of Table Conditional Formatting)	<p>Specifies a hexadecimal code containing a bitmask of options, interpreted as follows:</p> <ul style="list-style-type: none"> <li>• 0x0020=Apply first row conditional formatting</li> <li>• 0x0040=Apply last row conditional formatting</li> <li>• 0x0080=Apply first column conditional formatting</li> <li>• 0x0100=Apply last column conditional formatting</li> <li>• 0x0200=Do not apply row banding conditional formatting</li> <li>• 0x0400=Do not apply column banding conditional formatting</li> </ul> <p>If omitted, the bitmask of table style options on the current table shall be assumed to be 0000.</p> <p>[<i>Example:</i> Consider a table which must use the following conditional formatting properties from the referenced table style:</p> <ul style="list-style-type: none"> <li>• First row conditional formatting</li> <li>• Last row conditional formatting</li> </ul> <p>This table would then apply the following portions of the bitmask:</p> <ul style="list-style-type: none"> <li>• 0x0020=Apply first row conditional formatting</li> <li>• 0x0040=Apply last row conditional formatting</li> <li>• 0x0200=Do not apply row banding conditional formatting</li> <li>• 0x0400=Do not apply column banding conditional formatting</li> </ul> <p>The resulting WordprocessingML would be specified as follows:</p> <pre>&lt;w:tblPr&gt;   &lt;w:tblLook w:val="0660"/&gt; &lt;/w:tblPr&gt;</pre> <p>The val attribute specifies a bitmask which determines the components of the table style applied to the current table. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ShortHexNumber simple type (Part 1, §17.18.79).</p>

### 14.3.12 Additional attribute for tblLook element (Part 1, §17.4.56)

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description
val (Bitmask of Table Conditional Formatting)	<p>Specifies a hexadecimal code containing a bitmask of options, interpreted as follows:</p> <ul style="list-style-type: none"> <li>• 0x0020=Apply first row conditional formatting</li> <li>• 0x0040=Apply last row conditional formatting</li> <li>• 0x0080=Apply first column conditional formatting</li> <li>• 0x0100=Apply last column conditional formatting</li> <li>• 0x0200=Do not apply row banding conditional formatting</li> <li>• 0x0400=Do not apply column banding conditional formatting</li> </ul> <p>If omitted, the bitmask of table style options on the current table shall be assumed to be 0000.</p> <p>[<i>Example:</i> Consider a table which must use the following conditional formatting properties from the referenced table style:</p> <ul style="list-style-type: none"> <li>• First row conditional formatting</li> <li>• Last row conditional formatting</li> </ul> <p>This table would then apply the following portions of the bitmask:</p> <ul style="list-style-type: none"> <li>• 0x0020=Apply first row conditional formatting</li> <li>• 0x0040=Apply last row conditional formatting</li> <li>• 0x0200=Do not apply row banding conditional formatting</li> <li>• 0x0400=Do not apply column banding conditional formatting</li> </ul> <p>The resulting WordprocessingML would be specified as follows:</p> <pre>&lt;w:tblPr&gt;   &lt;w:tblLook w:val="0660"/&gt; &lt;/w:tblPr&gt;</pre> <p>The val attribute specifies a bitmask which determines the components of the table style applied to the current table. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ShortHexNumber simple type (Part 1, §17.18.79).</p>

### 14.3.13 hMerge (Horizontally Merged Cell)

This element specifies that this cell is part of a horizontally merged set of cells in a table. The val attribute on this element determines how this cell is defined with respect to the previous cell in the table (i.e., whether this cell continues the horizontal merge or starts a new merged group of cells).

[*Note:* This property is maintained for compatibility with legacy word processing documents that defined tables in this manner. Whenever possible, this form or horizontal merges should not be produced, and should be translated to the appropriate gridSpan (Part 1) settings on the table cells instead. *end note*]

If this element is omitted, then this cell shall not be part of any horizontally merged grouping of cells, and any horizontal merge group in the preceding cells shall be closed.

[*Example*: Consider a table with one row and three columns with the last two columns horizontally merged:

--	--	--

The second cell in the first row starts a merge that is completed in the right adjacent cell, resulting in the following WordprocessingML:

```
<w:tbl>
...
<w:tr>
  <w:tc>
    ...
  </w:tc>
  <w:tc>
    <w:tcPr>
      <w:hMerge w:val="restart"/>
    </w:tcPr>
    ...
  </w:tc>
  <w:tc>
    <w:tcPr>
      <w:hMerge/>
    </w:tcPr>
    ...
  </w:tc>
</w:tr>
</w:tbl>
```

The hMerge element defines the cells that are to be horizontally merged, and how each group is merged together. *end example*]

Attributes	Description
val (Horizontal Merge Type)	<p>Specifies how the table cell is part of a horizontally merged region. This determines whether the cell should join onto an existing grouping of merged cells if any exist, or start a new group of merged cells. Refer to the simple type definition for a full description of each type.</p> <p>If this attribute is omitted, its value shall be assumed to be continue.</p> <p>[<i>Example:</i> Consider a table cell where a horizontal cell merge begins represented as the following WordprocessingML:</p> <pre data-bbox="451 604 831 709">&lt;w:tcPr&gt;   &lt;w:hMerge w:val="restart"/&gt; &lt;/w:tcPr&gt;</pre> <p>The attribute value of restart specifies that this element must start a new horizontally merged region in this table. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Merge simple type (Part 1, §17.18.57).</p>

[*Note:* The W3C XML Schema definition of this element's content model (CT\_HMerge) is located in §A.1. *end note*]

## 14.4 Fonts

### 14.4.1 Elements

#### 14.4.1.1 Additional attribute for charset element (Part 1, §17.8.3.2)

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description								
val (Value)	<p>Specifies a value specified as single octet (two-digit) hexadecimal number whose contents are interpreted based on the context of the parent XML element.</p> <p>If this attribute is not present, then the character set for this font shall be assumed to be ISO/IEC 8859-1.</p> <p>The value of this attribute shall be interpreted as follows:</p> <table data-bbox="415 1703 1479 1892"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0x00</td><td>Specifies a Latin character set. (IANA name iso-8859-1)</td></tr> <tr> <td>0x01</td><td>Specifies the default character set.</td></tr> <tr> <td>0x02</td><td>Specifies the Symbol character set. This value specifies that the</td></tr> </table>	Value	Description	0x00	Specifies a Latin character set. (IANA name iso-8859-1)	0x01	Specifies the default character set.	0x02	Specifies the Symbol character set. This value specifies that the
Value	Description								
0x00	Specifies a Latin character set. (IANA name iso-8859-1)								
0x01	Specifies the default character set.								
0x02	Specifies the Symbol character set. This value specifies that the								

Attributes	Description																																				
	<table border="1"> <tr> <td></td><td>characters in the Unicode private use area (U+FF00 to U+FFFF) of the font should be used to display the corresponding characters in the range U+0000 to U+00FF.</td></tr> <tr> <td>0x4D</td><td>Specifies a Macintosh (Standard Roman) character set. (IANA name <i>macintosh</i>)</td></tr> <tr> <td>0x80</td><td>Specifies the JIS character set. (IANA name <i>shift_jis</i>)</td></tr> <tr> <td>0x81</td><td>Specifies the Hangul character set. (IANA name <i>ks_c-5601-1987</i>)</td></tr> <tr> <td>0x82</td><td>Specifies a Johab character set. (IANA name <i>KS_C-5601-1992</i>)</td></tr> <tr> <td>0x86</td><td>Specifies the GB-2312 character set. (IANA name <i>GBK</i>)</td></tr> <tr> <td>0x88</td><td>Specifies the Chinese Big Five character set. (IANA name <i>Big5</i>)</td></tr> <tr> <td>0xA1</td><td>Specifies a Greek character set. (IANA name <i>windows-1253</i>)</td></tr> <tr> <td>0xA2</td><td>Specifies a Turkish character set. (IANA name <i>iso-8859-9</i>)</td></tr> <tr> <td>0xA3</td><td>Specifies a Vietnamese character set. (IANA name <i>windows-1256</i>)</td></tr> <tr> <td>0xBA</td><td>Specifies a Baltic character set. (IANA name <i>windows-1257</i>)</td></tr> <tr> <td>0xCC</td><td>Specifies a Russian character set. (IANA name <i>windows-1251</i>)</td></tr> <tr> <td>0xDE</td><td>Specifies a Thai character set. (IANA name <i>windows-874</i>)</td></tr> <tr> <td>0xEE</td><td>Specifies an Eastern European character set. (IANA name <i>windows-1250</i>)</td></tr> <tr> <td>0xFF</td><td>Specifies an OEM character set not defined by ISO/IEC 29500.</td></tr> <tr> <td>Any other value</td><td>Application-defined, can be ignored.</td></tr> </table> <p>[<i>Example</i>: Consider the following value for an attribute of type ST_UCharHexNumber:</p> <pre>&lt;... w:val="BE"/&gt;</pre> <p>This value is permitted, as it contains two hexadecimal digits, an encoding of an octet of the actual decimal number value. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_UCharHexNumber simple type (Part 1, §17.18.98).</p>		characters in the Unicode private use area (U+FF00 to U+FFFF) of the font should be used to display the corresponding characters in the range U+0000 to U+00FF.	0x4D	Specifies a Macintosh (Standard Roman) character set. (IANA name <i>macintosh</i> )	0x80	Specifies the JIS character set. (IANA name <i>shift_jis</i> )	0x81	Specifies the Hangul character set. (IANA name <i>ks_c-5601-1987</i> )	0x82	Specifies a Johab character set. (IANA name <i>KS_C-5601-1992</i> )	0x86	Specifies the GB-2312 character set. (IANA name <i>GBK</i> )	0x88	Specifies the Chinese Big Five character set. (IANA name <i>Big5</i> )	0xA1	Specifies a Greek character set. (IANA name <i>windows-1253</i> )	0xA2	Specifies a Turkish character set. (IANA name <i>iso-8859-9</i> )	0xA3	Specifies a Vietnamese character set. (IANA name <i>windows-1258</i> )	0xB1	Specifies a Hebrew character set. (IANA name <i>windows-1255</i> )	0xB2	Specifies an Arabic character set. (IANA name <i>windows-1256</i> )	0xBA	Specifies a Baltic character set. (IANA name <i>windows-1257</i> )	0xCC	Specifies a Russian character set. (IANA name <i>windows-1251</i> )	0xDE	Specifies a Thai character set. (IANA name <i>windows-874</i> )	0xEE	Specifies an Eastern European character set. (IANA name <i>windows-1250</i> )	0xFF	Specifies an OEM character set not defined by ISO/IEC 29500.	Any other value	Application-defined, can be ignored.
	characters in the Unicode private use area (U+FF00 to U+FFFF) of the font should be used to display the corresponding characters in the range U+0000 to U+00FF.																																				
0x4D	Specifies a Macintosh (Standard Roman) character set. (IANA name <i>macintosh</i> )																																				
0x80	Specifies the JIS character set. (IANA name <i>shift_jis</i> )																																				
0x81	Specifies the Hangul character set. (IANA name <i>ks_c-5601-1987</i> )																																				
0x82	Specifies a Johab character set. (IANA name <i>KS_C-5601-1992</i> )																																				
0x86	Specifies the GB-2312 character set. (IANA name <i>GBK</i> )																																				
0x88	Specifies the Chinese Big Five character set. (IANA name <i>Big5</i> )																																				
0xA1	Specifies a Greek character set. (IANA name <i>windows-1253</i> )																																				
0xA2	Specifies a Turkish character set. (IANA name <i>iso-8859-9</i> )																																				
0xA3	Specifies a Vietnamese character set. (IANA name <i>windows-1258</i> )																																				
0xB1	Specifies a Hebrew character set. (IANA name <i>windows-1255</i> )																																				
0xB2	Specifies an Arabic character set. (IANA name <i>windows-1256</i> )																																				
0xBA	Specifies a Baltic character set. (IANA name <i>windows-1257</i> )																																				
0xCC	Specifies a Russian character set. (IANA name <i>windows-1251</i> )																																				
0xDE	Specifies a Thai character set. (IANA name <i>windows-874</i> )																																				
0xEE	Specifies an Eastern European character set. (IANA name <i>windows-1250</i> )																																				
0xFF	Specifies an OEM character set not defined by ISO/IEC 29500.																																				
Any other value	Application-defined, can be ignored.																																				

## 14.5 Numbering

### 14.5.1 pict (Picture Numbering Symbol Properties)

This element specifies the properties for a picture which shall be used as a picture numbering symbol in a given document, using the VML syntax.

[*Example:* Consider the WordprocessingML below illustrating the usage of the pict element in a document containing a single picture numbering symbol:

```
<w:numPicBullet w:numPicBulletId="0">
  <w:pict>
    <v:shapetype id="_x0000_t75" coordsize="21600,21600" o:spt="75"
o:preferrelative="t" path="m@4@5l@4@11@9@11@9@5xe" filled="f" stroked="f">
      <v:stroke joinstyle="miter" />
      <v:formulas>
        <v:f eqn="if lineDrawn pixelLineWidth 0" />
        <v:f eqn="sum @0 1 0" />
        <v:f eqn="sum 0 0 @1" />
        <v:f eqn="prod @2 1 2" />
        <v:f eqn="prod @3 21600 pixelWidth" />
        <v:f eqn="prod @3 21600 pixelHeight" />
        <v:f eqn="sum @0 0 1" />
        <v:f eqn="prod @6 1 2" />
        <v:f eqn="prod @7 21600 pixelWidth" />
        <v:f eqn="sum @8 21600 0" />
        <v:f eqn="prod @7 21600 pixelHeight" />
        <v:f eqn="sum @10 21600 0" />
      </v:formulas>
      <v:path o:extrusionok="f" gradientshapeok="t" o:connecttype="rect" />
      <o:lock v:ext="edit" aspectratio="t" />
    </v:shapetype>
    <v:shape id="_x0000_i1029" type="#_x0000_t75"
style="width:11.25pt;height:11.25pt" o:bullet="t">
      <v:imagedata r:id="rId1" o:title="sample picture" />
    </v:shape>
  </w:pict>
</w:numPicBullet>
```

*end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT\\_Picture](#)) is located in §A.1. *end note]*

### 14.5.2 legacy (Legacy Numbering Level Properties)

This element specifies that a given numbering level is from an earlier word processing application which did not support the full richness of the numbering properties supported by WordprocessingML.

These properties shall be used to render any numbered paragraph which references this numbering level if the legacy attribute is set. [Note: Using this element in generated WordprocessingML documents is not recommended, as updated numbering structures in WordprocessingML should be used in its place. This element is provided solely to save and roundtrip the numbering properties of legacy word processing products in WordprocessingML such that they are recreated if the document is resaved in an older word processor format. *end note*]

[Example: Consider the following WordprocessingML numbering level:

```
<w:lvl w:ilvl="0">
...
<w:legacy w:legacySpace="820" w:legacyIndent="960" />
<w:lvlJc w:val="start" />
<w:pPr>
  <w:ind w:start="360" w:hanging="360" />
</w:pPr>
</w:lvl>
```

This level has the legacy element present, therefore the legacy numbering level properties must be used to format all paragraphs which reference this level. *end example*]

Attributes	Description
legacy (Use Legacy Numbering Properties)	<p>Specifies whether the legacy numbering properties present for this numbering level shall be used to format the numbering for any paragraph which references it.</p> <p>A value of on, 1, or true for this attribute value specifies that the legacy numbering properties shall be applied. This is the default value for this attribute, and is implied when the attribute is omitted.</p> <p>A value of off, 0, or false for this attribute value specifies that the legacy numbering properties shall not be used, and shall be explicitly turned off.</p> <p>[Example: For example, consider the set of legacy numbering properties from a document:</p> <pre>&lt;w:legacy w:legacy="off" w:legacySpace="820" w:legacyIndent="960" /&gt;</pre> <p>This set of legacy properties are explicitly not used when processing the numbering level via the fact that the legacy attribute is turned off for this example. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (Part 1, §22.9.2.7).</p>

Attributes	Description
legacyIndent (Legacy Indent)	<p>Specifies the indentation which shall be applied to a legacy numbering symbol from the text margin of the document. This value is specified in twentieths of a point.</p> <p>If this attribute is not present, then no indentation shall be applied with respect to the margin.</p> <p>[<i>Example:</i> For example, consider the set of legacy numbering properties from a document:</p> <pre data-bbox="451 470 1227 499">&lt;w:legacy w:legacySpace="820" w:legacyIndent="960" /&gt;</pre> <p>This set of legacy properties specify that there must be exactly 960 twentieths of a point (½ of an inch) between the text margin and the start of the numbering on the paragraph. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_SignedTwipsMeasure simple type (Part 1, §17.18.81).</p>
legacySpace (Legacy Spacing)	<p>Specifies the indentation which shall be applied between a legacy numbering symbol and the accompanying text of the associated paragraph in the document. This value is specified in twentieths of a point.</p> <p>If this attribute is not present, then no indentation shall be applied with respect to the paragraph text.</p> <p>[<i>Example:</i> For example, consider the set of legacy numbering properties from a document:</p> <pre data-bbox="451 999 1227 1029">&lt;w:legacy w:legacySpace="820" w:legacyIndent="960" /&gt;</pre> <p>This set of legacy properties specify that there must be exactly 860 twentieths of a point between the end of the numbering on the paragraph and the associated paragraph text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TwipsMeasure simple type (Part 1, §22.9.2.14).</p>

[*Note:* The W3C XML Schema definition of this element's content model (CT\_LvlLegacy) is located in §A.1. *end note*]

## 14.6 Annotations

### 14.6.1 Revisions

#### 14.6.1.1 numberingChange (Previous Numbering Field Properties)

This element specifies the previous state of the numbering displayed by a LISTNUM field (Part 1, §17.16.5.33) within a WordprocessingML document when additional LISTNUM fields are added and revisions are being tracked.

[*Rationale:* The legacy numbering mechanism provided by the LISTNUM field relies on the presence of fields in the run content of the document, rather than being a paragraph property (as numbering typically is represented). For this reason, these fields must store their previous state as a unique revision type on the field character of the numbering field. *end rationale*]

If this element is supplied for a field which is not of type LISTNUM as defined by its field codes (Part 1, §17.16.5), then this property shall be ignored.

[Example: Consider the following paragraph containing a single LISTNUM field, as follows:

Some 1. text

If another LISTNUM field is added before it in the document, resulting in its evaluation to a different number, as follows:

Some ~~1~~.2. text

This revision to the field result would be stored as follows in the WordprocessingML:

```
<w:fldChar w:fldCharType="begin">
  <w:numberingChange w:id="0" ... w:original="1." />
</w:fldChar>
<w:r>
  <w:instrText>LISTNUM</w:instrText>
</w:r>
<w:fldChar w:fldCharType="separate"/>
<w:r>
  <w:t>2.</w:t>
</w:r>
<w:fldChar w:fldCharType="end" />
```

The numberingChange element specifies that the numbering resulting from this LISTNUM field was modified and this change was tracked as a revision. The previous numbering result of 1. is cached in the original attribute. *end example*]

For numbering fields, the original attribute shall specify the previous numbering displayed by the parent LISTNUM field within a WordprocessingML document. This information is a performance-enhancing cache of the state of the numbering before the revision to allow applications to show the previous state without having to recalculate all of the LISTNUM fields in the document.

If this attribute is omitted, then no previous numbering value is implied and applications can choose to calculate this value, or display no previous numbering value.

[Example: Consider the following paragraph containing a single LISTNUM field with a revision, as follows:

Some ~~1~~.2. text

This revision to the field result would be stored as follows in the WordprocessingML:

```
<w:fldChar w:fldCharType="begin">
  <w:numberingChange w:id="0" ... w:original="1." />
</w:fldChar>
```

The original attribute specifies that the previous numbering value of the field was 1. *end example*

Attributes	Description
author (Annotation Author)	<p>Specifies the author for an annotation within a WordprocessingML document.</p> <p>If this attribute is omitted, then no author shall be associated with the parent annotation type.</p> <p>[<i>Example</i>: Consider a comment represented using the following WordprocessingML fragment:</p> <pre>&lt;... w:id="1" w:author="Example Author"&gt;   ... &lt;/...&gt;</pre> <p>The author attribute specifies that the author of the current annotation is Example Author, which can be used as desired. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>
date (Annotation Date)	<p>Specifies the date information for an annotation within a WordprocessingML document. The use of this information is outside of the scope of ISO/IEC 29500.</p> <p>If this attribute is omitted, then no date information shall be associated with the parent annotation type.</p> <p>[<i>Example</i>: Consider a comment represented using the following WordprocessingML fragment:</p> <pre>&lt;... w:id="1" w:date="2006-01-01T10:00:00"&gt;   ... &lt;/...&gt;</pre> <p>The date attribute specifies that the date of the current annotation is January 1st 2006 at 10:00 AM, which can be used as desired. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_DateTime simple type (Part 1, §17.18.9).</p>
id (Annotation Identifier)	<p>Specifies a unique identifier for an annotation within a WordprocessingML document. The restrictions on the id attribute, if any, are defined by the parent XML element.</p> <p>If this attribute is omitted, then the document is non-conformant.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider an annotation represented using the following WordprocessingML fragment:</p> <pre>&lt;... w:id="1" ... &gt; ... &lt;/...&gt;</pre> <p>The id attribute specifies that the ID of the current annotation is 1. This value is used to uniquely identify this annotation within the document content. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (Part 1, §17.18.10).</p>
original (Previous Numbering Value)	<p>Specifies the previous numbering displayed by the parent numbering change revision. Its format is specified by the parent element.</p> <p>If this attribute is omitted, then no previous numbering value is implied and applications can choose to calculate this value, or display no previous numbering value.</p> <p>[<i>Example:</i> Consider the following paragraph containing a single LISTNUM field with a revision, as follows:</p> <p style="text-align: center;">Some <del>1</del><ins>2</ins>. text</p> <p>This revision to the field result would be stored as follows in the WordprocessingML:</p> <pre>&lt;w:fldChar w:fldCharType="begin"&gt;   &lt;w:numberingChange w:id="0" ... w:original="1." /&gt; &lt;/w:fldChar&gt;</pre> <p>The original attribute specifies that the previous numbering value of the field was 1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT\\_TrackChangeNumbering](#)) is located in §A.1. *end note*]

#### 14.6.1.2 numberingChange (Previous Paragraph Numbering Properties)

This element specifies the previous state of the numbering on a paragraph when revisions are being tracked.

[*Rationale:* This mechanism is simply used to provide storage for revisions to numbering produced by legacy word processing applications, and applications are encouraged to use the pPrChange element to store these changes as changes to the paragraph properties instead. *end rationale*]

[Example: Consider the following list using Arabic numerals as the numbering, as follows:

1. one
2. two
3. three

Consider a revision where the numbering definition is changed from Arabic numerals to Roman numerals, as follows:

i. one  
ii. two  
iii. three

This revision to the numbering definition would be stored as follows in the WordprocessingML:

```
<w:p>
  <w:pPr>
    <w:numPr>
      <w:ilvl w:val="0" />
      <w:numId w:val="1" />
      <w:numberingChange w:id="0" ... w:original="%1:1:0:." />
    </w:numPr>
  </w:pPr>
  <w:r>
    <w:t>one</w:t>
  </w:r>
</w:p>
<w:p>
  <w:pPr>
    <w:numPr>
      <w:ilvl w:val="0" />
      <w:numId w:val="1" />
      <w:numberingChange w:id="1" ... w:original="%1:2:0:." />
    </w:numPr>
  </w:pPr>
  <w:r>
    <w:t>two</w:t>
  </w:r>
</w:p>
<w:p>
  <w:pPr>
    <w:numPr>
      <w:ilvl w:val="0" />
      <w:numId w:val="1" />
```

```

        <w:numberingChange w:id="2" ... w:original="%1:3:0:." />
    </w:numPr>
</w:pPr>
<w:r>
    <w:t>three</w:t>
</w:r>
</w:p>

```

The numberingChange element specifies that the numbering definition was modified and this change was tracked as a revision. The previous Arabic numeral numbering definition is cached in the original attribute. *end example]*

For paragraph numbering, the original attribute shall specify the previous numbering definition for an individual paragraph of text within a WordprocessingML document while revisions are being tracked.

The value of original is represented as separate numbering level definitions defined as follows:

```

< %[numbering level]:[nfc value]:[numbering format]:[separator]>[repeat if more
than one level]

```

where

- **numbering level** – The level for which the numbering definition is defined
- **nfc value** – The value of the numbering style at the specific numbering level
- **numbering format** – The nfc value of the numbering format, as referenced in the table below.
- **separator** – The separator used to separate the numbering level definitions

The numbering format values are mapped as follows:

nfc Value	ST_NumberFormat enumeration equivalent
0	decimal
1	upperRoman
2	lowerRoman
3	upperLetter
4	lowerLetter
5	ordinal
6	cardinalText
7	ordinalText
8	hex
9	chicago
10	ideographDigital
11	japaneseCounting
12	Aiueo

nfc Value	ST_NumberFormat enumeration equivalent
13	Iroha
14	decimalFullWidth
15	decimalHalfWidth
16	japaneseLegal
17	japaneseDigitalTenThousand
18	decimalEnclosedCircle
19	decimalFullWidth2
20	aiueoFullWidth
21	irohaFullWidth
22	decimalZero
23	bullet
24	ganada
25	chosung
26	decimalEnclosedFullstop
27	decimalEnclosedParen
28	decimalEnclosedCircleChinese
29	ideographEnclosedCircle

38	chineseLegalSimplified
39	chineseCountingThousand
40	Application-defined. Can be ignored.
41	koreanDigital
42	koreanCounting
43	koreanLegal
44	koreanDigital2
45	hebrew1
46	arabicAlpha
47	hebrew2
48	arabicAbjad
49	hindiVowels
50	hindiConsonants

nfc Value	ST_NumberFormat enumeration equivalent
51	hindiNumbers
52	hindiCounting
53	thaiLetters
54	thaiNumbers
55	thaiCounting
56	vietnameseCounting
57	numberInDash
58	russianLower
59	russianUpper
60 or above	Application-defined. Can be ignored.

[Example: Consider the following numbered paragraph where the numbering definition has changed while revisions are being tracked, as follows:

~~1.1.1.~~ Three

This revision to the numbered paragraph would be stored as follows in the WordprocessingML:

```
<w:numPr>
...
  <w: numberingChange ... w:original="%1:1:0:.%2:1:2:.%3:1:0:." />
</w:numPr>
```

In the above example there are three levels in the original numbering definition, thus three numbering level definitions are needed to represent the original numbering definition.

The first level is specified by %1, and says that it was number value 1 in the nfc format 0 (arabic).

The original attribute specifies that the previous numbering definition was made up of three levels whose value was 1.i.1.. end example]

Attributes	Description
author (Annotation Author)	<p>Specifies the author for an annotation within a WordprocessingML document.</p> <p>If this attribute is omitted, then no author shall be associated with the parent annotation type.</p> <p>[Example: Consider a comment represented using the following WordprocessingML fragment:</p> <pre>&lt;... w:id="1" w:author="Example Author"&gt; ... </pre>

Attributes	Description
	<p>&lt;/...&gt;</p> <p>The author attribute specifies that the author of the current annotation is Example Author, which can be used as desired. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>
date (Annotation Date)	<p>Specifies the date information for an annotation within a WordprocessingML document. The use of this information is outside of the scope of ISO/IEC 29500.</p> <p>If this attribute is omitted, then no date information shall be associated with the parent annotation type.</p> <p>[Example: Consider a comment represented using the following WordprocessingML fragment:</p> <pre data-bbox="451 829 1112 924">&lt;... w:id="1" w:date="2006-01-01T10:00:00"&gt; ... &lt;/...&gt;</pre> <p>The date attribute specifies that the date of the current annotation is January 1st 2006 at 10:00 AM, which can be used as desired. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_DateTime simple type (Part 1, §17.18.9).</p>
id (Annotation Identifier)	<p>Specifies a unique identifier for an annotation within a WordprocessingML document. The restrictions on the id attribute, if any, are defined by the parent XML element.</p> <p>If this attribute is omitted, then the document is non-conformant.</p> <p>[Example: Consider an annotation represented using the following WordprocessingML fragment:</p> <pre data-bbox="451 1444 695 1539">&lt;... w:id="1" ... &gt; ... &lt;/...&gt;</pre> <p>The id attribute specifies that the ID of the current annotation is 1. This value is used to uniquely identify this annotation within the document content. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (Part 1, §17.18.10).</p>
original (Previous Numbering Value)	<p>Specifies the previous numbering displayed by the parent numbering change revision. Its format is specified by the parent element.</p>

Attributes	Description
	<p>If this attribute is omitted, then no previous numbering value is implied and applications can choose to calculate this value, or display no previous numbering value.</p> <p>[<i>Example:</i> Consider the following paragraph containing a single LISTNUM field with a revision, as follows:</p> <p style="text-align: center;">Some <del>1</del><ins>2</ins>. text</p> <p>This revision to the field result would be stored as follows in the WordprocessingML:</p> <pre>&lt;w:fldChar w:fldCharType="begin"&gt;   &lt;w:numberingChange w:id="0" ... w:original="1." /&gt; &lt;/w:fldChar&gt;</pre> <p>The original attribute specifies that the previous numbering value of the field was 1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT\\_TrackChangeNumbering](#)) is located in §A.1. *end note*]

## 14.7 Settings

### 14.7.1 Legacy Password Hash Algorithm

When a password hash value is stored using the transitional hashing mechanism described in the following subclause, that process shall be done in two stages:

The following steps assume that all words are unsigned, the word size is two bytes, and that bit-level SHL/SHR operations shift in the direction of the highest-order and lowest-order bit, respectively. [*Example:* 0x61 SHR 1 is 0xC2, as 01100001 shifted one position in the direction of its highest-order bit is 11000010. *end example*]

The UTF-16LE encoded password shall be hashed using the following algorithm (if there is a leading BOM character (U+FEFF) in the encoded password it is removed before hash calculation):

- Passwords of 15 or fewer characters shall be used in the hash without further change; passwords longer than 15 characters shall be truncated to 15 characters.
- Construct a new NULL-terminated string consisting of single-byte values using the algorithm described by the following bullet. The input to this step should be the series of UTF-16 characters defined above:
  - Get the single-byte values by iterating through the Unicode characters of the truncated password. For each character, if the low byte is not equal to 0, take it. Otherwise, take the high byte.

- From now on, the single-byte character string is used.
- If the password is empty, return 0.
- Compute the high-order word of the new key:
  - Initialize from the initial code array (see below), depending on the password's length. For each character in the password:
    - For every bit in the character, starting with the least significant and progressing to (but excluding) the most significant, if the bit is set, XOR the key's high-order word with the corresponding word from the encryption matrix
- Compute the low-order word of the new key:
  - Initialize with 0
  - For each character in the password, going backwards, low-order word = (((low-order word SHR 14) AND 0x0001) OR (low-order word SHL 1) AND 0x7FFF) XOR character
  - Lastly, low-order word = (((low-order word SHR 14) AND 0x0001) OR (low-order word SHL 1) AND 0x7FFF) XOR password length XOR 0xCE4B.

#### Initial code array

The initial code array contains the initial values for the key's high-order word. The initial value depends on the length of the password, as follows:

Password length	Initial value for the key's high-order word
1	0xE1F0
2	0x1D0F
3	0xCC9C
4	0x84C0
5	0x110C
6	0x0E10
7	0xF1CE
8	0x313E
9	0x1872
10	0xE139
11	0xD40F
12	0x84F9
13	0x280C
14	0xA96A
15	0x4EC3

## Encryption matrix

The encryption matrix contains codes used during the calculation of the key's high-order word. As described in the algorithm above, for every bit of the password's characters, if the bit is set, a corresponding value is taken from this encryption matrix and is used to XOR the key's high-order word with it. Each row in the encryption matrix corresponds to a single character from the password, and each of the seven columns corresponds to a particular bit (0-6) in this character.

The values are taken in such a way so that the last character of the password uses the last row in the encryption matrix. The next-to-last character uses the next-to-last row in the matrix, and so on. This means that the beginning of the matrix might be unused, depending on the length of the password.

	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6
Last-14	0xAEFC	0x4DD9	0x9BB2	0x2745	0x4E8A	0x9D14	0x2A09

Last-6	0xB861	0x60E3	0xC1C6	0x93AD	0x377B	0x6EF6	0xDDEC
Last-5	0x45A0	0x8B40	0x06A1	0x0D42	0x1A84	0x3508	0x6A10
Last-4	0xAA51	0x4483	0x8906	0x022D	0x045A	0x08B4	0x1168
Last-3	0x76B4	0xED68	0xCAF1	0x85C3	0x1BA7	0x374E	0x6E9C
Last-2	0x3730	0x6E60	0xDCC0	0xA9A1	0x4363	0x86C6	0x1DAD
Last-1	0x3331	0x6662	0xCCC4	0x89A9	0x0373	0x06E6	0x0DCC
Last	0x1021	0x2042	0x4084	0x8108	0x1231	0x2462	0x48C4

[Example: Consider a password which has been supplied - the string "Example". It is already under 15 characters, so truncation does not affect it. It is then converted to a string of single-byte characters.

- The password is 7 characters long, so, from the initial code array, the initial value for the key's high-order word is 0xF1CE.
- The key's high-order word is then computed further depending on the password's characters:
  - The first character is 'E' (0x45). This is the first character of a 7-character password, so its corresponding row in the encryption matrix is "Last-6".

- Bit 0 is set, therefore the key's high-order word is combined (via XOR) with the corresponding value for Bit 0 on row "Last-6", which is 0xB861. The new result is 0xF1CE XOR 0xB861 = 0x49AF.
- Bit 2 is set, so the key's high-order word is XOR-ed with the corresponding value for Bit 2 on row "Last-6", which is 0xC1C6. The new result is 0x49AF XOR 0xC1C6 = 0x8869.
- This process is repeated for each bit.
- The next character is 'x' (0x78). Its corresponding row in the encryption matrix is "Last-5".
  - Bit 3 is set. The value for Bit 3 on row "Last-5" in the encryption matrix is 0x0D42. The current value for the key's high-order byte is 0x5585, so the new one should be 0x5585 XOR 0x0D42 = 0x58C7.
  - This process is repeated for each bit.
- This process is repeated for all characters.
- After the last character has been processed, the above step produced 0x64CE for the key's high-order word. Now the low-order word needs to be calculated:
  - The initial value is 0.
  - It is then calculated using the password:
    - The last character of the password is 'e' (0x65), so, by the formula, low-order word = (((low-order word SHR 14) AND 0x0001) OR ((low-order word SHL 1) AND 0x7FFF)) XOR 'e' = (((0 SHR 14) AND 0x0001) OR ((0 SHL 1) AND 0x7FFF)) XOR 0x65 = 0x0065.
    - The next to last character of the password is 'l' (0x6C). Again, by the formula, (((0x0065 SHR 14) AND 0x0001) OR ((0x0065 SHL 1) AND 0x7FFF)) XOR 0x6C = (0x0000 OR 0x00CA) XOR 0x6C = 0x00CA XOR 0x6C = 0x00A6.
    - This process is repeated for each character.
  - After the password's first character has been processed, we have 0x1199 for the key's low-order word. Lastly, the password's length is combined into it: low-order word = (((0x1199 SHR 14) AND 0x0001) OR ((0x1199 SHL 1) AND 0x7FFF)) XOR 0x0007 XOR 0xCE4B = 0x2332 XOR 0x0007 XOR 0xCE4B = 0x2335 XOR 0xCE4B = 0xED7E.
- The end result for the key is 0x64CEED7E.

*end example]*

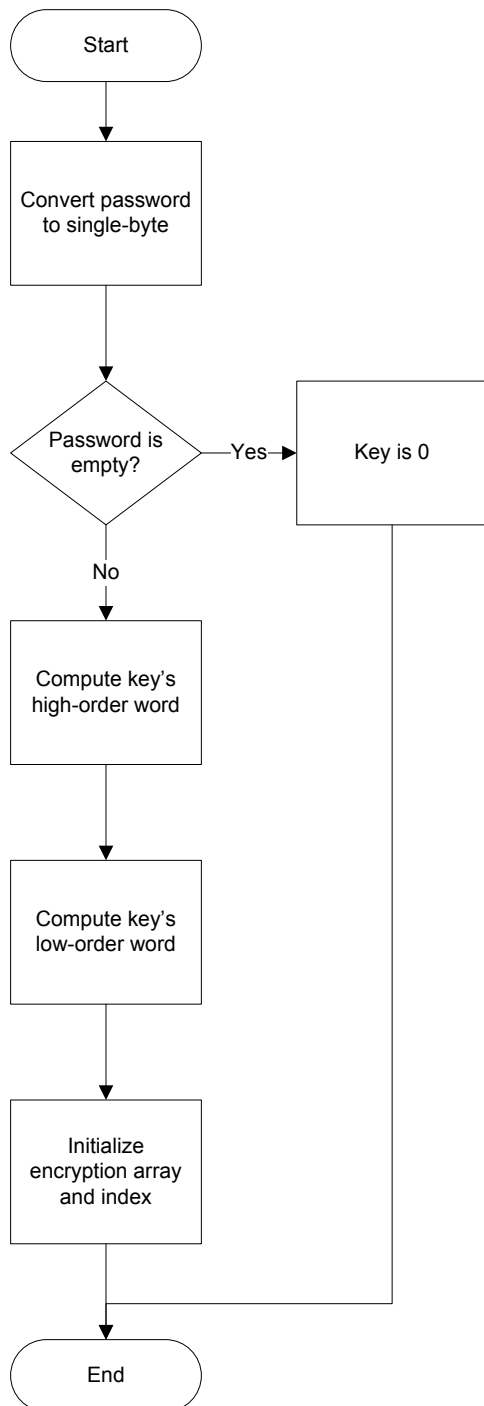

[*Rationale:* This pre-processing step is necessary for compatibility with legacy word processing applications which hashed their password solely using this mechanism. *end rationale]*

Second, the byte order of the result shall be reversed [*Example:* 0x64CEED7E becomes 7EEDCE64. *end example]*, and that value shall be hashed as defined by the attribute values.

[*Note:* The algorithm above can be stated as follows using diagrams:

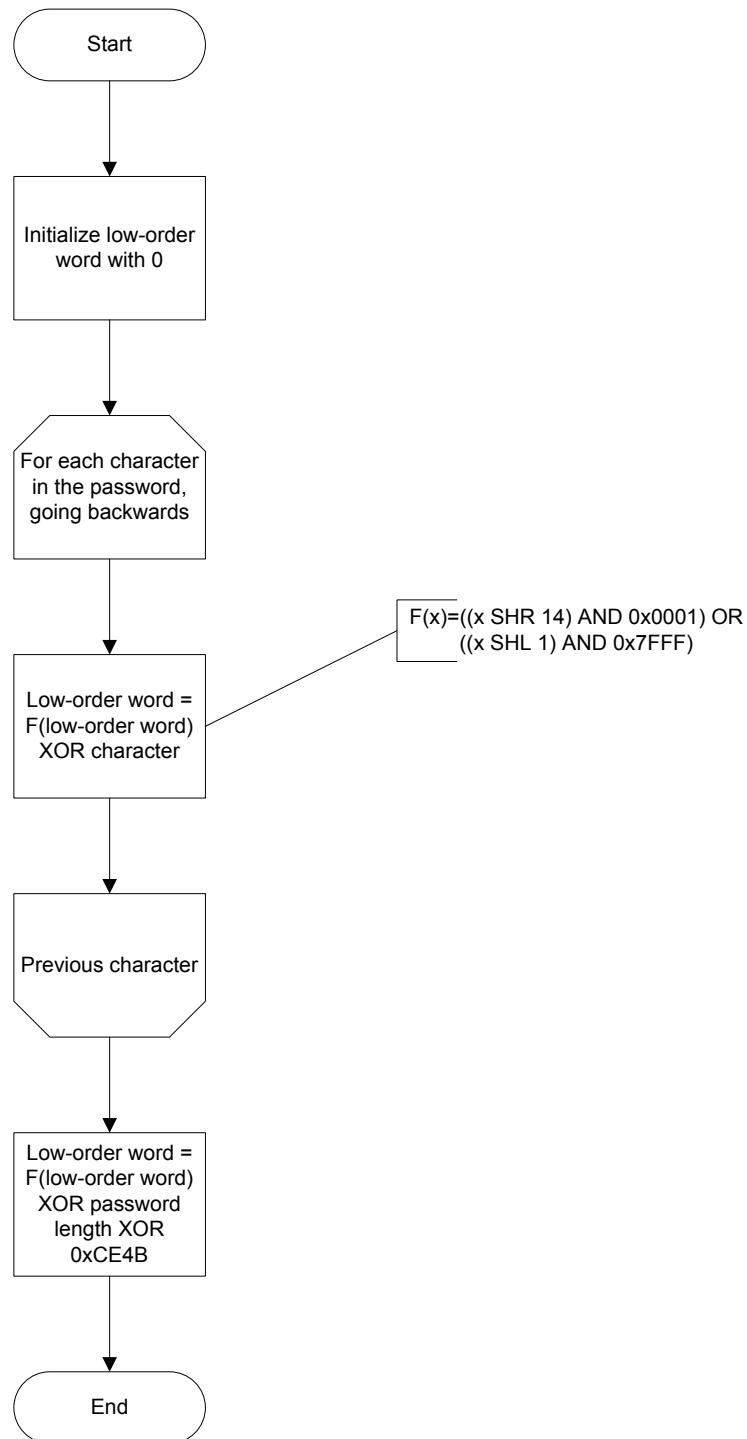

# Calculate Key

# Compute Key's High-Order Word

# Compute Key's Low-Order Word

*end note]*

[*Example:* Consider a WordprocessingML document which specifies that applications must not allow any modifications to this document other than the addition of comments. This requirement would be specified using the following WordprocessingML in the document settings:

```
<w:documentProtection w:edit="comments" w:enforcement="true" ...
  w:cryptAlgorithmClass="hash" w:cryptAlgorithmType="typeAny"
  w:cryptAlgorithmSid="1" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The documentProtection element has an edit attribute value of comments, specifying that the only modification allowed should be comments, the enforcement attribute has a value of true, specifying that the document protection specified is to be enforced on the given document. Finally, in order for the hosting application to stop enforcement of the document protection applied to the document, the hosting application would have to be provided with a password that the hosting application would then hash, compare to the value of the hash attribute (9oN7nWkCAyEZib1RomSJTjmPpCY=), and if the two values matched, halt enforcement of any document protection. *end example*]

## 14.7.2 Document Settings

### 14.7.2.1 hdrShapeDefaults (Default Properties for VML Objects in Header and Footer)

This element specifies the default parameters for object using the VML syntax (§19.1) inserted in the header and footer of a WordprocessingML document. The definition and semantics of these parameters is described in the VML - Office Drawing subclause (§19.2) of ISO/IEC 29500.

If this element is omitted, then no default properties are applied to VML objects in the header and footer of this document.

[*Example:* Consider a WordprocessingML document whose document settings contain the following markup:

```
<w:hdrShapeDefaults>
  <o:shapedefaults v:ext="edit" spidmax="2050" fillcolor="none [3207]"
strokecolor="none [3041]">
    <v:fill color="none [3207]" />
    <v:stroke color="none [3041]" weight="3pt" />
    <v:shadow on="t" type="perspective" color="none [1607]" opacity=".5"
offset="1pt" offset2="1pt" />
  </o:shapedefaults>
  <o:shapelayout v:ext="edit">
    <o:idmap v:ext="edit" data="2" />
  </o:shapelayout>
</w:hdrShapeDefaults>
```

The hdrShapeDefaults element specifies a set of shape defaults which must be applied to the set of all shapes present in the header and footer of this document. *end example*]

[Note: The W3C XML Schema definition of this element's content model ([CT\\_ShapeDefaults](#)) is located in §A.1. *end note*]

#### 14.7.2.2 [shapeDefaults \(Default Properties for VML Objects in Main Document\)](#)

This element specifies the default parameters for object using the VML syntax (§19.1) inserted in the body (the main document story, comments, footnotes, and endnotes) of the WordprocessingML document. The definition and semantics of these parameters is described in the VML - Office Drawing subclause (§19.2) of ISO/IEC 29500.

If this element is omitted, then no default properties are applied to VML objects in the body of this document.

[Example: Consider a WordprocessingML document whose document settings contain the following markup:

```
<w:shapeDefaults>
  <o:shapedefaults v:ext="edit" spidmax="1026" />
  <o:shapelayout v:ext="edit">
    <o:idmap v:ext="edit" data="1" />
  </o:shapelayout>
</w:shapeDefaults>
```

The shapeDefaults element specifies a set of shape defaults which must be applied to the set of all shapes present in the body document. *end example*]

[Note: The W3C XML Schema definition of this element's content model ([CT\\_ShapeDefaults](#)) is located in §A.1. *end note*]

#### 14.7.2.3 [Additional attributes for documentProtection element \(Part 1, §17.15.1.29\)](#)

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description
algIdExt (Cryptographic Algorithm Extensibility)	<p>Specifies that a cryptographic algorithm which was not defined by ISO/IEC 29500 has been used to generate the hash value stored with this document.</p> <p>This value, when present, shall be interpreted based on the value of the algIdExtSource attribute in order to determine the algorithm used, which shall be application-defined. [Rationale: This extensibility affords the fact that with exponentially increasing computing power, documents created in the future might need to utilize as yet undefined hashing algorithms in order to remain secure. <i>end rationale</i>]</p> <p>If this value is present, the cryptAlgorithmClass, cryptAlgorithmType, and cryptAlgorithmSid attribute values shall be ignored in favor of the algorithm defined by this attribute.</p> <p>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:algIdExt="0000000A"</pre>

Attributes	Description
	<p><code>w:algIdExtSource="futureCryptography"</code>  <code>w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</code></p> <p>The <code>algIdExt</code> attribute value of <code>0000000A</code> specifies that the algorithm with hex code A must be used as defined by the <code>futureCryptography</code> application. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_LongHexNumber</code> simple type (Part 1, §17.18.50).</p>
<p><code>algIdExtSource</code>          (Algorithm          Extensibility Source)</p>	<p>Specifies the application which defined the algorithm value specified by the <code>algIdExt</code> attribute.</p> <p>[<i>Example</i>: Consider a <code>WordprocessingML</code> document with the following information stored in one of its protection elements:</p> <p><code>&lt;... w:algIdExt="0000000A"</code>  <code>w:algIdExtSource="futureCryptography"</code>  <code>w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</code></p> <p>The <code>algIdExtSource</code> attribute value of <code>futureCryptography</code> specifies that the algorithm used here was published by the <code>futureCryptography</code> application. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_String</code> simple type (Part 1, §22.9.2.13).</p>
<p><code>cryptAlgorithmClass</code>          (Cryptographic          Algorithm Class)</p>	<p>Specifies the class of cryptographic algorithm used by this protection. [<i>Note</i>: The initial version of ISO/IEC 29500 only supports a single version - <code>hash</code> - but future versions can expand this as necessary. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a <code>WordprocessingML</code> document with the following information stored in one of its protection elements:</p> <p><code>&lt;... w:cryptAlgorithmClass="hash"</code>  <code>w:cryptAlgorithmType="typeAny"</code>  <code>w:cryptAlgorithmSid="1"</code>  <code>w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</code></p> <p>The <code>cryptAlgorithmClass</code> attribute value of <code>hash</code> specifies that the algorithm used for the password is a hashing algorithm. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_AlgorithmClass</code> simple type (§20.1.2.1).</p>
<p><code>cryptAlgorithmSid</code>          (Cryptographic          Hashing Algorithm)</p>	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and user-supplied password in order to compute a hash value for comparison.</p> <p>The possible values for this attribute shall be interpreted as follows:</p>

Attributes	Description																																
	<table border="1" data-bbox="415 243 1349 1056"> <thead> <tr> <th data-bbox="415 243 586 289">Value</th><th data-bbox="586 243 1349 289">Algorithm</th></tr> </thead> <tbody> <tr><td data-bbox="415 289 586 336">1</td><td data-bbox="586 289 1349 336">MD2</td></tr> <tr><td data-bbox="415 336 586 382">2</td><td data-bbox="586 336 1349 382">MD4</td></tr> <tr><td data-bbox="415 382 586 428">3</td><td data-bbox="586 382 1349 428">MD5</td></tr> <tr><td data-bbox="415 428 586 474">4</td><td data-bbox="586 428 1349 474">SHA-1</td></tr> <tr><td data-bbox="415 474 586 520">5</td><td data-bbox="586 474 1349 520">MAC</td></tr> <tr><td data-bbox="415 520 586 567">6</td><td data-bbox="586 520 1349 567">RIPEMD</td></tr> <tr><td data-bbox="415 567 586 613">7</td><td data-bbox="586 567 1349 613">RIPEMD-160</td></tr> <tr><td data-bbox="415 613 586 659">8</td><td data-bbox="586 613 1349 659">Undefined. cryptAlgorithmType (Cryptographic Algorithm Type)	<p data-bbox="415 1562 1442 1667">Specifies the type of cryptographic algorithm used by this protection. [Note: The initial version of ISO/IEC 29500 only supports a single algorithm type - typeAny - but future versions can expand this as necessary. <i>end note</i>]</p> <p data-bbox="415 1709 1398 1772">[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre data-bbox="456 1814 967 1877">&lt;... w:cryptAlgorithmClass="hash"       w:cryptAlgorithmType="typeAny"</pre>																																

Attributes	Description
	<p><code>w:cryptAlgorithmSid="1"</code>  <code>w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</code></p> <p>The cryptAlgorithmType attribute value of typeAny specifies that any type of algorithm might have been used for the password. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_AlgType simple type (§20.1.2.2).</p>
cryptProvider (Cryptographic Provider)	<p>Specifies the cryptographic provider which was used to generate the hash value stored in this document. If the user provided a cryptographic provider which was not the system's built-in provider, then that provider shall be stored here so it can subsequently be used if available.</p> <p>If this attribute is omitted, then the built-in cryptographic provider on the system shall be used.</p> <p>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <p><code>&lt;... w:cryptProvider="Krista'sProvider"</code>  <code>w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</code></p> <p>The cryptProvider attribute value of Krista'sProvider specifies that the cryptographic provider with name "Krista's Provider" must be used if available. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>
cryptProviderType (Cryptographic Provider Type)	<p>Specifies the type of cryptographic provider to be used.</p> <p>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <p><code>&lt;... w:cryptProviderType="rsaAES"</code>  <code>w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</code></p> <p>The cryptProviderType attribute value of rsaAES specifies that the cryptographic provider type must be an Advanced Encryption Standard provider. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_CryptProv simple type (§20.1.2.4).</p>
cryptProviderTypeExt (Cryptographic Provider Type Extensibility)	<p>Specifies that a cryptographic provider type which was not defined by ISO/IEC 29500 has been used to generate the hash value stored with this document.</p> <p>This value, when present, shall be interpreted based on the value of the cryptProviderTypeExtSource attribute in order to determine the provider type used,</p>

Attributes	Description
	<p>which shall be application-defined. [<i>Rationale</i>: This extensibility affords the fact that with exponentially increasing computing power, documents created in the future might need to utilize as yet undefined cryptographic provider types in order to remain secure. <i>end rationale</i>]</p> <p>If this value is present, the cryptProviderType attribute value shall be ignored in favor of the provider type defined by this attribute.</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:cryptProviderTypeExt="00A5691D"       w:cryptProvideTypeExtSource="futureCryptography"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProviderTypeExt attribute value of 00A5691D specifies that the provider type associated with hex code A5691D must be used as defined by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_LongHexNumber simple type (Part 1, §17.18.50).</p>
cryptProviderTypeExtSource (Provider Type Extensibility Source)	<p>Specifies the application which defined the provider type value specified by the cryptProviderTypeExt attribute.</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:cryptProviderTypeExt="00A5691D"       w:cryptProvideTypeExtSource="futureCryptography"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProvideTypeExtSource attribute value of futureCryptography specifies that the provider type used here was published by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>
cryptSpinCount (Iterations to Run Hashing Algorithm)	<p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hash attribute. [<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p>

Attributes	Description
	<p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:cryptSpinCount="100000"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptSpinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the hash attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (Part 1, §17.18.10).</p>
hash (Password Hash)	<p>Specifies the hash value for the password stored with this document. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then no password shall be associated with the protection, and it can be turned off without supplying any password.</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:cryptAlgorithmClass="hash"       w:cryptAlgorithmType="typeAny"       w:cryptAlgorithmSid="1"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The hash attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the cryptAlgorithmSid attribute value of 1) and that the resulting hash value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
salt (Salt for Password Verifier)	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hash attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those precalculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:salt="ZUdHa+D8F/OAKP3I7ssUnQ=="       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The salt attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>

#### 14.7.2.4 Additional attribute for stylePaneFormatFilter element (Part 1, §17.15.1.85)

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description																						
val (Bitmask of Suggested Filtering Options)	<p>Specifies a bitmask of the following filtering options:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0x0001</td><td>Specifies that all styles present in the styles part should be displayed in the list of document styles.</td></tr> <tr> <td>0x0002</td><td>Specifies that only styles with the customStyle attribute should be displayed in the list of document styles.</td></tr> <tr> <td>0x0004</td><td>Specifies that all latent styles should be displayed in the list of document styles.</td></tr> <tr> <td>0x0008</td><td>Specifies that only styles used in the document should be displayed in the list of document styles.</td></tr> <tr> <td>0x0010</td><td>Undefined. Shall not be used.</td></tr> <tr> <td>0x0020</td><td>Specifies that heading styles (styles with a styleId of Heading1 to Heading9) should be displayed in the list of document styles when the previous style is used in the document and/or is present in the styles part.</td></tr> <tr> <td>0x0040</td><td>Specifies that numbering styles should be displayed in the list of document styles.</td></tr> <tr> <td>0x0080</td><td>Specifies that table styles should be displayed in the list of document styles.</td></tr> <tr> <td>0x0100</td><td>Specifies that all unique forms of run-level direct formatting should be displayed in the list of document styles as though they were each a unique style.</td></tr> <tr> <td>0x0200</td><td>Specifies that all unique forms of paragraph-level direct formatting should</td></tr> </table>	Value	Description	0x0001	Specifies that all styles present in the styles part should be displayed in the list of document styles.	0x0002	Specifies that only styles with the customStyle attribute should be displayed in the list of document styles.	0x0004	Specifies that all latent styles should be displayed in the list of document styles.	0x0008	Specifies that only styles used in the document should be displayed in the list of document styles.	0x0010	Undefined. Shall not be used.	0x0020	Specifies that heading styles (styles with a styleId of Heading1 to Heading9) should be displayed in the list of document styles when the previous style is used in the document and/or is present in the styles part.	0x0040	Specifies that numbering styles should be displayed in the list of document styles.	0x0080	Specifies that table styles should be displayed in the list of document styles.	0x0100	Specifies that all unique forms of run-level direct formatting should be displayed in the list of document styles as though they were each a unique style.	0x0200	Specifies that all unique forms of paragraph-level direct formatting should
Value	Description																						
0x0001	Specifies that all styles present in the styles part should be displayed in the list of document styles.																						
0x0002	Specifies that only styles with the customStyle attribute should be displayed in the list of document styles.																						
0x0004	Specifies that all latent styles should be displayed in the list of document styles.																						
0x0008	Specifies that only styles used in the document should be displayed in the list of document styles.																						
0x0010	Undefined. Shall not be used.																						
0x0020	Specifies that heading styles (styles with a styleId of Heading1 to Heading9) should be displayed in the list of document styles when the previous style is used in the document and/or is present in the styles part.																						
0x0040	Specifies that numbering styles should be displayed in the list of document styles.																						
0x0080	Specifies that table styles should be displayed in the list of document styles.																						
0x0100	Specifies that all unique forms of run-level direct formatting should be displayed in the list of document styles as though they were each a unique style.																						
0x0200	Specifies that all unique forms of paragraph-level direct formatting should																						

Attributes	Description
	be displayed in the list of document styles as though they were each a unique style.
	0x0400 Specifies that all unique forms of direct formatting of numbering data should be displayed in the list of document styles as though they were each a unique style.
	0x0800 Specifies that all unique forms of direct formatting of tables should be displayed in the list of document styles as though they were each a unique style.
	0x1000 Specifies that a style should be present which removes all formatting and styles from text.
	0x2000 Specifies that heading styles with a styleId of Heading1 to Heading3 should always be displayed in the list of document styles.
	0x4000 Specifies that styles should only be shown the semiHidden element (Part 1, §17.7.4.16) is false and the hidden element (Part 1, §17.7.4.4) is false.
	0x8000 Specifies that primary names for styles should not be shown if an alternate name using the name element (Part 1, §17.7.4.9) exists.
	Any other value Undefined. Shall not be used.
<p>[Example: Consider a document with the following value in its document settings:</p> <pre>&lt;w:stylePaneFormatFilter w:val="2002" /&gt;</pre> <p>The val attribute specifies two suggested filter options for the list of document styles:</p> <ul style="list-style-type: none"> <li>• Only custom styles should be shown (0002)</li> <li>• Heading styles with a styleId of Heading1 to Heading3 should always be displayed in the list (2000)</li> </ul> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ShortHexNumber simple type (Part 1, §17.18.79).</p>	

#### 14.7.2.5 Additional attributes for writeProtection element (Part 1, §17.15.1.93)

The following additional attributes can be specified for a document of a transitional conformance class:

Attributes	Description
algIdExt (Cryptographic Algorithm)	Specifies that a cryptographic algorithm which was not defined by ISO/IEC 29500 has been used to generate the hash value stored with this document.

Attributes	Description
Extensibility)	<p>This value, when present, shall be interpreted based on the value of the algIdExtSource attribute in order to determine the algorithm used, which shall be application-defined. <i>[Rationale: This extensibility affords the fact that with exponentially increasing computing power, documents created in the future might need to utilize as yet undefined hashing algorithms in order to remain secure. end rationale]</i></p> <p>If this value is present, the cryptAlgorithmClass, cryptAlgorithmType, and cryptAlgorithmSid attribute values shall be ignored in favor of the algorithm defined by this attribute.</p> <p><i>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</i></p> <pre>&lt;... w:algIdExt="0000000A"       w:algIdExtSource="futureCryptography"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The algIdExt attribute value of 0000000A specifies that the algorithm with hex code A must be used as defined by the futureCryptography application. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_LongHexNumber simple type (Part 1, §17.18.50).</p>
algIdExtSource (Algorithm Extensibility Source)	<p>Specifies the application which defined the algorithm value specified by the algIdExt attribute.</p> <p><i>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</i></p> <pre>&lt;... w:algIdExt="0000000A"       w:algIdExtSource="futureCryptography"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The algIdExtSource attribute value of futureCryptography specifies that the algorithm used here was published by the futureCryptography application. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>
cryptAlgorithmClass (Cryptographic Algorithm Class)	<p>Specifies the class of cryptographic algorithm used by this protection. <i>[Note: The initial version of ISO/IEC 29500 only supports a single version - hash - but future versions can expand this as necessary. end note]</i></p> <p><i>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</i></p> <pre>&lt;... w:cryptAlgorithmClass="hash"       w:cryptAlgorithmType="typeAny"</pre>

Attributes	Description																																
	<pre>w:cryptAlgorithmSid="1" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptAlgorithmClass attribute value of hash specifies that the algorithm used for the password is a hashing algorithm. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_AlgClass simple type (§20.1.2.1).</p>																																
cryptAlgorithmSid (Cryptographic Hashing Algorithm)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and user-supplied password in order to compute a hash value for comparison.</p> <p>The possible values for this attribute shall be interpreted as follows:</p> <table data-bbox="415 716 1349 1528"> <tr> <th>Value</th><th>Algorithm</th></tr> <tr><td>1</td><td>MD2</td></tr> <tr><td>2</td><td>MD4</td></tr> <tr><td>3</td><td>MD5</td></tr> <tr><td>4</td><td>SHA-1</td></tr> <tr><td>5</td><td>MAC</td></tr> <tr><td>6</td><td>RIPEMD</td></tr> <tr><td>7</td><td>RIPEMD-160</td></tr> <tr><td>8</td><td>Undefined. Shall not be used.</td></tr> <tr><td>9</td><td>HMAC</td></tr> <tr><td>10</td><td>Undefined. Shall not be used.</td></tr> <tr><td>11</td><td>Undefined. Shall not be used.</td></tr> <tr><td>12</td><td>SHA-256</td></tr> <tr><td>13</td><td>SHA-384</td></tr> <tr><td>14</td><td>SHA-512</td></tr> <tr><td>Any other value</td><td>Undefined. Shall not be used.</td></tr> </table> <p>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:cryptAlgorithmClass="hash" w:cryptAlgorithmType="typeAny" w:cryptAlgorithmSid="4" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptAlgorithmSid attribute value of 4 specifies that the SHA-1 hashing algorithm</p>	Value	Algorithm	1	MD2	2	MD4	3	MD5	4	SHA-1	5	MAC	6	RIPEMD	7	RIPEMD-160	8	Undefined. Shall not be used.	9	HMAC	10	Undefined. Shall not be used.	11	Undefined. Shall not be used.	12	SHA-256	13	SHA-384	14	SHA-512	Any other value	Undefined. Shall not be used.
Value	Algorithm																																
1	MD2																																
2	MD4																																
3	MD5																																
4	SHA-1																																
5	MAC																																
6	RIPEMD																																
7	RIPEMD-160																																
8	Undefined. Shall not be used.																																
9	HMAC																																
10	Undefined. Shall not be used.																																
11	Undefined. Shall not be used.																																
12	SHA-256																																
13	SHA-384																																
14	SHA-512																																
Any other value	Undefined. Shall not be used.																																

Attributes	Description
	<p>must be used to generate a hash from the user-defined password. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (Part 1, §17.18.10).</p>
cryptAlgorithmType (Cryptographic Algorithm Type)	<p>Specifies the type of cryptographic algorithm used by this protection. [<i>Note</i>: The initial version of ISO/IEC 29500 only supports a single algorithm type - typeAny - but future versions can expand this as necessary. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:cryptAlgorithmClass="hash"       w:cryptAlgorithmType="typeAny"       w:cryptAlgorithmSid="1"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptAlgorithmType attribute value of typeAny specifies that any type of algorithm might have been used for the password. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_AlgType simple type (§20.1.2.2).</p>
cryptProvider (Cryptographic Provider)	<p>Specifies the cryptographic provider which was used to generate the hash value stored in this document. If the user provided a cryptographic provider which was not the system's built-in provider, then that provider shall be stored here so it can subsequently be used if available.</p> <p>If this attribute is omitted, then the built-in cryptographic provider on the system shall be used.</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:cryptProvider="Krista'sProvider"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProvider attribute value of Krista'sProvider specifies that the cryptographic provider with name "Krista's Provider" must be used if available. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>
cryptProviderType (Cryptographic Provider Type)	<p>Specifies the type of cryptographic provider to be used.</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p>

Attributes	Description
	<p>&lt;... w:cryptProviderType="rsaAES" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</p> <p>The cryptProviderType attribute value of rsaAES specifies that the cryptographic provider type must be an Advanced Encryption Standard provider. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_CryptProv simple type (§20.1.2.4).</p>
cryptProviderTypeExt (Cryptographic Provider Type Extensibility)	<p>Specifies that a cryptographic provider type which was not defined by ISO/IEC 29500 has been used to generate the hash value stored with this document.</p> <p>This value, when present, shall be interpreted based on the value of the cryptProviderTypeExtSource attribute in order to determine the provider type used, which shall be application-defined. [<i>Rationale:</i> This extensibility affords the fact that with exponentially increasing computing power, documents created in the future might need to utilize as yet undefined cryptographic provider types in order to remain secure. <i>end rationale]</i></p> <p>If this value is present, the cryptProviderType attribute value shall be ignored in favor of the provider type defined by this attribute.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <p>&lt;... w:cryptProviderTypeExt="00A5691D" w:cryptProvideTypeExtSource="futureCryptography" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</p> <p>The cryptProviderTypeExt attribute value of 00A5691D specifies that the provider type associated with hex code A5691D must be used as defined by the futureCryptography application. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_LongHexNumber simple type (Part 1, §17.18.50).</p>
cryptProviderTypeExtSource (Provider Type Extensibility Source)	<p>Specifies the application which defined the provider type value specified by the cryptProviderTypeExt attribute.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <p>&lt;... w:cryptProviderTypeExt="00A5691D" w:cryptProvideTypeExtSource="futureCryptography" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</p> <p>The cryptProvideTypeExtSource attribute value of futureCryptography specifies that the provider type used here was published by the futureCryptography application. <i>end</i></p>

Attributes	Description
	<p><i>example]</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (Part 1, §22.9.2.13).</p>
<p>cryptSpinCount (Iterations to Run Hashing Algorithm)</p>	<p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hash attribute. [<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:cryptSpinCount="100000"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptSpinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the hash attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (Part 1, §17.18.10).</p>
<p>hash (Password Hash)</p>	<p>Specifies the hash value for the password stored with this document. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then no password shall be associated with the protection, and it can be turned off without supplying any password.</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:cryptAlgorithmClass="hash"       w:cryptAlgorithmType="typeAny"       w:cryptAlgorithmSid="1"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The hash attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the cryptAlgorithmSid attribute value of 1) and that the resulting hash value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.
salt (Salt for Password Verifier)	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hash attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those precalculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;... w:salt="ZUDHa+D8F/OAKP3I7ssUnQ=="       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The salt attribute value of ZUDHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>

### 14.7.3 Compatibility Settings

The last group of settings stored in WordprocessingML is compatibility settings. *Compatibility Settings* are optional settings used to preserve visual fidelity of documents created in earlier word processing applications. Some of these settings provide affordance for specific behaviors, described in detail below; and others simply instruct applications to mimic the behavior of an existing word processing application.

If compatibility settings are needed, they are stored in the Document Settings part.

It is important to note that all compatibility settings are optional in nature - applications can freely ignore all behaviors described within this section and these settings should not be added unless compatibility is specifically needed in one or more cases. The compatibility settings are provided for backward compatibility with documents created in legacy applications. As such, a number of the settings reference specific applications and specific versions of those applications. This is solely for backward compatibility reasons, and any of those settings are not intended for use by typical applications.

[*Note:* These settings can also be expressed using the generic compatSetting element defined in ISO/IEC 29500-1. *end note*]

[*Example:* Consider the following WordprocessingML fragment for the compatibility settings in a WordprocessingML document:

```
<w:settings>
...
<w:compat>
  <w:noTabHangInd />
</w:compat>
</w:settings>
```

The compat element contains all of the document settings for this document. In this case, the single setting applied is the suppression of a tab stop when using a hanging indent using the noTabHangInd element (§14.7.3.31). *end example*]

#### 14.7.3.1 alignTablesRowByRow (Align Table Rows Independently)

This element specifies whether applications shall align each row within a table independently based on the alignment setting of the jc element (Part 1, §17.4.28) when displaying the contents of a table in a WordprocessingML document.

When the justification of a table using the jc element is typically applied, that alignment is applied to the contents of the table (the table is centered, left justified, or right-aligned), and then individual rows are laid out based on the resulting table's position. This element, when present with a val attribute value of true (or equivalent), specifies that each table row shall be independently aligned based on the table alignment setting, ignoring the placement of all other rows.

[*Example:* Consider a WordprocessingML document with a single centered table, whose second row is defined such that one-half of an inch is left before the row begins, as follows:

```
<w:tbl>
  <w:tblPr>
    <w:jc w:val="center" />
  </w:tblPr>
  <w:tr>
    ...
  </w:tr>
  <w:tr>
    <w:trPr>
      <w:gridBefore w:val="1" />
```

```
<w:wBefore w:w="720" w:type="dxa" />
</w:trPr>
...
</w:tr>
<w:tr>
...
</w:tr>
</w:tbl>
```

The default presentation would have the entire table centered, then the second row indented beyond that by 720 points:

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:alignTablesRowByRow />
</w:compat>
```

Then that second row would instead be centered on the page independently of the other table rows, resulting in the following output:

In this case, the wBefore element's value is ignored, since the row was centered on the line as a row, and there is no table to be indented relative to. *end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

**14.7.3.2 allowSpaceOfSameStyleInTable (Allow Contextual Spacing of Paragraphs in Tables)**

This element specifies whether the suppression of additional space (contextual spacing) defined using the contextualSpacing element (Part 1, §17.3.1.9) shall be applied to paragraphs contained within tables.

Typically, the rules for the removal of additional paragraph spacing via the contextualSpacing element are applied to all paragraphs in a WordprocessingML document. This element, when present with a val attribute value of true (or equivalent), specifies that this setting shall always be ignored for paragraphs in table cells (and additional spacing shall be allowed).

[Example: Consider a WordprocessingML document with a default paragraph style with additional spacing after and contextual spacing set, as follows:

```
<w:style w:name="Normal" w:default="1">
...
<w:pPr>
  <w:spacing w:after="200" />
  <w:contextualSpacing />
</w:pPr>
</w:style>
```

The default presentation would have the spacing suppressed between all paragraphs, since they are all of the default paragraph style defined above (contextual spacing applies):

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

You can easily change the formatting of selected text in the document text by choosing a look for the selected text from the Quick Styles gallery on the Home tab. You can also format text directly by using the other controls on the Home tab. Most controls offer a choice of using the look from the current theme or using a format that you specify directly.

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:allowSpaceOfSameStyleInTable />
</w:compat>
```

Then the paragraphs in the table never have their spacing suppressed, resulting in the following output:

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

You can easily change the formatting of selected text in the document text by choosing a look for the selected text from the Quick Styles gallery on the Home tab. You can also format text directly by using the other controls on the Home tab. Most controls offer a choice of using the look from the current theme or using a format that you specify directly.

You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.3 `autofitToFirstFixedWidthCell` (Allow Table Columns To Exceed Preferred Widths of Constituent Cells)

This element specifies that when performing an AutoFit on a table in a WordprocessingML document in order to display it, applications shall alter that logic slightly in order to mimic the behavior of a previous word processing application.

Normally, the AutoFit behavior of a table is as is described in the associated simple type. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that this logic shall be changed as follows:

- If the width of a grid column in a table has been set by a preferred table cell width, then that column's width can be enlarged by the content of cells which themselves do not have a preferred width (in contrast, the normal logic never allows the content of cells to override a preferred width on a grid column).

[*Example:* Consider a WordprocessingML table with only one preferred cell width, a width of 720 points on the second cell in the first column, as follows:

```
<w:tbl>
...
<w:tr>
  <w:tc>
    <w:p/>
```

```

    </w:tc>
    <w:tc>
      <w:p/>
    </w:tc>
  </w:tr>
  <w:tr>
    <w:tc>
      <w:tcPr>
        <w:tcW w:w="720" w:type="dxa" />
      </w:tcPr>
      <w:p/>
    </w:tc>
    <w:tc>
      <w:p/>
    </w:tc>
  </w:tr>
</w:tbl>

```

The default presentation would have the first column constrained to 720 points by the preferred width of the second cell in the first column:

This is an example of a cell with lots of content.	

However, if this compatibility setting is turned on:

```

<w:compat>
  <w:autoFitToFirstFixedWidthCell />
</w:compat>

```

Then the column would be resized proportionally based on the content (ignoring the preferred width in that row), resulting in the following output:

This is an example of a cell with lots of content.	

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.4 autoSpaceLikeWord95 (Incorrectly Adjust Text Spacing for Specific Unicode Ranges)

This element specifies adjustments (detailed below) which should be applied to the spacing between adjoining regions of non-ideographic and ideographic text when the autoSpaceDE (Part 1, §17.3.1.2) and autoSpaceDN (Part 1, §17.3.1.3) elements have a value of true (or equivalent). This algorithm typically results in the following:

- An increase in the inter-character spacing added between non-ideographic and/or number characters and certain full-width characters
- No inter-character spacing between non-ideographic and/or number characters and certain half-width characters

Typically, applications apply additional spacing between ideographic and non-ideographic characters/numeric characters when the autoSpaceDE / autoSpaceDN properties are applied. This element, when present with a val attribute value of true (or equivalent), specifies that applications shall apply the following adjustments to this logic:

- Characters in the following Unicode ranges should be treated as ideographic, even though those characters are full-width forms of non-ideographic text: U+FF10–U+FF19, U+FF21–U+FF3A, and U+FF41–U+FF5A. [*Note*: This results in the unnecessary addition of space. *end note*]
- Characters in the following Unicode ranges should be treated as non-ideographic, even though those characters are ideographic: U+FF66–U+FF9F. [*Note*: This results in the omission of the intended additional space. *end note*]

[*Example*: Consider a WordprocessingML document with two paragraphs containing a mix of East Asian and Latin characters:

```
<w:p>
  <w:r>
    <w:t>ab</w:t>
  </w:r>
  <w:r>
    <w:t>ヲ</w:t>
  </w:r>
  <w:r>
    <w:t>ヲ</w:t>
  </w:r>
  <w:r>
    <w:t>cd</w:t>
  </w:r>
</w:p>
<w:p>
  <w:r>
```

```

    <w:t>ab</w:t>
  </w:r>
  <w:r>
    <w:t> 2 </w:t>
  </w:r>
  <w:r>
    <w:t> 2 </w:t>
  </w:r>
  <w:r>
    <w:t>cd</w:t>
  </w:r>
</w:p>

```

The first paragraph contains characters with Unicode value U+FF66 (𐤁). The second paragraph contains characters with Unicode value U+FF12 ( 2 ). If autoSpaceDE is true, spacing is added in the first paragraph (between the ideographs and the non-ideographic characters), but not in the second (all four characters are not ideographs):

ab 𐤁𐤁 cd  
 ab 2 2 cd

If this compatibility setting is turned on:

```

  <w:compat>
    <w:autoSpaceLikeWord95 />
  </w:compat>

```

Then, although it appears incorrect, applications should not add space in the first paragraph and should apply it in the second:

ab𐤁𐤁cd  
 ab 2 2 cd

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.5 [cachedColBalance \(Use Cached Paragraph Information for Column Balancing\)](#)

This element specifies whether applications shall incorrectly calculate the height of a paragraph for the purposes of column balancing when rendering WordprocessingML documents. Specifically, this element specifies that when a paragraph's lines have differing heights, an application shall treat this paragraph as though it had only one line equaling the full paragraph height, regardless of the actual number of lines in the paragraph.

[*Guidance*: It is recommended that applications not intentionally replicate this behavior; it is maintained only for compatibility with existing documents from a legacy application. *end guidance*]

Typically, lines are correctly measured for their height when balancing columns as part of a WordprocessingML document. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications shall perform the incorrect calculation in the conditions described above.

[*Example*: Consider a WordprocessingML document with two columns of text which shall be balanced.

If this compatibility setting is turned on:

```
<w:compat>
  <w:cachedColBalance />
</w:compat>
```

Then applications should perform the calculation described above to balance the columns, as needed. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.6 `convMailMergeEsc` (Treat Backslash Quotation Delimiter as Two Quotation Marks)

This element specifies whether applications should perform a conversion of the contents of a mail merge data source when reading those contents in order to perform a mail merge operation with their contents.

Typically, the contents of a mail merge data source are read in exactly as specified when performing a mail merge with the contents of a data source. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications shall interpret delimiters composed of a backslash and quotation mark (`\"`) as two quotation marks (`""`), within external data sources to be connected to via a mail merge.

[*Example*: Consider a WordprocessingML document with the following content in its data source:

```
This is a \"test\".
```

The default presentation would have the resulting merged data read in just as it appears:

```
This is a \"test\".
```

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:convMailMergeEsc />
</w:compat>
```

Then instances of a backslash and quotation mark would be converted, resulting in the following output:

```
This is a ""test"".
```

*end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.7 `displayHangulFixedWidth` (Always Use Fixed Width for Hangul Characters)

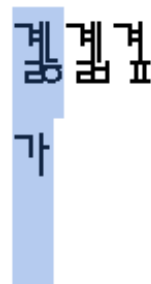

This element specifies whether applications should assume that all characters in the Hangul Syllables Unicode sub range (character values between 0xAC00 and 0xD7FF) are of a single fixed width or shall use the characters widths defined by the font in use (typical for a proportional width font).

Typically, applications shall retrieve the character width for any character in a document from the associated font, allowing each character to be of its own width (a proportional width character). This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications shall instead assume a single fixed width for all characters in the Hangul Syllables sub range, by reading the width of Unicode character 0x4E00 from the associated font and using that width for all Hangul characters (or, if that character is not present, the next available character in the font).

[Example: Consider a WordprocessingML document with three Hangul characters:

The default presentation would have each of those characters using the widths defined by the font (the highlighting indicates that each character has its own width):

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:displayHangulFixedWidth />
</w:compat>
```

Then all three characters are forced to the fixed width of character 0x4E00 from the font (or, in this case, the next available character), resulting in the characters in the font being forced to that fixed width, which results in the following output:

Notice from the highlighting that the characters have been compressed to the width of the single character and displayed at that fixed width. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

14.7.3.8 doNotAutofitConstrainedTables (Do Not AutoFit Tables To Fit Next To Wrapped Objects)

This element specifies whether applications shall allow tables to be resized to the remaining available line width when they are using the AutoFit algorithm and part of that line is filled by a shape with a wrapping type with a value of square or tight.

Typically, a table which is AutoFit and has a preferred width shall have its width reduced in order to allow a floating shape to wrap around its contents within the document, as that shape simply reduces the width of the line and the AutoFit algorithm applies to the remaining line width. This element, when present with a val attribute value of true (or equivalent), specifies that tables shall never have any preferred width overridden to allow them to wrap around that floating object, and shall instead be pushed to the next full width line in the document to be displayed.

[Example: Consider a WordprocessingML document with a floating shape centered in the document, followed by a table with preferred cell widths of 2.22", as follows:

This is some text.

This is some text.

This is some text.

The default presentation of this document overrides the preferred cell widths to force the table to fit on the line next to the floating shape with tight wrapping.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotAutofitConstrainedTables />
</w:compat>
```

Then that table is not resized, so it cannot fit and must be pushed to the next full width line, resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.9 `doNotBreakConstrainedForcedTable` (Don't Break Table Rows Around Floating Tables)

This element specifies whether applications shall allow a table row to be split in two when its contents are displayed under the following circumstances:

- The table row exceeds one page in height (it shall be split into two pages)
- The table row would need to be split in order to accommodate a floating table also on the page (tables which have been set to floating using the `tblpPr` element (Part 1, §17.4.58))

Typically, assuming the `cantSplit` property (Part 1, §17.4.6) is not set, a table row which cannot fit on one single page shall be split as needed around any floating table on a page, in order to allow its contents to be fully displayed across two or more pages. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that table rows which exceed one page in height shall never be split around floating tables in the document, and shall instead be displayed on the first page below the floating table, even if that means that part of the table row is clipped by the edge of the page.

[*Example:* Consider a WordprocessingML document with a long single table row which must be split across two separate pages in the document, in order to accommodate a floating table anchored in the footer, as follows:

[1]					
This is example test. This is example test.					

This is a single table cell in the footer

[2]					
This is example test. This is example test. This is example test. This is example test. This is example test. This is example test. This is example test.					

This is a single table cell in the footer

The default presentation of this document forces that row to be split as needed around that floating table.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotBreakConstrainedForcedTable />
</w:compat>
```

Then that table row is never split around the floating table, so it is always placed below that floating table on the page, and allowed to flow off the page as needed, resulting in the following output:

[illegible]

This example, while extreme, shows how the row is placed below the floating table, rather than breaking around it. *end example*]

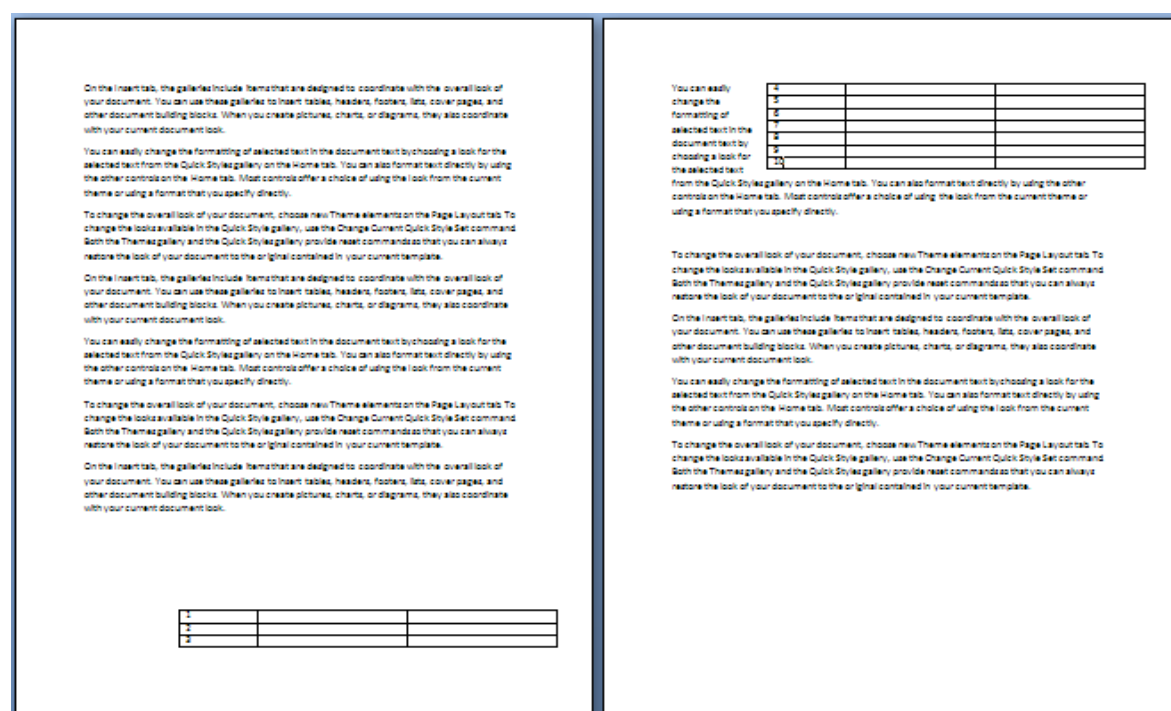

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

### 14.7.3.10 doNotBreakWrappedTables (Do Not Allow Floating Tables To Break Across Pages)

This element specifies whether applications shall allow tables which have been set to floating using the `tblPr` element (Part 1, §17.4.58) shall be allowed to break across multiple pages when needed.

Typically, a table whose contents cannot all be displayed on one page is broken as needed across multiple pages in order to preserve the location of the table (just as a paragraph of multiple lines is broken across pages as needed). This element, when present with a `val` attribute value of `true` (or equivalent), specifies that floating tables shall never be broken across pages, and shall instead be put on the first page by adjusting the starting position of the table as needed to fit on that single page.

[Example: Consider a WordprocessingML document with a floating table positioned at the bottom of a page, as follows:

The default presentation of this document results in that table being broken across two pages of content.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotBreakWrappedTables />
</w:compat>
```

Then that table is not broken across the page boundary, so it must be moved further up on the first page to accommodate its entire size, resulting in the following output:

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

You can easily change the formatting of selected text in the document text by choosing a look for the selected text from the Quick Styles gallery on the Home tab. You can also format text directly by using the other controls on the Home tab. Most controls offer a choice of using the look from the current theme or using a format that you specify directly.

To change the overall look of your document, choose new Theme elements on the Page Layout tab. To change the look available in the Quick Styles gallery, use the Change Current Quick Style Set command. Both the Themes gallery and the Quick Styles gallery provide reset commands so that you can always restore the look of your document to the original contained in your current template.

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. Notice that the table now flows into the page margins in order to keep it on one page. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

14.7.3.11 doNotSnapToGridInCell (Do Not Snap to Document Grid in Table Cells with Objects)

This element specifies whether a document grid defined using the docGrid element (Part 1, §17.6.5) shall be applied to the contents of table cells in that section which also contain floating objects. Note that the floating object shall be part of the cell, and simply not displayed over the cell due to its anchoring relative to another part of the document.

Typically, if a floating object is present in a table cell, then that setting shall have no impact on whether East Asian text in that cell is snapped to the document grid (as text is always snapped to the grid). This element, when present with a val attribute value of true (or equivalent), specifies that whenever a floating object is present in a table cell, that the cell's contents shall not be snapped to the document grid.

[Example: Consider a WordprocessingML document consisting of a single section, whose document grid settings specify that each page must be exactly 10 characters wide, as follows:

```
<w:sectPr>
  <w:docGrid w:type="snapToChars" w:charSpace="146636" />
</w:sectPr>
```

If this document contains a table with a single cell, containing some text and a single floating shape, the contents of the cell are still snapped to the 10 characters per line character grid, as follows:

ト	リ	ス	タ	ン	ト	リ	ス	タ	ン
ト	リ	ス	タ	ン					ン
リ	ス	タ	ン	ト					リ
ス	タ	ン	ト	リ					ス
タ	ン	ト	リ	ス	タ	ン	ト	リ	ス
タ	ン								

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotSnapToGridInCell />
</w:compat>
```

Then the presence of a floating object in each cell must result in the document grid setting being ignored, resulting in the following output:

ト	リ	ス	タ	ン	ト	リ	ス	タ	ン
ト	リ		ス	タ	ン				ン
リ	ス	ス	タ	ン	ト				リ
ス	タ	ン	ト	リ	ス				ス
タ	ン	ト	リ	ス	タ	ン	ト	リ	ス
タ	ン								

The additional character pitch was still added to each character on the line, but those characters are no longer snapped to the document grid. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.12 doNotSuppressIndentation (Do Not Ignore Floating Objects When Calculating Paragraph Indentation)

This element specifies whether applications should ignore the presence of floating objects when calculating the starting position of paragraphs which are wrapped around floating objects.

Typically, the presence of a floating object on the same line or lines as a paragraph shall only affect the text when the floating object occurs where that text would normally be presented. [*Example*: Text at a 1" indentation would only be displaced by a floating object that appears at that position and not one that appears from 0" to 0.5" on the same line. *end example*].

This element, when present with a `val` attribute value of `true` (or equivalent), specifies that floating objects shall always impact paragraphs on the same line in two ways:

- If the paragraph is not numbered, then it shall tightly wrap any floating object which precedes it on the same line, ignoring its own indentation settings. [*Example*: A paragraph with a 1" left indent shall tightly wrap a floating object which appears at only 0.25" on the same line. *end example*]
- If the paragraph is numbered using the numPr element (Part 1, §17.3.1.19), then it shall calculate and use its full indent relative to the edge of the floating object, not relative to the edge of the page. [*Example*: A numbered paragraph with a 1" left indent must appear 1.5" into the page if it is preceded by a floating object which appears at 0.5" on the same line. *end example*]

[*Example*: Consider a WordprocessingML document with a narrow floating object at 0.5" on the page, surrounded by both numbered and unnumbered paragraphs.

The default presentation would have no impact on the paragraphs based on that floating object, since the two do not intersect:

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotSuppressIndentation />
</w:compat>
```

Then the two alternate rules defined above would apply, resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

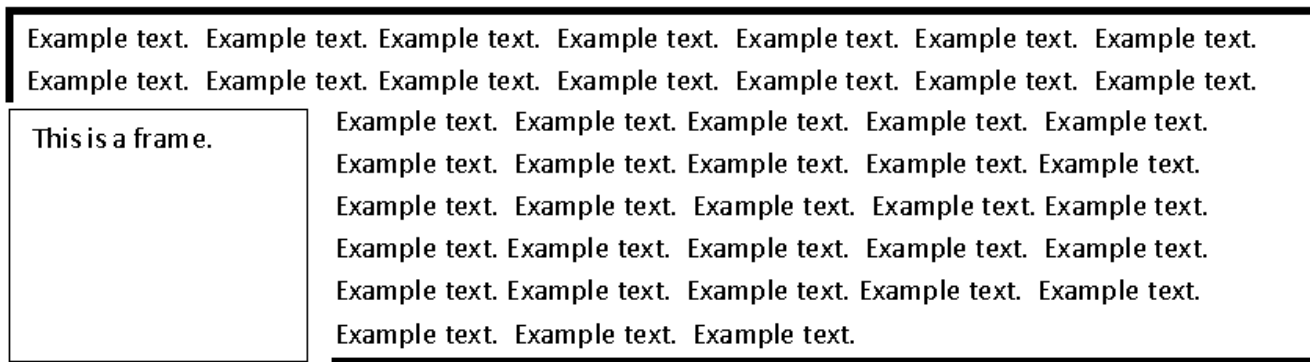

#### 14.7.3.13 `doNotSuppressParagraphBorders` (Do Not Suppress Paragraph Borders Next To Frames)

This element specifies whether applications should suppress paragraph borders defined using the `pBdr` element (Part 1, §17.3.1.24) when those borders would be displayed next to the contents of paragraphs which have been defined as frames using the `framePr` element (Part 1, §17.3.1.11).

Typically, when a paragraph's borders appear next to a frame, those borders are suppressed to avoid having two borders in close proximity. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that those borders shall not be suppressed.

[*Example:* Consider a WordprocessingML document with a paragraph with a paragraph border that is bounded on its bottom left side by a text frame.

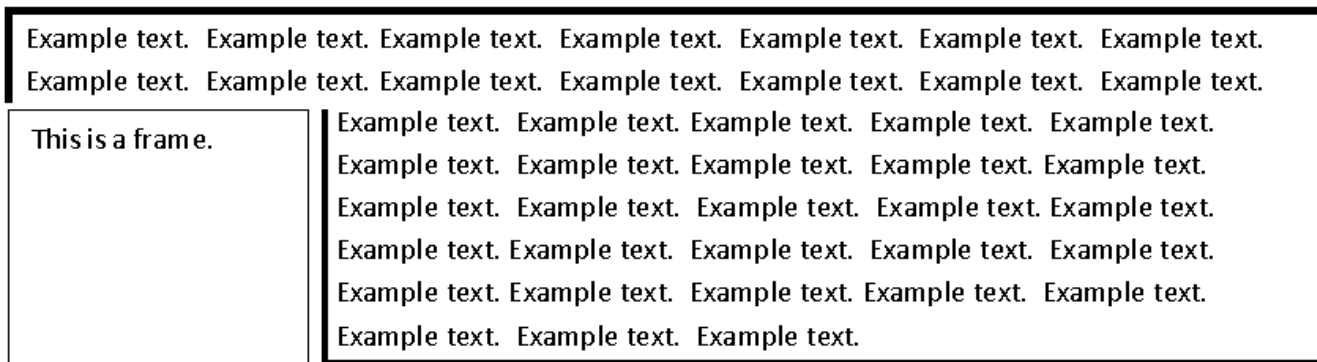

The default presentation would suppress the borders which intersect the frame (in this case, the right border of lines three through eight):

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotSuppressParagraphBorders />
</w:compat>
```

Then no border suppression must take place, resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.14 `doNotUseEastAsianBreakRules` (Do Not Compress Compressible Characters When Using Document Grid)

This element specifies whether applications should compress characters with identical compression rules when the document grid has been defined using the `docGrid` element (Part 1, §17.6.5). *Compression rules* refer to the additional bearing on the left and/or right side of a typical character, which can be compressed as needed without modifying the actual width of the character (its breadth).

Typically, punctuation characters with an identical set of compression rules are compressed when the contents of a document are displayed. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that if a document grid is defined for the current section, compression shall never be performed on any character - all compressible characters shall be individually snapped to the document grid.

[Example: Consider a WordprocessingML document with a document grid set to allow 10 characters per line:

```
<w:sectPr>
  <w:docGrid w:type="snapToChars" w:charSpace="146636" ... />
</w:sectPr>
```

The default presentation would allow characters with identical compression rules to compress and utilize a single slot on the document grid (notice that the four parenthesis on the first line are combined since they can be compressed identically, while the two parenthesis with different compression on line two are not):

```
あ あ あ あ ) ) ) ) v あ あ あ あ
あ あ あ あ a あ あ ) (
```

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotUseEastAsianBreakRules />
</w:compat>
```

Then no character with compression is compressed and instead are snapped to the grid individually, resulting in the following output:

```
あ あ あ あ ) ) ) ) v あ
あ あ あ あ あ あ あ a あ あ )
(
```

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.15 doNotUseHTMLParagraphAutoSpacing (Use Fixed Paragraph Spacing for HTML Auto Setting)

This element specifies whether applications should use a fixed definition when interpreting automatic paragraph spacing defined by a value of true (or equivalent) on the beforeAutospaceing and/or afterAutospaceing attributes on the spacing element (Part 1, §17.3.1.33).

Typically, applications shall interpret these settings to match the behavior of most HTML user agents, mimicking the default spacing above and below an HTML p element without additional spacing information. This element, when present with a val attribute value of true (or equivalent), specifies that those two attributes shall result in the following settings for each value:

- beforeAutospacing = 5 points of spacing before
- afterAutospacing = 10 points of spacing after

[Example: Consider a WordprocessingML document with a three paragraphs using HTML autospacing, as follows:

```
<w:p>
  <w:pPr>
    <w:spacing w:beforeAutospacing="true" w:afterAutospacing="true" />
  </w:pPr>
  <w:r>
    <w:t>Paragraph One</w:t>
  </w:r>
</w:p>
<w:p>
  <w:pPr>
    <w:spacing w:beforeAutospacing="true" w:afterAutospacing="true" />
  </w:pPr>
  <w:r>
    <w:t>Paragraph Two</w:t>
  </w:r>
</w:p>
<w:p>
  <w:pPr>
    <w:spacing w:beforeAutospacing="true" w:afterAutospacing="true" />
  </w:pPr>
  <w:r>
    <w:t>Paragraph Three</w:t>
  </w:r>
</w:p>
```

The default presentation would result in output designed to match that of all common HTML user agents:

Paragraph One.

Paragraph Two.

Paragraph Three.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotUseHTMLParagraphAutoSpacing />
</w:compat>
```

Then the paragraphs has exact spacing of 5 points before and 10 points after, resulting in the following output:

Paragraph One.

Paragraph Two.

Paragraph Three.

Notice that the paragraphs are more condensed in the second example. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.16 doNotUseIndentAsNumberingTabStop (Ignore Hanging Indent When Creating Tab Stop After Numbering)

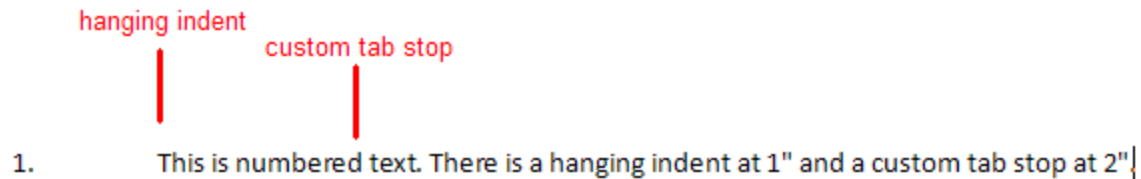

This element specifies whether applications shall use the custom tab stop generated by the hanging indent (if any) when advancing the text after the numbering for a numbered paragraph.

Typically, a hanging indent on a paragraph creates a virtual custom tab stop at that location, and therefore a tab added after the numbering on a numbered paragraph by the suff element (Part 1, §17.9.29) shall advance to that tab stop, so that the text of the numbered paragraph begins at that location. This element, when present with a val attribute value of true (or equivalent), specifies that a tab stop added as the suffix to the numbering of a numbered paragraph shall ignore that virtual custom tab stop and shall instead advance to the next real tab stop (custom or automatic) on the current line.

[Example: Consider a WordprocessingML document with numbering, whose first level of numbering specifies a tab stop suffix, a hanging indent at 1", and a custom tab stop at 2":

```
<w:abstractNum w:abstractNumId="0">
  ...
  <w:lvl1 w:ilvl="0">
    <w:suff w:val="tab" />
    <w:pPr>
      <w:ind w:left="1440" w:hanging="1440" />
      <w:tabs>
        <w:tab w:val="2880" />
      </w:tabs>
    </w:pPr>
  </w:lvl1>
</w:abstractNum>
```

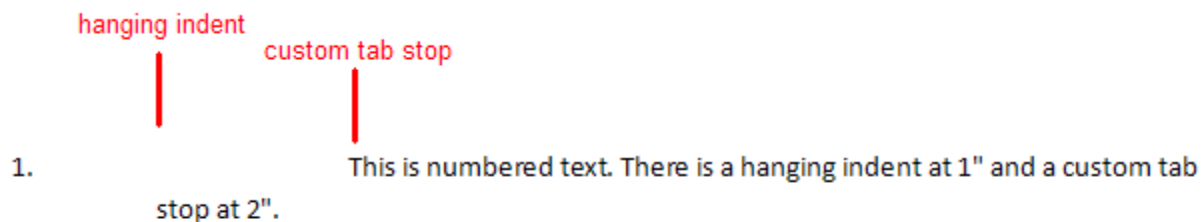

The default presentation of this document results in the tab stop generated by the numbering advancing to the virtual tab stop generated by the hanging indent at 1", as follows:

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotUseIndentAsNumberingTabStop />
</w:compat>
```

Then that tab suffix ignores the virtual tab stop of the hanging indent, so it must advance to the next custom tab stop on the line (at 2"), resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.17 doNotVertAlignCellWithSp (Don't Vertically Align Cells Containing Floating Objects)

This element specifies whether applications shall vertically align the contents of a table cell, even when the contents of that table cell include one or more floating objects. Note that the floating object shall be part of the cell, and simply not displayed over the cell due to its anchoring relative to another part of the document.

Typically, if the alignment of a table cell in a WordprocessingML document is specified, then the entire contents of that cell are aligned as specified [*Example*: The entire contents of the cell are centered vertically and moved right-aligned horizontally at that point. *end example*]. This element, when present with a *val* attribute value of *true* (or equivalent), specifies that whenever a floating object is present in a table cell, that no vertical alignment shall be applied to the contents of that cell, and the contents of the cell shall instead always be top aligned to the cell's contents.

[*Example*: Consider a WordprocessingML table with two cells, each containing some text and a single floating shape. The first cell is vertically aligned to the bottom of the cell, and the second cell is vertically aligned to the center of the cell.

The default presentation of this document results in each cell (including the extents of the floating objects) being vertically aligned as specified, as follows:

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotVertAlignCellWithSp />
</w:compat>
```

Then the presence of a floating object in each cell must result in the vertical alignment setting being ignored (each vertical alignment must be top-aligned relative to the cell), resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.18 `doNotVertAlignInTxbx` (Ignore Vertical Alignment in Textboxes)

This element specifies whether applications shall allow text within text boxes to be vertically aligned when the `v-text-anchor` property is set within the parent VML shape.

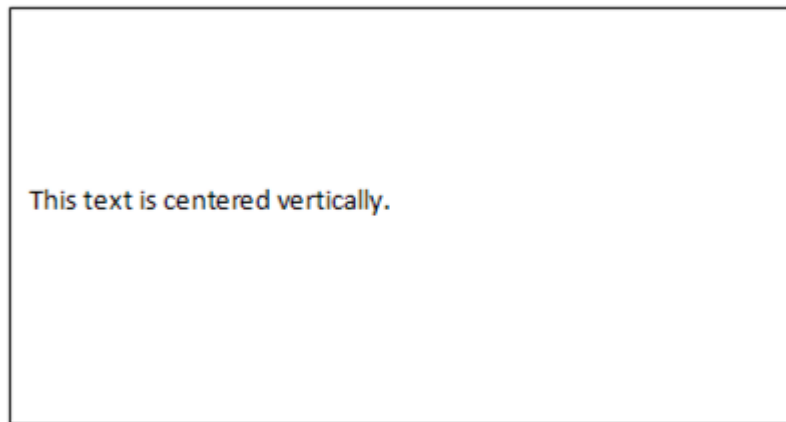

Typically, if when the `v-text-anchor` property is set within the parent VML shape, then based on the value of that property, the text is top, center, or bottom aligned appropriately. This element, when present with a `val` attribute value of true (or equivalent), specifies that the property shall be ignored, and instead the contents of the table shall always be top-aligned.

[Example: Consider a WordprocessingML table with a single center-aligned text box:

```
<v:shape id="_x0000_s1026" type="#_x0000_t202" style="v-text-anchor:middle">
  <v:textbox>
    <w:txbxContent>
      <w:p>
        <w:r>
          <w:t>This text is centered vertically.</w:t>
        </w:r>
      </w:p>
    </w:txbxContent>
  </v:textbox>
</v:shape>
```

```
</w:txbxContent>  
</v:textbox>  
</v:shape>
```

The default presentation of this document results in the contents of the text box being center aligned, as follows:

However, if this compatibility setting is turned on:

```
<w:compat>  
  <w:doNotVertAlignInTxbx />  
</w:compat>
```

Then the text must always be top aligned, regardless of the -text-anchor property, resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.19 `doNotWrapTextWithPunct` (Do Not Allow Hanging Punctuation With Character Grid)

This element specifies whether applications shall allowing hanging punctuation when:

- The `overflowPunct` element (Part 1, §17.3.1.21) is turned on for a paragraph
- A document grid is defined using the `docGrid` element (Part 1, §17.6.5) which defines the number of characters per line

Typically, paragraphs which allow hanging punctuation shall allow the number of characters on a line as specified by the document grid to be exceeded by one in order to allow for hanging punctuation. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that the document grid shall never be exceeded for hanging punctuation.

[*Example:* Consider a WordprocessingML document with a document grid set to allow 10 characters per line:

```
<w:sectPr>
  <w:docGrid w:type="snapToChars" w:charSpace="146636" ... />
</w:sectPr>
```

If the eleventh character on the line was a punctuation characters, the default presentation would allow that character to behave as hanging punctuation on the first line:

“ 言 葉 が 言 葉 が 言 葉 が ”  
 言 葉 が 言 葉

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotwrapTextWithPunct />
</w:compat>
```

Then the character grid cannot be exceeded even for the hanging punctuation, resulting in the following output:

“ 言 葉 が 言 葉 が 言 葉  
 が ” 言 葉 が 言 葉

The hanging punctuation was disallowed, moving it (and the character before it, since that character cannot begin a line) to the following line. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.20 footnoteLayoutLikeWW8 (Ignore Page Break from Continuous Section Break)

This element specifies that applications should override the default behaviour for a continuous section break when one or more footnotes are present on the page with the footnote. This override typically results in text being displayed on the same page as a continuous section break (after the break, which would normally move all following text to the next page).

Typically, applications render a continuous section break as a page break when one or more footnoteRef elements (Part 1, §17.11.13) occur on that page before the break, as described in Part 1, §17.18.77. This element, when present with a val attribute value of true (or equivalent), specifies that applications should allow any paragraph after the section break that contains no footnoteRef elements (Part 1, §17.11.13) to be displayed on the same page. If the resulting content reaches the page extents, the section's page break is ignored.

[*Example*: Consider a WordprocessingML document with two footnotes contained in two sections, separated by a continuous section break:

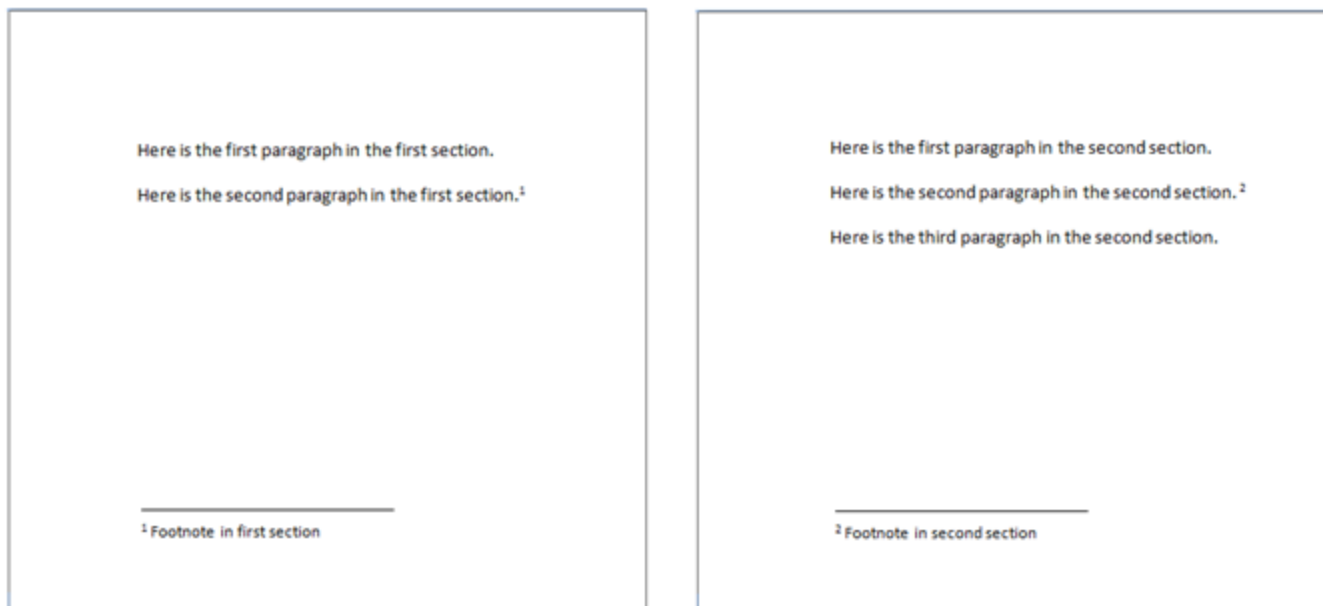

```
<w:p>
  <w:r>
    <w:t xml:space="preserve">Here is the first paragraph in the first
section.</w:t>
  </w:r>
</w:p>
<w:p>
  <w:r>
    <w:t>Here is the second paragraph in the first section.</w:t>
  </w:r>
  <w:r>
    <w:rPr>
      <w:rStyle w:val="FootnoteReference" />
    </w:rPr>
    <w:footnoteReference w:id="2" />
  </w:r>
</w:p>
<w:p/>
<w:p>
  <w:pPr>
    <w:sectPr>
      ...
    </w:sectPr>
  </w:pPr>
```

```

    </w:p>
<w:p>
  <w:r>
    <w:t>Here is the first paragraph in the second section.</w:t>
  </w:r>
</w:p>
<w:p>
  <w:r>
    <w:t xml:space="preserve">Here is the second paragraph in the second
section.</w:t>
  </w:r>
  <w:r>
    <w:rPr>
      <w:rStyle w:val="FootnoteReference" />
    </w:rPr>
    <w:footnoteReference w:id="3" />
  </w:r>
</w:p>
<w:p>
  <w:r>
    <w:t xml:space="preserve">Here is the third paragraph in the second section.
</w:t>
  </w:r>
</w:p>
<w:sectPr>
  <w:type w:val="continuous" />
  ...
</w:sectPr>

```

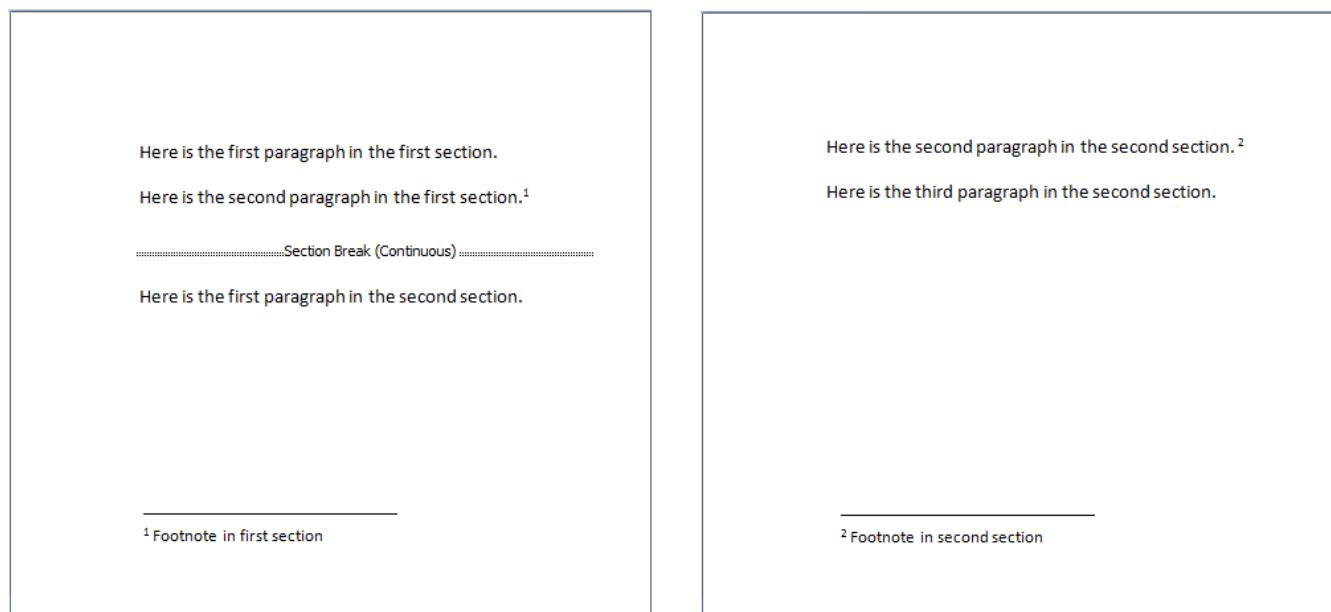

The default rendering of such a document results in the continuous section break as a page break, resulting in the following two page document:

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:footnoteLayoutLikeWW8 />
</w:compat>
```

Then the first paragraph following the section break (not having any footnote references) is displayed on the same page, despite the section break, resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.21 `forgetLastTabAlignment` (Ignore Width of Last Tab Stop When Aligning Paragraph If It Is Not Left Aligned)

This element specifies how applications should handle the final tab stop on a line when aligning the contents of a paragraph as specified by the `jc` element (Part 1, §17.3.1.13) in the paragraph's properties.

Typically, aligning the contents of a paragraph involves the following:

- Determining the layout of that line before the alignment (including all tab stops)
- Aligning the resulting contents of the line

This is done to ensure that tab stops on a line do not change when the contents of the paragraph are aligned (i.e. the tab stops should not have to take into account the paragraph alignment).

This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications shall ignore the additional line width generated by the last tab stop (and only the last tab stop) when the alignment of the tab stop as defined by the `val` attribute on the `tab` element (Part 1, §17.3.1.37) is not `left` (or `bar`, which as defined by ISO/IEC 29500, is not a tab stop per se) when determining the width of the line. The resulting full line shall then be aligned at the position where the line would have been aligned without that tab stop.

[*Example:* Consider a WordprocessingML document with two center aligned paragraphs of text - the first also containing a centered tab stop positioned at 2":

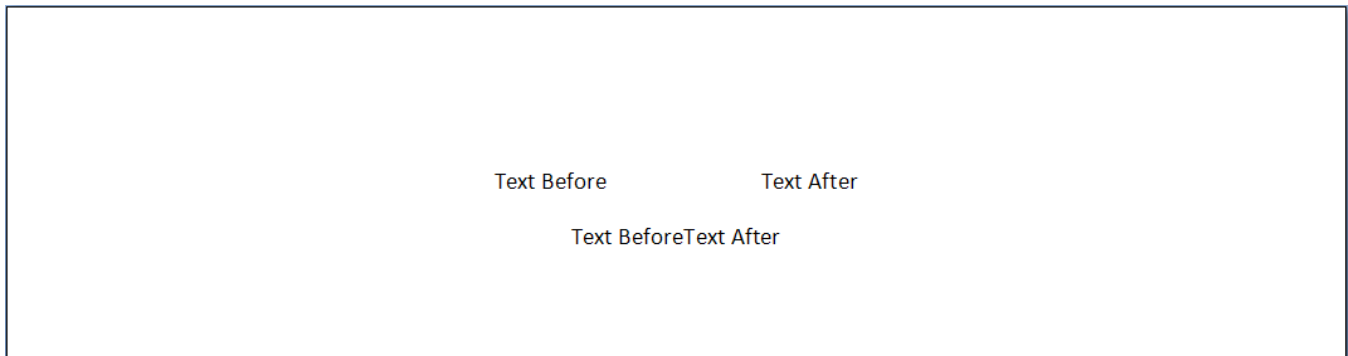

```

<w:p>
  <w:pPr>
    <w:tabs>
      <w:tab w:val="center" w:pos="2880" />
    </w:tabs>
    <w:jc w:val="center" />
  </w:pPr>
  <w:r>
    <w:t>Text Before</w:t>
    <w:tab/>
    <w:t>Text After</w:t>
  </w:r>
</w:p>
<w:p>
  <w:pPr>
    <w:jc w:val="center" />
  </w:pPr>
  <w:r>
    <w:t>Text BeforeText After</w:t>
  </w:r>
</w:p>

```

The default presentation would determine the full width of each line including the tab stops, finally aligning the resulting text to the center position as requested by the jc element:

However, if this compatibility setting is turned on:

```

<w:compat>
  <w:forgetLastTabAlignment />
</w:compat>

```

Then the width added to the line by the last tab is ignored when centering the paragraph because that tab is a center aligned tab stop, resulting in the following output:

[illegible]

In the resulting output, the starting location of both lines is at the same place on the page, as the resulting width of both lines is identical when the tab stop is removed from the line width calculation. *end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.22 growAutofit (Allow Tables to AutoFit Into Page Margins)

This element specifies whether applications shall allow a table which is using the AutoFit table layout algorithm to extend beyond the margins of the page if the minimum width of each table cell would result in an overall table width which is wider than those page margins.

Typically, if a table is using the AutoFit layout algorithm, then based on the definition of that logic, each column in the table shall be increased to the minimum width of its contents (e.g. the longest non-breaking run of text contained within it and/or the width of an inline image contained in one of its cells) until the overall width of the table reaches that of the text extents on the page, at which point text shall be broken and images shall be clipped as needed to maintain the width of the table at the page width (i.e. the page width is an immutable maximum width for the table). This element, when present with a `val` attribute value of `true` (or equivalent), specifies that the minimum width of the cells shall not be constrained by the page width, and instead the table shall be allowed to extend into the page margins as needed in order to meet the minimum widths of each of its cells.

[*Example:* Consider a WordprocessingML table with three cells in each row. If the contents of each cell in that first row each contain a long non-breaking string (such that the minimum widths of each cell's contents exceed the page width), then the rules for table AutoFit specify that each cell must be broken proportionally when the overall width of the table reaches the page width.

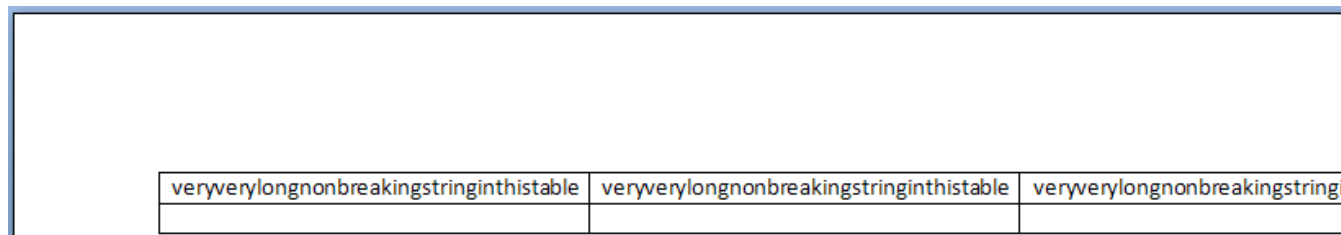

The default presentation of this document results in each cell being broken as needed to maintain the table width, as follows:

veryverylongnonbreakingstringin thistable	veryverylongnonbreakingstringin thistable	veryverylongnonbreakingstringin thistable

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:growAutofit />
</w:compat>
```

Then the presence of those long non-breaking strings (and the resulting large minimum widths for each table cell) must result in a table width which is then allowed to override the page margins, resulting in the following output:

veryverylongnonbreakingstringinthistable	veryverylongnonbreakingstringinthistable	veryverylongnonbreakingstringinthistable

The resulting table is clipped by the edge of the page on its right side, but the minimum widths of each cell are maintained as defined by the long non-breaking string contents of each. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.23 layoutRawTableWidth (Ignore Space Before Table When Deciding If Table Should Wrap Floating Object)

This element specifies how tables which have been indented from the margin using the tblInd element (Part 1, §17.4.51) shall be wrapped around floating objects.

Typically, when a table is positioned next to a floating object, the table shall only remain next to the object if it can fit in the remaining space on the line when considering the full width needed for the table: the space before the table, plus the width of the table. This element, when present with a val attribute value of true (or equivalent), specifies that the calculation determining whether the table shall fit next to the object shall not include the space before the table, even if that means that the table is actually clipped by the object.

[*Example:* Consider a WordprocessingML document with a floating shape using square wrapping, next to a table which has been indented one inch from the left margin:

```
<w:tbl>
  <w:tblPr>
    <w:tblInd w:w="1440" w:type="dxa" />
  </w:tblPr>
  ...
</w:tbl>
```

The resulting presentation would place the table next to the object:

If this object is then moved to the left, such that it would clip the table, the default presentation would have the entire table moved below the shape, since it does not fit in the remaining space on the line:

However, if this compatibility setting is turned on:

```
<w:compat>  
  <w:layoutRawTableWidth />  
</w:compat>
```

Then the determination to move the table is done ignoring the spaced needed before the table, resulting in the following output:

The resulting table is clipped behind the object, as the fit calculation ignores the space needed before the table.  
*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.24 `layoutTableRowsApart` (Allow Table Rows to Wrap Inline Objects Independently)

This element specifies whether tables which are wrapping around floating objects shall wrap around the object as a whole, or if each table row shall individually wrap the object as needed (causing a more stuttered, yet tighter, wrapping of the object).

Typically, when a table wraps around a floating object, the table shall wrap the object as a unit (i.e. the whole table square wraps the object). This element, when present with a `val` attribute value of `true` (or equivalent), specifies that wrapping is applied to each row in the table one by one, even if its means that each row has a different resulting position with respect to the table.

[*Example:* Consider a WordprocessingML document with a floating shape using square wrapping.

The default presentation would have the entire table wrapping around that shape:

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:layoutTableRowsApart />
</w:compat>
```

Then each row would wrap around the shape one by one, resulting in the following output:

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.25 [lineWrapLikeWord6 \(Ignore Compression of Full-Width Punctuation Ending a Line\)](#)

This element specifies that applications should ignore the character compression settings specified by the `characterSpacingControl` element (Part 1, §17.15.1.18) when determining if one more character fits within the text margins on each line of the document. This setting typically results in a character being pushed to the following line, ignoring the fact that the character compression settings would have allowed it to fit within the text boundaries.

Typically, an application would check the character compression settings, and apply any character-level whitespace compression before attempting to fit the last character on the line. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications shall ignore that compression and fit the character as if it should be displayed at its full width, regardless of whether the compression settings are applied.

[*Example:* Consider a paragraph which ends with the following two characters (with each character's bounding box outlined for illustrative purposes:

If the document's character compression settings were not set to `doNotCompress` and text extent fell at the location identified by this red line:

The last character would have compression applied to its blank half, and would fit on the line.

If this compatibility setting is turned on:

```
<w:compat>
  <w:lineWrapLikeWord6 />
</w:compat>
```

Then applications should compress the character, but should treat the character as full width when determining if it fits on the line; in this case, the second character would be displayed on the following line. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.26 mwSmallCaps (Use Specific Small Caps Algorithm)

This element specifies that applications should use a specific algorithm to determine the font size of small caps (the formatting resulting from the use of the `smallCaps` element (Part 1, §17.3.2.33). This emulation typically results in small caps which are smaller than typical small caps at most font sizes.

Typically, applications can utilize any algorithm that results in small caps formatting. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications should determine the font size for small caps using the following algorithm:

- If  $font \leq 7$ , then the font size for small caps is 7 points.
- Otherwise, sequentially iterate through *sequence* until  $sequence[i] \leq font \leq sequence[i + 1]$ , at which point the font size for small caps is  $sequence[i]$  points.

where

- *sequence* is an array defined as follows:  
 $\{7,9,10,12,14,18,24,36,48,60,72,80, x_1, x_2, \dots, x_n\}$  where  $x_n = 80 + 10 * n$ .
- *font* is an integer calculated as follows:  
 The font size of the run to which small caps formatting is applied (in points).

[*Example*: Consider a WordprocessingML document with small caps on its text contents.

If this compatibility setting is turned on:

```
<w:compat>
  <w:mwSmallCaps />
</w:compat>
```

And the font size for a single run is 16 points, and performing the algorithm above would result in 14 points as the calculated font size for small caps. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.27 noColumnBalance (Do Not Balance Text Columns within a Section)

[*Note*: Typically, a continuous section break (Part 1, §17.18.77) balances the content of the previous section, unless the "noColumnBalance" compatibility option is given. *end note*]

This element specifies whether the contents of sections with multiple columns defined using the cols element (Part 1, §17.6.4) should automatically be balanced. In terms of column layout, *balancing* is the act of attempting to ensure that the number of lines in each column is equivalent (rather than completely filling one column before populating the next).

Typically, column balancing is automatically performed on the contents of sections with multiple columns. This element, when present with a val attribute value of true (or equivalent), specifies that column balancing shall not occur, and each column shall be filled individually until the end of the current page, until all text has been displayed, even if this means one or more columns are unused.

[*Example*: Consider a WordprocessingML document with an initial section with three columns, defined by the following section properties:

```
<w:sectPr>
  <w:cols w:num="3" w:space="720" />
</w:sectPr>
```

The default presentation would have the text in that section balanced between those three columns:

This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in

a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.

This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three

columns. This is some text in  
a section of three columns.

This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns.

This is text in a section with one column. This is text in a section with one column. This is text in a section with one column. This is text in a section with one column. This is text in a section with one column. This is text in a section with one column.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:noColumnBalance />
</w:compat>
```

Then the columns are not balanced, and the contents of the section are used to fill each column to the bottom of the current page in succession, resulting in the following output:

[illegible]

The next section is now forced to begin on the next page, as the columns on page one extend to the bottom of that page. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.28 noExtraLineSpacing (Do Not Center Content on Lines With Exact Line Height)

This element specifies whether an exact line height using the spacing element (Part 1, §17.3.1.33) in the paragraph's properties, each line shall not be automatically centered within the given amount of line spacing.

Typically, if the exact amount of spacing allotted to a line via the paragraph properties exceeds the amount of space required by that line, then the line of text shall be automatically centered when the text of the document is displayed. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that all additional spacing shall instead be placed below the normal layout of the line of text.

[Example: Consider a WordprocessingML document with a line with an exact height of 32 points:

```

<w:p>
  <w:pPr>
    <w:spacing w:line="640" w:lineRule="exact" />
  </w:pPr>
  <w:r>
    <w:t>This is text on a line that's exactly 32 points high.</w:t>
  </w:r>
</w:p>

```

The default presentation would have the resulting text centered on that line:

This is text

This is text on a line that's exactly 32 points high.

This is text.

However, if this compatibility setting is turned on:

```

<w:compat>
  <w:noExtraLineSpacing />
</w:compat>

```

Then all line spacing is added after the text, resulting in the following output:

This is text

This is text on a line that's exactly 32 points high.

This is text.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.29 noLeading (Do Not Add Leading Between Lines of Text)

This element specifies whether the additional leading specified by the current font face shall be added between each line of text when that text is displayed. *Leading* refers to the additional spacing requested by a particular font in order to ensure that letters on subsequent lines do not display in a fashion where they are positioned too closely together.

Typically, leading should be added as specified by the associated font. This element, when present with a val attribute value of true (or equivalent), specifies that the additional leading specified by the font shall never be output when the text is displayed.

[*Example:* Consider a WordprocessingML document with three lines of text. The default presentation would have the text displayed as follows:

**EXAMPLE TEXT**

Some text.  
Some text.  
Some text.

However, if this compatibility setting is turned on:

```
<w:compat>  
  <w:noLeading />  
</w:compat>
```

Then no leading is added between lines, resulting in the following output:

**EXAMPLE TEXT**

Some text.  
Some text.  
Some text.

This adjustment is usually very minute in nature; therefore the result is better illustrated by showing how the characters were pushed out due to the leading added to that text:

**EXAMPLE TEXT**

Some text.  
Some text.  
Some text.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.30 noSpaceRaiseLower (Do Not Increase Line Height for Raised/Lowered Text)

This element specifies whether the height which is allotted to any given line of text when the contents of this document are displayed shall include additional spacing in order to ensure that all raised and/or lowered text can be fully displayed.

Typically, any extra space needed is added to the line to prevent raised and lowered text from being truncated or hidden. This element, when present with a val attribute value of true (or equivalent), specifies that the height of the line shall be determined solely by the spacing settings on the parent paragraph, and any raised/lowered text shall just be clipped if it exceeds that space.

[*Example:* Consider a WordprocessingML document with both raised and lowered text. The default presentation would have that text visible:

This is text.

This is text – a lowered word, a raised word.

This is text.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:noSpaceRaiseLower />
</w:compat>
```

Then no additional space should be added to the line height, resulting in the following output:

This is text.

This is text – a lowered word, a raised word.

This is text.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.31 noTabHangInd (Do Not Create Custom Tab Stop for Hanging Indent)

This element specifies whether applications should always create a hanging indent as a custom tab stop when handling tabs within the contents of a WordprocessingML paragraph. The dontUseIndentAsNumberingTabStop element (§14.7.3.16) specifies if this tab stop shall be used in the case of a tab added as the suffix to numbering in a numbered paragraph, while this element handles the same

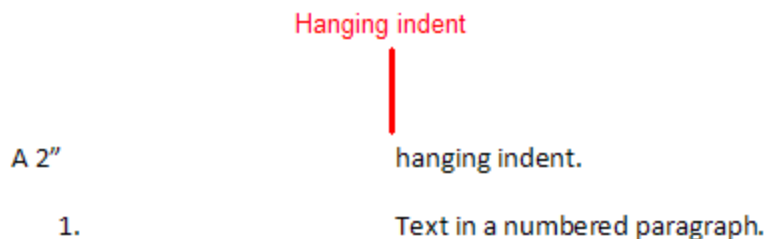

functionality in the generic case (i.e. this element, when set, renders that setting irrelevant as the tab stop is never used).

Typically, the hanging indent on a paragraph shall be treated as a custom tab stop location within that paragraph, allowing the first tab on the first line in the paragraph to advance to the location of the hanging indent. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that no custom tab stop shall be created for a hanging indent on a line under any circumstances.

[Example: Consider a WordprocessingML document with two paragraphs (the second numbered, the first not), each with a 2" hanging indent defined as follows (assume the numbering suffix - not shown - is a tab character):

```
<w:p>
  <w:pPr>
    <w:ind w:left="2880" w:hanging="2880" />
  </w:pPr>
  <w:r>
    <w:t>A 2"</w:t>
    <w:tab/>
    <w:t>hanging indent</w:t>
  </w:r>
</w:p>
<w:p>
  <w:pPr>
    <w:numPr>
      <w:ilvl w:val="0" />
      <w:numId w:val="1" />
    </w:numPr>
    <w:ind w:left="2880" w:hanging="2880" />
  </w:pPr>
  <w:r>
    <w:t>Text in a numbered paragraph.</w:t>
  </w:r>
</w:p>
```

The default presentation would have both the numbering and the tab in the regular paragraph advancing to the 2" custom tab stop generated by the hanging indent:

A 2"      hanging indent.

1.      Text in a numbered paragraph.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:noTabHangInd />
</w:compat>
```

Then no tab stop exists at 2", and therefore the tab stops must advance to the location of the next automatic tab stop for this document (which is set to occur every 0.5"), resulting in the following output:

Hanging indent

1. Text in a numbered paragraph.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.32 `printBodyTextBeforeHeader` (Print Body Text before Header/Footer Contents)

This element specifies the order in which the contents of the main document story and any headers and/or footers shall be sent to the printer.

Typically, the contents of a document are sent to the printer as follows:

- First, the contents of headers/footers are sent to the printer
- Finally, the contents of the main document story are sent to the printer

This element, when present with a `val` attribute value of `true` (or equivalent), specifies that this order shall be reversed, and that the body text shall be sent to the printer before any header/footer text. This reversal allows for the processing of PostScript codes in the text layer in the same order as afforded by some legacy word processing applications.

[*Example:* Consider a WordprocessingML document which is printed. The default resulting print order is the headers and footers for each page, followed by the page contents.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:printBodyTextBeforeHeader />
</w:compat>
```

Then this order must be reversed, and the page contents must be printed before the corresponding header and/or footer for each page. *end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.33 `printColBlack` (Print Colors as Black And White without Dithering)

This element specifies the way in which colored text and/or objects shall be handled when printed to a printer whose printer settings indicate that it can only handle black and white text.

Typically, the contents of a colored document are sent to a black and white printer using grayscale (different shades of gray) to represent each of the possible colors. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that colors are not printed as mapped shades of grey, but rather exclusively in solid black and white. This setting prevents the fuzzy look that can occur when gray or blue content is dithered. *Dithering* is the process by which colors are simulated using various patterns of black dots on a white background

[*Example:* Consider a WordprocessingML document which is printed to a black and white printer. The default resulting printed content is typically dithered to appear in the appropriate shade of grayscale text.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:printColBlack />
</w:compat>
```

Then the page contents must be printed as exclusively black or exclusively white text as needed, and no grayscale output must occur. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.34 `selectFldWithFirstOrLastChar` (Select Field When First or Last Character Is Selected)

This element specifies whether applications should automatically select the entire contents of a field in a WordprocessingML document when the first or last character is selected.

Typically, users can select any character individually within the result of a field in the document. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that selecting the first or last character of that field result shall automatically result in the selection of the entire field.

[*Example:* Consider a WordprocessingML document which contains the following (with a field marked in gray shading):

Author Tristan Davis would like to welcome you.

The default presentation would allow the first character of that field to be selected:

Author  would like to welcome you.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:selectFldWithFirstOrLastChar />
</w:compat>
```

Then that selection would automatically result in the entire field being selected, resulting in the following:

Author  would like to welcome you.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.35 `shapeLayoutLikeWW8` (Ignore Text Wrapping around Objects at Bottom of Page)

This element specifies that applications should ignore the line wrapping setting specified by a floating object, instead allowing text to be displayed beneath it under the specific set of conditions identified below.

Typically, text wrapping around a floating object is dictated by the presence of one of the following as a child element of the object's anchor element (Part 1, §20.4.2.3):

- `wrapNone` (Part 1, §20.4.2.15) element, which specifies no text wrapping
- `wrapSquare` (Part 1, §20.4.2.17) element, which specifies square text wrapping
- `wrapThrough` (Part 1, §20.4.2.18) element, which specifies through text wrapping
- `wrapTight` (Part 1, §20.4.2.19) element, which specifies tight text wrapping
- `wrapTopAndBottom` (Part 1, §20.4.2.19) element, which specifies top and bottom text wrapping

This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications shall allow text to wrap beneath a floating object, ignoring the object's true wrapping setting, when the following conditions are met:

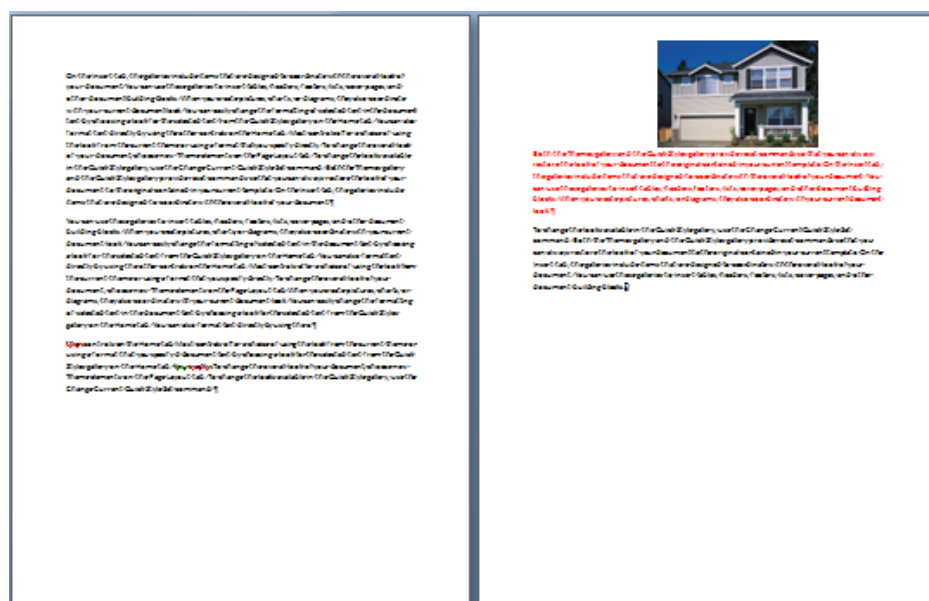

- The floating object has any of the following elements present as a child of the object's anchor element: `wrapSquare`, `wrapTight`, or `wrapTopAndBottom`.
- The floating object has a `positionV` element (Part 1, §20.4.2.11) with a `relativeFrom` attribute value of `line`.
- The floating object has a negative value for the child `posOffset` element (Part 1, §20.4.2.12) of the `positionV` element.
- The paragraph containing the anchor element would appear directly after the previous paragraph if the wrapping settings were ignored.

- The paragraph containing the anchor element would be pushed to the next page if the wrapping settings were respected.

[*Example:* Consider a WordprocessingML document containing a DrawingML object which meets the conditions outlined above:

```
<w:p>
  <w:r>
    <w:t>Sample text. Sample text. Sample text. Sample text. Sample text. Sample
text.</w:t>
  </w:r>
  <w:r>
    <w:drawing>
      <wp:anchor ... >
        <wp:positionV relativeFrom="line">
          <wp:posOffset>-428914</wp:posOffset>
        </wp:positionV>
        <wp:wrapTopAndBottom />
        ...
      </wp:anchor>
    </w:drawing>
  </w:r>
  <w:r>
    <w:t> Sample text. Sample text. Sample text. Sample text. Sample text.
Sample text.</w:t>
  </w:r>
  ...
</w:p>
```

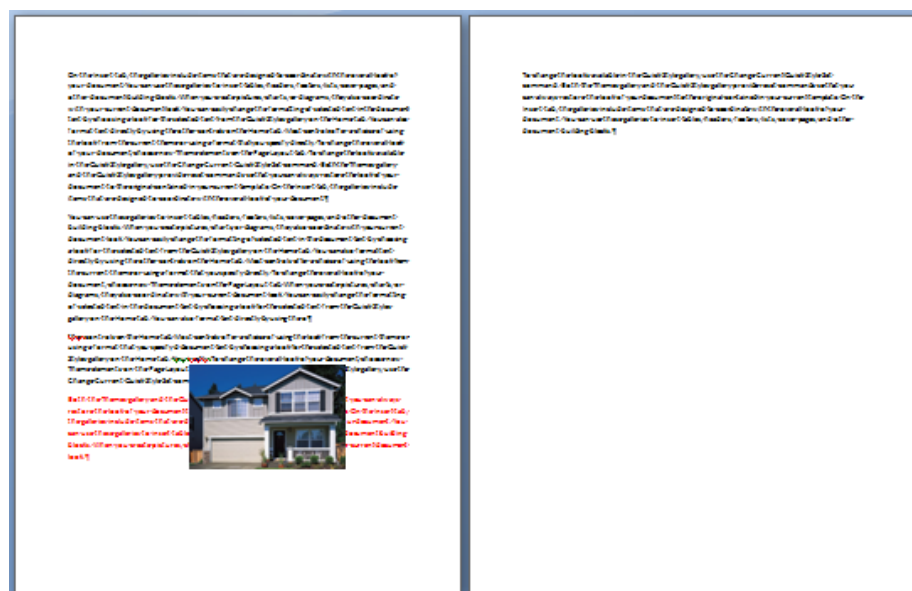

When the wrapping settings are respected, the shape and its paragraph do not fit on the page, so they are moved to the next page (the paragraph containing the anchor has been highlighted for illustrative purposes):

If this compatibility setting is turned on:

```
<w:compat>
  <w:shapeLayoutLikeWW8 />
</w:compat>
```

Then applications should ignore the wrapping setting and allow text to wrap below the object. This behaviour results in the following (again, the paragraph containing the anchor has been highlighted for illustrative purposes):

*end example]*

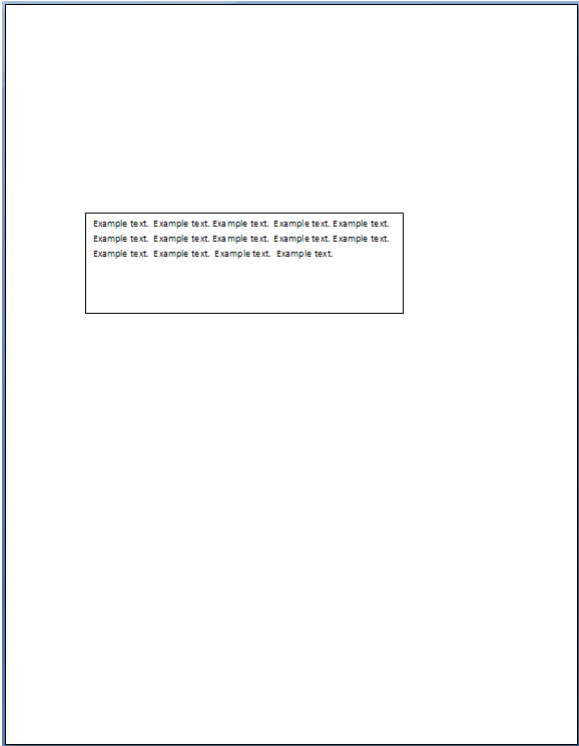

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

14.7.3.36 showBreaksInFrames (Display Page/Column Breaks Present in Frames)

This element specifies whether applications should honor the presence of page and/or column breaks which are present within the contents of paragraphs which have been defined as frames using the framePr element (Part 1, §17.3.1.11).

Typically, breaks within frames shall be ignored and shall have no effect on the display of the paragraph in which they are contained. This element, when present with a val attribute value of true (or equivalent), specifies that rather than completely ignoring these breaks, applications should display the break and move the remaining frame content, and all subsequent text, to the next page and/or column, as needed.

[Example: Consider a WordprocessingML document with a paragraph contained within a text frame:

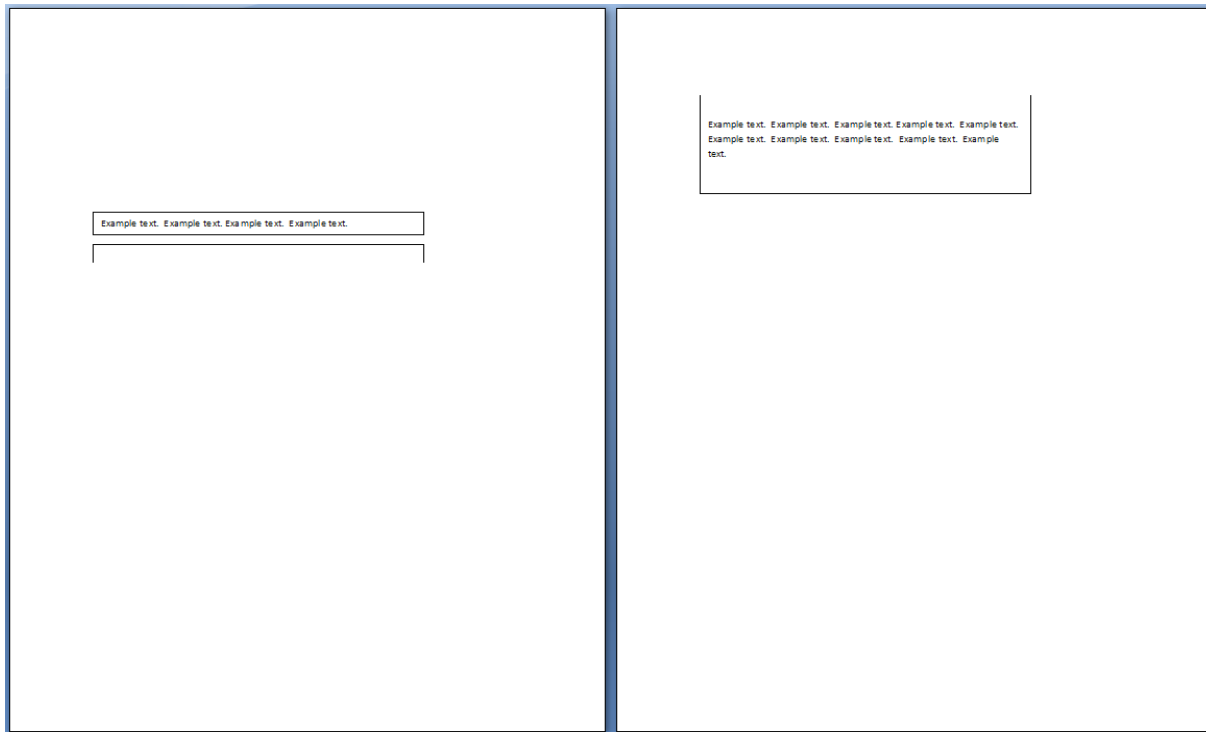

The default presentation would display the page break inline in the frame (breaking the frame into two) but would not actually break the page:

However, if this compatibility setting is turned on:

```
<w:compat>  
  <w:showBreaksInFrames />  
</w:compat>
```

Then the page breaks is used even though they are present in the frame, breaking the page and resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.37 **spacingInWholePoints (Only Expand/Condense Text By Whole Points)**

This element specifies how applications should apply text expansion/compression defined using the spacing element (Part 1, §17.3.2.35) within a set of run properties.

Typically, as defined in the spacing element, text within runs in a WordprocessingML document can be expanded or compressed in increments of twentieths of a point. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that the expansion and compression of text shall only be performed in increments of points. Any value which is not equal to an expansion or compression of a whole point shall be rounded down to the nearest whole point when the text is expanded/compressed within the WordprocessingML document.

[*Example:* Consider a WordprocessingML document with three paragraphs of text, each expanded by a varying amount, as follows:

```
<w:p>
...
<w:r>
  <w:t>This is text.</w:t>
</w:r>
</w:p>
```

```

<w:p>
...
<w:r>
  <w:rPr>
    <w:spacing w:val="20" />
  </w:rPr>
  <w:t>This is text.</w:t>
</w:r>
</w:p>
<w:p>
...
<w:r>
  <w:rPr>
    <w:spacing w:val="36" />
  </w:rPr>
  <w:t>This is text.</w:t>
</w:r>
</w:p>

```

The default presentation would have each run of text expanded exactly as requested:

Regular Text:	This is text.
Text expanded by 1 point:	This is text.
Text expanded by 1.8 points:	This is text.

However, if this compatibility setting is turned on:

```

<w:compat>
  <w:spacingInWholePoints />
</w:compat>

```

Then the third line - with an expansion of 1.8 points - would instead be rounded down to the nearest whole number of points when expanded, resulting in the following output:

Regular Text:	This is text.
Text expanded by 1 point:	This is text.
Text expanded by 1.8 points:	This is text.

In the resulting output, the second and third lines are identical, as the third line has a next expansion of exactly one point. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.38 `splitPgBreakAndParaMark` (Always Move Paragraph Mark to Page after a Page Break)

This element specifies whether a page break shall automatically complete the line on which it appears, moving the end of the paragraph to a new line on the next page, or if it shall behave as true run-level content within its current paragraph.

Typically, a page break defined using the `br` element (Part 1, §17.3.3.1) is treated as run-level content, which means that although it delimits the end of the page, if there is no content after it within the current paragraph, that the paragraph shall also end on that page. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that a page break shall always immediately end the current page, moving the paragraph mark which delimits the end of its parent paragraph to a new line on the next page.

Note that this setting only affects the case where there is no run-level content after the page break within the paragraph - if any further run content appears in the paragraph it shall appear on subsequent lines on the next page.

[*Example:* Consider a WordprocessingML document with two paragraphs of content - the first ending with a page break:

```
<w:p>
  <w:r>
    <w:t>This is text before a page break.</w:t>
    <w:br w:type="page" />
  </w:r>
</w:p>
<w:p>
  <w:r>
    <w:t>This is text on the next page.</w:t>
  </w:r>
</w:p>
```

The default presentation would have the text content `This is text on the next page.` as the first line of the second page, as there is no run content after the page break in paragraph one, and therefore no need for a new line on page two (in this image, a graphical illustration of the pilcrow and the page break have been added for clarity):

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:splitPgBreakAndParaMark />
</w:compat>
```

Then even though it is followed by no additional content, the page break must immediately end the first page, pushing the end of the first paragraph onto the first line of the second page, resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.39 **subFontBySize (Require Exact Size During Font Substitution)**

This element specifies whether applications shall accept fonts which cannot be rendered at the size specified by the *sz* (Part 1, §17.3.2.38) and/or *szCs* (Part 1, §17.3.2.39) elements on the parent run when performing font substitution.

Typically, applications can perform font substitution as defined in Part 1, §17.8.2, with no additional restrictions. This element, when present with a *val* attribute value of *true* (or equivalent), specifies that when a potential substitute font has been located, an application shall check whether that font is capable of displaying characters at the specified point size. If it is not, that font is not considered as a substitute font (i.e. it is rejected, and the next closest match is considered).

[*Example:* Consider a WordprocessingML document with a series of characters in an unavailable font. The default presentation would use any method used by the application to perform that font substitution.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:subFontBySize />
</w:compat>
```

For each run, the application determines if the substitute font produced by its font substitution algorithm can be displayed at the size specified by the run's `sz` and/or `szCs` elements. If it cannot, that font is not used and the next closest match as substitute font is considered. *end example*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.40 `suppressBottomSpacing` (Ignore Exact Line Height for Last Line on Page)

This element specifies whether an exact line height specified using the spacing element (Part 1, §17.3.1.33) with a `lineRule` attribute value of `exact` shall be ignored for the last line on each page.

Typically, if an exact line height has been specified using the spacing element, then all lines within that paragraph have the necessary line spacing added to them in order to meet this constraint. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that no additional spacing shall be added below the last line on each page as a result of these line spacing requirements - a line shall be placed on the bottom of the page if its characters fit on that page ignoring the necessary space after.

[*Example:* Consider a WordprocessingML document whose first paragraph has a line spacing setting requiring exactly 48 points of space per line:

```
<w:p>
  <w:pPr>
    <w:spacing w:line="960" w:lineRule="exact" />
  </w:pPr>
  ...
</w:p>
```

The default presentation would have the necessary amount of space added between each line such that all lines in the paragraph are centered within 48 points of spacing:

[illegible]

The first line from the following page was moved on the first page, as without being subjected to the line height constraint, it is possible to fit it at the bottom of the first page. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.41 suppressSpacingAtTopOfPage (Ignore Minimum Line Height for First Line on Page)

This element specifies whether the minimum line height specified using the spacing element (Part 1, §17.3.1.33) with a lineRule attribute value of atLeast shall be ignored for the first line on each page.

Typically, if a minimum line height has been specified using the spacing element, then all lines within that paragraph have the necessary line spacing added to them in order to meet this constraint. This element, when present with a val attribute value of true (or equivalent), specifies that no additional spacing shall be added above the first line on each page as a result of this line spacing requirements - the top of the text characters on the first line shall be at the top edge of the page.

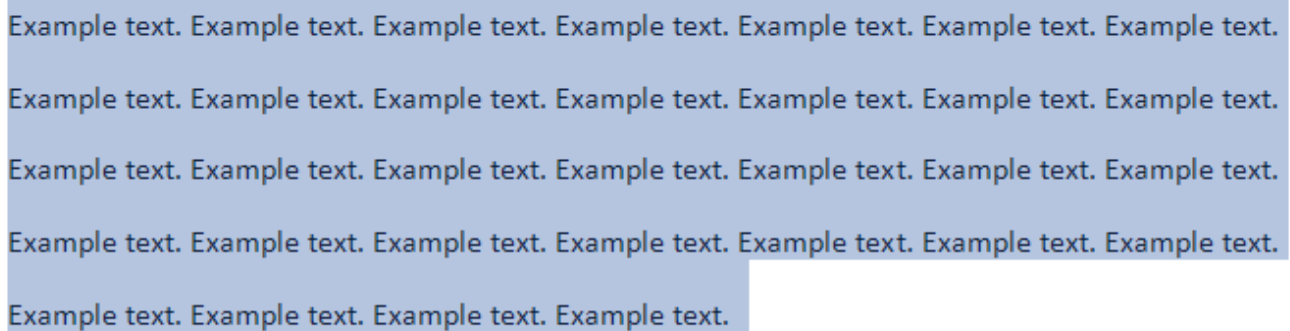

[*Example:* Consider a WordprocessingML document whose first paragraph has a line spacing setting requiring at least 25 points of space per line:

```

<w:p>
  <w:pPr>
    <w:spacing w:line="500" w:lineRule="atLeast" />
  </w:pPr>
  ...
</w:p>

```

The default presentation would have the necessary amount of space added between each line such that all lines in the paragraph are centered within 25 points of spacing (highlighting has been added to the image below in order to illustrate the additional spacing above the first line):

Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text.

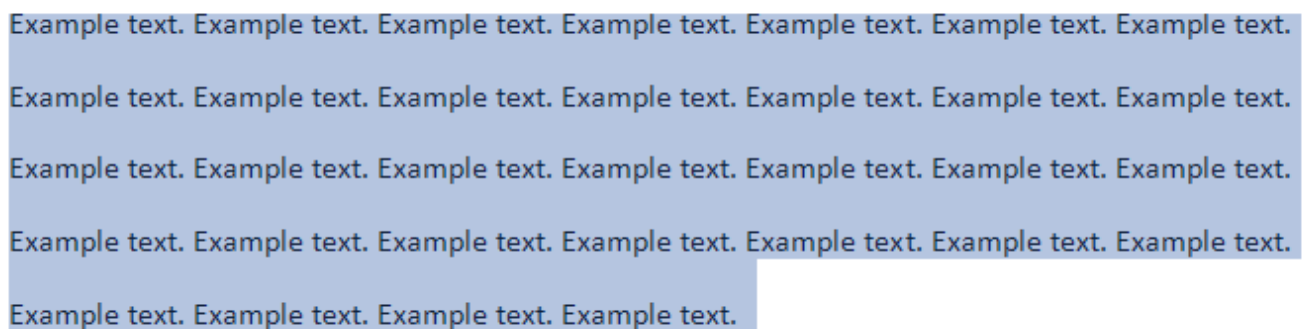

However, if this compatibility setting is turned on:

```

<w:compat>
  <w:suppressSpacingAtTopOfPage />
</w:compat>

```

Then no additional line spacing must be added above the first line on the page (although all other lines are unaffected), resulting in the following output:

Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text.

However, if this line spacing constraint was exactly 25 points, then this setting would have no effect:

Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.42 `suppressSpBfAfterPgBrk` (Do Not Use Space Before On First Line After a Page Break)

This element specifies that applications should not postpone any before paragraph spacing to the first line containing content after a page break.

Typically, a page break defined using the `br` element (Part 1, §17.3.3.1) is treated as run-level content, which means that although it delimits the end of the page, if there is no content after it within the current paragraph, that the paragraph shall also end on that page. However, in the case where there is additional run-level content within the same paragraph, that content, although part of the same paragraph as the page break, is displayed on the following page.

This leads to a situation where the only run content on the page with the page break is the break itself, with all subsequent content on the following page. In this case, applications shall apply the value specified by the spacing element's `before` attribute to the first line on the new page (since it is ostensibly the only page with content in that paragraph).

This element, when present with a `val` attribute value of `true` (or equivalent), specifies the paragraph before spacing shall not be 'postponed' in this way - if the line with the page break has no content, then the spacing element's `before` attribute is simply ignored.

[*Example:* Consider a WordprocessingML document whose first paragraph specifies that it must be preceded by 50 points of additional spacing:

```

<w:p>
  <w:pPr>
    <w:spacing w:before="1000" />
  </w:pPr>
  <w:r>
    <w:br w:type="page" />
    <w:t>This is sample text with 50 points before formatting.</w:t>
  </w:r>
</w:p>

```

The default presentation would have the necessary amount of space added to the first line on the second page, as the page break was not preceded by any run content (highlighting has been added to the image below in order to illustrate the additional spacing above the first line):

However, if this compatibility setting is turned on:

```

<w:compat>
  <w:suppressSpBfAfterPgBrk />
</w:compat>

```

Then the spacing must not be added above the first line on the page (it is essentially ignored), resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.43 `suppressTopSpacing` (Ignore Minimum and Exact Line Height for First Line on Page)

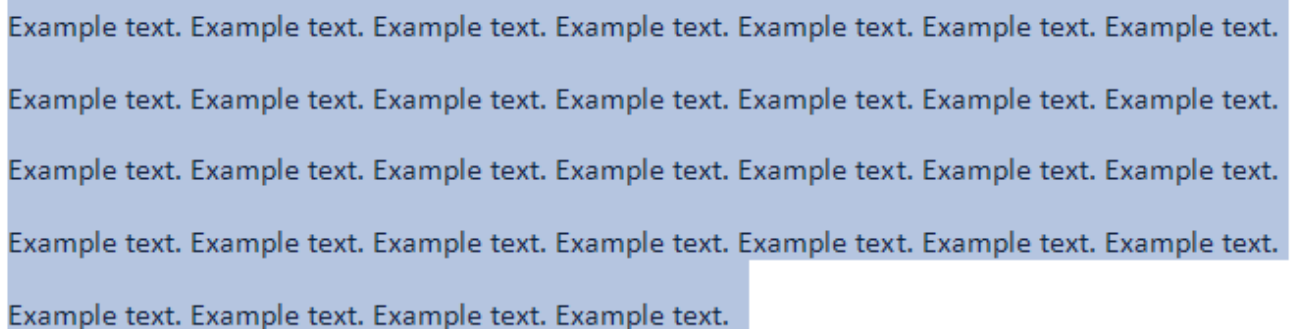

This element specifies whether the minimum line height specified using the spacing element (Part 1, §17.3.1.33) with a `lineRule` attribute value of `atLeast` or `exact` shall be ignored for the first line on each page.

Typically, if a minimum or exact line height has been specified using the spacing element, then all lines within that paragraph have the necessary line spacing added to them in order to meet this constraint. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that no additional spacing shall be added above the first line on each page as a result of these line spacing requirements - the top of the text characters on the first line shall be at the top edge of the page.

[*Example:* Consider a WordprocessingML document whose first paragraph has a line spacing setting requiring exactly 25 points of space per line:

```
<w:p>
  <w:pPr>
    <w:spacing w:line="500" w:lineRule="exact" />
  </w:pPr>
  ...
</w:p>
```

The default presentation would have the necessary amount of space added between each line such that all lines in the paragraph are centered within 25 points of spacing (highlighting has been added to the image below in order to illustrate the additional spacing above the first line):

Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:suppressTopSpacing />
</w:compat>
```

Then no additional line spacing must be added above the first line on the page (although all other lines are unaffected), resulting in the following output:

Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
 Example text. Example text. Example text. Example text.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.44 `suppressTopSpacingWP` (Use Static Text Leading)

(The terms *baseline to baseline distance* and *unitsPerEm*, used below, are defined in ISO/IEC 14496-22.)

This element specifies that applications should use the values defined below to calculate the baseline to baseline distance (BTBD) in this document. This can result in lines appearing slightly condensed vertically.

Without this setting, applications calculate baseline to baseline distance using the metrics defined by ISO/IEC 14496-22. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications should calculate this as follows:

$$BTBD = \text{unitsPerEm} + 2\text{pt}$$

[*Example:* If this compatibility setting is turned on:

```
<w:compat>
  <w:suppressTopSpacingWP />
</w:compat>
```

Then applications use a baseline to baseline distance as calculated before. With a 16 point font, this would result in a baseline to baseline distance of 18 points. *end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.45 `swapBordersFacingPages` (Swap Paragraph Borders on Odd Numbered Pages)

This element specifies whether left and right paragraph borders defined under the `pBdr` element (Part 1, §17.3.1.24) shall be swapped under conditions where it is possible that the those pages are intended to be used to create a book-like publication.

Typically, no changes shall be made to the positions of paragraph borders defined under the pBdr element - a right border is always on the right, and a left border is always on the left. This element, when present with a val attribute value of true (or equivalent), specifies that under the two following conditions:

- The margins in this document are mirrored using the mirrorMargins element (Part 1, §17.15.1.57)
- The header/footers in this document are different on even and odd numbered pages using the evenAndOddHeaders element (Part 1, §17.10.1)

That paragraph borders on odd-numbered pages are swapped - that is, left borders shall be displayed on the right and right borders shall be displayed on the left.

[*Example:* Consider a WordprocessingML document for which the mirrorMargins element is present, and whose default paragraph style includes a paragraph border to be displayed on the right side of each paragraph:

```
<w:style w:type="paragraph" w:default="1" w:styleId="Normal" >
...
<w:pPr>
  <w:pBdr>
    <w:right w:val="single" w:color="auto" />
  </w:pBdr>
  ...
</w:pPr>
</w:style>
```

If a two-page document is created using this default paragraph style, then all paragraphs has a border on the right side, as follows:

<p>On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.</p> <p>You can easily change the formatting of selected text in the document text by choosing a look for the selected text from the Quick Styles gallery on the Home tab. You can also format text directly by using the other controls on the Home tab. Most controls offer a choice of using the look from the current theme or using a format that you specify directly.</p> <p>To change the overall look of your document, choose new Theme elements on the Page Layout tab. To change the looks available in the Quick Style gallery, use the Change Current Quick Style Set command. Both the Themes gallery and the Quick Styles gallery provide reset commands so that you can always restore the look of your document to the original contained in your current template.</p> <p>On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.</p> <p>You can easily change the formatting of selected text in the document text by choosing a look for the selected text from the Quick Styles gallery on the Home tab. ---	---

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:swapBordersFacingPages />
</w:compat>
```

Then the borders on the first page (being an odd-numbered page) must be swapped, resulting in the following output:

<p>On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.</p> <p>You can easily change the formatting of selected text in the document text by choosing a look for the selected text from the Quick Styles gallery on the Home tab. ---	---

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.46 `truncateFontHeightsLikeWP6` (Use Truncated Integer Division For Font Calculation)

This element specifies that applications should perform a specific method of calculation when converting font heights, specified in points using the `sz` (Part 1, §17.3.2.38) and `szCs` (Part 1, §17.3.2.39) elements, into pixels. This algorithm often results in a smaller than typical visual appearance of text for a given point size.

Typically, applications convert points to pixels using any approximate mathematical conversion mechanism (often, rounded integer division). This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications should use truncated integer division when performing this conversion (any non-integer value is truncated to determine the integer value resulting from the conversions).

[Example: If this compatibility setting is turned on:

```
<w:compat>
  <w:truncateFontHeightsLikeWP6 />
</w:compat>
```

Then applications shall use truncated integer division when calculating the height of characters.

For example, if the conversion is done as follows:

$$sz_{px} = sz_{pt} * N \frac{px}{inch} * \frac{1 inch}{72 pt}$$

where:

- $sz_{pt}$  = size in points
- $sz_{px}$  = size in pixels
- $N$  = resolution in pixels per inch

Converting a 14 point font on a 96 dpi device results in  $sz_{px} = 14 * 96 * \frac{1}{72} = 18\frac{2}{3}px$ . If this setting is on, the result is truncated and the font is displayed using 18 pixels, even though 19 would be closer to the actual value. *end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.47 underlineTabInNumList (Underline Following Character Following Numbering)

This element specifies whether applications shall underline the character following the numbering defined using the suff element (Part 1, §17.9.29) when both the numbering itself and the first letter of the corresponding numbered paragraph is underlined.

Typically, the tab or space character generated between numbering and the corresponding paragraph of text is never formatted, since it is automatically generated by the suff element. This element, when present with a val attribute value of true (or equivalent), specifies that the tab or space shall be underlined the same way as the numbering symbol itself in the following conditions:

- The numbering is underlined
- The first character of the paragraph is underlined

[*Example:* Consider a WordprocessingML document with two numbered paragraphs: one with underlined text and the other without. The default presentation would have the tab characters free of underlining in both cases:

1. Example Text

2. Example Text

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:underlineTabInNumList />
</w:compat>
```

Then the second paragraph meets the criteria defined above for having the suffix character underlined, resulting in the following output:

## 1. Example Text

## 2. Example Text

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.48 useAltKinsokuLineBreakRules (Use Alternate Set of East Asian Line Breaking Rules)

This element specifies an alternate set of characters which can be used to determine which characters can begin and/or end a line when kinsoku line breaking rules are enabled using the kinsoku element (Part 1, §17.3.1.16).

Typically, the characters used to determine which characters shall not end a line are those listed by the kinsoku element in the paragraph properties subclause of this document. This element, when present with a val attribute value of true (or equivalent), specifies that the following settings shall be used instead (for brevity, only those settings which are different are listed below):

Chinese (Simplified)

- Cannot start a line:

!) , ; ? ] " ' ) , . : ; ? ] ` | } ~ ¢

- Cannot end a line:

([{.““ < > 〔 〕 【 】 ( ) . [ { £ ¥

Chinese (Traditional)

- Cannot start a line:

!,.,;?]}¢—”•.....’-、。>>>」』】) ” : || { ~~~~~~  
~~~~~! ) , . : ; ? | } 、

Korean

- Cannot end a line:

( [ { £ ¥ “ ” ‹ › ≪ ≫ ⌈ ⌋ 【 】 ⌊ ⌋ \$ ( [ { ≠

[Example: Consider a line of text in a WordprocessingML document within a paragraph marked as Chinese (Simplified) which begins with a % symbol, as follows:

%...

Typically, the kinsoku settings for Chinese (Simplified) do not allow this character to begin a line, so the character before that symbol would be moved down onto this line:

⌈ %...

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:useAltKinsokuLineBreakRules />
</w:compat>
```

Then the alternate kinsoku rules are in place, which do not prevent the % character from beginning the new line, resulting in the following output:

%...

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.49 useAnsiKerningPairs (Use ANSI Kerning Pairs from Fonts)

This element specifies whether applications shall use the ANSI or Unicode kerning pair information from fonts stored in the document when displaying those characters within the document's contents.

Typically, applications shall use the Unicode kerning pair information in order to determine all possible kerning pairs in the fonts in use. This element, when present with a val attribute value of true (or equivalent), specifies that the ANSI kerning information shall be used instead.

[*Example:* Consider a WordprocessingML document with text that contains one or more kerning pairs.

If this compatibility setting is turned on:

```
<w:compat>
  <w:useAnsiKerningPairs />
</w:compat>
```

Then the ANSI kerning pairs are used in place of the Unicode kerning pairs, potentially resulting in different line breaks.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.50 useFELayout (Do Not Bypass East Asian/Complex Script Layout Code)

This element specifies that applications shall not bypass code relating to the layout of East Asian and/or Complex Script characters when presenting this document.

[*Guidance:* Previous word processing applications relied on this flag to determine whether to perform functions which allow for the correct layout of East Asian and Complex Script text. Although current applications no longer rely on this flag (as they should correctly use the Unicode subranges and code pages of the text in use), this flag

should be output in order to ensure that files with this content can be viewed correctly in previous word processors. *end guidance*]

[*Example:* Consider a WordprocessingML document with East Asian text.

If this compatibility setting is turned on:

```
<w:compat>
  <w:useFELayout />
</w:compat>
```

Then the flag is set telling previous applications that East Asian content is present, and they should display the document accordingly. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.51 `useNormalStyleForList` (Do Not Automatically Apply List Paragraph Style To Bulleted/Numbered Text)

This element specifies whether applications shall automatically apply the paragraph style with the `styleId` attribute `ListParagraph` when numbering is applied to a paragraph currently formatted using the default paragraph style.

Typically, when a paragraph is formatted using the default paragraph style, and numbering is subsequently applied, the paragraph style with the `styleId` attribute `ListParagraph` when numbering is applied to ensure that paragraph properties are appropriate for a numbered paragraph. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that no alternate paragraph style shall ever be applied

[*Example:* Consider a WordprocessingML document with five unnumbered paragraphs:

Example text.

Example text.

Example text.

Example text.

Example text.

If numbering is applied to the three center paragraphs, the default presentation would have the `ListParagraph` style applied as well:

Example text.

- Example text.
- Example text.
- Example text.

Example text.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:useNormalStyleForList />
</w:compat>
```

Then the new paragraph style must not be applied, resulting in the following output:

Example text.

- Example text.
- Example text.
- Example text.

Example text.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.52 usePrinterMetrics (Use Printer Metrics To Display Documents)

This element specifies whether applications shall use the printer metrics of the currently active printer when determining how to display the contents of a WordprocessingML document. *Printer metrics* are printer-specific settings which can be queried to tell an application how and where text shall be displayed on a printed page.

Typically, applications display the content of a document in a device independent manner - the application is therefore not changing the layout of a document based on the currently attached printer, and instead shall dictate to the printer where characters shall be presented on the page when printed. This element, when present with a *val* attribute value of *true* (or equivalent), specifies that the metrics of the current printer shall be used to display the document instead.

Specifically, when this setting is enabled, the printer metrics are used to determine the number of pixels per logical inch along the screen width and height. This should then be used to compute the pixel height of the fonts requested when displaying the document, as well as to scale between any logical units within the document

(e.g. drawing object sizes) to the appropriate device units. Those units would then need to be scaled back into screen units for final display to a screen, but not scaled again when displayed to a printer.

[*Note:* On the Windows platform, you can use the `GetDeviceCaps` function to retrieve device-specific information for the specified printer. For this specific setting, you can use `GetDeviceCaps(hdc, LOGPIXELSX)` and `GetDeviceCaps(hdc, LOGPIXELSY)` with a printer DC to retrieve the number of pixels per logical inch along the screen width and height. With this, you can then use those DPI metrics to compute a pixel value for the font request in the `LOGFONT` structure (the `LOGFONT` structure defines the attributes of a font). A common formula to do this is  $S_{px} = S_{pts} * \frac{LOGPIXELSY}{72}$ . *end note*]

[*Example:* Consider a WordprocessingML document. The default must use device-independent layout to present the contents of the page.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:usePrinterMetrics />
</w:compat>
```

Then the printer metrics of the current active printer must be used to determine the display of the contents of the document instead, as needed. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.53 `useSingleBorderforContiguousCells` (Use Simplified Rules For Table Border Conflicts)

This element specifies whether applications should use an alternate simplified algorithm when handling conflicts between adjacent table borders within a table.

Typically, the conflicts between two adjacent table borders are handled using the conflict resolution algorithm defined in Part 1, §17.4.39 of ISO/IEC 29500. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that rather than using that algorithm to determine the outcome of the conflict to two adjacent borders, that the following logic shall be used instead:

- Cell borders shall supersede table borders
- Cell borders to the right shall supersede cell borders to the left (i.e. the rightmost border wins in conflicts between vertical borders)
- Cell borders below shall supersede cell borders above (i.e. the bottommost border wins in conflicts between horizontal borders)

[*Example:* Consider a WordprocessingML document with cell and table borders defined as follows. In the image below, 0.1" of padding has been added between each cell temporarily to clearly illustrate the borders on each cell and on the table:

The default presentation would have the border conflicts resolved using the algorithm defined by ISO/IEC 29500, resulting in the following table:

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:useSingleBorderforContiguousCells />
</w:compat>
```

Then the simplified table algorithm above shall be used instead (bottom and right cell borders always win), resulting in the following output:

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.54 useWord2002TableStyleRules (Incorrectly Display Top Border of Conditional Columns)

This element specifies whether applications should incorrectly calculate the top border of conditional columns (as specified by a `tblStylePr` element (Part 1, §17.7.6.6) with a type attribute value of `firstCol`, `lastCol`, `band1Vert`, or `band2Vert`) under the following conditions:

- A conditional formatting has also been defined for the first row (a `tblStylePr` element with a type attribute of `firstRow`)
- That conditional formatting has been applied to the table using the `tblLook` element (Part 1, §17.4.56)

Typically, table styles are applied according to the logic defined in Part 1, §17.7.2. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that the top border of those conditionally formatted columns should instead be displayed as the top border of the following row.

[Example: Consider a WordprocessingML document with table style that defines two conditional formats:

The first column has a one point border

The first row has red shading

That style would be defined as follows:

```
<w:style w:type="table" w:customStyle="1" w:styleId="TableTest">
  <w:name w:val="CompatibilitySetting"/>
  <w:tblStylePr w:type="firstRow">
    <w:tcPr>
      <w:shd w:val="clear" w:color="auto" w:fill="FF0000"/>
    </w:tcPr>
  </w:tblStylePr>
  <w:tblStylePr w:type="firstCol">
    <w:tcPr>
      <w:tcBorders>
        <w:top w:val="single" w:sz="4" w:space="0" w:color="auto"/>
        <w:left w:val="single" w:sz="4" w:space="0" w:color="auto"/>
        <w:bottom w:val="single" w:sz="4" w:space="0" w:color="auto"/>
        <w:right w:val="single" w:sz="4" w:space="0" w:color="auto"/>
      </w:tcBorders>
    </w:tcPr>
  </w:tblStylePr>
</w:style>
```

If the first column and first row formatting is applied, the table would appear as follows:

|     |     |
|-----|-----|
| 1,1 | 1,2 |
| 2,1 | 2,2 |

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:useWord2002TableStyleRules />
</w:compat>
```

Then the condition described by this element causes the top border defined by the conditional format for the first column to be displayed as the top border for the second column, resulting in the following output:

|     |     |
|-----|-----|
| 1,1 | 1,2 |
| 2,1 | 2,2 |

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.55 useWord97LineBreakRules (Use Incorrect Inter-Character Spacing Rules)

This element specifies that applications should perform specific calculations (detailed below) when determining inter-character spacing under certain conditions. These calculations would not normally be considered correct.

Typically, the behaviors specified by the following elements are applied unconditionally:

- The autoSpaceDE (Part 1, §17.3.1.2) and autoSpaceDN (Part 1, §17.3.1.3) elements
- The topLinePunct (Part 1, §17.3.1.43) element

The compatibility element described in this subclause, when present with a val attribute value of true (or equivalent), specifies that applications should ignore the settings listed above in the following scenarios:

1. If an ideographic character and a non-ideographic/numeric character are logically adjacent (ignoring all content which is not within a t element), but separated by a field boundary, i.e.:
  - The first character is within a fldSimple element, but the second is not.
  - The characters are separated by a fldChar element with a fldCharType attribute value of end

Then any appropriate inter-character spacing should be omitted. [*Note*: Inter-character spacing should still be calculated correctly within the field result. *end note*]

2. If a full-width punctuation character appears at the start of a paragraph which also specifies numbering via the numPr element (Part 1, §17.3.1.19), the compression specified by the topLinePunct element is ignored.

[*Example*: Consider a paragraph which contains a field ending in an ideograph and another paragraph, with numbering, which contains a full-width punctuation character in the first character position:

```
<w:p>
  <w:r>
    <w:fldChar w:fldCharType="begin" />
  </w:r>
  ...
  <w:r>
    <w:t>日</w:t>
  </w:r>
  <w:r>
    <w:fldChar w:fldCharType="end" />
```

```
</w:r>
<w:r>
  <w:t>1</w:t>
</w:r>
</w:p>
<w:p>
  <w:pPr>
    <w:numPr>
      ...
    </w:numPr>
  </w:pPr>
  <w:r>
    <w:t> (</w:t>
  </w:r>
</w:p>
```

Typically, if both the autoSpaceDN and topLinePunct are true, additional spacing is added after the ideograph in the first paragraph and punctuation kerning is applied in the second paragraph (with gridlines added for visual reference):

|    |    |   |    |   |    |   |   |
|----|----|---|----|---|----|---|---|
| 平成 | 19 | 年 | 12 | 月 | 20 | 日 | 1 |
| 1. | (  |   |    |   |    |   |   |

If this compatibility setting is turned on:

```
<w:compat>
  <w:useWord97LineBreakRules />
</w:compat>
```

Then applications should not add any inter-character spacing at th end of the field and should turn off punctuation kerning in the second paragraph:

|    |    |   |    |   |    |   |   |
|----|----|---|----|---|----|---|---|
| 平成 | 19 | 年 | 12 | 月 | 20 | 日 | 1 |
| 1. | (  |   |    |   |    |   |   |

*end example]*

This element’s content model is defined by the common boolean property definition in Part 1, §17.17.4.

### 14.7.3.56 wpJustification (Fit To Expanded Width When Performing Full Justification)

This element specifies that applications should perform a specific algorithm when determining the contents of each line in a fully justified paragraph (resulting from the use of the jc element (Part 1, §17.3.1.13)). This setting typically results in more words being fitted into lines (by reducing inter-word spacing as necessary).

Typically, applying full justification to a paragraph does not change the placement of line breaks, as inter-word spacing is expanded to ensure the resulting text is fully justified. This element, when present with a val attribute value of true (or equivalent), specifies that applications shall determine the contents of each line in a fully justified paragraph using the following algorithm:

For each line in the fully justified paragraph,

- Determine the actual line width,  $w$ , in pixels
- Calculate the “effective” line width by the following factor:

$$w_{\text{effective}} = w_{\text{actual}} + \left( w_{\text{actual}} * \frac{281}{7200} \right)$$

- Determine the text which can be displayed in a line of the “effective” line width
- Decrease the inter-word spacing as necessary to fit that text in the actual line width

[Example: Consider a WordprocessingML document with one or more paragraphs using full paragraph justification:

```
<w:p>
  <w:pPr>
    <w:jc w:val="both" />
  </w:pPr>
  ...
</w:p>
```

If this compatibility setting is turned on:

```
<w:compat>
  <w:wpJustification />
</w:compat>
```

Then, for a line 1000 pixels wide, an application would calculate the effective width as follows:

$$w_{\text{effective}} = 1000 + \left( 1000 * \frac{281}{7200} \right) = 1039 \text{ pixels}$$

This effective width is then used to determine how much text can be displayed on line. After calculating the text, the application can display the text on the actual line, fully justified. *end example*]

This element’s content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.57 wpSpaceWidth (Use Specific Space Width)

(The terms *ascent* and *descent* are used as defined in ISO/IEC 14496-22.)

This element specifies that applications should perform determine the width of the space character for all proportional fonts used in this document using the calculation specified below.

Typically, applications calculate the width of a whitespace character dynamically to optimize for the output device. This element, when present with a *val* attribute value of *true* (or equivalent), specifies that applications should instead use the following algorithm to determine the width of a whitespace character:

$$w_{\text{space}} = \left( \frac{\textit{ascent} + \textit{descent}}{3} \right)$$

where

- $w_{\text{space}}$  is the width of a space character
- is the ascent for the font
- is the descent for the font

[*Example*: Consider a WordprocessingML document with this compatibility setting turned on:

```
<w:compat>
  <w:suppressTopSpacingWP />
</w:compat>
```

If the font applied to a run specified an ascent value of 8 points and a descent value of 2 points, each space in that run would have a width of three and one-third points. *end example*]

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

#### 14.7.3.58 wrapTrailSpaces (Line Wrap Trailing Spaces)

This element specifies whether applications shall perform line wrapping on trailing spaces in the contents of a line when displaying in it a paragraph. *Trailing spaces* are all space characters which are not followed by non-space characters on the same line.

Typically, applications do not line wrap trailing spaces, instead allowing an unbounded number of trailing spaces on a line, with the next non-space character starting at the first character position on the next line. This element, when present with a *val* attribute value of *true* (or equivalent), specifies that all characters, including trailing spaces, shall be line wrapped normally.

[*Example*: Consider a WordprocessingML document with the following paragraph of text, including a long interstitial of spaces which become trailing spaces when the paragraph is displayed:

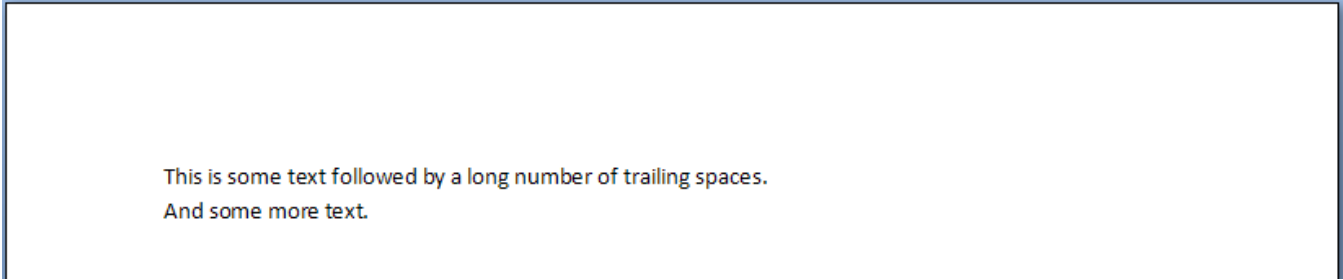

```

<w:r>
  <w:t> This is some text followed by a long number of trailing spaces.

      And some more text.</w:t>
</w:r>

```

The default presentation would not wrap those trailing spaces, so the text at the end of the run would begin at the first character position on the second line:

This is some text followed by a long number of trailing spaces.  
And some more text.

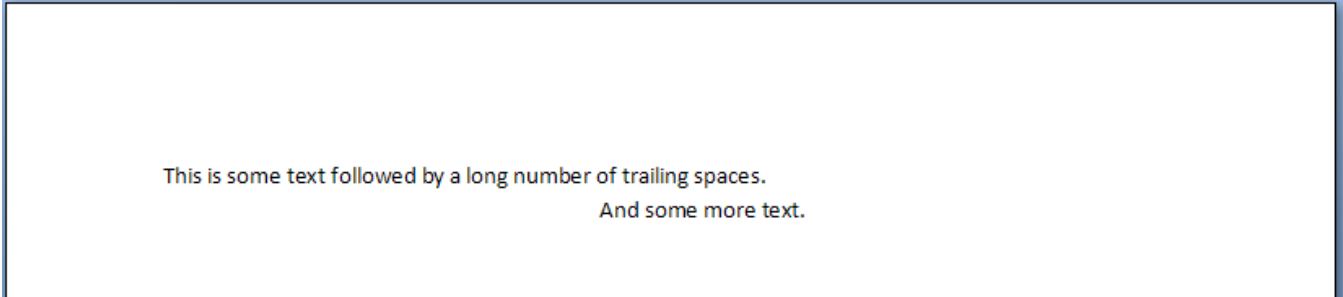

However, if this compatibility setting is turned on:

```

<w:compat>
  <w:wrapTrailSpaces />
</w:compat>

```

Then all trailing spaces would be handled as regular characters when line wrapping, resulting in the following output:

This is some text followed by a long number of trailing spaces.  
And some more text.

*end example]*

This element's content model is defined by the common boolean property definition in Part 1, §17.17.4.

## 14.7.4 Web Page Settings

### 14.7.4.1 [relyOnVML \(Utilize VML When Saving as Web Page\)](#)

This element specifies whether applications can utilize the Vector Markup Language format when saving the content of this WordprocessingML document as a web page, when graphical elements that can leverage this format are present in the document.

If this element is omitted, then a graphic image format should be used either in place of or in concert with the Vector Markup Language output in order to specify the formatting and positioning for objects that are part of the resulting web page.

[*Note:* This setting is intended for applications to save web pages that can be supported by legacy web browsers that do not support Vector Markup Language when attempting to read and display the resulting web page. *end note*]

[*Example:* Consider a WordprocessingML document that contains the following content within the web settings part:

```
<w:webSettings>
  <w:relyOnVML w:val="false" />
</w:webSettings>
```

The relyOnVML element has a val attribute value of false, which specifies that applications should utilize a graphical image version of all objects that could utilize Vector Markup Language output. This does not preclude the use of the VML output, but does specify that a graphical element must be included as well. *end example*]

This element's content model is defined by the common boolean property definition in Part 1 §17.17.4.

## 14.8 Miscellaneous Topics

### 14.8.1 Text Box Content

All VML-based drawing objects (except for connectors) support the addition of rich WordprocessingML content within their extents. When WordprocessingML contents have been added to a VML drawing object, the resulting text is contained within a *text box*.

When WordprocessingML content is contained within a text box, it is allowed within the object by specifying the VML textbox element (§19.1.2.22), which contains within it a single txbxContent element that contains all of the desired WordprocessingML content.

#### 14.8.1.1 txbxContent (Rich Text Box Content Container)

This element specifies that its contents shall be any rich WordprocessingML content, and that this content is the rich contents of a drawing object defined using the Vector Markup Language (VML) syntax (§19.1).

If this element contains within any of its contents any of the following content, then the document shall be considered non-conformant:

- References to other WordprocessingML document stories (comments, footnotes, endnotes)
- Additional txbxContent elements (as part of nested VML objects)

[*Example:* Consider a WordprocessingML document consisting of a single VML shape element (§19.1.2.19) (in this case, a star) that contains within it some WordprocessingML content:

That drawing object now contains a text box, and so uses the syntax for that text box:

```
<v:shape id="_x0000_s1026" type="#_x0000_t12" style="...">
  <v:textbox>
    <w:txbxContent>
      <w:p>
        <w:pPr>
          <w:jc w:val="center"/>
        </w:pPr>
        <w:r>
          <w:t>Rich WordprocessingML content!</w:t>
        </w:r>
      </w:p>
    </w:txbxContent>
  </v:textbox>
</v:shape>
```

*end example]*

[*Note:* The txbxContent element is the container for the WordprocessingML contained within the text box inside that shape - once inside this element any content (subject to the restrictions defined above) can be used. For compatibility with existing implementations, unqualified elements are used inside the txbxContent element to represent HTML fragments. *end note]*

[Note: The W3C XML Schema definition of this element's content model ([CT\\_TxbxContent](#)) is located in §A.1.  
end note]

## 14.9 Fields and Hyperlinks

### 14.9.1 Syntax

This subclause modifies the fields grammar defined in Part 1, §17.16.1 as necessary to support transitional use of fields.

The syntax rules in this subclause follow the system shown in ISO/IEC 14977: literal text is surrounded by double-quotes (or by apostrophes); the left-square-bracket and right-square-bracket designate the start and end of an option; the left-curly-bracket and right-curly-bracket designate the start and end of a sequence of one-or-more items; the vertical-line indicates an alternative; and each rule ends with a semicolon. Whenever hyphen is used as the exception-symbol (as per ISO/IEC 14977), it is surrounded by white space, and further clarified by a comment.

```

field-type=
    date-and-time |
    document-automation |
    document-information |
    document-property |
    equations-and-formulas |
    index-and-tables |
    links-and-references |
    mail-merge |
    numbering |
    user-information |
    form-field |
    user-defined-field |
    transitional-fields ;
transitional-fields=

    "AUTONUMOUT" |
    "BARCODE", field-argument |
    "BIDIOUTLINE" |
    "EQ", [switches], "(", [eq-argument-list], ")" (* and see §14.9.4.6 *) |
    "INFO", info-category, [field-argument] ;
eq-argument-list=
    expression, {eq-list-separator, expression} ;
eq-list-separator=
    comma | semicolon ;          (* depending on the rules in §14.9.4.6 *)

```

info-category:

```
"AUTHOR" | "COMMENTS" | "CREATEDATE" | "EDITTIME" |
"FILENAME" | "FILESIZE" | "KEYWORDS" | "LASTSAVEDBY" |
"NUMCHARS" | "NUMPAGES" | "NUMWORDS" | "PRINTDATE" |
"REVNUM" | "SAVEDATE" | "SUBJECT" | "TEMPLATE" | "TITLE" ;
```

### 14.9.2 Legacy language references

Whenever a field requires a language identifier as one of its *field-switches*, that language identifier should be provided using the syntax defined by the ST\_Lang simple type (Part 1, §22.9.2.6). However, there exists a legacy mechanism by which language identifiers can be stored. For that mechanism, the following table lists those language codes and their corresponding languages.

This mechanism can be used within the following *field-switches*:

- ADDRESSBLOCK (Part 1, §17.16.5.1), \l switch
- BIBLIOGRAPHY (Part 1, §17.16.5.7), \l and \f switches
- CITATION (Part 1, §17.16.5.8), \l switch
- GREETINGLINE (Part 1, §17.16.5.24), \l switch
- INDEX (Part 1, §17.16.5.29), \z switch

[*Rationale*: This list is maintained for compatibility with documents containing these values. The use of these identifiers is discouraged. *end rationale*]

[*Note*: The second column "Description" is informative only, and is provided as an aid to implementers. Note also that the inclusion of country subtags in the BCP 47 codes makes no assertion about the relationship between nations and languages. Rather, it reflects the historical commercial process by which office software products were localized for some particular market. For example, the Swahili language is spoken in several Eastern African nations. However, the localization identified by the legacy language code 1089 reflected work done in Kenya to address the needs of Swahili users there and thus is mapped to the modern BCP 47 code sw-KE. *end note*]

| Language Code | Description (informative) | BCP 47 Code |
|---------------|---------------------------|-------------|
| 1025          | Arabic - Saudi Arabia     | ar-SA       |
| 1026          | Bulgarian                 | bg-BG       |
| 1027          | Catalan                   | ca-ES       |
| 1028          | Chinese - Taiwan          | zh-TW       |
| 1029          | Czech                     | cs-CZ       |
| 1030          | Danish                    | da-DK       |
| 1031          | German - Germany          | de-DE       |
| 1032          | Greek                     | el-GR       |
| 1033          | English - United States   | en-US       |

| Language Code | Description (informative)          | BCP 47 Code |
|---------------|------------------------------------|-------------|
| 1034          | Spanish - Spain (Traditional Sort) | es-ES       |
| 1035          | Finnish                            | fi-FI       |
| 1036          | French - France                    | fr-FR       |
| 1037          | Hebrew                             | he-IL       |
| 1038          | Hungarian                          | hu-HU       |

### 14.9.3 Use of DOS File Paths

The following fields allow the use of a DOS file path in place of the (preferred) IRI syntax:

- INCLUDEPICTURE (Part 1, §17.16.5.27)
- INCLUDETTEXT (Part 1, §17.16.5.28)

When a DOS file path is specified in a *field-argument*, each backslash character shall be preceded directly by another backslash character [*Example*: E:\\example.docx *end example*] If *field-argument* contains white space, it shall be enclosed in double quotes.

### 14.9.4 Field definitions

#### 14.9.4.1 AUTONUM

**Syntax:**

AUTONUM [ *switches* ]

**Description:** In paragraphs formatted with one of the nine built-in heading styles, paragraph numbering restarts at 1 in each successive heading level. If headings that contain AUTONUM fields are followed by body text paragraphs that also contain AUTONUM fields, the paragraph numbering of the body text is restarted at 1 after each heading. If the headings don't contain AUTONUM fields, body text paragraphs that contain AUTONUM fields are numbered in a continuous, sequential series throughout the document. [*Note*: This field is supported for legacy reasons, It is recommended that LISTNUM (Part 1, §17.16.5.33) be used instead. *end note*]

The XML generated for a complex field implementation shall not have the optional field value stored.

**Field Value:** A new paragraph number in ascending sequential order.

**Switches:** Zero or one of the *general-formatting-switches*, or zero or more of the following *field-specific-switches*.

|                                       |                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\s <i>field-argument</i></code> | <i>text</i> in this switch's <i>field-argument</i> specifies the separator character to be used. If <code>\s</code> is omitted, a period (.) is used. |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

[*Example:* When the following fields are updated:

```
AUTONUM
AUTONUM \* Arabic \s :
AUTONUM \* alphabetic \s " "xxx
AUTONUM \* ROMAN
AUTONUM \* OrdText
```

The results are:

```
1.
2:
c xxx
IV.
fifth.
```

*end example]*

#### 14.9.4.2 AUTONUMLGL

##### Syntax:

AUTONUMLGL [ *switches* ]

**Description:** For legal and technical publications, use the nine built-in heading styles to format headings in the document, and then insert an AUTONUMLGL field at the beginning of each heading paragraph. The numbers reflect the heading levels that correspond to the heading styles. If an AUTONUMLGL field is inserted in paragraphs of body text paragraphs not formatted with built-in heading styles, the number of the preceding heading is included in the paragraph number. [*Note:* This field is supported for legacy reasons, It is recommended that LISTNUM (Part 1, §17.16.5.33) be used instead. *end note*]

This field only makes sense in terms of multi-level headings. Given the following headings:

```
Heading 1
Heading 2
Heading 2
Heading 1
```

this field allows

- 1. Heading 1
- 1.1. Heading 2
- 1.2. Heading 2
- 2. Heading 1

At each level, the numbering sequence does two things—it increments specific to that level, and it includes the value from the previous level.

The XML generated for a complex field implementation shall not have the optional field value stored.

**Field Value:** A new paragraph number in ascending sequential order.

**Switches:** Zero or one of the *general-formatting-switches*, or zero or more of the following *field-specific-switches*.

|                                       |                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\e</code>                       | Removes the trailing separator (period).                                                                                                              |
| <code>\s <i>field-argument</i></code> | <i>text</i> in this switch's <i>field-argument</i> specifies the separator character to be used. If <code>\s</code> is omitted, a period (.) is used. |

[*Example:* When the following fields are updated:

```
AUTONUMLGL
AUTONUMLGL \* Arabic \s :
AUTONUMLGL \* alphabetic \s " "xxx
AUTONUMLGL \* ROMAN
AUTONUMLGL \e xxx
```

The results are:

```
1.
2:
c xxx
IV.
5xxx
```

*end example]*

### 14.9.4.3 AUTONUMOUT

**Syntax:**

AUTONUMOUT

**Description:** Use the nine built-in heading styles to format headings in the document, and then insert an AUTONUMOUT field at the beginning of each heading paragraph. The numbers reflect the heading levels that

correspond to the heading styles. [*Note: This field is supported for legacy reasons, It is recommended that LISTNUM (Part 1, §17.16.5.33) be used instead. end note*]

The XML generated for a complex field implementation shall not have the optional field value stored.

This field allows the numbering to be incremented based on the heading level. Given the following:

```
{AutoNumOut} Heading 1
{AutoNumOut} Heading 2
{AutoNumOut} Heading 2
{AutoNumOut} Heading 1
```

results in

```
I. Heading 1
A. Heading 2
B. Heading 2
II. Heading 1
```

**Field Value:** A paragraph number.

**Switches:** None.

[*Example:* When the following fields are updated:

```
AUTONUMOUT
AUTONUMOUT
```

The results are:

```
1.
2.
```

*end example*]

#### 14.9.4.4 BARCODE

**Syntax:**

```
BARCODE field-argument [ switches ]
```

**Description:** Produces a postal bar code in a machine-readable form of address used by the U.S. Postal Service. The barcode is in the form of either a POSTNET delivery-point bar code or a Facing Identification Mark (FIM). *text* in *field-argument* can be either a postal address or a bookmark name. In the case of a postal address, all that is needed is a 5-digit or 9-digit ZIP code; the rest of the address is superfluous.

**Field Value:** A postal bar code.

**Switches:** Zero or more of the following *field-specific-switches*.

|                                       |                                                                                                                                                                        |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\b</code>                       | Indicates that <i>text</i> in <i>field-argument</i> is the name of a bookmark.                                                                                         |
| <code>\f <i>field-argument</i></code> | Inserts a Facing Identification Mark (FIM). <i>text</i> in this switch's <i>field-argument</i> shall be either "A" (courtesy reply mark) or "C" (business reply mark). |
| <code>\u</code>                       | Indicates that <i>text</i> in <i>field-argument</i> is a U.S. postal address.                                                                                          |

[*Example:* Consider the case in which PostalAddress is the name of a bookmark for the text "2051 Swans Neck Way, Reston VA 20191". When the following fields are updated:

```
BARCODE 20191
BARCODE 20191 \u
BARCODE 20191-4023 \u
BARCODE "2051 Swans Neck Way, Reston VA 20191" \u
BARCODE "2051 Swans Neck Way, Reston VA 20191" \f A
BARCODE 20191 \f C
BARCODE PostalAddress \b \f A
```

The results are:

*end example]*

#### 14.9.4.5 BIDIOUTLINE

##### Syntax:

BIDIOUTLINE

**Description:** This field is identical to the AUTONUMGL field (§14.9.4.3), except for the separator that delimits each level of the paragraph numbering (this field uses a hyphen-minus (U+002D) instead of a full stop (U+002E) character as the default separator character).

**Field Value:** A new paragraph number in ascending sequential order, as defined by the description in §14.9.4.3.

**Switches:** None.

#### 14.9.4.6 EQ

##### Syntax:

EQ [ *switches* ] ( *eq-argument-list* ) [ *switches* ]

*eq-argument-list* is a list of arguments separated using a separator character. For implementations using a period (.) as the radix point, the separator character is a comma (,). For implementations using a comma (,) as the radix point, the separator character is a semicolon (;).

**Description:** Computes the specified mathematical equation.

**Field Value:** The result of the specified mathematical equation. [Note: The result of an EQ field can be used as an argument in another EQ field's *eq-argument-list*. end note]

**Switches:** The left-hand *switches* can only be one of the following: \a, \b, \d, \f, \i, \l, \o, \r, \s, and \x. Each of these switches has one or more subswitches, as shown below.

\a produces an array using the argument values in *eq-argument-list* (which are in row-major order) and the *field-specific-switches* below:

|                           |                                                                                                                                                         |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| \ac                       | Alignment is centered in each array column.                                                                                                             |
| \al                       | Alignment is left in each array column.                                                                                                                 |
| \ar                       | Alignment is right in each array column.                                                                                                                |
| \co <i>field-argument</i> | The number of columns in the array is specified by <i>text</i> in this switch's <i>field-argument</i> . In the absence of this switch, the number is 1. |
| \hs <i>field-argument</i> | Adds the integral number of points of horizontal spacing specified by <i>text</i> in this switch's <i>field-argument</i> between columns.               |
| \vs <i>field-argument</i> | Adds the integral number of points of vertical spacing specified by <i>text</i> in this switch's <i>field-argument</i> between lines.                   |

`\b` brackets the single element in *eq-argument-list* in a size appropriate for that element. The default form of brackets is parentheses. The *field-specific-switches* below can be used:

|                        |                                                                                                                                                                                                                                               |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\bc \char</code> | Uses the character designated by <i>char</i> as both the left and right bracket character. However, if <i>char</i> is {, [, (, or <, that character is used for the left bracket, and }, ], ), or >, respectively, is used for right bracket. |
| <code>\lc \char</code> | Uses the character designated by <i>char</i> as the left bracket character.                                                                                                                                                                   |
| <code>\rc \char</code> | Uses the character designated by <i>char</i> as the right bracket character.                                                                                                                                                                  |

`\d` Controls where the next character following the EQ field is drawn (that is, the displacement). *eq-argument-list* shall have no arguments. The *field-specific-switches* below can be used:

|                                 |                                                                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>\ba field-argument</code> | Draws to the left (backward) the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> . |
| <code>\fo field-argument</code> | Draws to the right (forward) the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> . |
| <code>\li</code>                | Underlines the space up to the next character.                                                                               |

`\f` Creates a fraction with the first argument as numerator and the second argument as denominator, centered above and below the division line, respectively. *eq-argument-list* shall have exactly two arguments. There are no *field-specific-switches* for this switch.

`\i` Creates an integral using the specified or default symbol and three elements. The first argument is the lower limit, the second is the upper limit, and the third is the integrand. *eq-argument-list* shall have exactly three arguments. The *field-specific-switches* below can be used:

|                        |                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\fc \char</code> | Uses the character designated by <i>char</i> as the fixed-height character for the symbol.                                                         |
| <code>\in</code>       | Uses an inline format with the limits displayed to the right of the symbol instead of above and below it.                                          |
| <code>\pr</code>       | Uses the symbol Capital pi and creates a product.                                                                                                  |
| <code>\su</code>       | Uses the symbol Capital sigma and creates a summation.                                                                                             |
| <code>\vc \char</code> | Uses the character designated by <i>char</i> as the variable-height character for the symbol. The symbol matches the height of the third argument. |

`\lf` Creates a list from an arbitrary number of arguments. There are no *field-specific-switches* for this switch.

`\o` Using an arbitrary number of arguments, displays each successive argument on top of the previous one. Each character is displayed within an invisible character box, with the switches being available to align the boxes on top of one another. The *field-specific-switches* below can be used:

|                  |                                               |
|------------------|-----------------------------------------------|
| <code>\ac</code> | Alignment character box center (the default). |
| <code>\al</code> | Alignment character box left.                 |
| <code>\ar</code> | Alignment character box right.                |

`\r` Creates a radical. *eq-argument-list* shall have either one or two arguments. If it has one argument, the result is the square root of that argument. If it has two arguments, the result is the *n*th root of the second argument, where *n* is the first argument. There are no *field-specific-switches* for this switch.

`\s` Creates a subscript or superscript. One or more arguments are permitted. If more than one element is specified, the elements are stacked and left-aligned. The *field-specific-switches* below can be used:

|                                 |                                                                                                                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\ai field-argument</code> | Adds space above a line in a paragraph by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> . The default is 2 points.          |
| <code>\di field-argument</code> | Adds space below a line in a paragraph by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .                                   |
| <code>\do field-argument</code> | Moves a single argument below the adjacent text by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> . The default is 2 points. |
| <code>\up field-argument</code> | Moves a single argument above the adjacent text by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .                          |

`\x` Creates one or more border segments around a single argument. By default, all four borders are added. *eq-argument-list* shall have no arguments. The *field-specific-switches* below can be used:

|                  |                                                       |
|------------------|-------------------------------------------------------|
| <code>\bo</code> | Draws a horizontal border below the argument.         |
| <code>\le</code> | Draws a vertical border to the left of the argument.  |
| <code>\ri</code> | Draws a vertical border to the right of the argument. |
| <code>\to</code> | Draws a horizontal border above the argument.         |

[Example: When the following fields are updated:

```
EQ \a \co 2 \ac \hs 10 ( 1000, 20, A, Sunday )
EQ \b \bc \l ( -100 ) EQ \b \bc \l ( \r(3, a + b)
xx EQ \d \fo 20 ( ) xx EQ \d \fo 30 \li ( )xx
EQ \f ( 1, 32 ) EQ \f ( 7, 64 )
EQ \i ( 0, ∞, x ) EQ \i \su \in ( 0, 10, x ) EQ \i \pr \in ( 0, 5, x )
EQ \i \fc \{ ( 0, 5, \f (x, 0.34) ) EQ \i \vc \{ ( 0, 5, \f (x, 0.34) )

EQ \l ( 0, 10 )
EQ \b \lc \l ( \rc \l ( \l (0, 10))
```

$\text{EQ}\backslash\text{o}(0,0,0)\text{EQ}\backslash\text{o}(0,+)\text{EQ}\backslash\text{o}\backslash\text{ar}(0,|,_{-})$   
 $\text{EQ}\backslash\text{r}(2)\text{EQ}\backslash\text{r}(2,x)$   
 $a\text{EQ}\backslash\text{s}\backslash\text{up}(2)+b\text{EQ}\backslash\text{s}\backslash\text{up}(2)$   
 $a\text{EQ}\backslash\text{x}(+)b\text{aEQ}\backslash\text{x}\backslash\text{to}\backslash\text{le}(+)b\text{aEQ}\backslash\text{x}\backslash\text{bo}\backslash\text{ri}(+)b$

The results are:

1000 20  
A Sunday  
| -100 |  $\left|\sqrt[3]{a+b}\right|$

14.9.4.7 INFO

**Syntax:**

INFO info-category [*field-argument*] [*switches*]

This field is documented for purposes of backwards compatibility. Each permitted value for *info-category* is also permitted as a *field-type*. Instances of the INFO field shall be treated as an instance of the *field-type* with the same value as *info-category*; that is, as if the INFO token was not present.

#### 14.9.4.8 QUOTE

This field retrieves the text specified by *text* in *field-argument*. In strict conformance mode, this text may include any other fields except SYMBOL. However, in transitional conformance mode, this text may include any other fields except AUTONUM, AUTONUMLGL, AUTONUMOUT, and SYMBOL.

#### 14.9.5 fldData (Custom Field Data)

This element specifies custom field data which shall be associated with the parent field. No information or semantics are applied to the contents of this data by ISO/IEC 29500, and therefore this field can be used as desired to store additional application-defined data with the field. However, applications should not lose the contents of this custom data if they do not understand or utilize it (i.e. the information should continue to be saved with the file).

If this element is omitted, then no custom field data is stored with the parent field. If the type attribute of the current field character is not *start*, then this setting can be ignored.

[*Example*: Consider the following WordprocessingML fragment for a complex field:

```
<w:r>
  <w:fldChar w:fldCharType="start">
    <w:fldData xml:space="preserve">///3645ERKJHE</w:fldData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText>PRIVATE</w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate" />
</w:r>
...
```

The fldData element contains custom data stored with this PRIVATE field (Part 1, §17.16.5.48), the contents of which are determined by a hosting application. *end example*]

| Attributes                                                                             | Description                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xml:space (Content Contains Significant Whitespace)<br>Namespace:<br>http://www.w3.org | Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.<br><br>[ <i>Example</i> : Consider the following run contained within a WordprocessingML document:<br><br><w:r> |

| Attributes           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| g/XML/1998/namespace | <p><code>&lt;w:t&gt;    significant whitespace    &lt;/w:t&gt;</code><br/> <code>&lt;/w:r&gt;</code></p> <p>Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is subject to the space preservation rules currently specified in that run's scope. <i>end example</i></p> <p>The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_Text](#)) is located in §A.1. *end note*]

#### 14.9.6 fldData (Custom Field Data)

This element specifies custom field data which shall be associated with the parent field. No information or semantics are applied to the contents of this data by ISO/IEC 29500, and therefore this field can be used as desired to store additional application-defined data with the field. However, applications should not lose the contents of this custom data if they do not understand or utilize it (i.e. the information should continue to be saved with the file).

If this element is omitted, then no custom field data is stored with the parent field.

[Example: Consider the following WordprocessingML fragment for a simple field:

```
<w:fldSimple w:instr="PRIVATE">
  <w:fldData xml:space="preserve">///3645ERKJHE</w:fldData>
</w:fldSimple>
```

The fldData element contains custom data stored with this PRIVATE field (Part 1, §17.16.5.48), the contents of which are determined by a hosting application. *end example*]

| Attributes                                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>xml:space (Content Contains Significant Whitespace)</p> <p>Namespace:<br/>http://www.w3.org/XML/1998/namespace</p> | <p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>[Example: Consider the following run contained within a WordprocessingML document:</p> <p><code>&lt;w:r&gt;</code><br/> <code>&lt;w:t&gt;    significant whitespace    &lt;/w:t&gt;</code><br/> <code>&lt;/w:r&gt;</code></p> <p>Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is subject to the space preservation rules currently specified in that run's scope. <i>end example</i>]</p> <p>The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.</p> |

[Note: The W3C XML Schema definition of this element's content model (CT\_Text) is located in §A.1. *end note*]

### 14.9.7 hyperlink (Hyperlink) (Part 1, §17.16.22)

| Attributes                                                                       | Description                                        |
|----------------------------------------------------------------------------------|----------------------------------------------------|
| id (Hyperlink Target)<br>Namespace:<br>.../officeDocument<br>/2006/relationships | The same as the id attribute in Part 1, §17.16.22. |

## 14.10 Simple Types

The following additional simple type information in the <http://schemas.openxmlformats.org/wordprocessingml/2006/main> namespace is used for documents of a transitional conformance class.

### 14.10.1 Additional member types for the union in ST\_DecimalNumberOrPercent (Part 1, §17.18.11)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_UnqualifiedPercentage simple type (§14.10.10).

### 14.10.2 Additional enumeration values for ST\_Jc (Part 1, §17.18.44)

The following additional enumeration values can be specified for a document of a transitional conformance class.

| Enumeration Value              | Description                       |
|--------------------------------|-----------------------------------|
| left (Align to Leading Edge)   | Semantically equivalent to start. |
| right (Align to Trailing Edge) | Semantically equivalent to end.   |

### 14.10.3 Additional enumeration values for ST\_JcTable (Part 1, §17.18.45)

The following additional enumeration values can be specified for a document of a transitional conformance class.

| Enumeration Value             | Description                                                                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| left (Align to Starting Edge) | Specifies that the table shall be aligned to the leading edge of the text flow – the left text margin (for a left-to-right table); or the right text margin (for a right-to-left table) in the document. (See Part 1, §17.4.1) |

| Enumeration Value              | Description                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| right (Align to Trailing Edge) | Specifies that the table shall be aligned to the trailing edge of the text flow – the right text margin (for a left-to-right table); or the left text margin (for a right-to-left table) in the document. (See Part 1, §17.4.1) |

#### 14.10.4 Additional enumeration values for ST\_NumberFormat (Part 1, §17.18.59)

| Enumeration Value                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| decimalFullWidth2 (Full Width Arabic Numerals Alternate) | <p>Specifies that the sequence shall consist of a set of full-width Arabic numbering.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and 0 (represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 0–9 is U+FF10–U+FF19, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> <li>1. Divide the value by 10 and write the symbol which represents the remainder.</li> <li>2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing position.</li> <li>3. Repeat step 2 until the remaining value is equal to zero.</li> </ol> <p>[Example: The numbering for the items should be represented by the following pattern: 1, 2, 3, ..., 8, 9, 10, 11, 12, ..., 18, 19, 20, 21, ... <i>end example</i>]</p> |

#### 14.10.5 Additional enumeration values for ST\_StyleSort (Part 1, §17.18.82)

The following additional enumeration values can be specified for a document of a transitional conformance class.

| Enumeration Value             | Description                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| 0000 (Sort by Style Name)     | Specifies that styles which are visible should be sorted by their names.                                                         |
| 0001 (Sort by Style Priority) | Specifies that styles which are visible should be sorted by their UI priority using the uiPriority element (Part 1, §17.7.4.19). |
| 0002 (Sort by Default Method) | Specifies that styles which are visible should be sorted                                                                         |

| Enumeration Value             | Description                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|                               | by the default sorting of the host application.                                                                                              |
| 0003 (Sort by Font)           | Specifies that styles which are visible should be sorted by the font which they apply.                                                       |
| 0004 (Sort by Based On Style) | Specifies that styles which are visible should be sorted by the style on which they are based using the basedOn element (Part 1, §17.7.4.3). |
| 0005 (Sort by Style Type)     | Specifies that styles which are visible should be sorted by their style types (i.e. character, linked, paragraph).                           |

#### 14.10.6 Additional enumeration values for ST\_TabJc (Part 1, §17.18.84)

The following additional enumeration values can be specified for a document of a transitional conformance class.

| Enumeration Value    | Description                       |
|----------------------|-----------------------------------|
| left (Leading Tab)   | Semantically equivalent to start. |
| right (Trailing Tab) | Semantically equivalent to end.   |

#### 14.10.7 Additional enumeration values for ST\_TextDirection (Part 1, §17.18.93)

The following additional enumeration values can be specified for a document of a transitional conformance class.

| Enumeration Value                              | Description                     |
|------------------------------------------------|---------------------------------|
| btLr (Lines Flow From Left to Right)           | Semantically equivalent to lr.  |
| lrTb (Lines Flow From Top To Bottom)           | Semantically equivalent to tb.  |
| lrTbV (Lines Flow From Top to Bottom, Rotated) | Semantically equivalent to tbV. |
| tbLrV (Lines Flow From Left to Right, Rotated) | Semantically equivalent to lrV. |
| tbRl (Lines Flow From Right to Left)           | Semantically equivalent to rl.  |
| tbRlV (Lines Flow From Right to Left, Rotated) | Semantically equivalent to rlV. |

#### 14.10.8 Additional member types for the union in ST\_TextScale (Part 1, §17.18.95)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

The ST\_TextScaleDecimal simple type (§9.10.11).

#### 14.10.9 ST\_Cnf (Conditional Formatting Bitmask)

This simple type specifies the format for the set of conditional formatting properties that have been applied to this object.

These properties are expressed using a string serialization of a binary bitmask for each of the following properties (reading from the first character position right):

- First Row - Is this the first row of the table?
- Last Row - Is this the last row of the table?
- First Column - Does this belong to the first column of the table?
- Last Column - Does this belong to the last column of the table?
- Band 1 Vertical - Does this belong to a column which should receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered columns (e.g. 1,3,5,...)
- Band 2 Vertical - Does this belong to a column which should receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered columns (e.g. 2,4,6...)
- Band 1 Horizontal - Does this receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered rows (e.g. 1,3,5,...)
- Band 2 Horizontal - Does this receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered rows (e.g. 2,4,6...)
- NE Cell - Is this part of the top-right corner of the table?
- NW Cell - Is this part of the top-left corner of the table?
- SE Cell - Is this part of the bottom-right corner of the table?
- SW Cell - Is this part of the bottom-left corner of the table?

For each of these properties, a value of 1 in the specified character position in the string means that the value is true, a value of 0 means false. All values shall be specified.

[*Example:* Consider a paragraph in the top right corner of a table with a table style applied. This paragraph would need to specify the following WordprocessingML:

```
<w:p>
  <w:pPr>
    <w:cnfStyle w:val="101000000100" />
    ...
  </w:pPr>
  ...
</w:p>
```

This paragraph specifies that it has the conditional properties from the table style for the first column, first row, and the NW corner of the parent table by setting the appropriate bits in the val attribute. *end example]*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 12 characters.

- This simple type's contents shall match the following regular expression pattern: `[01]*`.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST\\_Cnf](#)) is located in §A.1. *end note*]

#### 14.10.10 ST\_UnqualifiedPercentage (Percentage Value Without Percent Sign)

This simple type specifies additional formats for percentage-based values which can only be used within the transitional conformance class.

Specifically, this value allows percentage-based values to be specified as follows:

- For the `w` attribute in `CT_TblWidth` (Part 1, §17.4.88), the value is stored in 50ths of a percent.
- For all other uses, the value is stored in whole percentage points.

[*Example*: Consider the following WordprocessingML fragment:

```
<w:tblW w:w="1000" w:type="pct" />
```

The `tblW` element is based on the `CT_TblWidth` complex type, and the type attribute's value is `pct`, which means that this value is measured in 50ths of a percent (i.e. 1000 is equal to 20%). *end example*]

This simple type's contents are a restriction of the W3C XML Schema integer datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST\\_UnqualifiedPercentage](#)) is located in §A.1. *end note*]

#### 14.10.11 ST\_TextScaleDecimal (Text Expansion/Compression Percentage)

This simple type specifies that the percentage by which the contents of a run shall be expanded or compressed with respect to its normal (100%) character width, with a minimum width of 1% and maximum width of 600%.

[*Example*: Consider a run of text which must be expanded to 300% when displaying each character within the contents of the run. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
  <w:w w:val="300"/>
</w:rPr>
```

This run explicitly declares that the `w` value is 300, so the contents of this run appear at 300% of their normal character width by expanding the width of each character. *end example*]

This simple type's contents are a restriction of the W3C XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 600.

## 14.11 Changed attributes

The following attributes, which are defined in subclauses within Part 1, §17, “WordprocessingML”, have different source relationships when used in documents of the Transitional conformance class:

### 14.11.1 Changed attribute for contentPart element (Part 1, §17.3.3.2)

| Attributes                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>id (Relationship to Part)</p> <p>Namespace:<br/>.../officeDocument/2006/relationships</p> | <p>Specifies the relationship ID to a specified part.</p> <p>The specified relationship shall match the relationship type required by the parent element:</p> <ul style="list-style-type: none"> <li>http://schemas.openxmlformats.org/officeDocument/2006/customXml for the contentPart element</li> <li>http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer for the footerReference element</li> <li>http://schemas.openxmlformats.org/officeDocument/2006/relationships/header for the headerReference element</li> <li>http://schemas.openxmlformats.org/officeDocument/2006/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements</li> <li>http://schemas.openxmlformats.org/officeDocument/2006/relationships/printerSettings for the printerSettings element</li> <li>http://schemas.openxmlformats.org/officeDocument/2006/relationships/hyperlink for the longDesc or hyperlink element</li> </ul> <p>[Example: Consider an XML element which has the following id attribute:</p> <pre>&lt;... r:id="rId1" /&gt;</pre> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |

### 14.11.2 Changed attribute for control element (Part 1, §17.3.3.3)

| Attributes                                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Embedded Control Properties Relationship Reference)<br><br>Namespace:<br>.../officeDocument/2006/relationships | <p>Specifies the relationship ID for the relationship that contains the properties for this embedded control. This property bag is contained in a separate part within the Office Open XML package.</p> <p>The relationship explicitly targeted by this attribute shall be of type <code>http://schemas.openxmlformats.org/officeDocument/2006/relationships/control</code> or the document shall be considered non-conformant.</p> <p>If this attribute is omitted, then the embedded control shall be given no property bag when instantiated.</p> <p>[<i>Example:</i> Consider the following WordprocessingML markup for an embedded control in a document:</p> <pre>&lt;w:control r:id="rId5" w:name="CheckBox1" w:shapeid="_x0000_s1027" /&gt;</pre> <p>The id attribute in the relationship reference namespace specifies that the relationship with relationship ID rId5 must contain the property data for this embedded control. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |

### 14.11.3 Changed attribute for movie element (Part 1, §17.3.3.17)

| Attributes                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 15.2 Workbook

### 15.2.1 Additional attribute for fileSharing element (Part 1, §18.2.12)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes                                       | Description                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reservationPassword (Write Reservation Password) | <p>Specifies the legacy hash of the password required for editing this workbook.</p> <p>The hash is generated using the logic defined in the revisionsPassword attribute of the workbookProtection element (Part 1, §18.2.29).</p> <p>The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§15.7.2).</p> |

### 15.2.2 Additional attribute for webPublishing element (Part 1, §18.2.24)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| codePage (Code Page) | <p>This attribute is used only for compatibility with the existing corpus of binary documents, and is ignored if the characterSet attribute is present. Specifies the encoding the application uses when a Web page is saved. A code page is a table that relates the binary character codes used by a program to keys on the keyboard or to the appearance of characters on the display. Code pages are a means of providing support for the languages used in different countries.</p> <p>[Note: There are a number of code page technologies. One example of potential values can be found at: <a href="http://www.unicode.org/Public/MAPPINGS/">http://www.unicode.org/Public/MAPPINGS/</a> end note]</p> <p>The default value for this attribute is the workbook's encoding.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

### 15.2.3 Additional attributes for workbookProtection element (Part 1, §18.2.29)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| revisionsPassword (Legacy Revisions Password) | <p>Specifies the legacy hash of the password required for unlocking revisions in this workbook. The hash is generated from an 8-bit wide character. The input string shall be in UTF-16LE format (if there is a leading BOM character (U+FEFF) in the encoded password it is removed before hash calculation), and these 16-bit Unicode characters shall be converted down to 8 bits before the hash is computed, using the following logic:</p> <p>[Note: This legacy conversion attempts to fit UTF-16 encoded characters into a single-</p> |

| Attributes | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p>byte character set. As such, if the input string uses characters from multiple character sets, many characters are unmapped in the destination character set and take on the default value, 0x3F. For this reason, it is recommended that applications choose a character set which maps the maximum number of characters from the input string and explicitly declare the character set used in the revisionsCharacterSet attribute. Not doing so will inhibit interoperability. <i>end note</i>]</p> <p>For SpreadsheetML password hash purposes, Unicode UTF-16 input code points are converted to a single or double byte character set.</p> <p>Code points with no representation in the target character set are replaced with Unicode character 0x3f (?).</p> <p>The values permitted by this attribute are names and aliases listed in the IANA character set listing found at <a href="http://www.iana.org/assignments/character-sets">http://www.iana.org/assignments/character-sets</a>.<br/>For single byte character sets, each Unicode code point is replaced by a single byte or 0x3f if an appropriate character doesn't exist in the character set.</p> <p>For double byte character sets, each Unicode code point is replaced by either a single byte, or a two byte sequence, depending on the input character, or 0x3f if an appropriate character doesn't exist in the character set. In our tables the target is a single byte sequence if the most significant byte is 0x00, otherwise it is a double byte sequence, with the lead byte being the most significant byte.</p> <p>To convert, first check if conversion is being done to a single or double byte code page and load the appropriate WCTABLE code page table.</p> <p>For each input character, look up the code point in the WCTABLE. There are 3 possibilities: Not found, single byte, or double byte.</p> <ul style="list-style-type: none"> <li>• If the input character is not found, append 0x3f and continue to the next character.</li> <li>• If the result is a single byte, check to make sure the entry in the MBTABLE matches the input. If it matches, append the single byte to the output. If it does not match, append 0x3f to the output.</li> <li>• If the result is a double byte, check to make sure the entry in the DBCSEENTRY table for the appropriate lead byte matches the input character. If it matches, append the lead byte and trail byte to the output. If it does not match, append 0x3f to the output.</li> </ul> <p>The following pseudocode describes how this conversion should be done:</p> <pre> int WideCharToMultiByte(wchar_t* wszInput, byte* szOutput) {     // Remember output start so we can return length     byte* szOutputStart = szOutput; </pre> |

#### 15.2.4 Modified content for Date Conversion for Serial Date-Times (Part 1, §18.17.4.1)

When interpreting a document of a transitional conformance class, Part 1, §18.17.4.1 is replaced by the following text:

A *serial date-time* is a number that represents a date and time. This signed value is in units of days relative to the base date for the selected date system. Serial date-times increase by 1 into each successive day, and decrease by 1 into each preceding day. Fractional portions of serial date-times represent fractions of a single day. [Example: When using the 1900 date system, which has a base date of 30<sup>th</sup> December 1899, a serial date-time of 1.5 represents midday on the 31<sup>st</sup> December 1899 (serial date-time day 1); that is, 1899-12-31T12:00. A serial date-time of -4.25 represents 6 pm on the 25<sup>th</sup> December 1899; that is, 1899-12-25T18:00. *end example*] The base dates and the related serial date-times represent local date and time.

Two different bases are used for converting dates to and from serial date-times:

- In the *1900 date system*, the lower limit is January 1, 1900, 00:00:00, which has a serial date-time of 1. The upper limit is December 31, 9999, 23:59:59, which has a serial date-time of 2,958,465.9999884. The base date for this date base system is December 31, 1899, which has a serial date-time of 0.
- In the *1904 date system*, the lower limit is January 1<sup>st</sup>, 0001, 00:00:00, which has a serial date-time of -695055. The upper limit is December 31<sup>st</sup>, 9999, 23:59:59.999, which has a serial date-time of 2,957,003.9999884. The base date for this system is midnight (00:00:00) on the morning of January 1<sup>st</sup>, 1904, which has a serial date-time of 0.

A serial date-time outside the temporal range for the selected date system is invalid.

The date system is specified by the value of the date1904 attribute of the workbookPr element. [Example:

1900 date system: <workbookPr showObjects="all"/>

1904 date system: <workbookPr date1904="1" showObjects="all"/>

*end example*]

## 15.3 Worksheets

### 15.3.1 Worksheets

#### 15.3.1.1 legacyDrawing (Legacy Drawing Reference)

This element is present when the sheet contains drawing shapes defined by VML. In this case, the element contains an explicit relationship whose ID points to the part containing the VML definitions.

[Example:

<drawing r:id="rId1"/>

*end example*]

| Attributes                       | Description                                                                                                                    |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)             | This value references a relationship Id for the sheet. The relationship shall point to the part containing the VML definition. |
| Namespace:<br>.../officeDocument | The possible values for this attribute are defined by the ST_RelationshipId simple type                                        |

| Attributes          | Description          |
|---------------------|----------------------|
| /2006/relationships | (Part 1, §22.8.2.1). |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_LegacyDrawing](#)) is located in §A.2.  
end note]

### 15.3.1.2 legacyDrawingHF (Legacy Drawing Reference in Header Footer)

This element specifies the explicit relationship to the part containing the VML defining pictures rendered in the header / footer of the sheet.

| Attributes                                              | Description                                                                                                                    |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)                                    | This value references a relationship Id for the sheet. The relationship shall point to the part containing the VML definition. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                   |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_LegacyDrawing](#)) is located in §A.2.  
end note]

### 15.3.1.3 Additional attribute for dataConsolidate element (Part 1, §18.3.1.29)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes                          | Description                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| leftLabels (Starting Column Labels) | Semantically equivalent to startLabels.<br><br>The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

### 15.3.1.4 Additional attributes for protectedRange element (Part 1, §18.3.1.71)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes                 | Description                                                                                                                                                                                                                                                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| password (Legacy Password) | Specifies the legacy hash of the password required for editing this range.<br><br>The hash is generated using the logic defined in the revisionsPassword attribute of the workbookProtection element (Part 1, §18.2.29).<br><br>The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§15.7.2). |

| Attributes                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| securityDescriptor<br>(Security Descriptor) | <p>Optional setting to specify the relative security descriptor. The security descriptor defines user accounts who can edit this range without providing a password to access the range.</p> <p>The format of a securityDescriptor is application defined; however, it is recommended that the following format be used for interoperability between implementations:</p> <ul style="list-style-type: none"> <li><code>username@domain</code></li> </ul> <p>If multiple user accounts are specified in the securityDescriptor attribute, each account shall be delimited by parentheses.</p> <p>[Example: This example demonstrates two user accounts in the security descriptor attribute:</p> <pre>&lt;protectedRanges&gt;   &lt;protectedRange sqref="A1:C5" name="Range1"     securityDescriptor="(user1@iso.org)(user2@iso.org)"/&gt; &lt;/protectedRanges&gt;</pre> <p>end example]</p> <p>If an application is unable to resolve the meaning of the securityDescriptor, it shall treat the attribute as if it had been removed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

#### 15.3.1.5 Additional attribute for sheetProtection element (Part 1, §18.3.1.84)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes             | Description                                                                                                                                                                                                                                                                                                                               |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| password<br>(Password) | <p>Specifies the hash of the password required for editing this chart sheet.</p> <p>The hash is generated using the logic defined in the revisionPassword attribute of the workbookProtection element (Part 1, §18.2.29).</p> <p>The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§15.7.2).</p> |

#### 15.3.1.6 Additional attribute for sheetProtection element (Part 1, §18.3.1.85)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes                 | Description                                                                    |
|----------------------------|--------------------------------------------------------------------------------|
| password (Legacy Password) | Specifies the legacy hash of the password required for editing this worksheet. |

| Attributes | Description                                                                                                                                                                                                                                               |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p>The hash is generated using the logic defined in the revisionsPassword attribute of the workbookProtection element (Part 1, §18.2.29).</p> <p>The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§15.7.2).</p> |

## 15.3.2 AutoFilter Settings

### 15.3.2.1 Attributes with modified descriptions for dynamicFilter element (Part 1, §18.3.2.5)

The following attributes have modified descriptions when specified for a document of a transitional conformance class:

| Attributes         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| maxVal (Max Value) | <p>A maximum value for dynamic filter. maxVal/maxValIso shall be required for today, yesterday, tomorrow, nextWeek, thisWeek, lastWeek, nextMonth, thisMonth, lastMonth, nextQuarter, thisQuarter, lastQuarter, nextYear, thisYear, lastYear, and yearToDate.</p> <p>The above criteria are based on a value range. [<i>Example: If today's date is September 22nd, then the range for thisWeek is the values greater than or equal to September 17 and less than September 24. end example</i>] In the thisWeek range, the lower value is expressed using val or valIso. The higher value is expressed using maxVal or maxValIso.</p> <p>These dynamic filter shall not require val/valIso or maxVal/maxValIso:<br/>Q1, Q2, Q3, Q4,<br/>M1, M2, M3, M4, M5, M6, M7, M8, M9, M10, M11 and M12.</p> <p>The above criteria shall not specify the range using val/valIso and maxVal/maxValIso because Q1 always starts from M1 to M3, and M1 is always January.</p> <p>These types of dynamic filters shall use val and shall not use maxVal/maxValIso: aboveAverage and belowAverage.</p> <p>If maxValIso and maxVal are both present, maxValIso shall take precedence.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p> |
| val (Value)        | <p>A minimum numeric or serial date value for dynamic filter. (See description of ValIso to understand when val is required.)</p> <p>If valIso and val are both present, valIso shall take precedence.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| valIso (ISO Value) | <p>A minimum date value for dynamic filter. (See description of maxVal/maxValIso to</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Attributes | Description                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------|
|            | understand when val/valIso is required.)<br><br>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype. |

## 15.4 Styles

### 15.4.1 left (Leading Edge Border)

Semantically equivalent to start (Part 1, §18.8.37).

| Attributes         | Description                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| style (Line Style) | The line style for this border.<br><br>The possible values for this attribute are defined by the ST_BorderStyle simple type (Part 1, §18.18.3). |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_BorderPr](#)) is located in §A.2. *end note*]

### 15.4.2 right (Trailing Edge Border)

Semantically equivalent to end (Part 1, §18.8.16).

| Attributes         | Description                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| style (Line Style) | The line style for this border.<br><br>The possible values for this attribute are defined by the ST_BorderStyle simple type (Part 1, §18.18.3). |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_BorderPr](#)) is located in §A.2. *end note*]

## 15.5 Pivot Tables

### 15.5.1 Pivot Tables

#### 15.5.1.1 Additional attribute for pivotCacheDefinition element (Part 1, §18.10.1.67)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes                        | Description                                                                                                                                                                |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| refreshedDate<br>(PivotCache Last | Specifies the date when the cache was last refreshed. This attribute depends on whether the application exposes mechanisms via the user interface whereby the end-user can |

| Attributes      | Description                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refreshed Date) | <p>refresh the cache.</p> <p>If refreshedDateIso and refreshedDate are both present, refreshedDateIso shall take precedence.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p> |

## 15.6 External Data Connections

### 15.6.1 Additional attribute for textPr element (Part 1, §18.13.12)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| codePage (Code Page) | <p>Code page associated with the text file. This attribute is used only for backwards compatibility, and is ignored if the characterSet attribute is present.</p> <p>[Note: There are a number of code page technologies. One example of potential values can be found at: <a href="http://www.unicode.org/Public/MAPPINGS">http://www.unicode.org/Public/MAPPINGS</a> end note]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

## 15.7 Simple Types

The following additional simple type information in the <http://schemas.openxmlformats.org/spreadsheetml/2006/main> namespace is used for documents of a transitional conformance class.

### 15.7.1 Additional enumeration values for ST\_PivotAreaType (Part 1, §18.18.58)

The following additional enumeration values can be specified for a document of a transitional conformance class.

| Enumeration Value                    | Description                        |
|--------------------------------------|------------------------------------|
| topRight (Top Corner, Trailing Edge) | Semantically equivalent to topEnd. |

### 15.7.2 ST\_UnsignedShortHex (Unsigned Short Hex)

This simple type defines the Hex representation of an unsigned short.

This simple type's contents are a restriction of the W3C XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 4 hexadecimal digit(s).

[Note: The W3C XML Schema definition of this simple type's content model ([ST\\_UnsignedShortHex](#)) is located in §A.2. *end note*]

### 15.7.3 Removed enumeration values for ST\_CellType (Part 1, §18.18.11)

For transitional documents, the restriction on the simple type ST\_CellType having the value “d” (ISO 8601 format) is removed.

## 15.8 Formulas

### 15.8.1 Attribute synonym for c element (Part 1, §18.6.1)

The following additional attribute can be specified for a document of a transitional conformance class:

| Attributes           | Description                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| ref (Cell Reference) | An A-1 style reference to a cell. The possible values for this attribute are defined by the ST_CellRef simple type (Part 1, §18.18.7). |

This attribute is semantically equivalent to r (Part 1, §18.6.1).

Only one or the other of r and ref can be defined in any given instance.

### 15.8.2 Additional representation for dates and times (Part 1, §18.17.4)

For a document of a transitional conformance class, each unique instant in SpreadsheetML time shall be stored as an ISO 8601-formatted string or as a serial value.

## 15.9 Changed attributes

The following attributes, which are defined in subclauses within Part 1, §18, “SpreadsheetML”, have different source relationships when used in documents of the Transitional conformance class:

### 15.9.1 Changed attribute for externalReference element (Part 1, §18.2.8)

| Attributes                                                                          | Description                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)<br><br>Namespace:<br>.../officeDocument<br>/2006/relationships | Specifies a unique identifier that is used to identify a relationship to another part in the file. Relationship identifiers link the element definition with the part where data for the element is stored.<br><br>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 15.9.2 Changed attribute for pivotCache element (Part 1, §18.2.17)

| Attributes                                                   | Description                                                                                                               |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)<br><br>Namespace:<br>.../officeDocument | Specifies the identifier to a pivot cache definition part where cached data is stored.<br><br>This attribute is required. |

| Attributes          | Description                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------|
| /2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 15.9.3 Changed attribute for sheet element (Part 1, §18.2.19)

| Attributes                       | Description                                                                                                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)             | Specifies the identifier of the sheet part where the definition for this sheet is stored.                    |
| Namespace:<br>.../officeDocument | This attribute is required.                                                                                  |
| /2006/relationships              | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 15.9.4 Changed attribute for control element (Part 1, §18.3.1.19)

| Attributes                       | Description                                                                                                                                                           |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)             | This relationship ID references an Embedded Control Data part that contains control-specific properties and state information about this particular embedded control. |
| Namespace:<br>.../officeDocument | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                          |
| /2006/relationships              |                                                                                                                                                                       |

### 15.9.5 Changed attribute for controlPr element (Part 1, §18.3.1.20)

| Attributes                                           | Description                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship ID for Embedded Control Properties) | Specifies the relationship ID for the relationship which contains the properties for this embedded control. This property bag is contained in a separate part within the package.                                                                                                                              |
| Namespace:<br>.../officeDocument                     | The relationship explicitly targeted by this attribute shall be of relationship type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/control">http://schemas.openxmlformats.org/officeDocument/2006/relationships/control</a> or the document shall be considered non-conformant. |
| /2006/relationships                                  | If this attribute is omitted, then the embedded control shall be given no property bag when instantiated.                                                                                                                                                                                                      |
|                                                      | [Example: Consider the following WordprocessingML markup for an embedded control in a document:                                                                                                                                                                                                                |
|                                                      | <pre>&lt;w:control r:id="rId5" w:id="CheckBox1" w:name="CheckBox1" w:shapeid="_x0000_s1027" w:class="shape" w:w="145" w:h="28" w:align="left" /&gt;</pre>                                                                                                                                                      |
|                                                      | The id attribute in the relationship reference namespace specifies that the relationship with relationship ID rId5 must contain the property data for this embedded control. <i>end example</i>                                                                                                                |

| Attributes | Description                                                                                                  |
|------------|--------------------------------------------------------------------------------------------------------------|
|            | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 15.9.6 Changed attribute for customPr element (Part 1, §18.3.1.22)

| Attributes                                                                          | Description                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)<br><br>Namespace:<br>.../officeDocument<br>/2006/relationships | This relationship references the binary part containing the specified custom properties.<br><br>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 15.9.7 Changed attribute for dataRef element (Part 1, §18.3.1.30)

| Attributes                                                                          | Description                                                                                                                                                                       |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (relationship Id)<br><br>Namespace:<br>.../officeDocument<br>/2006/relationships | Used only when the source range is external to this workbook.<br><br>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 15.9.8 Changed attribute for drawing element (Part 1, §18.3.1.36)

| Attributes                                                                          | Description                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship id)<br><br>Namespace:<br>.../officeDocument<br>/2006/relationships | Relationship Id referencing a part containing DrawingML definitions for this worksheet.<br><br>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 15.9.9 Changed attribute for drawingHF element (Part 1, §18.3.1.37)

| Attributes                                                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship ID for Embedded Control Properties)<br><br>Namespace:<br>.../officeDocument<br>/2006/relationships | Specifies the relationship ID for the relationship to the DrawingML part that contains the drawing objects used in the header and footer. This DrawingML part is a separate part within the package.<br><br>[Example:<br><br><drawingHF r:id="rId2" lho="7" lhf="6"/><br><br>The id attribute in the relationship reference namespace specifies that the relationship with relationship ID rId5 must contain the drawing objects used in the header and |

| Attributes | Description                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p>footer. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |

#### 15.9.10 Changed attribute for hyperlink element (Part 1, §18.3.1.47)

| Attributes                                                                                   | Description                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>id (Relationship Id)</p> <p>Namespace:<br/>.../officeDocument<br/>/2006/relationships</p> | <p>Relationship Id in this sheet's relationships part, expressing the target location of the resource.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |

#### 15.9.11 Changed attribute for objectPr element (Part 1, §18.3.1.56)

| Attributes                                                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>id (Relationship ID to Embedded Object Data)</p> <p>Namespace:<br/>.../officeDocument<br/>/2006/relationships</p> | <p>Specifies the relationship ID for the relationship that targets the Embedded Object Part containing the embedded object data.</p> <p>The specified relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/oleObject">http://schemas.openxmlformats.org/officeDocument/2006/oleObject</a> or the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider an XML element which has the following id attribute:</p> <pre>&lt;... r:id="rId1" /&gt;</pre> <p>The markup specifies the associated relationship part with relationship ID rId1 targets the part containing the corresponding embedded object information. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |

#### 15.9.12 Changed attribute for oleObject element (Part 1, §18.3.1.59)

| Attributes                                                                                   | Description                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>id (Relationship Id)</p> <p>Namespace:<br/>.../officeDocument<br/>/2006/relationships</p> | <p>Relationship Id of the relationship pointing to the object persistence part.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |

**15.9.13 Changed attribute for pageSetup element (Part 1, §18.3.1.63)**

| Attributes                                              | Description                                                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| id (Id)                                                 | Relationship Id of the devMode printer settings part.                                                        |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

**15.9.14 Changed attribute for pageSetup element (Part 1, §18.3.1.64)**

| Attributes                                              | Description                                                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| id (Id)                                                 | Relationship Id of the devMode printer settings part.                                                        |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

**15.9.15 Changed attribute for picture element (Part 1, §18.3.1.67)**

| Attributes                                              | Description                                                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)                                    | Relationship Id pointing to the image part.                                                                  |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

**15.9.16 Changed attribute for pivotSelection element (Part 1, §18.3.1.69)**

| Attributes                                              | Description                                                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)                                    | Relationship Id pointing to the particular PivotTable Part corresponding to this selection.                  |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

**15.9.17 Changed attribute for tablePart element (Part 1, §18.3.1.94)**

| Attributes                                              | Description                                                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)                                    | This relationship Id is used to locate a particular table definition part.                                   |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

| Attributes | Description |
|------------|-------------|
| ps         |             |

#### 15.9.18 Changed attribute for pivotCacheDefinition element (Part 1, §18.10.1.67)

| Attributes                                              | Description                                                                                                                             |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)                            | Specifies the unique identifier that corresponds to the related pivotCacheRecords part. See (Part 1, §18.10.1.68) for more information. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                            |

#### 15.9.19 Changed attribute for rangeSet element (Part 1, §18.10.1.79)

| Attributes                                              | Description                                                                                                                            |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)                                    | Specifies the unique identifier of the Workbook part where the range set is stored. See Workbook (Part 1, §18.2) for more information. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                           |

#### 15.9.20 Changed attribute for worksheetSource element (Part 1, §18.10.1.95)

| Attributes                                              | Description                                                                                                                               |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Id)                                    | Specifies the identifier to the Sheet part whose data is stored in the cache. See the Sheet section (Part 1, §18.2) for more information. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                              |

#### 15.9.21 Changed attribute for header element (Part 1, §18.11.1.1)

| Attributes                                              | Description                                                                                                                                                                                                                                            |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship ID)                                    | This is the ID that is used to find the corresponding log record of the changes made for this header.                                                                                                                                                  |
| Namespace:<br>.../officeDocument<br>/2006/relationships | Use the corresponding relationship expressed in the revisionHeaders part to locate the log record that lists the specific changes.<br><br>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 15.9.22 Changed attribute for externalBook element (Part 1, §18.14.7)

| Attributes                                          | Description                                                                                                                                                                                                                                            |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship to supporting book file path)      | Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the worksheet XML file in the current SpreadsheetML document ZIP archive that makes use of this externalbook. |
| Namespace:<br>.../officeDocument/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                                                                           |

### 15.9.23 Changed attribute for oleLink element (Part 1, §18.14.11)

| Attributes                                          | Description                                                                                                                                                                            |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Object Link Relationship)                       | Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the external file name used for this oleLink. |
| Namespace:<br>.../officeDocument/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                           |

## 16.2 Presentation

### 16.2.1 Presentation Properties

#### 16.2.1.1 htmlPubPr (HTML Publishing Properties)

This element specifies the publishing properties to be used when publishing this presentation document to the HTML file format. The target output profile is identified by the contents of the target attribute.

| Attributes                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |       |        |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|--------|
| id (Publish Path)                                       | Specifies the path that should be used when publishing.                                                                                                                                                                                                                                                                                                                                                                            |       |        |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                                                                                                                                                                                                                                                       |       |        |
| showSpeakerNotes<br>(Show Speaker Notes)                | Specifies whether to show speaker notes when publishing.<br><br>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.                                                                                                                                                                                                                                                                         |       |        |
| target (Target Output Profile)                          | Specifies the version of HTML output targeted by the output of any web page produced by this document. This attribute shall only contain a string that represents an output profile defined by published standards and W3C recommendations. Product names shall not be used to define a profile.<br><br>The following reserved values and their targets are listed below: <table> <tr> <th>Value</th><th>Target</th></tr> </table> | Value | Target |
| Value                                                   | Target                                                                                                                                                                                                                                                                                                                                                                                                                             |       |        |

| Attributes                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |                       |

#### 16.2.1.2 webPr (Web Properties)

This element specifies all general output properties that pertain to generating a web format version of the presentation document.

| Attributes                                    | Description                                                                                                                                                                                     |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| allowPng (Allow PNG in HTML output)           | <p>Specifies whether to allow the output of PNG format pictures in the HTML document.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>     |
| clr (Slide Navigation Colors for HTML output) | <p>Specifies the color constraints that are to be used when generating HTML output.</p> <p>The possible values for this attribute are defined by the ST_WebColorType simple type (§16.4.1).</p> |
| encoding (Encoding for HTML output)           | <p>Specifies the particular HTML character set encoding that should be used when generating output.</p>                                                                                         |

| Attributes                                            | Description                                                                                                                                                                                              |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                       | The possible values for this attribute are defined by the ST_WebEncoding simple type (§16.4.2).                                                                                                          |
| imgSz (Image size for HTML output)                    | Specifies the screen size for which the images in the HTML output should be optimized.<br><br>The possible values for this attribute are defined by the ST_WebScreenSize simple type (§16.4.3).          |
| organizeInFolders (Organize HTML output in folders)   | Specifies whether the supporting output files should be automatically organized into a folder.<br><br>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.         |
| relyOnVml (Rely on VML for HTML output)               | Specifies whether graphics should be output in VML within the HTML.<br><br>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.                                    |
| resizeGraphics (Resize graphics in HTML output)       | Specifies whether to resize graphics to fit within the browser window when generating the HTML output.<br><br>The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| showAnimation (Show animation in HTML output)         | Specifies whether to show presentation animation in the HTML output file.<br><br>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.                              |
| useLongFilenames (Use long file names in HTML output) | Specifies whether to allow the use of long file names when generating the HTML output.<br><br>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.                 |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_WebProperties](#)) is located in §A.3. end note]

### 16.2.1.3 Additional attributes for modifyVerifier element (Part 1, §19.2.1.19)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| algIdExt (Cryptographic Algorithm Extensibility) | Specifies that a cryptographic algorithm which was not defined by ISO/IEC 29500 has been used to generate the hash value stored with this document.<br><br>This value, when present, shall be interpreted based on the value of the algIdExtSource attribute in order to determine the algorithm used, which shall be application-defined.<br>[Rationale: This extensibility affords the fact that with exponentially increasing |

| Attributes                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                       | The possible values for this attribute are defined by the W3C XML Schema string datatype.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| hashData<br>(Password Hash)           | <p>Specifies the hash value for the password stored with this document. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then no password shall be associated with the protection, and it can be turned off without supplying any password.</p> <p>[<i>Example:</i> Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;... p:cryptAlgorithmClass="hash"       p:cryptAlgorithmType="typeAny"       p:cryptAlgorithmSid="1"       p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The hashData attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password shall be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the cryptAlgorithmSid attribute value of 1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p> |
| saltData (Salt for Password Verifier) | <p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hashData attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those precalculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;... p:saltData="ZUdHa+D8F/OAKP3I7ssUnQ=="       p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The saltData attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password shall have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p>        |

| Attributes                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                    | The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| spinCount<br>(Iterations to Run Hashing Algorithm) | <p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashData attribute. [<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example</i>: Consider a PresentationML document with the following information stored in its protection element:</p> <pre data-bbox="456 793 1192 863">&lt;... p:spinCount="100000"       p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The spinCount attribute value of 100000 specifies that the hashing function shall be run one hundred thousand times to generate a hash value for comparison with the hash attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

## 16.3 Slides

### 16.3.1 Embedded Objects

#### 16.3.1.1 Additional attribute for control element (Part 1, §19.3.2.1)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes                      | Description                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spid (Embedded object Shape ID) | <p>Specifies the identifier of the shape associated with this Embedded object. The shape contains all coordinate anchoring information.</p> <p>This optional attribute shall be present if the parent element does not contain a child pic element.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (Part 1, §20.1.10.55).</p> |

#### 16.3.1.2 Additional attribute for oleObj element (Part 1, §19.3.2.4)

The following additional attributes can be specified for a document of a transitional conformance class:

| Attributes                      | Description                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spid (Embedded object Shape ID) | <p>Specifies the identifier of the shape associated with this Embedded object. The shape contains all coordinate anchoring information.</p> <p>This optional attribute shall be present if the parent element does not contain a child pic element.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (Part 1, §20.1.10.55).</p> |

## 16.4 Simple Types

The following additional simple type information in the <http://schemas.openxmlformats.org/presentationml/2006/main> namespace is used for documents of a transitional conformance class.

### 16.4.1 ST\_WebColorType (HTML Slide Navigation Control Colors)

This simple type specifies the coloring that should be used when outputting to web formats.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

| Enumeration Value                               | Description                                  |
|-------------------------------------------------|----------------------------------------------|
| blackTextOnWhite (Black Text on White Colors)   | Black Text on White coloring should be used. |
| browser (Browser Colors)                        | Browser coloring should be used.             |
| none (Non-specific Colors)                      | No specific coloring has been specified.     |
| presentationAccent (Presentation Accent Colors) | Presentation accent coloring should be used. |
| presentationText (Presentation Text Colors)     | Presentation text coloring should be used.   |
| whiteTextOnBlack (White Text on Black Colors)   | White text on black coloring should be used. |

[Note: The W3C XML Schema definition of this simple type's content model ([ST\\_WebColorType](#)) is located in §A.3. *end note*]

### 16.4.2 ST\_WebEncoding (Web Encoding)

This simple type specifies a string representing the HTML character set used when outputting to web formats.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST\\_WebEncoding](#)) is located in §A.3. *end note*]

### 16.4.3 ST\_WebScreenSize (HTML/Web Screen Size Target)

This simple type specifies the intended screen resolution for output to web formats.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

| Enumeration Value                               | Description                     |
|-------------------------------------------------|---------------------------------|
| 1024x768 (HTML/Web Size Enumeration 1024x768)   | Screen size is 1024x768 pixels  |
| 1152x882 (HTML/Web Size Enumeration 1152x882)   | Screen size is 1152x882 pixels  |
| 1152x900 (HTML/Web Size Enumeration 1152x900)   | Screen size is 1152x900 pixels  |
| 1280x1024 (HTML/Web Size Enumeration 1280x1024) | Screen size is 1280x1024 pixels |
| 1600x1200 (HTML/Web Size Enumeration 1600x1200) | Screen size is 1600x1200 pixels |
| 1800x1400 (HTML/Web Size Enumeration 1800x1400) | Screen size is 1800x1400 pixels |
| 1920x1200 (HTML/Web Size Enumeration 1920x1200) | Screen size is 1920x1200 pixels |
| 544x376 (HTML/Web Size Enumeration 544x376)     | Screen size is 544x376 pixels   |
| 640x480 (HTML/Web Size Enumeration 640x480)     | Screen size is 640x480 pixels   |
| 720x512 (HTML/Web Size Enumeration 720x512)     | Screen size is 720x512 pixels   |
| 800x600 (HTML/Web Size Enumeration 800x600)     | Screen size is 800x600 pixels   |

[Note: The W3C XML Schema definition of this simple type's content model ([ST\\_WebScreenSize](#)) is located in §A.3. *end note*]

## 16.5 Changed attributes

The following attributes, which are defined in subclauses within Part 1, §19, "PresentationML", have different source relationships when used in documents of the Transitional conformance class:

### 16.5.1 Changed attribute for bold element (Part 1, §19.2.1.1)

| Attributes                                              | Description                                                                                                                                                                                  |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)                            | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                 |

### 16.5.2 Changed attribute for boldItalic element (Part 1, §19.2.1.2)

| Attributes                                              | Description                                                                                                                                                                                  |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)                            | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                 |

### 16.5.3 Changed attribute for font element (Part 1, §19.2.1.13)

| Attributes                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |             |      |                                                          |      |                                      |      |                                                                                                                                                                                                                 |      |                                                                             |      |                                                        |      |                                                                |      |                                                             |      |                                                      |      |                                                                |      |                                                           |      |                                                           |      |                                                                |      |                                                            |      |                                                             |      |                                                            |

| charset (Similar Character Set)       | Specifies the character set that is supported by the parent font. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available. This information is determined by querying the font when present and shall not be modified when the font is not available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |       |             |      |                                                          |      |                                      |      |                                                                                                                                                                                                                 |      |                                                                             |      |                                                        |      |                                                                |      |                                                             |      |                                                      |      |                                                                |      |                                                           |      |                                                           |      |                                                                |      |                                                            |      |                                                             |      |                                                            |

| typeface (Text Typeface)<br><br>Namespace:<br>.../drawingml/2006/main | <p>Specifies the typeface, or name of the font that is to be used. The typeface is a string name of the specific font that should be used in rendering the presentation. If this font is not available within the font list of the generating application than font substitution logic should be utilized in order to select an alternate font.</p> <p>The possible values for this attribute are defined by the ST_TextTypeface simple type (Part 1, §20.1.10.81).</p>                                                                                      |      |                                         |

#### 16.5.4 Changed attribute for handoutMasterId element (Part 1, §19.2.1.14)

| Attributes                                                                              | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)<br><br>Namespace:<br>.../officeDocument/2006/relationships | <p>Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the handoutMaster element defining this handout master.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |

#### 16.5.5 Changed attribute for italic element (Part 1, §19.2.1.16)

| Attributes                                                                              | Description                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)<br><br>Namespace:<br>.../officeDocument/2006/relationships | <p>Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |

### 16.5.6 Changed attribute for notesMasterId element (Part 1, §19.2.1.20)

| Attributes                                          | Description                                                                                                                                                                                                   |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)                        | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the notesMaster element defining this notes master. |
| Namespace:<br>.../officeDocument/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                                  |

### 16.5.7 Changed attribute for notesSz element (Part 1, §19.2.1.22)

| Attributes                            | Description                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cx (Extent Length)                    | Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).                                                                                                                                                                                                |
| Namespace:<br>.../drawingml/2006/main | <p>[Example: Consider a DrawingML object specified as follows:</p> <pre>&lt;... cx="1828800" cy="200000"/&gt;</pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (Part 1, §20.1.10.42).</p> |
| cy (Extent Width)                     | Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).                                                                                                                                                                                                 |
| Namespace:<br>.../drawingml/2006/main | <p>[Example: Consider a DrawingML object specified as follows:</p> <pre>&lt; ... cx="1828800" cy="200000"/&gt;</pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (Part 1, §20.1.10.42).</p>   |

### 16.5.8 Changed attribute for regular element (Part 1, §19.2.1.29)

| Attributes                                              | Description                                                                                                                                                                                  |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)                            | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                 |

### 16.5.9 Changed attribute for sld element (Part 1, §19.2.1.31)

| Attributes                                              | Description                                                                                                                                                                      |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship ID)                                    | This attribute specifies the relationship id that is used to reference to the actual slide XML file that contains all the information to the slide listed within the slide list. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                     |

### 16.5.10 Changed attribute for sldId element (Part 1, §19.2.1.33)

| Attributes                                              | Description                                                                                                                                                                                    |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)                            | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sld element defining this slide. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                   |

### 16.5.11 Changed attribute for sldMasterId element (Part 1, §19.2.1.36)

| Attributes                                              | Description                                                                                                                                                                                                 |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)                            | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sldMaster element defining this slide master. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                                |

### 16.5.12 Changed attribute for SmartTags element (Part 1, §19.2.1.40)

| Attributes                                          | Description                                                                                                                                         |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Identifier)                        | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this smart tag. |
| Namespace:<br>.../officeDocument/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                        |

### 16.5.13 Changed attribute for gridSpacing element (Part 1, §19.2.2.3)

| Attributes                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cx (Extent Length)<br><br>Namespace:<br>.../drawingml/2006/main | <p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>&lt;... cx="1828800" cy="200000"/&gt;</pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (Part 1, §20.1.10.42).</p> |
| cy (Extent Width)<br><br>Namespace:<br>.../drawingml/2006/main  | <p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>&lt; ... cx="1828800" cy="200000"/&gt;</pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (Part 1, §20.1.10.42).</p>    |

### 16.5.14 Changed attribute for origin element (Part 1, §19.2.2.9)

| Attributes                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>x (X-Axis Coordinate)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;... x="0" y="100" /&gt;</pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (Part 1, §20.1.10.16).</p>  |
| <p>y (Y-Axis Coordinate)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies a coordinate on the y-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;... x="0" y="100" /&gt;</pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (Part 1, §20.1.10.16).</p> |

### 16.5.15 Changed attribute for sld element (Part 1, §19.2.2.14)

| Attributes                                                                                      | Description                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>id (Relationship Identifier)</p> <p>Namespace:<br/>.../officeDocument/2006/relationships</p> | <p>Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this presentation slide within a presentation.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |

### 16.5.16 Changed attribute for bgRef element (Part 1, §19.3.1.3)

| Attributes                                                            | Description                                                                                                                                                                              |
|-----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| idx (Style Matrix Index)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies the style matrix index of the style referred to.<br><br>The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (Part 1, §20.1.10.57). |

### 16.5.17 Changed attribute for blipFill element (Part 1, §19.3.1.4)

| Attributes                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dpi (DPI Setting)<br><br>Namespace:<br>.../drawingml/2006/main                | Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.<br><br>[Note: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i> ]<br><br>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| rotWithShape (Rotate With Shape)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation.<br><br>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.                                                                                                                                     |

### 16.5.18 Changed attribute for clrMap element (Part 1, §19.3.1.6)

| Attributes                                                      | Description                                                                                                                                                                                  |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accent1 (Accent 1)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies a color defined which is associated as the accent 1 color.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14). |
| accent2 (Accent 2)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies a color defined which is associated as the accent 2 color.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14). |
| accent3 (Accent 3)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies a color defined which is associated as the accent 3 color.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14). |

| Attributes                                                                 | Description                                                                                                                                                                                                  |
|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accent4 (Accent 4)<br><br>Namespace:<br>.../drawingml/2006/main            | Specifies a color defined which is associated as the accent 4 color.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14).                 |
| accent5 (Accent 5)<br><br>Namespace:<br>.../drawingml/2006/main            | Specifies a color defined which is associated as the accent 5 color.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14).                 |
| accent6 (Accent 6)<br><br>Namespace:<br>.../drawingml/2006/main            | Specifies a color defined which is associated as the accent 6 color.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14).                 |
| bg1 (Background 1)<br><br>Namespace:<br>.../drawingml/2006/main            | A color defined which is associated as the first background color.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14).                   |
| bg2 (Background 2)<br><br>Namespace:<br>.../drawingml/2006/main            | Specifies a color defined which is associated as the second background color.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14).        |
| folHlink (Followed Hyperlink)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies a color defined which is associated as the color for a followed hyperlink.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14). |
| hlink (Hyperlink)<br><br>Namespace:<br>.../drawingml/2006/main             | Specifies a color defined which is associated as the color for a hyperlink.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14).          |
| tx1 (Text 1)<br><br>Namespace:<br>.../drawingml/2006/main                  | Specifies a color defined which is associated as the first text color.<br><br>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14).               |

| Attributes                            | Description                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------|
| tx2 (Text 2)                          | Specifies a color defined which is associated as the second text color.                                          |
| Namespace:<br>.../drawingml/2006/main | The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14). |

### 16.5.19 Changed attribute for cNvPicPr element (Part 1, §19.3.1.11)

| Attributes                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| preferRelativeResize (Relative Resize Preferred) | Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Namespace:<br>.../drawingml/2006/main            | <p>[Example: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

### 16.5.20 Changed attribute for cNvPr element (Part 1, §19.3.1.12)

| Attributes                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| descr (Alternative Text for Object)   | Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications that do not display the current object.                                                                                                                                                                                                                                                                                                         |
| Namespace:<br>.../drawingml/2006/main | <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre>&lt;... descr="A picture of a bowl of fruit"&gt;</pre> <p>The descr attribute contains alternative text that can be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

| Attributes                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>hidden (Hidden)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>        | <p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [<i>Note</i>: An application can have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example</i>: Consider an inline DrawingML object that must be hidden within the document's content. This setting would be specified as follows:</p> <pre>&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| <p>id (Unique Identifier)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>&lt;... id="10" ... &gt;</pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (Part 1, §20.1.10.21).</p>                                                                                                                                                                                                                |
| <p>name (Name)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>            | <p>Specifies the name of the object. [<i>Note</i>: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>&lt; ... name="foo.jpg" &gt;</pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| flipV (Vertical Flip)<br><br>Namespace:<br>.../drawingml/2006/main   | Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box.<br><br>[Example: The following illustrates the effect of a vertical flip.<br><br><br><i>end example</i><br><br>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.       |

| Attributes                                                  | Description                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rot (Rotation)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below.<br><br>The possible values for this attribute are defined by the ST_Angle simple type (Part 1, §20.1.10.3). |

### 16.5.29 Changed attribute for control element (Part 1, §19.3.2.1)

| Attributes                                                                      | Description                                                                                                                                                                                                          |
|---------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship ID)<br><br>Namespace:<br>.../officeDocument/2006/relationships | Specifies the relationship id that is used to identify this Embedded object from within a slide.<br><br>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 16.5.30 Changed attribute for oleObj element (Part 1, §19.3.2.4)

| Attributes                                                                      | Description                                                                                                                                                                                                          |
|---------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship ID)<br><br>Namespace:<br>.../officeDocument/2006/relationships | Specifies the relationship id that is used to identify this Embedded object from within a slide.<br><br>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 16.5.31 Changed attribute for pos element (Part 1, §19.4.5)

| Attributes                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x (X-Axis Coordinate)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.<br><br>[Example: Consider the following point on a basic wrapping polygon for a DrawingML object:<br><br><pre>&lt;... x="0" y="100" /&gt;</pre> The x attribute defines an x-coordinate of 0. <i>end example</i> ]<br><br>The possible values for this attribute are defined by the ST_Coordinate simple type (Part 1, §20.1.10.16). |
| y (Y-Axis Coordinate)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies a coordinate on the y-axis. The origin point for this coordinate shall be specified by the parent XML element.<br><br>[Example: Consider the following point on a basic wrapping polygon for a DrawingML object:                                                                                                                                                                                                                                    |

| Attributes | Description                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6/main     | <p>&lt;... x="0" y="100" /&gt;</p> <p>The y attribute defines a y-coordinate of 100. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (Part 1, §20.1.10.16).</p> |

### 16.5.32 Changed attribute for snd element (Part 1, §19.5.68)

| Attributes                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| embed (Embedded Audio File Relationship ID)<br><br>Namespace:<br>.../officeDocument/2006/relationships | <p>Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [Note: A list of suggested audio types is provided in Part 1, §15.2.2. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |
| name (Sound Name)<br><br>Namespace:<br>.../drawingml/2006/main                                         | <p>Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                  |

### 16.5.33 Changed attribute for sndTgt element (Part 1, §19.5.70)

| Attributes                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| embed (Embedded Audio File Relationship ID)<br><br>Namespace:<br>.../officeDocument/2006/relationships | <p>Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [Note: A list of suggested audio types is provided in Part 1, §15.2.2. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |
| name (Sound Name)<br><br>Namespace:<br>.../drawingml/2006/main                                         | <p>Specifies the original name or given short name for the corresponding sound. End of informative text.

### 17.1.2 Simple Types

The following additional simple type information in the <http://schemas.openxmlformats.org/drawingml/2006/main> namespace is used for documents of a transitional conformance class.

#### 17.1.2.1 Additional member types for the union in ST\_FixedPercentage (Part 1, §20.1.10.24)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_FixedPercentageDecimal simple type (§17.1.2.7).

#### 17.1.2.2 Additional member types for the union in ST\_Percentage (Part 1, §20.1.10.40)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_PercentageDecimal simple type (Part 4, §12.1.2.12).

#### 17.1.2.3 Additional member types for the union in ST\_PositiveFixedPercentage (Part 1, §20.1.10.45)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_PositiveFixedPercentageDecimal simple type (§17.1.2.8).

#### 17.1.2.4 Additional member types for the union in ST\_PositivePercentage (Part 1, §20.1.10.46)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_PositivePercentageDecimal simple type (§17.1.2.9).

#### 17.1.2.5 Additional member types for the union in ST\_TextFontScalePercentOrPercentString (Part 1, §20.1.10.67)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_TextFontScalePercent simple type (§17.1.2.10).

#### 17.1.2.6 Additional member types for the union in ST\_TextSpacingPercentOrPercentString (Part 1, §20.1.10.77)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_TextSpacingPercent simple type (§17.1.2.11).

#### 17.1.2.7 ST\_FixedPercentageDecimal (Fixed Percentage)

This simple type represents a fixed percentage in 1000ths of a percent. Range from [-100%, 100%].

This simple type's contents are a restriction of the ST\_PercentageDecimal datatype (Part 1, §20.1.10.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -100000.

- This simple type has a maximum value of less than or equal to 100000.

[Note: The W3C XML Schema definition of this simple type's content model (ST\_FixedPercentageDecimal) is located in §A.4.1. *end note*]

#### 17.1.2.8 ST\_PositiveFixedPercentageDecimal (Positive Fixed Percentage)

This simple type represents a positive fixed percentage in 1000ths of a percent. Range from [0%, 100%].

This simple type's contents are a restriction of the ST\_PercentageDecimal datatype (Part 1, §20.1.10.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 100000.

[Note: The W3C XML Schema definition of this simple type's content model (ST\_PositiveFixedPercentageDecimal) is located in §A.4.1. *end note*]

#### 17.1.2.9 ST\_PositivePercentageDecimal (Positive Percentage as Decimal Number)

This simple type represents a positive percentage in 1000ths of a percent. Range from 0% up to and including infinity.

This simple type's contents are a restriction of the ST\_PercentageDecimal datatype (Part 1, §20.1.10.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

[Note: The W3C XML Schema definition of this simple type's content model (ST\_PositivePercentageDecimal) is located in §A.4.1. *end note*]

#### 17.1.2.10 ST\_TextFontScalePercent (Text Font Scale Percentage)

This simple type specifies the percentage range text can be scaled to in order to fit, in 1000ths of a percent.

This simple type's contents are a restriction of the ST\_PercentageDecimal datatype (Part 1, §20.1.10.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1000.
- This simple type has a maximum value of less than or equal to 100000.

[Note: The W3C XML Schema definition of this simple type's content model (ST\_TextFontScalePercent) is located in §A.4.1. *end note*]

#### 17.1.2.11 ST\_TextSpacingPercent (Text Spacing Percent)

This type specifies the range of text spacing in thousandths of a percent, in terms of a line.

This simple type's contents are a restriction of the ST\_PercentageDecimal datatype (Part 1, §20.1.10.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 13200000.

[Note: The W3C XML Schema definition of this simple type's content model (ST\_TextSpacingPercent) is located in §A.4.1. *end note*]

#### 17.1.2.12 ST\_PercentageDecimal (Percentage as Decimal Number)

This simple type represents a percentage in 1000ths of a percent, e.g., a value of 1 represents 0.001% == 0.00001; a value of 100000 is equal to 100%. Percentages have no intrinsic units, but are used to scale other values with units.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

[Note: The W3C XML Schema definition of this simple type's content model (ST\_PercentageDecimal) is located in §A.4.1. *end note*]

#### 17.1.2.13 Additional member types for the union in ST\_PrSetCustVal (Part 1, §21.4.7.66)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

The W3C XML Schema int datatype.

#### 17.1.2.14 ST\_TextBulletSizeDecimal (Bullet Size Percentage)

This simple type specifies the range that the bullet percent can be. A bullet percent is the size of the bullet with respect to the text that should follow it. 25000 = 25%, 400000 = 400%

This simple type's contents are a restriction of the ST\_PercentageDecimal datatype (Part 4, §12.1.2.12).

This simple type also specifies the following restrictions:

This simple type has a minimum value of greater than or equal to 25000.

This simple type has a maximum value of less than or equal to 400000.

[Note: The W3C XML Schema definition of this simple type's content model (ST\_TextBulletSizeDecimal) is located in §A.4.1. *end note*]

#### 17.1.2.15 Additional member types for the union in ST\_TextBulletSize (Part 1, §20.1.10.86)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

The ST\_TextBulletSizeDecimal simple type (Part 4, §12.1.2.14).

## 17.2 DrawingML - Legacy Compatibility

Within the context of DrawingML, it shall be possible (for considerations to legacy compatibility) to be able to include explicit references to specific shapes within VML Drawing parts.

[*Example:* A VML Drawing part is used to define ink on a PresentationML slide, but the resulting ink is referenced from the slide by its shape ID using the elements of this namespace. *end example*]

### 17.2.1 Table of Contents

This subclause is informative.

## 17.2.2 Basics

Legacy Compatibility is part of the shape definitions and properties of the DrawingML framework.

### 17.2.2.1 legacyDrawing (Legacy Drawing Object)

This element specifies the shape ID for a legacy drawing object. These legacy drawing objects all have a shape ID associated with them that is unique across the entire document. In order to store these legacy shape IDs as well as new shape IDs this legacyDrawing element should be used.

| Attributes      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| spid (Shape ID) | <p>Legacy Shape ID that is unique throughout the entire document. Legacy shape IDs should be assigned based on which portion of the document the drawing resides on. The assignment of these ids is broken down into clusters of 1024 values. The first cluster is 1-1024, the second 1025-2048 and so on.</p> <p>This optional attribute shall be present if the parent element does not contain a child picture element.</p> <p><i>[Example: Within a word processing application the spid should be assigned based on the page that the drawing resides on. If the drawing resides on the second page then the assigned spid should be a value between 1025 and 2048. end example]</i></p> <p><i>[Example: Within a spreadsheet application the spid should be assigned based on the sheet that the drawing resides on. If the drawing resides on the second sheet then the assigned spid should be a value between 1025 and 2048. end example]</i></p> <p><i>[Example: Within a presentation application the spid should be assigned based on the slide that the drawing resides on. If the drawing resides on the second slide then the assigned spid should be a value between 1025 and 2048. end example]</i></p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (Part 1, §20.1.10.55).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT\\_Compat](#)) is located in §<sup>+</sup>  
*end note*]

### 17.3 Changed attributes

The following attributes, which are defined in subclauses within Part 1, §20, “DrawingML - Framework Reference Material”, have different source relationships when used in documents of the Transitional conformance class:

#### 17.3.1 Changed attribute for hlinkHover element (Part 1, §20.1.2.2.23)

| Attributes                                              | Description                                                                                                                                                 |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Drawing Object Hyperlink Target)                    | Specifies the relationship id that when looked up in this slides relationship file contains the target of this hyperlink. This attribute cannot be omitted. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                |

#### 17.3.2 Changed attribute for snd element (Part 1, §20.1.2.2.32)

| Attributes                                              | Description                                                                                                                                                                                                                                                             |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| embed (Embedded Audio File Relationship ID)             | Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [ <i>Note:</i> A list of suggested audio types is provided in Part 1, §15.2.2. <i>end note</i> ] |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                                                                                            |

#### 17.3.3 Changed attribute for audioFile element (Part 1, §20.1.3.2)

| Attributes                                              | Description                                                                                                                                                      |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| link (Linked Relationship ID)                           | Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                     |

### 17.3.4 Changed attribute for quickTimeFile element (Part 1, §20.1.3.4)

| Attributes                                              | Description                                                                                                                                                      |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| link (Linked Relationship ID)                           | Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                     |

### 17.3.5 Changed attribute for videoFile element (Part 1, §20.1.3.6)

| Attributes                                              | Description                                                                                                                                                      |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| link (Linked Relationship ID)                           | Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                     |

### 17.3.6 Changed attribute for wavAudioFile element (Part 1, §20.1.3.7)

| Attributes                                              | Description                                                                                                                                                                                                                                                     |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| embed (Embedded Audio File Relationship ID)             | Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [Note: A list of suggested audio types is provided in Part 1, §15.2.2. <i>end note</i> ] |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                                                                                                                    |

### 17.3.7 Changed attribute for blip element (Part 1, §20.1.8.13)

| Attributes                                              | Description                                                                                                                                        |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| embed (Embedded Picture Reference)                      | Specifies the identification information for an embedded picture. This attribute is used to specify an image that resides locally within the file. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                       |

| Attributes                                          | Description                                                                                                                                      |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| link (Linked Picture Reference)                     | Specifies the identification information for a linked picture. This attribute is used to specify an image that does not reside within this file. |
| Namespace:<br>.../officeDocument/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                     |

### 17.3.8 Changed attribute for blipFill element (Part 1, §20.2.2.1)

| Attributes                            | Description                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dpi (DPI Setting)                     | Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.                                                                                                                                                                                                                         |
| Namespace:<br>.../drawingml/2006/main | <p>[Note: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| rotWithShape (Rotate With Shape)      | Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation.                                                                                                       |
| Namespace:<br>.../drawingml/2006/main | The possible values for this attribute are defined by the W3C XML Schema boolean datatype.                                                                                                                                                                                                                                                             |

### 17.3.9 Changed attribute for cNvPicPr element (Part 1, §20.2.2.2)

| Attributes                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| preferRelativeResize (Relative Resize Preferred) | Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Namespace:<br>.../drawingml/2006/main            | <p>[Example: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

### 17.3.10 Changed attribute for cNvPr element (Part 1, §20.2.2.3)

| Attributes                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>descr (Alternative Text for Object)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications that do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre>&lt;... descr="A picture of a bowl of fruit"&gt;</pre> <p>The descr attribute contains alternative text that can be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                 |
| <p>hidden (Hidden)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>                     | <p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [Note: An application can have settings that allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[Example: Consider an inline DrawingML object that must be hidden within the document's content. This setting would be specified as follows:</p> <pre>&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| <p>id (Unique Identifier)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>              | <p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre>&lt;... id="10" ... &gt;</pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML</p>                                                                                                                                                                                                                                                                                                                                                            |

| Attributes                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                    | <p>object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (Part 1, §20.1.10.21).</p>                                                                                                                                                                                                                                                                                                                                                          |
| <p>name (Name)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>   | <p>Specifies the name of the object. [<i>Note</i>: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 583 776 615">&lt; ... name="foo.jpg" &gt;</pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| <p>title (Title)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies the title (caption) of the current DrawingML object.</p> <p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 1056 971 1087">&lt;... title="Process Flow Diagram"&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                               |

### 17.3.11 Changed attribute for spPr element (Part 1, §20.2.2.6)

| Attributes                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>bwMode (Black and White Mode)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (Part 1, §20.1.10.10).</p> |

### 17.3.12 Changed attribute for docPr element (Part 1, §20.4.2.5)

| Attributes                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>descr (Alternative Text for Object)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications that do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre>&lt;... descr="A picture of a bowl of fruit"&gt;</pre> <p>The descr attribute contains alternative text that can be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                 |
| <p>hidden (Hidden)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>                     | <p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [Note: An application can have settings that allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[Example: Consider an inline DrawingML object that must be hidden within the document's content. This setting would be specified as follows:</p> <pre>&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| <p>id (Unique Identifier)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>              | <p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre>&lt;... id="10" ... &gt;</pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML</p>                                                                                                                                                                                                                                                                                                                                                            |

| Attributes                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                    | <p>object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (Part 1, §20.1.10.21).</p>                                                                                                                                                                                                                                                                                                                              |
| <p>name (Name)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>   | <p>Specifies the name of the object. [<i>Note</i>: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>&lt; ... name="foo.jpg" &gt;</pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| <p>title (Title)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies the title (caption) of the current DrawingML object.</p> <p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>&lt;... title="Process Flow Diagram"&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                 |

### 17.3.13 Changed attribute for extent element (Part 1, §20.4.2.7)

| Attributes                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>cx (Extent Width)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example</i>: Consider a DrawingML object specified as follows:</p> <pre>&lt;... cx="1828800" cy="200000"/&gt;</pre> <p>The cx attribute specifies that this object has a width of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (Part 1, §20.1.10.42).</p> |

| Attributes                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### 17.3.23 Changed attribute for grpSpPr element (Part 1, §20.5.2.18)

| Attributes                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bwMode (Black and White Mode)<br><br>Namespace:<br>.../drawingml/2006/main | <p>Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note:</i> This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes use when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (Part 1, §20.1.10.10).</p> |

### 17.3.24 Changed attribute for pos element (Part 1, §20.5.2.26)

| Attributes                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x (X-Axis Coordinate)<br><br>Namespace:<br>.../drawingml/2006/main | <p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;... x="0" y="100" /&gt;</pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (Part 1, §20.1.10.16).</p> |

| Attributes                            | Description                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| y (Y-Axis Coordinate)                 | Specifies a coordinate on the y-axis. The origin point for this coordinate shall be specified by the parent XML element.                                                                                                                                                                                                            |
| Namespace:<br>.../drawingml/2006/main | <p>[Example: Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;... x="0" y="100" /&gt;</pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (Part 1, §20.1.10.16).</p> |

### 17.3.25 Changed attribute for spPr element (Part 1, §20.5.2.30)

| Attributes                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bwMode (Black and White Mode)         | Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.                                                                                                                                                                                                                                                    |
| Namespace:<br>.../drawingml/2006/main | <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[Note: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (Part 1, §20.1.10.10).</p> |

### 17.3.26 Changed attribute for xfrm element (Part 1, §20.5.2.36)

| Attributes                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| flipH (Horizontal Flip)               | Specifies a horizontal flip. When true, this attribute defines that the shape is flipped horizontally about the center of its bounding box.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Namespace:<br>.../drawingml/2006/main | <p>[Example: The following illustrates the effect of a horizontal flip.</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  <p>Unflipped</p> </div> <div style="text-align: center;">  <p>flipH True</p> </div> </div> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

| Attributes                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |

End of informative text.

## 18.1.2 Elements

### 18.1.2.1 legacyDrawingHF (Legacy Drawing for Headers and Footers)

This element specifies the VML Drawing part that contains any pictures used in the header or footer of the chart.

| Attributes                                              | Description                                                                                                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Reference)                             | Specifies the relationship ID for the relationship for this Chart or Chart Drawing part. The type of relationship needed is specified by the parent element. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                 |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_RelId](#)) is located in §A.5.1. *end note*]

## 18.1.3 Simple Types

### 18.1.3.1 Additional member types for union in ST\_DepthPercent

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_DepthPercentUShort simple type (§13.1.3.2).

#### 18.1.3.2 [ST\\_DepthPercentUShort \(Depth Percent UnsignedShort\) \(Part 1, §21.2.3.9\)](#)

This simple type specifies that its contents contain a whole number between 20 and 2000, whose contents are a percentage. This simple type's contents are a restriction of the W3C XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

This simple type has a minimum value of greater than or equal to 20.

This simple type has a maximum value of less than or equal to 2000.

#### 18.1.3.3 [Additional member types for union in ST\\_HPercent \(Part 1, §21.2.3.19\)](#)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_HPercentUShort simple type (§13.1.3.4).

#### 18.1.3.4 [ST\\_HPercentUShort \(Depth Percent UnsignedShort\)](#)

This simple type specifies that its contents contain a whole number between 5 and 500, whose contents are a percentage.

This simple type's contents are a restriction of the W3C XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

This simple type has a minimum value of greater than or equal to 5.

This simple type has a maximum value of less than or equal to 500.

#### 18.1.3.5 [Additional member types for union in ST\\_GapAmount \(Part 1, §21.2.3.16\)](#)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_GapAmountUShort simple type (§13.1.3.6).

#### 18.1.3.6 [ST\\_GapAmountUShort \(Gap Amount UnsignedShort\)](#)

This simple type specifies that its contents contain a whole number between 0 and 500, whose contents are a percentage.

This simple type's contents are a restriction of the W3C XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

This simple type has a minimum value of greater than or equal to 0.

This simple type has a maximum value of less than or equal to 500.

#### 18.1.3.7 Additional member types for union in ST\_SecondPieSize (Part 1, §21.2.3.41)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_SecondPieSizeUShort simple type (§13.1.3.10).

#### 18.1.3.8 ST\_SecondPieSizeUShort (Second Pie Size UnsignedShort)

This simple type specifies that its contents contain a whole number between 5 and 200, whose contents are a percentage.

This simple type's contents are a restriction of the W3C XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

This simple type has a minimum value of greater than or equal to 5.

This simple type has a maximum value of less than or equal to 200.

#### 18.1.3.9 Additional member types for union in ST\_HoleSize (Part 1, §21.2.3.18)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_HoleSizeUByte simple type (§13.1.3.12).

#### 18.1.3.10 ST\_HoleSizeUByte (Hole Size UnsignedByte)

This simple type specifies that its contents contain a whole number between 10 and 90, whose contents are a percentage.

This simple type's contents are a restriction of the W3C XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

This simple type has a minimum value of greater than or equal to 10.

This simple type has a maximum value of less than or equal to 90.

#### 18.1.3.11 Additional member types for union in ST\_LblOffset (Part 1, §21.2.3.23)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_LblOffsetUShort simple type (§13.1.3.14).

#### 18.1.3.12 ST\_LblOffsetUShort (Label Offset UnsignedShort)

This simple type specifies that its contents contain a whole number between 0 and 1000, whose contents are a percentage.

This simple type's contents are a restriction of the W3C XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

This simple type has a minimum value of greater than or equal to 0.

This simple type has a maximum value of less than or equal to 1000.

#### 18.1.3.13 Additional member types for union in ST\_Overlap (Part 1, §21.2.3.31)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_OverlapByte simple type (§13.1.3.16).

#### 18.1.3.14 ST\_OverlapByte (Overlap Byte)

This simple type specifies that its contents contain a whole number between -100 and 100, whose contents are a percentage.

This simple type's contents are a restriction of the W3C XML Schema byte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -100.

This simple type has a maximum value of less than or equal to 100.

#### 18.1.3.15 Additional member types for union in ST\_BubbleScale (Part 1, §21.2.3.5)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The ST\_BubbleScaleUInt simple type (§13.1.3.18).

#### 18.1.3.16 ST\_BubbleScaleUInt (Bubble Scale UnsignedInt)

This simple type specifies that its contents contain a whole number between 0 and 300, whose contents are a percentage.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

This simple type has a minimum value of greater than or equal to 0.

This simple type has a maximum value of less than or equal to 300.

#### 18.1.3.17 Additional member types for union in ST\_Thickness (Part 1, §21.2.3.206)

The value space of the following additional member types can be used within the context of this simple type for a document of a transitional conformance class.

- The W3C XML Schema unsignedInt datatype.

## 18.2 Changed attributes

The following attributes, which are defined in subclauses within Part 1, §21, “DrawingML - Components Reference Material”, have different source relationships when used in documents of the Transitional conformance class:

### 18.2.1 Changed attribute for `hlinkClick` element (Part 1, §21.1.2.3.5)

| Attributes                                              | Description                                                                                                                                                 |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Drawing Object Hyperlink Target)                    | Specifies the relationship id that when looked up in this slides relationship file contains the target of this hyperlink. This attribute cannot be omitted. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                |

### 18.2.2 Changed attribute for `hlinkMouseOver` element (Part 1, §21.1.2.3.6)

| Attributes                                              | Description                                                                                                                                                 |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Drawing Object Hyperlink Target)                    | Specifies the relationship id that when looked up in this slides relationship file contains the target of this hyperlink. This attribute cannot be omitted. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                |

### 18.2.3 Changed attribute for `chart` element (Part 1, §21.2.2.26)

| Attributes                                              | Description                                                                                                                                                  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Reference)                             | Specifies the relationship ID for the relationship for this Chart or Chart Drawing part. The type of relationship needed is specified by the parent element. |
| Namespace:<br>.../officeDocument<br>/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                 |

### 18.2.4 Changed attribute for `clrMapOvr` element (Part 1, §21.2.2.30)

| Attributes                            | Description                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------|
| accent1 (Accent 1)                    | Specifies a color defined that is associated as the accent 1 color.                                              |
| Namespace:<br>.../drawingml/2006/main | The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (Part 1, §20.1.10.14). |

| Attributes                                                                 | Description                                                                                                                                                                                                 |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 18.2.5 Changed attribute for externalData element (Part 1, §21.2.2.63)

| Attributes                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Reference)<br><br>Namespace:<br>.../officeDocument/2006/relationships | Specifies the relationship ID for the relationship for this chart. The relationship explicitly targeted by this attribute shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/package">http://schemas.openxmlformats.org/officeDocument/2006/relationships/package</a> .<br><br>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1). |

### 18.2.6 Changed attribute for spPr element (Part 1, §21.2.2.197)

| Attributes                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bwMode (Black and White Mode)<br><br>Namespace:<br>.../drawingml/2006/main | Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.<br><br>No gray is to be used in rendering this image, only stark black and stark white.<br><br>[Note: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i> ]<br><br>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (Part 1, §20.1.10.10). |

### 18.2.7 Changed attribute for userShapes element (Part 1, §21.2.2.221)

| Attributes                                          | Description                                                                                                                                                  |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id (Relationship Reference)                         | Specifies the relationship ID for the relationship for this Chart or Chart Drawing part. The type of relationship needed is specified by the parent element. |
| Namespace:<br>.../officeDocument/2006/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).                                                 |

### 18.2.8 Changed attribute for blipFill element (Part 1, §21.3.2.2)

| Attributes                            | Description                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dpi (DPI Setting)                     | Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.                                                                                                                                                                                                                                |
| Namespace:<br>.../drawingml/2006/main | <p>[<i>Note:</i> This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| rotWithShape (Rotate With Shape)      | Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation.                                                                                                              |
| Namespace:<br>.../drawingml/2006/main | The possible values for this attribute are defined by the W3C XML Schema boolean datatype.                                                                                                                                                                                                                                                                    |

### 18.2.9 Changed attribute for cNvPicPr element (Part 1, §21.3.2.6)

| Attributes                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| preferRelativeResize (Relative Resize Preferred) | Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Namespace:<br>.../drawingml/2006/main            | <p>[<i>Example:</i> Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p> |

|            | datatype.   |

### 18.2.10 Changed attribute for cNvPr element (Part 1, §21.3.2.7)

| Attributes                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>descr (Alternative Text for Object)</p> <p>Namespace:<br/>.../drawingml/2006/main</p> | <p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications that do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre>&lt;... descr="A picture of a bowl of fruit"&gt;</pre> <p>The descr attribute contains alternative text that can be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                 |
| <p>hidden (Hidden)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>                     | <p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [Note: An application can have settings that allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[Example: Consider an inline DrawingML object that must be hidden within the document's content. This setting would be specified as follows:</p> <pre>&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| <p>id (Unique Identifier)</p> <p>Namespace:<br/>.../drawingml/2006/main</p>              | <p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[Example: Consider a DrawingML object defined as follows:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Attributes                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

# 19. VML Reference Material

[No documentation has been entered for this section heading.]

## 19.1 VML

VML is a language for defining graphical objects in cases where DrawingML does not apply, such as text boxes and shapes in WordprocessingML documents and comments and controls in SpreadsheetML documents. The urn:schemas-microsoft-com:vml namespace provides the base elements and attributes for defining shape primitives. The urn:schemas-microsoft-com:office:office, urn:schemas-microsoft-com:office:word, urn:schemas-microsoft-com:office:excel and urn:schemas-microsoft-com:office:powerpoint namespaces define elements that layer on information beyond the baseline graphical definition. To maintain backward compatibility, all VML namespaces defined in ISO/IEC 29500 maintain the legacy namespace structure used by the existing corpus of binary documents.

[*Note:* The VML format is a legacy format used in an existing corpus of binary documents and is included and fully defined in ISO/IEC 29500 for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a transitional format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML .*end note*]

[*Example:* Assume the following shapes exist in a WordprocessingML document:

The drawing consists of four shapes. The arrows are specified by extending the shape type base definition in the shapetype element. Each shape representing an arrow references the shapetype it is extending via its type attribute.

```
<v:shapetype id="_x0000_t32" coordsize="21600,21600" o:spt="32" o:oned="t"
  path="m,l21600,21600e" filled="f">
  <v:path arrowok="t" fillok="f" o:connecttype="none"/>
  <o:lock v:ext="edit" shapetype="t"/>
</v:shapetype>
```

```
<v:shape id="_x0000_s1030" type="#_x0000_t32" style="position:absolute;left:0;
  text-align:left;margin-left:105pt;margin-top:36pt;width:48pt;height:0;flip:x;
  z-index:251661312" o:connectortype="straight">
```

```
<v:stroke endarrow="block"/>
</v:shape>
```

```
<v:shape id="_x0000_s1029" type="#_x0000_t32" style="position:absolute;left:0;
text-align:left;margin-left:105pt;margin-top:21.75pt;width:48pt;height:0;
z-index:251660288" o:connectortype="straight">
  <v:stroke endarrow="block"/>
</v:shape>
```

The rounded rectangles use the VML roundrect element.

```
<v:roundrect id="_x0000_s1028" style="position:absolute;left:0;
text-align:left;margin-left:153pt;margin-top:8.25pt;width:68.25pt;height:42pt;
z-index:251659264" arcsize="10923f"/>
```

```
<v:roundrect id="_x0000_s1027" style="position:absolute;left:0;
text-align:left;margin-left:36.75pt;margin-top:8.25pt;width:68.25pt;
height:42pt;z-index:251658240" arcsize="10923f"/>
```

*end example]*

Throughout VML, numeric values that are allowed to take units can be specified in: cm (centimeters), mm (millimeters), in (inches), pt (points), pc (picas), px (pixels).

## 19.1.2 Elements

The following elements comprise the contents of the urn:schemas-microsoft-com:vml namespace:

[*Note:* As the VML format is a format provided for backward compatibility, many VML elements are defined in the same urn:schemas-microsoft-com:vml namespace that is already used by millions of documents already using VML. *end note*]

### 19.1.2.1 arc (Arc Segment)

This element specifies an arc defined as a segment of an oval. The CSS2 style content width and height define the width and height of that oval. The arc is defined by the intersection of the oval with the start and end radius vectors given by the angles. The angles are calculated on the basis of a circle (width equal to height) which is then scaled anisotropically to the desired width and height.

[*Example:* The following specifies a simple half-circle arc open at the top:

```
<v:arc
  style="position:relative;top:120;left:20;width:200;height:200"
  startangle="90" endangle="270">
</v:arc>
```

The shape looks like this:

*end example]*

| Attributes                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>allowincell (Allow in Table Cell)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p>  | <p>Specifies whether a shape can be placed in a table. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                                                                                                                                                           |
| <p>allowoverlap (Allow Shape Overlap)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape shifts left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                       |
| <p>alt (Alternate Text)</p>                                                                             | <p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre>&lt;v:shape ... fillcolor="red" alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> |

| Attributes                                                                                                              | Description                                                                                                                                                                                                                                                                                                   |

| <p>bwmode (Black-and-White Mode)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p>   | <p>Specifies how a shape renders for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is <i>auto</i>, which uses <i>o:bwnormal</i> for normal black-and-white rendering and <i>o:bwpure</i> for pure black-and-white rendering.</p> <p><i>bwnormal</i> and <i>bwpure</i> are subordinate to <i>bwmode</i>. If <i>bwmode</i> is "auto" then the value for <i>bwnormal</i> or <i>bwpure</i> is used depending on what the output format is. An application can define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. [Example: Normal B&amp;W might allow greyscale and pure B&amp;W might not. <i>end example]</i></p> <p>[Example: This shape renders in grayscale in a black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§19.2.3.3).</p> |

| <p>coordorigin<br/>(Coordinate Space Origin)</p> | <p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| <p>coordsize<br/>(Coordinate Space Size)</p>     | <p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt;</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Attributes                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                                                                                                                       |
| <p>oned (Shape Handle Toggle)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p>            | <p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p> |
| <p>opacity (Fill Color Opacity)</p>                                                                        | <p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value can also be specified in 1/65536-ths if a trailing "f" is supplied. [Example: A value of "52429f" represents 52429/65536 or 0.8. end example]</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red" color2="blue" opacity=".25"&gt;</pre>                                                                       |

| Attributes                                                                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                            | <p><code>&lt;/v:fill&gt;</code></p>  <p>opacity="1"</p> <p>opacity=".25"</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                     |
| <p>preferrelative<br/>(Relative Resize Toggle)</p> <p>Namespace:<br/>urn:schemas-<br/>microsoft-<br/>com:office:office</p> | <p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing resets the scale to 100%.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p> |
| <p>print (Print Toggle)</p>                                                                                                | <p>Specifies whether the shape is printed. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                                                                                                                                                                                                         |
| <p>regroupid (Regroup ID)</p> <p>Namespace:<br/>urn:schemas-<br/>microsoft-<br/>com:office:office</p>                      | <p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[Example: The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre>                                                                                                                                                                       |

| Attributes                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                             | <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema integer datatype.</p>                                                                                                                                                                                                                                                                                                                                                                                 |
| <p>spid (Optional String)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Specifies an optional string that an application can use to Identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                      |
| <p>spt (Optional Number)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p>  | <p>Specifies an optional number that an application can use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the W3C XML Schema float datatype.</p>                                                                                                                                                                                                                                                                   |
| <p>startAngle (Starting Angle)</p>                                                          | <p>Specifies an angle that defines the starting point of the arc. The angle is measured in degrees clockwise from the vertical.</p> <p>Default is 0.</p> <p>[Example: This arc begins in the upper-right quadrant:</p> <pre>&lt;v:arc ... startangle="45" ... &gt; &lt;/v:arc&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema decimal datatype.</p>                                                                                         |
| <p>strokecolor (Shape Stroke Color)</p>                                                     | <p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§19.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre> |

| Attributes                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                    |  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§20.1.2.3).</p>                                                                                                                                                                                                                                                                                                                                                                                   |
| stroked (Shape Stroke Toggle)      | <p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§19.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre data-bbox="456 751 1062 852">&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p> |
| strokeweight (Shape Stroke Weight) | <p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§19.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre data-bbox="456 1394 984 1461">&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                  |
| style (Shape Styling Properties)   | <p>Specifies the CSS2 styling properties of the shape. The CSS2 (Cascading Style Sheets, Level 2) specification, a Recommendation of the World Wide Web Consortium, is available</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Attributes | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |          |             |      |                                                                                                                                                                                                                                                                                                                                                                                            |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|            |                          | <ul style="list-style-type: none"> <li>• text</li> <li>• line</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|            | mso-wrap-distance-bottom | Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.                                                                                                                                                                                                                                                                                                                         |
|            | mso-wrap-distance-left   | Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.                                                                                                                                                                                                                                                                                                                      |
|            | mso-wrap-distance-right  | Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.                                                                                                                                                                                                                                                                                                                     |
|            | mso-wrap-distance-top    | Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.                                                                                                                                                                                                                                                                                                                            |
|            | mso-wrap-edited          | Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.                                                                                                                                                                                                                                                                                                                                                                                           |
|            | mso-wrap-style           | <p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>                                                                                                                                                                                                                                                                                                                              |
|            | position                 | <p>Specifies the kind of positioning used to place an element. Default is static. When the element is contained inside a group, this property shall be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the</li> </ul> |

| Attributes | Description |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|            |             | normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|            | rotation    | Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|            | top         | <p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul> |
|            | visibility  | <p>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:</p> <ul style="list-style-type: none"> <li>• hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• inherit - The visibility state is inherited from the parent of the shape.</li> </ul>                                                                                                                                                                                                                                                                                                                   |
|            | width       | <p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>                                                                                                                                     |
|            | z-index     | <p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page,</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Property              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |                                                                                                                                                                                                                                             |          |             |           |                                                                                                                                                                                                                                                                                                                          |             |                                                                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                                                                                              |                       |                                                                                         |                       |                                                                            |                     |                                                                                                                                                                                                                    |                  |                                                                                                                         |
| direction             | Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are: <ul style="list-style-type: none"> <li>• ltr - Text is displayed left-to-right.</li> <li>• rtl - Text is displayed right-to-left.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |                                                                                                                                                                                                                                             |          |             |           |                                                                                                                                                                                                                                                                                                                          |             |                                                                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                                                                                              |                       |                                                                                         |                       |                                                                            |                     |                                                                                                                                                                                                                    |                  |                                                                                                                         |
| layout-flow           | Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are: <ul style="list-style-type: none"> <li>• horizontal - Text is displayed horizontally.</li> <li>• vertical - Text is displayed vertically.</li> <li>• vertical-ideographic - Ideographic text is displayed vertically.</li> <li>• horizontal-ideographic - Ideographic text is displayed horizontally.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |                                                                                                                                                                                                                                             |          |             |           |                                                                                                                                                                                                                                                                                                                          |             |                                                                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                                                                                              |                       |                                                                                         |                       |                                                                            |                     |                                                                                                                                                                                                                    |                  |                                                                                                                         |
| mso-direction-alt     | Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |                                                                                                                                                                                                                                             |          |             |           |                                                                                                                                                                                                                                                                                                                          |             |                                                                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                                                                                              |                       |                                                                                         |                       |                                                                            |                     |                                                                                                                                                                                                                    |                  |                                                                                                                         |
| mso-fit-shape-to-text | Specifies whether the shape stretches to fit the text in the textbox. Default is false.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |                                                                                                                                                                                                                                             |          |             |           |                                                                                                                                                                                                                                                                                                                          |             |                                                                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                                                                                              |                       |                                                                                         |                       |                                                                            |                     |                                                                                                                                                                                                                    |                  |                                                                                                                         |
| mso-fit-text-to-shape | Specifies whether the text stretches to fit the textbox. Default is false.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |                                                                                                                                                                                                                                             |          |             |           |                                                                                                                                                                                                                                                                                                                          |             |                                                                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                                                                                              |                       |                                                                                         |                       |                                                                            |                     |                                                                                                                                                                                                                    |                  |                                                                                                                         |
| mso-layout-flow-alt   | Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |                                                                                                                                                                                                                                             |          |             |           |                                                                                                                                                                                                                                                                                                                          |             |                                                                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                                                                                              |                       |                                                                                         |                       |                                                                            |                     |                                                                                                                                                                                                                    |                  |                                                                                                                         |
| mso-next-textbox      | Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |                                                                                                                                                                                                                                             |          |             |           |                                                                                                                                                                                                                                                                                                                          |             |                                                                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                                                                                              |                       |                                                                                         |                       |                                                                            |                     |                                                                                                                                                                                                                    |                  |                                                                                                                         |

| <p>userdrawn (Exists In Master Slide)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Specifies whether the user has added the shape to a master slide. Default is false. Used by PresentationML.</p> <p>[Example:</p> <p><code>&lt;v:shape ... o:userdrawn="true" ... &gt;</code><br/> <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                                                                                                                 |
| <p>userhidden (Hide Script Anchors)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p>   | <p>Specifies whether a script anchor is hidden. Default is false. If true, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <p><code>&lt;v:shape ... o:userhidden="true" ... &gt;</code><br/> <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p> |
| <p>wrapcoords (Shape Bounding Polygon)</p>                                                              | <p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is</p>                                                                                                                                                                                                                                                                                                                   |

| Attributes | Description                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p>tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to <code>tight</code> or <code>through</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_Arc](#)) is located in §A.6.1. end note]

### 19.1.2.2 background (Document Background)

This element describes the fill of the background of a page using vector graphics fills. Fills consist of simple colors, more advanced effects defined through the fill element (§19.1.2.5), or images.

[Example: The following shades the page background a pale red:

```
<v:background fillcolor="#c0504d">
</v:background>
```

This uses the fill element (§19.1.2.5) to create a gradient background fill:

```
<v:background>
  <v:fill type="gradient" color="#c0504d" color2="#f0504d" angle="45"/>
</v:background>
```

end example]

| <p>bwpure (Pure Black-and-White Mode)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p>     | <p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p>[<i>Example:</i> This shape renders in high contrast when in a pure black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§19.2.3.3).</p>                                                                                                                                                                                               |
| <p>fillcolor (Fill Color)</p>                                                                               | <p>Specifies the color to use for the fill. Default is white. If the fill element (§19.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[<i>Example:</i> This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt;</pre> |

| <p>targetscreensize (Target Screen Size)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Specifies the target resolution used for WordprocessingML documents with a gradient or picture filled background. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• 544,376</li> <li>• 640,480</li> <li>• 720,512</li> <li>• 800,600</li> <li>• 1024,768</li> <li>• 1152,862</li> </ul>                                                                                                                    |

| Attributes | Description                                                                                       |
|------------|---------------------------------------------------------------------------------------------------|
|            | The possible values for this attribute are defined by the ST_ScreenSize simple type (§19.2.3.23). |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_Background](#)) is located in §A.6.1.  
end note]

### 19.1.2.3 curve (Bezier Curve)

This element is used to draw a cubic bézier curve.

The following properties of the style attribute are ignored:

- top
- margin-top
- center-y
- left
- margin-left
- center-x
- width
- height

[Example: The following specifies a simple curve that opens upward:

```
<v:curve id="mycurve"
from="10pt,10pt" to="100pt,10pt"
control1="40pt,30pt" control2="85pt,30pt">
</v:curve>
```

This shape is created:

end example]

| Attributes                                                                                     | Description                                                                                                                                                                          |

| cliptowrap (Clip to Wrapping Polygon)<br><br>Namespace:<br>urn:schemas-microsoft-com:office:office | <p>Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p> |
| connectortype (Shape Connector Type)<br><br>Namespace:<br>urn:schemas-microsoft-com:office:office  | <p>Specifies the kind of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§19.2.3.7).</p>                                                                                                                                                                                   |
| control1 (First Curve Control Point)                                                               | <p>Specifies the first control point for the curve, given in the coordinate space of the parent element. Default is "10,10". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.</p> <p>[Example:</p> <pre>&lt;v:curve ... control1="20,30" ... &gt; &lt;/v:curve&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                          |

| Attributes                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>control2 (Second Curve Control Point)</b> | <p>Specifies the second control point for the curve, given in the coordinate space of the parent element. Default is "20,0". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.</p> <p><i>[Example:</i></p> <pre>&lt;v:curve ... control2="50,20" ... &gt; &lt;/v:curve&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>coordorigin (Coordinate Space Origin)</b> | <p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p><i>[Example:</i> The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200" coordorigin="-100,-100" path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| <b>coordsize (Coordinate Space Size)</b>     | <p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Attributes                                                                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                 | <p>the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

| regroupid (Regroup ID)<br><br>Namespace:<br>urn:schemas-microsoft-com:office:office | <p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[Example: The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema integer datatype.</p>                                                                                                                                                        |
| spid (Optional String)<br><br>Namespace:<br>urn:schemas-microsoft-com:office:office | <p>Specifies an optional string that an application can use to identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                                                                                              |
| spt (Optional Number)<br><br>Namespace:<br>urn:schemas-microsoft-com:office:office  | <p>Specifies an optional number that an application can use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the W3C XML Schema float datatype.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| strokecolor (Shape Stroke Color)                                                    | <p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§19.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> |

| Attributes                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                           | <p>The possible values for this attribute are defined by the ST_ColorType simple type (§20.1.2.3).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p>stroked (Shape Stroke Toggle)</p>      | <p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§19.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p> |
| <p>strokeweight (Shape Stroke Weight)</p> | <p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§19.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                   |
| <p>style (Shape Styling Properties)</p>   | <p>Specifies the CSS2 styling properties of the shape. The CSS2 (Cascading Style Sheets, Level 2) specification, a Recommendation of the World Wide Web Consortium, is available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>.</p> <p>This attribute uses a semi-colon delimited list of “name:value” pairs, the syntax defined by section 4.1.8 of the CSS2 specification for grouped declarations (without the surrounding braces). The following tables define the allowed properties and the VML treatment of each.</p>    |

| Attributes    | Description It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul data-bbox="727 963 1453 1203" style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |          |             |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |               |                                                                                                                                                                                                                                                                                           |
| left          | <p data-bbox="678 1224 1453 1402">Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul data-bbox="727 1444 1453 1684" style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |          |             |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |               |                                                                                                                                                                                                                                                                                           |
| margin-bottom | <p data-bbox="678 1707 1453 1843">Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |          |             |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |               |                                                                                                                                                                                                                                                                                           |

| Attributes | Description   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul> |
|            | mso-position-vertical            | <p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>           |
|            | mso-position-vertical-relative   | <p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>     |
|            | mso-wrap-distance-bottom         | <p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change</p>                           |

| Attributes | Description             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            |                         | the origin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|            | mso-wrap-distance-left  | Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|            | mso-wrap-distance-right | Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|            | mso-wrap-distance-top   | Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|            | mso-wrap-edited         | Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|            | mso-wrap-style          | <p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|            | position                | <p>Specifies the kind of positioning used to place an element. Default is static. When the element is contained inside a group, this property shall be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul> |
|            | rotation                | Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Attributes | Description |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | top         | <p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul> |
|            | visibility  | <p>Specifies whether a shape is displayed. Only <code>inherit</code> and <code>hidden</code> are used; any other values are mapped to <code>inherit</code>. Default is <code>inherit</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• inherit - The visibility state is inherited from the parent of the shape.</li> </ul>                                                                                                                                                                                                                                                               |
|            | width       | <p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>                                                                                                                                     |
|            | z-index     | <p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>                                                                                                                                                                                                                                                                                    |

Default is false.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |          |             |           |                                                                                                                                                                                                                                                                                                                             |             |                                                                                                                                                                                                                                                                                                                                                                                                                 |                   |                                                                                                                                     |                       |                                                                                                |                       |                                                                                   |                     |                                                                                                                                                                                                                           |                  |                                                                                                                                |            |                                                                                                                                                                                  |
| mso-layout-flow-alt   | <p>Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |          |             |           |                                                                                                                                                                                                                                                                                                                             |             |                                                                                                                                                                                                                                                                                                                                                                                                                 |                   |                                                                                                                                     |                       |                                                                                                |                       |                                                                                   |                     |                                                                                                                                                                                                                           |                  |                                                                                                                                |            |                                                                                                                                                                                  |
| mso-next-textbox      | <p>Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |          |             |           |                                                                                                                                                                                                                                                                                                                             |             |                                                                                                                                                                                                                                                                                                                                                                                                                 |                   |                                                                                                                                     |                       |                                                                                                |                       |                                                                                   |                     |                                                                                                                                                                                                                           |                  |                                                                                                                                |            |                                                                                                                                                                                  |
| mso-rotate            | <p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>0</li> <li>90</li> <li>180</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |          |             |           |                                                                                                                                                                                                                                                                                                                             |             |                                                                                                                                                                                                                                                                                                                                                                                                                 |                   |                                                                                                                                     |                       |                                                                                                |                       |                                                                                   |                     |                                                                                                                                                                                                                           |                  |                                                                                                                                |            |                                                                                                                                                                                  |

|                                                                                                                                                                                                                                                                                                                                                                                                                                | letters               |                                                                                                                                                                                                                                                                                                                                                                                        |
|                                                                                                                                                                                                                                                                                                                                                                                                                                | v-same-letter-heights | Specifies whether all letters are the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.                                                                                                                                                                                                   |
|                                                                                                                                                                                                                                                                                                                                                                                                                                | v-text-align          | <p>Specifies the alignment of text. Default is left. Allowed values are:</p> <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>                                      |
|                                                                                                                                                                                                                                                                                                                                                                                                                                | v-text-kern           | Specifies whether kerning is turned on. Default is false.                                                                                                                                                                                                                                                                                                                              |
|                                                                                                                                                                                                                                                                                                                                                                                                                                | v-text-reverse        | Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.                                                                                                                                                                                                                                                                       |
|                                                                                                                                                                                                                                                                                                                                                                                                                                | v-text-spacing-mode   | <p>Specifies the mode for letter spacing. Default is tightening. This property determines whether space is removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• tightening</li> <li>• tracking</li> </ul> |
|                                                                                                                                                                                                                                                                                                                                                                                                                                | v-text-spacing        | Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.                                                                                                                                                                                                                                                                                             |
| <p>The line (§19.1.2.12), polyline (§19.1.2.15) and curve (§19.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• width</li> <li>• height</li> </ul> <p>The following properties are not inherited by an element that references a shapetype element (§19.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"> <li>• flip</li> </ul> |                       |                                                                                                                                                                                                                                                                                                                                                                                        |

| Attributes                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |       |             |              |                                                                                  |        |                                                                                                 |        |                                                                                  |         |                                                                                                             |         |                                                                              |       |                                                                                                                 |      |                                                                       |

|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                     | <p><code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                                                                                                                                                                                                                                                                                                                                                                      |
| wrapcoords (Shape Bounding Polygon) | <p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to tight or through.</p> <p>[Example:</p> <pre> &lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_Curve](#)) is located in §A.6.1. *end note]*

#### 19.1.2.4 f (Single Formula)

This element defines a single value as the result of the evaluation of an expression. The expression is defined by the eqn attribute and has the general form of an operation followed by up to three arguments, which consist of adjustment values (see the adj attribute of the shape element (§19.1.2.19)), the results of earlier formulas, fixed numbers or pre-defined values. Each f value is referenced using "@" followed by a number corresponding to the zero-based index for that value in the list of f elements. [Example: For example, the value of the second f element is referenced as "@2". *end example]*

[Example: The following defines a blue arrow pointing to the right:

```

<v:shape coordsize="21600,21600" adj="18000,5400,10800"
  path="m @0,0 l @0,@1 0,@1 0,@3 @0,@3 @0,21600 21600,10800 x e"
  style='left:50pt;top:50pt;width:90pt;height:30pt'
  fillcolor="#4f81bd" strokecolor="#4f81bd" strokeweight="2pt">
<v:formulas>
  <v:f eqn="val #0"/>
  <v:f eqn="val #1"/>
  <v:f eqn="val #2"/>

```

```
<v:f eqn="sum height 0 #1"/>
<v:f eqn="sum #2 0 #1"/>
<v:f eqn="sum width 0 #0"/>
<v:f eqn="prod @5 @4 #2"/>
<v:f eqn="sum width 0 @6"/>
</v:formulas>
</v:shape>
```

The shape looks like this:

*end example]*

| Attributes     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |           |             |     |                                         |     |                                                   |         |                                                               |     |                                                       |     |                              |     |                                                |     |                                                 |    |                                                    |     |                                                 |       |                                                                                                                                    |

Inexact.</td></tr> </table> <p>Formulas are evaluated to full precision, but the result is always a 32-bit integer. Formula authors should avoid formulas which are discontinuous - not only are many of the trigonometric operations inexact, the transformations within the coordinate spaces are also inexact. This can mean that a set of formulas which is discontinuous evaluates to give very different path values with the same input on two different systems.</p> <p>When an operation is marked as exact then a conforming implementation shall always generate the correct arithmetic answer (unless the calculations overflow internally). The product operation is required to round to the nearest integer. If the result is exactly 0.5 then it shall be rounded up to the next numerically greater integer. The mid operation is required to round towards 0.</p> <p>All other operations are inexact, but the implementation shall round non-integral values down (towards -infinity) and should perform internal calculations with this form of</p> |  | Inexact. | sin | $v \times \sin(P1)$<br>Sine. |                | <p>rounding.</p> <p>The arguments used in the evaluation of a formula are normally either fixed numbers, the result of the evaluation of a previous formula or an adjust value - the value of the corresponding entry in the shape adj attribute. Fixed numbers shall be positive integral values in the range 0 to 65535 (unsigned 16-bit numbers). The following named values are defined:</p> <table data-bbox="418 531 1206 1898"> <tr> <th data-bbox="418 531 630 579">Value</th><th data-bbox="630 531 1206 579">Description</th></tr> <tr> <td data-bbox="418 579 630 737">@n</td><td data-bbox="630 579 1206 737">The value of formula n, where n is the zero-based index of the formula in the list of formulas. n shall be less than the current formula index.</td></tr> <tr> <td data-bbox="418 737 630 821">#n</td><td data-bbox="630 737 1206 821">Adjustment (adj) value n. n shall be in the range 0 to 7.</td></tr> <tr> <td data-bbox="418 821 630 894">width</td><td data-bbox="630 821 1206 894">The width defined by the coordsize attribute.</td></tr> <tr> <td data-bbox="418 894 630 978">height</td><td data-bbox="630 894 1206 978">The height defined by the coordsize attribute.</td></tr> <tr> <td data-bbox="418 978 630 1062">xcenter</td><td data-bbox="630 978 1206 1062">The x ordinate of the center of the coordinate space defined by coordorigin and coordsize.</td></tr> <tr> <td data-bbox="418 1062 630 1146">ycenter</td><td data-bbox="630 1062 1206 1146">The y ordinate of the center of the coordinate space defined by coordorigin and coordsize.</td></tr> <tr> <td data-bbox="418 1146 630 1230">xlimo</td><td data-bbox="630 1146 1206 1230">The x value of the limo attribute (see also the path element (§19.1.2.14)).</td></tr> <tr> <td data-bbox="418 1230 630 1314">ylimo</td><td data-bbox="630 1230 1206 1314">The y value of the limo attribute (see also the path element (§19.1.2.14)).</td></tr> <tr> <td data-bbox="418 1314 630 1430">hasstroke</td><td data-bbox="630 1314 1206 1430">1 if the shape has a stroke operation, 0 if it does not, as determined by the on attribute of the stroke element (§19.1.2.21).</td></tr> <tr> <td data-bbox="418 1430 630 1545">hasfill</td><td data-bbox="630 1430 1206 1545">1 if the shape has a fill operation, 0 if it does not, as determined by the on attribute of the fill element (§19.1.2.5).</td></tr> <tr> <td data-bbox="418 1545 630 1776">pixellinewidth</td><td data-bbox="630 1545 1206 1776">The line width in output device pixels. This is used to outset lines from the edge of a rectangle on the assumption that the implementation draws to lower right pixel in preference to the upper left pixel when a line is on a pixel boundary. | pixelwidth | The width of the shape in device pixels (i.e., the coordsize width transformed into device space). |
| Value          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |
| @n             | The value of formula n, where n is the zero-based index of the formula in the list of formulas. n shall be less than the current formula index.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |

| height         | The height defined by the coordsize attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |
| xcenter        | The x ordinate of the center of the coordinate space defined by coordorigin and coordsize.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |
| ycenter        | The y ordinate of the center of the coordinate space defined by coordorigin and coordsize.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |
| xlimo          | The x value of the limo attribute (see also the path element (§19.1.2.14)).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |
| ylimo          | The y value of the limo attribute (see also the path element (§19.1.2.14)).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |
| hasstroke      | 1 if the shape has a stroke operation, 0 if it does not, as determined by the on attribute of the stroke element (§19.1.2.21).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |
| hasfill        | 1 if the shape has a fill operation, 0 if it does not, as determined by the on attribute of the fill element (§19.1.2.5).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |
| pixellinewidth | The line width in output device pixels. This is used to outset lines from the edge of a rectangle on the assumption that the implementation draws to lower right pixel in preference to the upper left pixel when a line is on a pixel boundary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |
| pixelwidth     | The width of the shape in device pixels (i.e., the coordsize width transformed into device space).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |             |    |                                                                                                                                                 |    |                                                           |       |                                               |        |                                                |         |                                                                                            |         |                                                                                            |       |                                                                             |       |                                                                             |           |                                                                                                                                |         |                                                                                                                           |                |                                                                                                                                                                                                                                                  |            |                                                                                                    |

| Attributes | Description                                                                                                                                                                                                                                                                     |                                               |

|            | emuheight                                                                                                                                                                                                                                                                       | The height of the coordsize in EMUs.          |
|            | emuwidth2                                                                                                                                                                                                                                                                       | Half the width of the coordsize in EMUs.      |
|            | emuheight2                                                                                                                                                                                                                                                                      | Half the height of the coordsize in EMUs.     |
|            | <p>The EMU, or English Metric Unit, is the smallest unit of measure in VML and corresponds to 914400 EMU per inch or 12700 EMU per point.</p> <p>See above for an example.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |                                               |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_F](#)) is located in §A.6.1. *end note*]

#### 19.1.2.5 fill (Shape Fill Properties)

This element specifies how the path should be filled if something beyond a solid color fill is desired. The attributes of the fill element can be used to describe a powerful set of image- or gradient-based fill patterns. Extensions to the VML fill definition are encoded as sub-elements of fill.

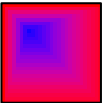

| Attributes                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| alignshape (Align Image With Shape) | <p>Specifies whether an image aligns with the shape. Default is true.</p> <p>[Example: The image displayed in the shape is not rotated even though the shape is rotated 30 degrees:</p> <pre>&lt;v:shape coordorigin="0,0"   coordsize="200,200"   style="top:1;left:1;width:50;   height:50;rotation:30"   path="m 1,1 l 1,200, 200,200, 200,1 x e"&gt;   &lt;v:fill alignshape="false" type="frame"     src="myimage.gif"&gt;   &lt;/v:fill&gt; &lt;/v:shape&gt;</pre> <p>Applied to a simple square the fill looks like this:</p> |

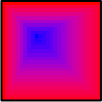

| Attributes                                                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <p>althref (Alternate Image Reference Location)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Defines an alternate reference for an image in Macintosh PICT format.</p> <p>[Example:</p> <pre>&lt;v:fill ... althref="myimage.pcz" ... &gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p>angle (Gradient Angle)</p>                                                                                     | <p>Specifies the direction of a gradient. The vector of a gradient is perpendicular to the vector of the blend direction from one color to another. The default value is zero degrees, which is a horizontal vector from left to right. Positive angles rotate the gradient in a counter-clockwise direction.</p> <p>[Example: The fill is composed of a 45-degree gradient of two colors. Blue is in the top left corner and red is in the bottom right corner.</p> <pre>&lt;v:fill type="gradient" color="red" color2="blue" angle="45"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema decimal datatype.</p> |
| <p>aspect (Image Aspect Ratio)</p>                                                                                | <p>Specifies how the fill image aspect ratio is preserved. Default is ignore. Allowed values are:</p> <ul style="list-style-type: none"> <li>• ignore - Ignore aspect ratio.</li> <li>• atleast - At least as large as defined by the size attribute.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Attributes               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <ul style="list-style-type: none"> <li>• atmost - No larger than that defined by the size attribute.</li> </ul> <p>In each case, the size attribute is adjusted to preserve the aspect ratio of the image.</p> <p>[Example: The image that makes up the fill is no larger than 20 points by 20 points, limiting the size of the tiles inside the shape.</p> <pre>&lt;v:fill type="tile" aspect="atmost"   size="20pt,20pt" src="myimage.gif"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ImageAspect simple type (§19.1.3.5).</p>            |
| color (Primary Color)    | <p>Specifies the main fill color; functions the same as the fillcolor attribute of the shape element (§19.1.2.19). This attribute overrides the shape's fillcolor. Default is white. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: The shape is blue:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt;   &lt;v:fill color="blue"/&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§20.1.2.3).</p> |
| color2 (Secondary Color) | <p>Specifies the secondary fill color, used when a fill type is a pattern or a gradient. Default is white. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: The shape is filled with a horizontal gradient with red at the bottom and blue on top:</p> <pre>&lt;v:fill type="gradient"   color="red" color2="blue"&gt; &lt;/v:fill&gt;</pre>                                                                                                                                                       |

|                                                                                                                | <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§20.1.2.3).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p>colors<br/>(Intermediate Colors)</p>                                                                        | <p>Specifies an array of comma-separated percentage-color pairs that define intermediate colors and their positions in a gradient fill. The primary color, specified either by the fillcolor attribute of the shape element (§19.1.2.19) or the color attribute of the fill element (§19.1.2.5), is used at the 0% endpoint. The secondary color, specified by the color2 attribute of the fill element (§19.1.2.5), is used at the 100% endpoint. The numeric values can also be specified in 1/65536ths if a trailing "f" is supplied. <i>[Example: For example, a value of "52429f" represents 52429/65536 or 0.8. end example]</i></p> <p><i>[Example: The shape is filled with a horizontal gradient colored, from bottom to top, red, yellow, green, blue:</i></p> <pre>&lt;v:fill type="gradient"   color="red" color2="blue"   colors="30% yellow,70% green"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| <p>detectmouseclick<br/>(Detect Mouse Click)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Specifies whether a mouse click is detected on the fill of a shape.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p>focus (Gradient Center)</p>                                                                                 | <p>Specifies the center starting position of a gradient. Values <a href="#">are in the</a> range 100% to -100%. Default is 0.</p> <p>A value of 100% or -100% reverses the direction of the gradient (in effect swapping color and color2). A value of 50% changes the gradient so that color is at both ends and color2 is in the middle. A value of -50% changes the gradient so that color2 is at both ends and color is in the middle.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

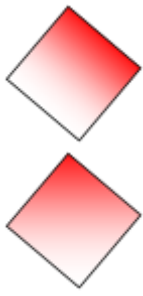

| Attributes                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                   | <p>[<i>Example</i>: The shape is filled with a horizontal gradient with red at both ends and blue in the middle:</p> <pre>&lt;v:fill type="gradient"   color="red" color2="blue"   focus="50%"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p>focusposition<br/>(Radial Gradient Center)</p> | <p>Specifies the position of the center rectangle of a radial gradient. The vector is a fraction of the width and height of the shape. The first is a percentage of the fill to the left edge; the second is a percentage of the fill to the top. Default is 0,0. To position a radial fill at the center of a shape, use a value of 50%,50%.</p> <p>[<i>Example</i>: The shape is filled with a rectangular gradient positioned in the top-left quadrant of the shape. The interior of the gradient is blue and the exterior is red:</p> <pre>&lt;v:fill type="gradientradial"   color="red" color2="blue"   focusposition="25%,25%"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| <p>focussize (Radial Gradient Size)</p>           | <p>Specifies the size of the center rectangle of a radial gradient. The vector is a fraction of the width and height of the shape. The first is a percentage of the fill to the right edge; the second is a percentage of the fill to the bottom. Default is 0,0.</p> <p>A focussize value of 100%,100% and a focusposition of 0,0 makes color2 dominate the gradient completely. Small values of around 10%,10% are recommended for balanced gradients.</p> <p>[<i>Example</i>: The shape is filled with a rectangular gradient positioned in the top-left</p>                                                                                                                                                                                                                                                                                                                 |

| Attributes                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                              | <p>quadrant of the shape. The interior of the gradient is blue and the exterior is red. The red portion is wider on the bottom and right sides of the blue region. The pure blue region is 25% the width and 25% the height of the shape:</p> <pre>&lt;v:fill type="gradientradial"   color="red" color2="blue"   focussize="25%,25%"   focusposition="25%,25%"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                               |
| <p>href (Hyperlink Target)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:href="myimage.gif" ... &gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                                                                 |
| <p>id (Relationship to Part)</p> <p>Namespace:<br/>.../officeDocument/2006/relationships</p> | <p>Specifies the relationship ID of the relationship to the image used for this fill. The specified relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a> or the document shall be considered non-conformant.</p> <p>[Example: The markup specifies the associated relationship part with relationship ID rId10 contains the corresponding relationship information for the fill:</p> <pre>&lt; ... r:id="rId10" /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (Part 1, §22.8.2.1).</p> |
| id (Unique                                                                                   | Specifies a unique identifier that can be used to reference a VML object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Attributes                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Identifier)                     | <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                            |
| method (Gradient Fill Method)   | <p>Specifies the method used to generate the transition from color to color2 in a gradient fill. Default is <i>sigma</i>.</p> <p>[Example:</p> <pre>&lt;v:fill type="gradient" color="red" color2="blue" method="any"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FillMethod simple type (§19.1.3.3).</p> |
| on (Fill Toggle)                | <p>Specifies whether to fill the shape. Default is <i>true</i>. This attribute overrides the shape's fill attribute.</p> <p>[Example: The shape has a transparent fill:</p> <pre>&lt;v:shape ... fill="true" ... &gt; &lt;v:fill color="red" on="false"&gt; &lt;/v:fill&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                  |
| opacity (Primary Color Opacity) | <p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value can also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f"</p>                                                                                                                                                                                                                                                                       |

[Note: The W3C XML Schema definition of this element’s content model ([CT\\_Fill](#)) is located in §A.6.1. *end note*]

19.1.2.6 formulas (Set of Formulas)

This element defines a set of formulas whose calculated values are referenced by other attributes. Each formula is contained in a child *f* element (§19.1.2.4).

[Note: The W3C XML Schema definition of this element’s content model ([CT\\_Formulas](#)) is located in §A.6.1. *end note*]

### 19.1.2.7 group (Shape Group)

This element is used to collect shapes and groups so they can be positioned and transformed as a single unit. A group contains group, shapetype, shape, pre-defined shape - arc, curve, image, line, oval, polyline, rect, roundrect - and lock elements.

[Example: The following example defines a few basic parts of a flying saucer graphic. The group consists of five shapes. Each shape's position is determined within the coordinate space of the group, which is defined by the group's attributes.

```
<v:group id="saucer"
  style='position:relative;left:200;top:200;width:50;height:50'

| <b>coordorigin</b><br>(Coordinate Space Origin) | <p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[<i>Example:</i> The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200" coordorigin="-100,-100" path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| <b>coordsize</b><br>(Coordinate Space Size)     | <p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[<i>Example:</i> The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Attributes                                                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | relative                       | <p>position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>                                                                                                          |
|            | mso-position-vertical          | <p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>       |
|            | mso-position-vertical-relative | <p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul> |
|            | mso-wrap-distance-bottom       | <p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>           |
|            | mso-wrap-distance-left         | <p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>        |
|            | mso-wrap-distance-right        | <p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>       |
|            | mso-wrap-                      | <p>Specifies the distance from the top of the shape to the text that</p>                                                                                                                                                                                                                      |

| Attributes | Description     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | distance-top    | wraps around it. Default is 0 pt. This property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|            | mso-wrap-edited | Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|            | mso-wrap-style  | Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|            | position        | Specifies the kind of positioning used to place an element. Default is static. When the element is contained inside a group, this property shall be absolute. Allowed values are: <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>            |
|            | rotation        | Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|            | top             | Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul> |

Default is horizontal. Allowed values are:</p>                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |          |             |           |                                                                                                                                                                                                                                                                                                                          |             |                                                                                                        |

| Attributes | Description                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            |                                    | <ul style="list-style-type: none"> <li>• <code>horizontal</code> - Text is displayed horizontally.</li> <li>• <code>vertical</code> - Text is displayed vertically.</li> <li>• <code>vertical-ideographic</code> - Ideographic text is displayed vertically.</li> <li>• <code>horizontal-ideographic</code> - Ideographic text is displayed horizontally.</li> </ul>                                                                                                                                                         |
|            | <code>mso-direction-alt</code>     | Specifies an alternate direction for text in textboxes. Overrides the <code>direction</code> property. The only allowed value is <code>context</code> .                                                                                                                                                                                                                                                                                                                                                                      |
|            | <code>mso-fit-shape-to-text</code> | Specifies whether the shape stretches to fit the text in the textbox. Default is <code>false</code> .                                                                                                                                                                                                                                                                                                                                                                                                                        |
|            | <code>mso-fit-text-to-shape</code> | Specifies whether the text stretches to fit the textbox. Default is <code>false</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|            | <code>mso-layout-flow-alt</code>   | Specifies the alternate layout flow for text in textboxes. This property is used instead of <code>layout-flow</code> when the layout flow is from bottom to top for non-ideographic languages. Its only value is <code>bottom-to-top</code> .                                                                                                                                                                                                                                                                                |
|            | <code>mso-next-textbox</code>      | Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.                                                                                                                                                                                                                                                                                                                                                                                                      |
|            | <code>mso-rotate</code>            | <p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>• 0</li> <li>• 90</li> <li>• 180</li> <li>• -90</li> </ul>                                                                                                                                                                                                                                                                                                                        |
|            | <code>mso-text-scale</code>        | Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if <code>mso-fit-text-to-shape</code> is <code>true</code> .                                                                                                                                                                                                                                                                                                                                                               |
|            | <code>v-text-anchor</code>         | <p>Specifies the vertical anchoring of text in a textbox. Default is <code>top</code>. The alignment of a text anchor only becomes evident if <code>mso-fit-text-to-shape</code> is <code>false</code>. This property is different from the <code>vertical-align</code> CSS property, which is used for ideographic languages. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>top</code></li> <li>• <code>middle</code></li> <li>• <code>bottom</code></li> <li>• <code>top-center</code></li> </ul> |

| Attributes | Description                                                                  |                                                                                                                                                                                                                                                                                                                |       |             |        |                      |         |  |

| <p><b>tablelimits</b> (Table Row Height Limits)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Specifies a list of minimum height values for each row in a table. Default is no value.</p> <p>Used by PresentationML for native tables. This attribute is only useful when the table is made up of shapes that are grouped. When text is added to table cells, the row height can increase. The tablelimits attribute stores the original row height so that if text is deleted, the row height does not fall below the original value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:tablelimits="30pt 20pt" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                              |       |             |              |                                                                                  |   |                                    |   |                                          |
| <p><b>tableproperties</b> (Table Properties)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p>    | <p>Specifies a bitmask, represented as an integer, that determines table properties. Only the first three bits of this integer are used. Default is 0.</p> <p>Used by PresentationML for native tables. This attribute is only useful when the table is made up of shapes that are grouped. Allowed values are:</p> <table border="1" data-bbox="418 1037 1260 1234"> <thead> <tr> <th>Bit</th><th>Description</th></tr> </thead> <tbody> <tr> <td>1</td><td>Set if the group of shapes is a table.</td></tr> <tr> <td>2</td><td>Set if the shape is a placeholder.</td></tr> <tr> <td>3</td><td>Set if the table text is bi-directional.</td></tr> </tbody> </table> <p>[Example: Decimal 3 means that bits 1 and 2 are set.</p> <pre>&lt;v:shape ... o:tableproperties="3" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> | Bit   | Description | 1            | Set if the group of shapes is a table.                                           | 2 | Set if the shape is a placeholder. | 3 | Set if the table text is bi-directional. |
| Bit                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |             |              |                                                                                  |   |                                    |   |                                          |
| 1                                                                                                                 | Set if the group of shapes is a table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |       |             |              |                                                                                  |   |                                    |   |                                          |

| <p>userhidden (Hide Script Anchors)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Specifies whether a script anchor is hidden. Default is false. If true, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                                                             |
| <p>wrapcoords (Shape Bounding Polygon)</p>                                                            | <p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to tight or through.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT\\_Group](#)) is located in §A.6.1. *end note]*

#### 19.1.2.8 h (Shape Handle)

This element defines a single handle, which is a user interface element tied to one or two adj values. Moving the handle changes its linked adj values, which in turn changes formulas and attributes that depend on them. The handle is optionally constrained vertically or horizontally. The linked adj values store the position of the handle in the shape's coordinate space.

[Example: The example below defines a simple kite shape with a resizable width:

```

<v:shape coordsize="200,200" coordorigin="-100,-100" adj="100"
style="width:50;height:50;position:relative"
path="m @1,-50 l 0,-200 @0,-50 0,200 x e">
  <v:formulas>
    <v:f eqn="val #0"/>
    <v:f eqn="sum 0 0 @0"/>
  </v:formulas>
  <v:handles>
    <v:h position="#0,0"/>

|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Coordinate Mapping)         | <p>into the specified range. Default is "0,1000".</p> <p>[Example:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... map="-1000,1000" ... /&gt; &lt;/v:handles&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| polar (Handle Polar Center) | <p>Specifies the center position of a handle that uses polar coordinates. If specified, the position attribute is assumed to contain radius and angle values. If omitted, the position attribute is assumed to contain x and y positions. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... polar="0,0" ... /&gt; &lt;/v:handles&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                                                     |
| position (Handle Position)  | <p>Specifies the x and y position of the handle. If the polar attribute is present, defines the handle position using radius and angle values. Default is "0,0".</p> <p>Each value in the vector is one of the following:</p> <ul style="list-style-type: none"> <li>• constant</li> <li>• formula (e.g., @2)</li> <li>• adj value (e.g., #2)</li> <li>• center</li> <li>• topleft</li> <li>• bottomright</li> </ul> <p>Each of the above except for an adj value reference fixes the handle position for that dimension. Specifying an adj value allows the handle to move in that dimension and the handle position for that dimension is stored in the adj value.</p> <p>[Example: The handle's x position is fixed but it is free to move in the y dimension:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... position="topleft,#2" ... /&gt;</pre> |

| Attributes                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                            | <p><code>&lt;/v:handles&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>                                                                                                                                                                                                                                                                                                                                                                                                 |
| radiusrange<br>(Handle Polar Radius Range) | <p>Specifies a range of minimum and maximum values that constrain the radius of a handle using polar coordinates. Default is "0,0". Each value is either a constant or a formula reference. Omitting a value leaves that bound unconstrained.</p> <p>[Example: The polar handle can only be moved within a radius range of 25 to 50.</p> <pre> &lt;v:handles&gt;   &lt;v:h ... radiusrange="25,50" ... /&gt; &lt;/v:handles&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| switch (Handle Inversion Toggle)           | <p>Specifies whether the x and y dimensions of the handle are switched when the shape is taller than it is wide. Default is false. This is useful for shapes with limo stretch behavior.</p> <p>[Example:</p> <pre> &lt;v:handles&gt;   &lt;v:h ... switch="true" ... /&gt; &lt;/v:handles&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§20.1.2.6).</p>                                                                                                                       |
| xrange (Handle X Position Range)           | <p>Specifies a range of minimum and maximum values that constrain the x position of a handle. Default is "0,0". Each value is either a constant or a formula reference. Omitting a value leaves that bound unconstrained.</p> <p>[Example: The handle's x position has a maximum bound of 500 and no minimum bound:</p> <pre> &lt;v:handles&gt;   &lt;v:h ... xrange=",500" ... /&gt; &lt;/v:handles&gt; </pre> <p><i>end example]</i></p>                                                                                                                         |

| Attributes                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                  | The possible values for this attribute are defined by the W3C XML Schema string datatype.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| yrange (Handle Y Position Range) | <p>Specifies a range of minimum and maximum values that constrain the y position of a handle. Default is "0,0". Each value is either a constant or a formula reference. Omitting a value leaves that bound unconstrained.</p> <p>[<i>Example</i>: The handle's y position has a minimum bound of -500 and no maximum bound:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... yrange="-500," ... /&gt; &lt;/v:handles&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT\\_H](#)) is located in §A.6.1. *end note*]

### 19.1.2.9 handles (Set of Handles)

This element defines a set of user interface elements which can vary a shape's adj values. All dependent formulas and attributes are recalculated. Each handle is defined by a child h element.

[*Note*: The W3C XML Schema definition of this element's content model ([CT\\_Handles](#)) is located in §A.6.1. *end note*]

### 19.1.2.10 image (Image File)

This element is used to draw an image that has been loaded from an external source. There is an implied rectangle that is the same size as the image. Any stroke or fill is applied to this implied rectangle. The stroke is drawn on top of the image. The fill is behind the image and therefore only visible through transparent areas of the image. Image transparency is either encoded in the file or defined via a color value using the chromakey attribute. Unlike the imagedata element (§19.1.2.11), the image element does not have a parent element.

[*Example*:

```
<v:image src="myimage.gif"
  style="position:relative;top:1;left:1;width:50;height:45"
  cropbottom="10%" gamma="0.5" gain="2">
</v:image>
```

| <b>bwpure</b> (Pure Black-and-White Mode)<br><br>Namespace:<br>urn:schemas-microsoft-com:office:office | <p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p>[<i>Example:</i> This shape renders in high contrast when in a pure black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§19.2.3.3).</p>                                                                  |
| <b>chromakey</b> (Image Transparency Color)                                                            | <p>Specifies a color value that is transparent and show anything behind the shape. Default is no value.</p> <p>[<i>Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§20.1.2.3).</p>                                                                                                                                                              |
| <b>class</b> (CSS Reference)                                                                           | <p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p>[<i>Example:</i> The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle" style="top:1;left:1"&gt; &lt;/v:shape&gt;</pre> <pre>&lt;v:shape ... style="top:1;left:1; width:50;height:100"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

| Attributes                                                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>clip (Clipping Toggle)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p>                | <p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§19.2.2.3) element to create a clipping region.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                                                                                                                                                                |
| <p>cliptowrap (Clip to Wrapping Polygon)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p> | <p>Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§20.1.2.5).</p>                                          |
| <p>connectortype (Shape Connector Type)</p> <p>Namespace:<br/>urn:schemas-microsoft-com:office:office</p>  | <p>Specifies the kind of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§19.2.3.7).</p>                                                                                                                                                                                                                            |
| <p>coordorigin (Coordinate Space Origin)</p>                                                               | <p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> |

| Attributes                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
